Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

- [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

[**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development path for PD.

[**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

[**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

[**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

[**Protein transport channel offers new target for thwarting pathogen**](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and

compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

- [**Fossil footprints challenge established theories of human evolution**](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [**New findings on brain functional connectivity may lend insights into mental disorders**](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

- [**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

- [**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

- [**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

- [**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**Bacterial protein acts as aphrodisiac for choanoflagellates**](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same species.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Newly emerged superbug discovered**](#) [周四, 31 8月 22:15]

Scientists have discovered a newly emerged superbug, hyper-resistant and hypervirulent *Klebsiella pneumoniae*, which may cause untreatable and fatal infections in relatively healthy individuals and will pose enormous threat to human health.

- [**Why are coyote populations difficult to control?**](#) [周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and

pregnancy rates among individuals that survive.

- [**Antidepressants found in fish brains in Great Lakes region**](#) [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

- [**Mind wandering is common during driving**](#) [周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were mind wandering, but need to do further work to clarify if it is dangerous during driving.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Children's sleep quality linked to mothers' insomnia**](#) [周四, 31 8月 21:33]

Children sleep more poorly if their mothers suffer from insomnia symptoms – potentially affecting their mental wellbeing and development - according to new research. Nearly 200 school kids and their parents were studied, results indicating that children whose mothers have insomnia symptoms fall asleep later, get less sleep and spend less time in deep sleep. There appeared to be no link between fathers' insomnia symptoms and children's sleep.

- [**Little known theory could hold key to sporting success**](#) [周四, 31 8月 21:33]

An established but little known psychological theory is likely to improve performances across a range of activities, including sport, according to new research.

- [**New possibility of studying how Alzheimer's disease affects the brain at different ages**](#) [周四, 31 8月 21:33]

Alzheimer's disease can lead to several widely divergent symptoms and, so far, its various expressions have mainly been observed through the behavior and actions of patients. Researchers have now produced images showing the changes in the brain associated with these symptoms – a development which increases knowledge and could facilitate future diagnostics and treatment.

- [**First look at potentially deadly metabolic disorder that strikes infants**](#) [周四, 31 8月 21:32]

You may have never heard of congenital disorder of glycosylation, but parents whose children are born with forms of this rare -- and underreported -- metabolic disorder know all too well the dangers they pose, including developmental delay, failure to thrive, stroke-like symptoms, seizures and cerebellar dysfunction.

- [**Using DNA to predict schizophrenia, autism**](#) [周四, 31 8月 21:32]

A single amino acid substitution in the protein CX3CR1 may act as predictor for schizophrenia and autism, a multi-institute collaboration demonstrates.

- [**Faulty DNA repair depresses neural development**](#) [周四, 31 8月 21:32]

Researchers have discovered DNA polymerase δ (Pol δ) deficiency in neural stem cells affects neuronal survival and neural network in the developing brain.

- [**A philosophical mythbuster**](#) [周四, 31 8月 21:32]

Cognitive neuroscience gives us a glimpse into our brain activity; it allows us to learn more about ourselves. Or do brain scans actually not say very much about who we are? A philosopher examines four myths about neuroscience and self-understanding.

- [**Alcohol abuse, dental conditions, mental health found to be causes of avoidable US emergency**](#)

[visits](#) [周四, 31 8月 21:26]

Alcohol abuse, dental conditions, and mental health were found to be the main causes of avoidable emergency room visits in the US, a new report reveals.

• [Record-low 2016 Antarctic sea ice due to 'perfect storm' of tropical, polar conditions](#) [周四, 31 8月 21:26]

The sudden, unexpected nosedive in Antarctic sea ice last year was due to a unique one-two punch from atmospheric conditions both in the tropical Pacific Ocean and around the South Pole.

• [Improving earthquake resistance with a single crystal](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

• [Apes' abilities misunderstood by decades of poor science](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

• [Mass production of biodegradable plastic](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

• [Love your beauty rest? You can thank these brain cells](#) [周四, 31 8月 21:14]

Researchers report the unexpected presence of a type of neuron in the brains of mice that appears to play a central role in promoting sleep by turning 'off' wake-promoting neurons. The newly identified brain cells, located in a part of the hypothalamus called the zona incerta, they say, could offer novel drug targets to treat sleep disorders, such as insomnia

and narcolepsy, caused by the dysfunction of sleep-regulating neurons.

• [**Turning heat energy into a viable fuel source**](#) [周四, 31 8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode. It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

• [**Perfect mannequins a turnoff for some consumers**](#) [周四, 31 8月 21:14]

Mannequins' long legs, tiny waistlines and perfect busts can sour some shoppers on the products they're wearing, especially consumers who don't like the look of their own bodies.

• [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

• [**Forensic science techniques help discover new molecular fossils**](#) [周四, 31 8月 21:14]

Researchers believe they have found new molecular fossils of archaea using a method of analysis commonly used in forensic science.

• [**Fathers of American newborns keep getting older, study finds**](#) [周四, 31 8月 21:14]

While data on the moms of newborn American children has been abundant, equivalent data on dads hasn't -- a gap that scientists have now filled.

• [**E-cigarettes can help smokers quit, but there's a catch**](#) [周四, 31 8月 21:14]

Frequent e-cigarette use does help smokers quit -- a finding that

researchers say supports the use of e-cigarettes as a cessation aid for those trying to quit cigarette smoking. But, they note, an examination of a recent national survey uncovers important clues about who's successful at quitting and why.

- [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

- [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

- [**American pika disappears from large area of California's Sierra Nevada mountains**](#) [周四, 31 8月 08:21]

The American pika, a small mammal adapted to high altitudes and cold temperatures, has died out from a 165-square-mile span of habitat in California's northern Sierra Nevada mountains, and the cause appears to be climate change. Researchers surveyed pika habitat throughout the north Lake Tahoe area and found that pikas had disappeared from an area that stretches from near Tahoe City to Truckee, more than 10 miles away, and includes Mount Pluto.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [Profitable cooperation: Ants protect and fertilize plants](#) [周四, 31 8月 08:21]

Biologists describe how the waste left by ants on plant leaves serves as a valuable fertilizer for the plants -- handed on a silver platter.

• [Good as gold](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

New source for brain's development discovered -- ScienceDaily

A team of biologists has found an unexpected source for the brain's development, a finding that offers new insights into the building of the nervous system.

The research, which appears in the journal *Science*, discovered that glia, a collection of non-neuronal cells that had long been regarded as passive support cells, in fact are vital to nerve-cell development in the brain.

"The results lead us to revise the often neuro-centric view of brain development to now appreciate the contributions for non-neuronal cells such as glia," explains Vilaiwan Fernandes, a postdoctoral fellow in New York University's Department of Biology and the study's lead author. "Indeed, our study found that fundamental questions in brain development with regard to the timing, identity, and coordination of nerve cell birth can only be understood when the glial contribution is accounted for."

The brain is made up of two broad cell types, nerve

cells or neurons and glia, which are non-nerve cells that make up more than half the volume of the brain. Neurobiologists have tended to focus on the former because these are the cells that form networks that process information.

However, given the preponderance of glia in the brain's cellular make-up, the NYU researchers hypothesized that they could play a fundamental part in brain development.

To explore this, they examined the visual system of the fruit fly. The species serves as a powerful model organism for this line of study because its visual system, like the one in humans, holds repeated mini-circuits that detect and process light over the entire visual field.

This dynamic is of particular interest to scientists because, as the brain develops, it must coordinate the increase of neurons in the retina with other neurons in distant regions of the brain.

In their study, the NYU researchers found that the coordination of nerve-cell development is achieved through a population of glia, which relay cues from the

retina to the brain to make cells in the brain become nerve cells.

"By acting as a signaling intermediary, glia exert precise control over not only when and where a neuron is born, but also the type of neuron it will develop into," notes NYU Biology Professor Claude Desplan, the paper's senior author.

Does indoor spraying help prevent dengue? -- ScienceDaily

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report in *PLOS Neglected Tropical Diseases*.

Dengue infects between 300 and 500 million people every year, causing symptoms in around 100 million individuals and severe disease in half a million. The virus is primarily spread by *Aedes aegypti* mosquitoes, which live in tropical and subtropical areas of the world. Numerous insecticides are known to kill adult and immature *Aedes* mosquitoes, but exposing the mosquitoes to the insecticides can be challenging, since the insects tend to rest in hidden, indoor areas.

To determine the effectiveness of indoor spraying in preventing dengue, Olaf Horstick, of the University of

Heidelberg, Germany, and colleagues searched seven research databases for existing literature on indoor residual spraying (IRS) and indoor space spraying (ISS). They then systematically reviewed papers that were identified pertaining to the effect of IRS and ISS on dengue.

Out of seven studies -- three on IRS and four on ISS -- all concluded that there was some effect on either mosquito populations or dengue case numbers. The strength of evidence was strongest for the effect of IRS and ISS on adult mosquito populations, with multiple studies reporting no adult mosquitoes surviving the indoor treatments. Evidence on the indoor treatments to reduce larval populations or dengue cases was more limited. More research is needed on indoor spraying, the team concluded, although the review results are very promising, particularly in comparison with other *Aedes* control methods.

Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease -- ScienceDaily

Lewy bodies -- abnormal clumps of alpha-synuclein protein that accumulate in the brain -- are a hallmark of Parkinson's disease (PD). Traditional drug development approaches for PD have focused on clearing alpha-synuclein from the brain or on preventing its downstream effects. But researchers from Brigham and Women's Hospital want to prevent alpha-synuclein from accumulating in the first place. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied the health records of millions of people living in Norway. The results of their efforts, which point to a new drug development path for PD, are published in *Science*.

"Our study suggests a potential new pathway to target PD," said corresponding author Clemens Scherzer, MD, a neurologist and principal investigator at the Ann Romney Center for Neurologic Diseases at BWH and

Harvard Medical School.

The research team screened more 1,100 drugs already approved for treating diseases other than PD, looking for compounds that could be repurposed for lowering alpha-synuclein production in neuronal cells. They narrowed in on promising candidates, members of a class of drugs known as beta2-adrenergic agonists.

The team studied the effects of this class of drugs in mice, finding that it could significantly reduce alpha-synuclein levels. Working with collaborators from the University of Bergen, the team combed through data from the health records of more than 4 million Norwegians, pulling out information on patients who had been taking salbutamol, a beta2-adrenergic agonist commonly used to treat of asthma. They found that these patients were significantly less likely to develop PD -- PD risk was reduced by 34 percent for those taking the drug compared to those who were not.

Conversely, people taking propranolol -- a hypertension drug that increased alpha-synuclein production in cultured cells -- were at greater risk for developing PD.

"Clinical trials will be needed to determine if these insights can be translated into patients with PD." said Scherzer. " We are excited about this innovative drug development strategy. We hope it will speed up drug development for patients with PD and inspire therapeutic strategies for other brain diseases."

Reconstructing life at its beginning, cell by cell -- ScienceDaily

After 13 rapid divisions a fertilized fly egg consists of about 6,000 cells. They all look alike under the microscope. However, each cell of a *Drosophila melanogaster* embryo already knows by then whether it is destined to become a neuron or a muscle cell -- or part of the gut, the head, or the tail. Now, Nikolaus Rajewsky's and Robert Zinzen's teams at the Berlin Institute of Medical Systems Biology (BIMSB) of the Max Delbrück Center for Molecular Medicine in the Helmholtz Association (MDC) have analyzed the unique gene expression profiles of thousands of single cells and reassembled the embryo from these data using a new spatial mapping algorithm. The result is a virtual fly embryo showing exactly which genes are active where at this point in time. "It is basically a transcriptomic blueprint of early development," says Robert Zinzen, head of the Systems Biology of Neural Tissue Differentiation Lab. Their paper appears as a First Release in the online issue of *Science*.

"Only recently has it become possible to analyze genome-wide gene expression of individual cells at a large scale. Nikolaus recognized the potential of this technology very early on and established it in his lab," says Zinzen. "He started to wonder whether -- given a complex organized tissue -- one would be able to compute genome-wide spatial gene expression patterns from single-cell transcriptome data alone." BIMSB combines laboratories with different backgrounds and expertise, emphasizing the need of bringing computing power to biological problems. It turns out the institute had not only the perfect model system -- the *Drosophila* embryo -- to address Rajewsky's question, but also the right people with the right expertise, from physics and mathematics to biochemistry and developmental biology.

"The virtual embryo is much more than merely a cell mapping exercise," says Nikolaus Rajewsky, head of the Systems Biology of Gene Regulatory Elements Lab, who enjoyed returning to fly development 15 years after studying gene regulatory elements in *Drosophila* embryos during his post-doctoral time at the Rockefeller University. Using the interactive *Drosophila* Virtual Expression eXplorer (DVEX) database, researchers can now look at any of about

8,000 expressed genes in each cell and ask, "Gene X, where are you expressed and at what level? What other genes are active at the same time and in the same cells?" It also works with the enigmatic long non-coding RNAs. "Instead of time-consuming imaging experiments, scientists can do virtual ones to identify new regulatory players and even get ideas for biological mechanisms," says Rajewsky. "What would normally take years using standard approaches can now be done in a couple of hours."

Breaking the synchronicity of the first cell divisions

In their paper, the MDC researchers describe a dozen new transcription factors and many more long non-coding RNAs that have never been studied before. Also, they propose an answer to a question that has puzzled scientists for 35 years: How does the embryo break synchronicity of cell divisions to develop more complex structures?

In a process called gastrulation, distinct germ layers form and cells become restricted with regard to which tissues and organs they may differentiate into. "We believe that the Hippo signaling pathway is at least partly responsible for setting up gastrulation," says

Rajewsky. The pathway controls organ size, cell cycles and cell proliferation, but had never been implicated in the development of the early embryo. "We not only showed that Hippo is active in the fly, but we could even predict in which regions of the embryo this would lead to a different onset of mitosis and therefore break synchronicity. And that is just one example for how useful our tool is to understand mechanisms that have escaped traditional science."

Project underwent a tough gestation period

When the researchers started creating the virtual embryo, they did not know whether it would be possible. A key pillar of their eventual success is the Drop-Seq technology, a droplet-based, microfluidic method that allows the transcriptional profiling of thousands of individual cells at low cost. This technique had been newly set up in the Rajewsky lab by Jonathan Alles, a summer student.

However, the fly embryos needed to be selected precisely at the onset of gastrulation. Philipp Wahle, a PhD student in Robert Zinzen's lab, hand-picked about 5,000 of them before dissociating them into single cells. "I was convinced this would give us a large and

completely unique data set. This was a great motivation for me," says Wahle. That laborious process created a new challenge. "You need to collect over several sessions to have enough material for a sequencing run," says Christine Kocks, who led the single-cell sequencing team. It was composed of Jonathan Alles, Salah Ayoub and Anastasiya Boltengagen, who jointly with computational scientist Nikos Karaiskos optimized the droplet-based sequencing. "So we had to find a way to stabilize the transcriptomes in the cells," added Kocks. "Finally, based on his earlier work with *C. elegans* embryos, Nikolaus suggested using methanol." The new single-cell fixation method was published in *BMC Biology* in May 2017.

As the data got better and better, Nikos Karaiskos, a theoretical physicist and computational expert in Rajewsky's lab, took on the challenge of spatially mapping such a large number of cells to their precise embryonic position. None of the existing approaches in the field of spatial transcriptomics was suitable to reconstruct the *Drosophila* embryo. "It was a reiterative process to filter the data, see what is inside and try to map it. It changed many times along the way," says Karaiskos. There was a lot of back and forth

between members of the computer lab and wet lab -- exchanges that are a defining characteristic of the BIMS. "I had to question my work all the time, see where it was lacking and develop something better." He came up with a new algorithm called DistMap that can map transcriptomic data of cells back to their original position in the virtual embryo.

Navigating uncharted territory

The construction of the virtual embryo allowed Karaikos to readily predict the expression of thousands of genes, an almost impossible task by traditional experimental means. Philipp Wahle, supported by Claudia Kipar, validated these predictions by visualizing the gene expression profiles at the bench with a traditional approach: In situ hybridization allows visualizing patterns of gene expression with colorful dyes that are visible under the microscope. "At this stage, a single layer of cells surrounds the entire fly embryo," says Wahle. "This makes it very accessible, thus enabling you to compare the computational data with imaging."

It is the first time that it has been possible to look at the about 6,000 cells of the embryo individually, assess

their gene expression profiles -- and understand what determines their behavior in the embryo. "The most important technological advance of this study is that we don't lose the spatial information that is required to understand how embryonic cells act in concert," say the scientists. "This really is uncharted territory and requires new bioinformatics approaches to make sense of the collected data. This worked beautifully in our collaboration, not least because of the unique make-up of the Rajewsky lab, which integrates wet lab and computational approaches." One major advantage is that both groups are not only interested in technology but have specific biological questions that motivate them, says Rajewsky. "Robert has a deep understanding of early development. We can do single-cell sequencing runs and have the computational power to develop the tools that help us actually understand the underlying gene regulatory interactions."

The groups are already planning follow-up projects. One example would be to map the cells at different time points to see how they work together to form organs and tissues. Another would be to check whether the mapping approaches are applicable to more complex tissues.

All Top News

Top science stories featured on ScienceDaily's home page.

- [Reconstructing life at its beginning, cell by cell](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

- [Yawning: Why is it so contagious and why should it matter?](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain

responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

- [**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual

knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**New hope for reef fish living in a high CO2**](#)

[**world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

- [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early

infancy.

- [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

- [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

- [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

• [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

• [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever

analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

- [**Patient plays saxophone while surgeons remove brain tumor**](#) [周三, 30 8月 22:36]

Music is not only a major part of Dan Fabbio's life, as a music teacher it is his livelihood. So when doctors discovered a tumor located in the part of his brain responsible for music function, he began a long journey that involved a team of physicians, scientists, and a music professor and culminated with him awake and playing a saxophone as surgeons operated on his brain.

- [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

- [**Century-old seal pelts reveal changes in Ross Sea ecosystem**](#) [周三, 30 8月 21:43]

Scientists sampled a pile of frozen pelts left in a hut by Antarctic explorers for Weddell seal tissue from a century ago, at the very start of human activities in Antarctica. By using sophisticated isotope analysis to compare samples from modern and century-old seals, they were able to investigate human impacts on the Antarctic ecosystem.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

- [**Sense of smell is key factor in bird navigation, new study shows**](#) [周二, 29 8月 23:38]

How do birds navigate over long distances? This complex question has been the subject of debate and controversy among scientists for decades, with Earth's magnetic field and the bird's own sense of smell among the factors said to play a part. Now, researchers from the universities of Oxford, Barcelona and Pisa have shown in a new experiment that olfaction -- or sense of smell -- is almost certainly a key factor in long-distance oceanic navigation, eliminating previous misgivings about this hypoth...

- [**Woolly rhino neck ribs provide clues about their**](#)

[decline and eventual extinction](#) [周二, 29 8月 21:10]

A study reports on the incidence of abnormal cervical (neck) vertebrae in woolly rhinos, which strongly suggests a vulnerable condition in the species. Given the considerable birth defects that are associated with this condition, the researchers argue it is very possible that developmental abnormalities contributed towards the eventual extinction of these late Pleistocene rhinos.

[An alternative to wolf control to save endangered caribou](#) [周二, 29 8月 21:10]

The iconic woodland caribou across North America face increasing predation pressures from wolves. A short-term solution to caribou conservation would be to kill wolves. But a new government policy looks at reducing the invasive species moose numbers propping up the wolf population. Researchers have now evaluated the effects of this policy on the caribou population.

[Moderate consumption of fats, carbohydrates best for health, international study shows](#) [周二, 29 8月 21:10]

A diet that includes a moderate intake of fat and fruits and vegetables, and avoidance of high carbohydrates, is associated with lower risk of death, research with more than 135,000 people across five continents has shown.

[Complete remission of brain metastasis of difficult-to-treat tumor](#) [周二, 29 8月 02:07]

Medical researchers report a remarkable treatment response in a patient participating in a clinical trial of a novel immune-system-based cancer therapy.

[Algae fortifies coral reefs in past and present](#) [周二, 29 8月 02:07]

The Great Barrier Reef, and most other large reefs around the world, owe their bulk in large part to a type of red algae that grows on corals and strengthens them. New research has found that ancient coral reefs were also bolstered by their bond with red algae, a finding that could

help scientists better understand how reefs will respond to climate change.

- [**Galaxy 5 billion light-years away shows we live in a magnetic universe**](#) [周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

- [**Keeping pandas off endangered list ledge**](#) [周一, 28 8月 22:54]

Things aren't all black and white for giant pandas. The beloved Chinese icons have basked in good press lately -- their extinction risk status downgraded from 'endangered' to 'vulnerable,' their good fortunes have shown to rub off on their less charismatic forest neighbors that benefit from panda-centric conservation efforts.

- [**Compounds in cocoa may help delay onset of type 2 diabetes**](#) [周一, 28 8月 22:27]

What if eating chocolate helped prevent and treat diabetes? It's crazy enough to laugh off. But here's the thing: Researchers have discovered certain compounds found in cocoa can actually help your body release more insulin and respond to increased blood glucose better. Insulin is the hormone that manages glucose, the blood sugar that reaches unhealthy levels in diabetes.

- [**Eating triggers endorphin release in the brain**](#) [周一, 28 8月 22:27]

Researchers have revealed how eating stimulates brain's endogenous opioid system to signal pleasure and satiety.

- [**Oil and gas wells as a strong source of greenhouse gases**](#) [周一, 28 8月 22:27]

Boreholes in the North Sea could constitute a significantly more important source of methane, a strong greenhouse gas, than previously thought. Large amounts of methane are released from the sediments surrounding boreholes, probably over long periods of time.

• [**New ancient sea reptile found in Germany, the earliest of its kind**](#) [周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

• [**Statins linked to lower rates of breast cancer and mortality**](#) [周一, 28 8月 21:38]

A 14 year study in more than one million people has found that women with high cholesterol have significantly lower rates of breast cancer and improved mortality. The research suggests that statins are associated with lower rates of breast cancer and subsequent mortality.

• [**Air temperature is external trigger for heart attack**](#) [周一, 28 8月 21:38]

A 16-year study in more than 280,000 patients has suggested that air temperature is an external trigger for heart attack. The average number of heart attacks per day was significantly higher during seasons with colder outdoor temperatures as compared to warmer.

• [**Largest Ichthyosaurus was pregnant mother**](#) [周一, 28 8月 21:37]

Scientists have discovered the largest Ichthyosaurus on record and found it was pregnant at the time of death.

• [**80-year-olds as street-savvy as 18-year-olds**](#) [周一, 28 8月 21:37]

Our gut instinct about whether a stranger poses a threat is as good when we're 80 as when we're 18, according to new research. Older people are as good as young adults at knowing when someone is potentially aggressive, and being streetwise appears to be a skill honed in childhood but not fully reliable until adulthood.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

- [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

- [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development path for PD.

- [**New findings on brain functional connectivity may lend insights into mental disorders**](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits

function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

• [**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

• [**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

• [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

• [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Newly emerged superbug discovered**](#) [周四, 31 8月 22:15]

Scientists have discovered a newly emerged superbug, hyper-resistant and hypervirulent *Klebsiella pneumoniae*, which may cause untreatable and fatal infections in relatively healthy individuals and will pose enormous threat to human health.

- [**Mind wandering is common during driving**](#) [周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were mind wandering, but need to do further work to clarify if it is dangerous during driving.

- [**Children's sleep quality linked to mothers' insomnia**](#) [周四, 31 8月 21:33]

Children sleep more poorly if their mothers suffer from insomnia symptoms – potentially affecting their mental wellbeing and development - according to new research. Nearly 200 school kids and their parents were studied, results indicating that children whose mothers have insomnia symptoms fall asleep later, get less sleep and spend less time in deep sleep. There appeared to be no link between fathers' insomnia symptoms and children's sleep.

- [**Little known theory could hold key to sporting success**](#) [周四, 31 8月 21:33]

An established but little known psychological theory is likely to improve performances across a range of activities, including sport, according to new research.

- [**New possibility of studying how Alzheimer's disease affects the brain at different ages**](#) [周四, 31 8月 21:33]

Alzheimer's disease can lead to several widely divergent symptoms and, so far, its various expressions have mainly been observed through the behavior and actions of patients. Researchers have now produced images showing the changes in the brain associated with these symptoms – a development which increases knowledge and could facilitate future diagnostics and treatment.

- [**First look at potentially deadly metabolic disorder that strikes infants**](#) [周四, 31 8月 21:32]

You may have never heard of congenital disorder of glycosylation, but parents whose children are born with forms of this rare -- and underreported -- metabolic disorder know all too well the dangers they pose, including developmental delay, failure to thrive, stroke-like symptoms, seizures and cerebellar dysfunction.

- [**Using DNA to predict schizophrenia, autism**](#) [周四, 31 8月 21:32]

A single amino acid substitution in the protein CX3CR1 may act as predictor for schizophrenia and autism, a multi-institute collaboration demonstrates.

- [**Faulty DNA repair depresses neural development**](#) [周四, 31 8月 21:32]

Researchers have discovered DNA polymerase δ (Pol δ) deficiency in neural stem cells affects neuronal survival and neural network in the developing brain.

- [**A philosophical mythbuster**](#) [周四, 31 8月 21:32]

Cognitive neuroscience gives us a glimpse into our brain activity; it allows us to learn more about ourselves. Or do brain scans actually not say very much about who we are? A philosopher examines four myths about neuroscience and self-understanding.

- [**Alcohol abuse, dental conditions, mental health found to be causes of avoidable US emergency**](#)

[visits](#) [周四, 31 8月 21:26]

Alcohol abuse, dental conditions, and mental health were found to be the main causes of avoidable emergency room visits in the US, a new report reveals.

. [Love your beauty rest? You can thank these brain cells](#) [周四, 31 8月 21:14]

Researchers report the unexpected presence of a type of neuron in the brains of mice that appears to play a central role in promoting sleep by turning 'off' wake-promoting neurons. The newly identified brain cells, located in a part of the hypothalamus called the zona incerta, they say, could offer novel drug targets to treat sleep disorders, such as insomnia and narcolepsy, caused by the dysfunction of sleep-regulating neurons.

. [Perfect mannequins a turnoff for some consumers](#) [周四, 31 8月 21:14]

Mannequins' long legs, tiny waistlines and perfect busts can sour some shoppers on the products they're wearing, especially consumers who don't like the look of their own bodies.

. [Fathers of American newborns keep getting older, study finds](#) [周四, 31 8月 21:14]

While data on the moms of newborn American children has been abundant, equivalent data on dads hasn't -- a gap that scientists have now filled.

. [E-cigarettes can help smokers quit, but there's a catch](#) [周四, 31 8月 21:14]

Frequent e-cigarette use does help smokers quit -- a finding that researchers say supports the use of e-cigarettes as a cessation aid for those trying to quit cigarette smoking. But, they note, an examination of a recent national survey uncovers important clues about who's successful at quitting and why.

. [Three policies to improve children's language development](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

• [Good as gold](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

• [Gold nanoparticles fry cancer on glowing mice](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

• [Z-endoxifen shows promise as new treatment for common breast cancer type](#) [周四, 31 8月 08:21]

Z-endoxifen, a potent derivative of the drug tamoxifen, could itself be a new treatment for the most common form of breast cancer in women with metastatic disease, report investigators.

• [Concerns regarding radioactivity in migratory seafood negated](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

• [Protecting the guardians](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the

importance of avoiding antibiotic use during late pregnancy and early infancy.

- [**Breastfeeding reduces risk of endometriosis diagnosis**](#) [周四, 31 8月 03:55]

Women who breastfed for longer periods of time had significantly lower risk of being diagnosed with endometriosis, offering new insights into a condition that, up until now, has had very few known, modifiable risk factors, a new study concludes.

- [**Understanding perceptions of reputation, identity offers opportunity, study shows**](#) [周四, 31 8月 03:54]

Regardless of how people personally view another person, they also are aware of how that person sees themselves, as well as how they are generally perceived by others, research concludes.

- [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

- [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

- [**Blunting CRISPR's 'scissors' gives new insight into autoimmune disorders**](#) [周四, 31 8月 01:22]

A research team has used a modified version of the gene-editing technique CRISPR to find enhancers -- not by editing them but by prompting them into action.

- [**Powerful resource to advance treatment of pediatric solid tumors**](#) [周四, 31 8月 01:22]

St. Jude Children's Research Hospital is offering the global scientific community no-cost access to an unprecedented collection of pediatric solid tumor samples and data to fuel research and move treatment forward.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Blood test can predict early lung cancer prognosis**](#) [周四, 31 8月 01:22]

Cancer cells obtained from a blood test may be able to predict how early-stage lung cancer patients will fare, a team of researchers has shown.

- [**Dating? A magic formula to predict attraction is more elusive than ever**](#) [周四, 31 8月 01:22]

Dating websites often claim attraction between two people can be predicted from the right combination of traits and preferences, but a new study casts doubt on that assertion. The study, which used speed dating data, found a computer could predict who is desirable and how much someone would desire others -- who's hot and who's not -- but it could not unravel the mystery of unique desire for a specific person.

- [**Robotic system monitors specific neurons**](#) [周四, 31 8月 00:49]

Engineers have devised a way to automate the process of patch-

clamping, using a computer algorithm that analyzes microscope images and guides a robotic arm to the target cell to record its electrical activity.

- **[Millennials prefer healthy habits, less likely to choose opioids to manage pain](#)** [周四, 31 8月 00:49]

Often spending their days hunched over phones, tablets or computers and their free time at spin class or playing sports, millennials are the next generation poised to experience chronic pain. Even at their young age, millennials say acute and chronic pain are already interfering with their quality of life.

- **[Federal preemption of taxes on state and local sugar-sweetened beverages is not warranted](#)** [周四, 31 8月 00:49]

Federal and state government can alter or hinder state and local activity through a legal mechanism called preemption -- when a higher level of government blocks the action of a lower level of government. A new study evaluates whether it could be used to block taxes on sugar-sweetened beverages.

- **[When making decisions, monkeys use different brain areas to weigh value and availability](#)** [周四, 31 8月 00:26]

Seventeenth-century mathematician Blaise Pascal first introduced the idea of expected value, which is reached by multiplying the value of something (how much it's wanted or needed) with the probability that we might be able to obtain it. Now some very 21st century research is showing for the first time in monkeys which parts of the brain are involved in the two-pronged decision-making process that determines this expected value.

- **[A decline in navigational skills could predict neurodegenerative disease](#)** [周四, 31 8月 00:26]

Changes in how humans map their surroundings and construct and follow directions as they age have been understudied compared to effects on memory and learning. However, age-related declines in navigational ability are independent of those more well-known cognitive

downturns, and could form the basis for tools for the early diagnosis of Alzheimer's disease.

- [**'Seeing' robot learns tricky technique for studying brain cells in mammals**](#) [周四, 31 8月 00:25]

Scientists have successfully taught robots to perform a challenging brain technique only previously mastered by a handful of humans.

- [**How dietary fats' impact healthy or obese adults**](#) [周三, 30 8月 23:48]

Metabolically healthy obese adults consuming a diet high in unsaturated fat and low in saturated fat may be able to decrease their total cholesterol by 10 points, a new study suggests. However, there was little research evidence to support current dietary recommendations that replacing saturated fat with unsaturated fat aids in weight loss, the researchers also reported.

- [**Researchers raise health concerns about off-road vehicles and inhalation of asbestos**](#) [周三, 30 8月 23:47]

Preventing injuries may not be the only reason children shouldn't use off-road vehicles (ORVs). In a new study, public health scientists raise concerns that people who use ORVs in many regions of the country may face exposure to hazardous mineral fibers.

- [**Breakthrough in understanding mitochondria**](#) [周三, 30 8月 23:47]

Scientists have made a breakthrough in understanding how mitochondria -- the 'powerhouses' of human cells -- are made.

- [**Is changing languages effortful for bilingual speakers? Depends on the situation**](#) [周三, 30 8月 22:37]

Research on the neurobiology of bilingualism has suggested that switching languages is inherently effortful, requiring executive control to manage cognitive functions, but a new study shows this is only the case when speakers are prompted, or forced, to do so.

- [**Fetal membranes may help transform regenerative medicine**](#) [周三, 30 8月 22:36]

A new review looks at the potential of fetal membranes, which make up the amniotic sac surrounding the fetus during pregnancy, for regenerative medicine.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Improving earthquake resistance with a single crystal**](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived,

biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

• [**Turning heat energy into a viable fuel source**](#) [周四, 31 8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode. It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

• [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

• [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

• [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

• [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

• [**Toward a smart graphene membrane to**](#)

[desalinate water](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

• [New bar set for water-splitting, CO2-splitting techniques](#) [周四, 31 8月 02:13]

Researchers have significantly boosted the efficiency of two techniques, for splitting water to create hydrogen gas and splitting carbon dioxide to create carbon monoxide. The products are valuable feedstock for clean energy and chemical manufacturing applications.

• [Bioengineering a functional vascularized lung scaffold](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [Scientists recover nova first spotted 600 years ago by Korean astrologers](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

• [Artificial intelligence analyzes gravitational lenses 10 million times faster](#) [周四, 31 8月 01:22]

Researchers have for the first time shown that neural networks -- a form of artificial intelligence -- can accurately analyze the complex distortions in spacetime known as gravitational lenses 10 million times faster than traditional methods.

• [Motorized molecules drill through cells](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Dating? A magic formula to predict attraction is more elusive than ever**](#) [周四, 31 8月 01:22]

Dating websites often claim attraction between two people can be predicted from the right combination of traits and preferences, but a new study casts doubt on that assertion. The study, which used speed dating data, found a computer could predict who is desirable and how much someone would desire others -- who's hot and who's not -- but it could not unravel the mystery of unique desire for a specific person.

- [**Robotic system monitors specific neurons**](#) [周四, 31 8月 00:49]

Engineers have devised a way to automate the process of patch-clamping, using a computer algorithm that analyzes microscope images and guides a robotic arm to the target cell to record its electrical activity.

- [**'Seeing' robot learns tricky technique for studying brain cells in mammals**](#) [周四, 31 8月 00:25]

Scientists have successfully taught robots to perform a challenging brain technique only previously mastered by a handful of humans.

- [**Machine-learning earthquake prediction in lab shows promise**](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

- [**Silicon solves problems for next-generation battery technology**](#) [周三, 30 8月 23:48]

Silicon -- the second most abundant element in the earth's crust -- shows great promise in Li-ion batteries, according to new research. By replacing graphite anodes with silicon, it is possible to quadruple anode capacity.

- [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Stroke patient improvement with a brain-computer interface**](#) [周三, 30 8月 22:35]

It is possible for stroke patients to improve motor function using special training involving connecting brain signals with a computer, research shows.

- [**Leaf sensors can tell farmers when crops need to be watered**](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea**](#)

[creature's swimming style](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

• [Electricity production: When enzymes rival platinum](#) [周三, 30 8月 22:19]

Making a biocell that is as effective as a platinum fuel cell: that's the feat that researchers have achieved. Three years after making their first prototype biocell, the researchers have just reached a new milestone and increased its performance and stability. This biocell could, in the long run, offer an alternative to fuel cells that require rare and costly metals, such as platinum.

• [New significance of unheralded chemical reactions](#) [周三, 30 8月 21:45]

Researchers reveal new significance to a decades-old chemical reaction theory, increasing our understanding of the interaction of gases, relevant to combustion and planetary atmospheres.

• [New mini tool has massive implications](#) [周三, 30 8月 21:43]

Researchers have created a miniaturized, portable version of a tool now capable of analyzing Mars' atmosphere -- and that's just one of its myriad possible uses.

• [Making 3-D printing safer](#) [周三, 30 8月 21:42]

Within the past decade, 3-D printers have gone from bulky, expensive curiosities to compact, more affordable consumer products. At the same time, concerns have emerged that nanoparticles released from the machines during use could affect consumers' health. Now researchers report a way to eliminate almost all nanoparticle emissions from some of these printers.

• [Nanoparticles loaded with mRNA give disease-fighting properties to cells](#) [周三, 30 8月 21:42]

A new biomedical tool using nanoparticles that deliver transient gene changes to targeted cells could make therapies for a variety of diseases --

including cancer, diabetes and HIV -- faster and cheaper to develop, and more customizable.

- [**Adoption of robotics into a hospital's daily operations requires broad cooperation**](#) [周三, 30 8月 21:42]

Investigators studied the implementation of a logistics robot system at the Seinäjoki Central Hospital in South Ostrobothnia. The aim was to reduce transportation costs, improve the availability of supplies and alleviate congestion on hospital hallways by running deliveries around the clock on every day of the week.

- [**Nano chip system measures light from single bacterial cell to enable chemical detection**](#) [周三, 30 8月 21:42]

Researchers have created a nanophotonic chip system using lasers and bacteria to observe fluorescence emitted from a single bacterial cell. The novel system paves the way for an efficient and portable on-chip system for diverse cell-based sensing applications, such as detecting chemicals in real-time.

- [**NASA's Lunar mission captures solar eclipse as seen from the moon**](#) [周三, 30 8月 04:45]

LRO captured an image of the Moon's shadow over a large region of the United States, centered just north of Nashville, Tennessee.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

- [**Chemist synthesizes pure graphene**](#) [周三, 30 8月 01:53]

A chemist has patented a one-of-a-kind process for exfoliating graphene in its pure (unoxidized) form, as well as manufacturing innovative graphene nanocomposites that have potential uses in a variety of applications, including desalination of brackish water.

- [**Tiny nanopackages built out of DNA help scientists peek at how neurons work**](#) [周三, 30 8月 01:22]

Scientists have designed a way to use microscopic capsules made out of DNA to deliver a payload of tiny molecules directly into a cell. The technique gives scientists an opportunity to understand certain interactions among cells that have previously been hard to track.

- [**Scientists move graphene closer to transistor applications**](#) [周三, 30 8月 01:14]

Scientists were able to successfully manipulate the electronic structure of graphene, which may enable the fabrication of graphene transistors -- faster and more reliable than existing silicon-based transistors.

- [**Brain stimulation for children with learning difficulties?**](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- [**Photosynthesis discovery could help design more efficient artificial solar cells**](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

- [**Clamping down on causality by probing laser cavities**](#) [周二, 29 8月 23:39]

By monitoring the optical response of an externally probed laser cavity before and after gain clamping, researchers reveal the underlying mechanisms driving the cavity's responses.

- [**Scientists power past solar efficiency records**](#) [周二, 29 8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

- [**Researchers validate UV light's use in improving**](#)

[semiconductors](#) [周二, 29 8月 23:39]

A discovery by two scientists could aid the development of next-generation semiconductor devices, explains a new report.

• **[Lasers zap decontaminates from soil](#)** [周二, 29 8月 23:38]

There might be a new and improved way to rid contaminated soil of toxins and pollutants: zap it with lasers. By directly breaking down pollutants, researchers say, high-powered lasers can now be more efficient and cheaper than conventional decontamination techniques. They have shown how such a laser system could work and described the proof-of-principle results.

• **[Designing effective antennas 1000 times smaller](#)** [周二, 29 8月 23:38]

A new article describes a new approach to designing antennas. The discovery enables researchers to construct antennas that are up to a thousand times smaller than currently available antennas.

• **[Analysis identifies where commercial customers might benefit from energy storage](#)** [周二, 29 8月 23:38]

Commercial electricity customers who are subject to high demand charges may be able to reduce overall costs by using battery energy storage to manage demand, according to research.

• **[High-tech electronics made from autumn leaves](#)** [周二, 29 8月 23:38]

Northern China's roadsides are peppered with deciduous phoenix trees, producing an abundance of fallen leaves in autumn. These leaves are generally burned in the colder season, exacerbating the country's air pollution problem. Investigators in Shandong, China, recently discovered a new method to convert this organic waste matter into a porous carbon material that can be used to produce high-tech electronics.

• **[New technique to aid IVF embryo selection](#)** [周二, 29 8月 21:35]

An advanced new imaging technique that can help assess the quality of early-stage embryos has now been developed, investigators report.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

- [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because

their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

• [Pinpointing the sources of trans-pacific dust](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

• [Protein transport channel offers new target for thwarting pathogen](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

• [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

• [Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

[**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

[**Bacterial protein acts as aphrodisiac for choanoflagellates**](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same species.

[**Why are coyote populations difficult to control?**](#) [周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

[**Antidepressants found in fish brains in Great Lakes region**](#) [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

[**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

[**Record-low 2016 Antarctic sea ice due to**](#)

['perfect storm' of tropical, polar conditions](#) [周四, 31 8月 21:26]

The sudden, unexpected nosedive in Antarctic sea ice last year was due to a unique one-two punch from atmospheric conditions both in the tropical Pacific Ocean and around the South Pole.

• [Apes' abilities misunderstood by decades of poor science](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

• [Mass production of biodegradable plastic](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

• [Forensic science techniques help discover new molecular fossils](#) [周四, 31 8月 21:14]

Researchers believe they have found new molecular fossils of archaea using a method of analysis commonly used in forensic science.

• [New hope for reef fish living in a high CO2 world](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

• [American pika disappears from large area of California's Sierra Nevada mountains](#) [周四, 31 8月 08:21]

The American pika, a small mammal adapted to high altitudes and cold temperatures, has died out from a 165-square-mile span of habitat in California's northern Sierra Nevada mountains, and the cause appears to be climate change. Researchers surveyed pika habitat throughout the north Lake Tahoe area and found that pikas had disappeared from an area that stretches from near Tahoe City to Truckee, more than 10 miles

away, and includes Mount Pluto.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Profitable cooperation: Ants protect and fertilize plants**](#) [周四, 31 8月 08:21]

Biologists describe how the waste left by ants on plant leaves serves as a valuable fertilizer for the plants -- handed on a silver platter.

- [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

- [**Concerns regarding radioactivity in migratory seafood negated**](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

- [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

• [**Tracking down the whale-shark highway**](#) [周四, 31 8月 03:55]

Researchers recently discovered that whale sharks in the Eastern Tropical Pacific follow fronts -- the dynamic boundaries between warm and cold ocean waters.

• [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [**Peptide mass fingerprinting can identify whale species based solely on their baleen**](#) [周四, 31 8月 02:12]

Peptide mass fingerprinting accurately identified 10 species of whales from their baleen alone, according to a new study.

• [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

• [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

• [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as

Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

• [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

• [**A big difference between Asian and African elephants is diet**](#) [周四, 31 8月 01:22]

New research has shown that there are significant differences between the Asian and the African forest elephant -- and it isn't just about size and the shape of their ears. It is about what they eat and how they affect forest ecosystems.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**Fungal spore 'death clouds' key in gypsy moth fight**](#) [周四, 31 8月 00:49]

A fungus known to decimate populations of gypsy moths creates 'death clouds' of spores that can travel more than 40 miles to potentially infect populations of invasive moths, according to a new study.

• [**When making decisions, monkeys use different brain areas to weigh value and availability**](#) [周四, 31 8月 00:26]

Seventeenth-century mathematician Blaise Pascal first introduced the idea of expected value, which is reached by multiplying the value of something (how much it's wanted or needed) with the probability that we might be able to obtain it. Now some very 21st century research is showing for the first time in monkeys which parts of the brain are involved in the two-pronged decision-making process that determines this expected value.

• [**Hidden deep in the brain, a map that guides**](#)

[animals' movements](#) [周四, 31 8月 00:26]

New research has revealed that deep in the brain, in a structure called striatum, all possible movements that an animal can do are represented in a map of neural activity. If we think of neural activity as the coordinates of this map, then similar movements have similar coordinates, being represented closer in the map, while actions that are more different have more distant coordinates and are further away.

• [Periodic table of ecological niches could aid in predicting effects of climate change](#) [周四, 31 8月 00:25]

A group of ecologists has started creating a periodic table of ecological niches similar to chemistry's periodic table. It will be a critical resource for scientists seeking to understand how a warming climate may be spurring changes in species around the globe.

• [Machine-learning earthquake prediction in lab shows promise](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

• [Infested fossil worms show ancient examples of symbiosis](#) [周四, 31 8月 00:11]

One of the earliest examples of two invertebrate species living together in a symbiotic relationship has been found in 520-million-year-old fossils from China. The fossils show two species of marine worms with other, smaller worm-like animals attached to the outer surface of their body.

• [New clue may reveal the fate of famous French explorer](#) [周三, 30 8月 23:48]

An anthropologist may have stumbled across a clue to resolving one of the most enduring mysteries of Pacific history - the fate of famous French navigator, Jean François de Galaup, Comte de La Pérouse who disappeared in 1788.

• [**Hope for improving protection of the reticulated python**](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

• [**Breakthrough in understanding mitochondria**](#) [周三, 30 8月 23:47]

Scientists have made a breakthrough in understanding how mitochondria -- the 'powerhouses' of human cells -- are made.

• [**How invasive species threaten bats**](#) [周三, 30 8月 22:35]

A new review is the first to describe the scope of threats to bats by invasive species.

• [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

• [**Do squirrels teach bears to cross the railroad?**](#)

[**Grizzlies dig squirrel middens for grains**](#) [周三, 30 8月 22:34]

Grains have been reported to regularly trickle from hopper cars travelling via the railway through Canada's Banff and Yoho National Parks. As a result, the local red squirrels collect and bury the spilled seeds in their winter larders, which are sometimes discovered by hungry grizzly bears. Grain-conditioned bears may frequent the railway more often than usual, resulting in increased mortality by trains strikes.

• [**Wolf behavior undeterred by tailings ponds and pit mines**](#) [周三, 30 8月 22:34]

New research shows that predation rates of moose have increased near areas of high human disturbance, but low human activity, such as

tailings ponds and pit mines.

• [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

• [**An unusual delivery service**](#) [周三, 30 8月 22:15]

Is it better to produce locally or to import? That can be a crucial question for simple lifeforms as well. Mitochondria, the power plants of the cell, have their own protein factories although the cell apparatus could easily do the job for them. A special species of eukaryotes even has all the transfer-RNA it needs for protein assembly promptly delivered. Researchers have now uncovered how this highly unusual import mechanism works in detail.

• [**An island getaway: Why some Listeria strains survive good food hygiene standards**](#) [周三, 30 8月 21:50]

Despite the high standards of cleanliness and hygiene in the food industry, bacteria such as *Listeria monocytogenes* can still be found in the food processing environment. In a new study, a team of researchers has now shown that certain *Listeria* strains – figuratively speaking – take refuge on an island. An “islet” of two genes located in one area of the genome increases the bacteria’s survival under alkaline and oxidative stress conditions. The researchers were able to identify the two genes as a...

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new

article addresses how inequality impacts children's language development and details policies that can intervene.

• [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

• [**Federal preemption of taxes on state and local sugar-sweetened beverages is not warranted**](#) [周四, 31 8月 00:49]

Federal and state government can alter or hinder state and local activity through a legal mechanism called preemption -- when a higher level of government blocks the action of a lower level of government. A new study evaluates whether it could be used to block taxes on sugar-sweetened beverages.

• [**Hope for improving protection of the reticulated python**](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

• [**Researchers raise health concerns about off-road vehicles and inhalation of asbestos**](#) [周三, 30 8月 23:47]

Preventing injuries may not be the only reason children shouldn't use off-road vehicles (ORVs). In a new study, public health scientists raise concerns that people who use ORVs in many regions of the country may face exposure to hazardous mineral fibers.

• [**Is changing languages effortful for bilingual speakers? Depends on the situation**](#) [周三, 30 8月 22:37]

Research on the neurobiology of bilingualism has suggested that switching languages is inherently effortful, requiring executive control

to manage cognitive functions, but a new study shows this is only the case when speakers are prompted, or forced, to do so.

- [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

- [**Leaf sensors can tell farmers when crops need to be watered**](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

- [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- [**Conservation hindered by geographical mismatches between capacity, need**](#) [周三, 30 8月 21:45]

Geographical mismatches between conservation needs and expertise may hinder global conservation goals, new research suggests.

- [**Shared custody equals less stress for children**](#) [周三, 30 8月 21:42]

Children who live full time with one parent are more likely to feel stressed than children in shared custody situations. The benefit holds regardless of the level of conflict between the parents or between parent and child.

- [**Brain stimulation for children with learning difficulties?**](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- [**Exclusion from school can trigger long-term psychiatric illness**](#) [周三, 30 8月 00:45]

Excluding children from school may lead to long-term psychiatric problems and psychological distress, a study of thousands of children has shown.

- [**Where's the line? Managing extreme speech on social media**](#) [周三, 30 8月 00:45]

A new study shows that while people tend to dislike extreme speech on social media, there is less support for outright censorship. Instead, people believe sites need to do a better job promoting healthy discourse online.

- [**Photosynthesis discovery could help design more efficient artificial solar cells**](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

- [**Scientists power past solar efficiency records**](#) [周二, 29 8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

- [**Mental health linked to retirement savings**](#) [周二, 29 8月 23:38]

The question of how mental health status affects decisions regarding retirement savings is becoming a pressing issue in the United States. Key factors contributing to this issue include the tenuous state of the Social Security system, greater use of defined-contribution pension plans by employers, longer lifespans, and the rise of depression and

other mental health issues in older Americans.

• [**Origins of autism: Abnormalities in sensory processing at six months**](#) [周二, 29 8月 23:38]

The origins of autism remain mysterious. What areas of the brain are involved, and when do the first signs appear? New findings brings us closer to understanding the pathology of autism, and the point at which it begins to take shape in the human brain. Such knowledge will allow earlier interventions in the future and better outcomes for autistic children.

• [**Analysis identifies where commercial customers might benefit from energy storage**](#) [周二, 29 8月 23:38]

Commercial electricity customers who are subject to high demand charges may be able to reduce overall costs by using battery energy storage to manage demand, according to research.

• [**Inattentive kids show worse grades in later life**](#) [周二, 29 8月 21:50]

Researchers found that inattentiveness in childhood was linked to worse academic performance up to 10 years later in children with and without ADHD, even when they accounted for the children's intellectual ability. The results highlight the long-term effects that childhood inattention can have on academic performance, and suggest that parents and teachers should address inattentiveness in childhood.

• [**Doping in sports: Official tests fail to pick up majority of cases**](#) [周二, 29 8月 21:09]

A new scientific study has found that doping is far more common in professional sport than the rates suggested by blood and urine tests of the athletes.

• [**Cutbacks in foreign aid for HIV treatment would produce great harm, generate few savings**](#) [周二, 29 8月 06:34]

Proposed reductions in US foreign aid would have a devastating impact on HIV treatment and prevention programs in countries receiving such aid, an international team of investigators reports.

- **[Dispersants improved air quality for responders at Deepwater Horizon](#)** [周二, 29 8月 04:41]

A recent study adds a new dimension to the controversial decision to inject large amounts of chemical dispersants immediately above the crippled oil well at the seafloor during the Deepwater Horizon disaster in 2010.

- **[Americans' risk of needing nursing home care is higher than previously estimated](#)** [周二, 29 8月 04:41]

One worry Americans face as they grow older is the possibility of needing nursing home care and paying for the associated costs. A new study finds that the average American's lifetime risk of using a nursing home is substantially greater than previously believed, but the financial costs will be affordable for most people.

- **[Self-identifying as disabled and developing pride in disability aid overall well-being](#)** [周二, 29 8月 04:41]

Experiencing stigma, the severity of a disability and a person's age and income level help determine whether someone with an impairment considers themselves to be a person with a disability, and experiencing stigma predicts whether those individuals will ultimately develop disability pride, new research shows.

- **[Romance and affection top most popular sexual behaviors](#)** [周二, 29 8月 02:07]

Researchers have published a new US nationally representative study of sexual behavior, the first of its kind to capture a wide range of diverse sexual behaviors not previously examined in the general population.

- **[Nanoparticles pollution rises 30 percent when flex-fuel cars switch from bio to fossil](#)** [周二, 29 8月 00:45]

Use of ethanol in vehicles reduces pollution by nanoparticles, a study shows. Levels of ultrafine particulate matter in São Paulo City, Brazil, increased by up to 30 percent at times when ethanol prices rose and consumption fell.

• [**Preventing overcrowding in emergency rooms**](#) [周二, 29 8月 00:45]

A new study identifies four key strategies to reduce overcrowding in emergency rooms. The study concludes that engaged executive leadership can alleviate the problem when combined with a data-driven approach and coordination across the hospital from housekeepers to the CEO. Crowding in emergency rooms has been associated with decreased patient satisfaction and even death.

• [**'Marrying up' is now easier for men, improves their economic well-being, study finds**](#) [周一, 28 8月 22:54]

As the number of highly educated women has increased in recent decades, the chances of 'marrying up' have increased significantly for men and decreased for women, according to a new study.

• [**Popularity outranks strategy in supply chain integration decisions**](#) [周一, 28 8月 22:27]

Conscious comparison and indirect copying increase the similarity of supply chain management practices of peer group companies, sometimes at the cost of quality and operating culture.

• [**Deforestation in Cambodia linked to higher risk of ill health in young children**](#) [周一, 28 8月 21:41]

New research findings suggest the importance of considering health impacts when assessing trade-offs in land use planning.

• [**Expectations for all-day schools are too high**](#) [周一, 28 8月 21:39]

Children in the German-speaking part of Switzerland who utilize extended education offerings in the first two years of primary school generally perform no better in school than other children, an project has found. Overall, the research shows that all-day schools do not fulfil all the expectations people place in them.

• [**After Hurricane Katrina, personal debt fell for those worst hit, but at a cost**](#) [周一, 28 8月 21:37]

After Hurricane Katrina devastated New Orleans a dozen years ago,

there was a sharp and immediate drop in personal debt among residents living in city's most flooded blocks, according to a new study.

Researchers predicted when cholera epidemic in Yemen would peak [周五, 25 8月 21:11]

Scientists have developed a new mathematical model which accurately forecast that a devastating cholera epidemic in Yemen would peak by early July, the 26th week of 2017 and the cumulative incidence would be the order of 700-800 thousand cases.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

. [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

. [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

. [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

. [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

. [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

. [**Do squirrels teach bears to cross the railroad? Grizzlies dig squirrel middens for grains**](#) [周三, 30 8月 22:34]

Grains have been reported to regularly trickle from hopper cars travelling via the railway through Canada's Banff and Yoho National

Parks. As a result, the local red squirrels collect and bury the spilled seeds in their winter larders, which are sometimes discovered by hungry grizzly bears. Grain-conditioned bears may frequent the railway more often than usual, resulting in increased mortality by trains strikes.

• [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

• [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

• [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

• [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

• [**High-tech electronics made from autumn leaves**](#) [周二, 29 8月 23:38]

Northern China's roadsides are peppered with deciduous phoenix trees, producing an abundance of fallen leaves in autumn. These leaves are generally burned in the colder season, exacerbating the country's air pollution problem. Investigators in Shandong, China, recently discovered a new method to convert this organic waste matter into a porous carbon material that can be used to produce high-tech electronics.

• [**Galaxy 5 billion light-years away shows we live in a magnetic universe**](#) [周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

• [**New ancient sea reptile found in Germany, the earliest of its kind**](#) [周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

• [**Largest Ichthyosaurus was pregnant mother**](#) [周一, 28 8月 21:37]

Scientists have discovered the largest Ichthyosaurus on record and found it was pregnant at the time of death.

• [**Microbes compete for nutrients, affect metabolism, development in mice**](#) [周六, 26 8月 04:39]

If our microbiome overindulges, we might not have access to the nutrients we need. That's the suggestion from new research that shows mice that harbor high levels of microbes that eat choline are deprived of this essential nutrient.

• [**Given the choice, zebrafish willingly dose themselves with opioids**](#) [周六, 26 8月 02:06]

Researchers devised a system that allowed zebrafish to self-administer doses of hydrocodone, an opioid commonly prescribed to people for pain, to study drug dependency behavior.

• [**Drones relay RFID signals for inventory control**](#) [周五, 25 8月 23:28]

Researchers have developed a system that enables small, safe, aerial drones to read RFID tags from tens of meters away while identifying the tags' locations. The system could be used in large warehouses to prevent inventory mismatches and locate individual items.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Intellectual disabilities caused by protein defect**](#)

[周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#)

[周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#)

[周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

- [**Discovery may be key to obesity, Diabetes Rx**](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

- [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

• [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

• [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development path for PD.

• [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

• [**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when

honeybee larvae consume beebread/pollen and take up plant miRNAs.

• [**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

• [**Protein transport channel offers new target for thwarting pathogen**](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

• [**New findings on brain functional connectivity may lend insights into mental disorders**](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

• [**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

• [**Chemo-boosting drug discovered for leukemia**](#) [周五, 01 9月 00:30]

Drugs developed to treat heart and blood vessel problems could be used

in combination with chemotherapy to treat an aggressive form of adult leukemia, new research reveals.

- [**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

- [**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**Bacterial protein acts as aphrodisiac for choanoflagellates**](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same species.

- [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra

finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Why are coyote populations difficult to control?**](#) [周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

- [**Antidepressants found in fish brains in Great Lakes region**](#) [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

- [**Untreated sleep apnea shown to raise metabolic and cardiovascular stress**](#) [周四, 31 8月 22:14]

Sleep apnea, left untreated for even a few days, can increase blood sugar and fat levels, stress hormones and blood pressure, according to a new study of sleeping subjects. This research adds further support for the consistent use of continuous positive airway pressure, a machine that increases air pressure in the throat to keep the airway open during sleep.

Intellectual disabilities caused by protein defect -- ScienceDaily

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers from Radboudumc discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results published in the *American Journal of Human Genetics* on 31 August 2017 show that these changes in function play a more prominent role than previously thought.

Genes are responsible for protein production in cells. A common cause of intellectual disabilities is a de novo mutation (i.e. a mutation present in a child, but not in its parents) damaging a gene so severely that it is no longer able to produce functional proteins. The resulting protein defect will cause illness. In a number of disease-related genes, it is shown that a de novo

mutation does not eliminate the gene, but probably alters its function. These mutations are only located on specific parts of the gene.

Change in function

In order to find out how often this mechanism is involved, researchers from Radboudumc have combined the gene mutations in Dutch patients with a large international database comprising de novo mutations in patients. This research project was led by geneticist Christian Gilissen. "With our method, we were able to detect genes in which mutations not so much eliminate as affect the gene in another way. We found fifteen genes in which mutations cluster closely together, twelve of which being associated with developmental disorders. We also found three new genes that are likely to play a role in the development of intellectual disabilities as well," according to Gilissen.

Interactions

The de novo mutations that were found only change a very small part of a protein. The function of the protein remains largely, but not entirely the same. Gilissen

says: "The mutations are more likely to affect superficial parts of the proteins. These disturb interactions with other proteins and cause problems. Although mutations eliminating genes were often thought to be the main cause of intellectual disabilities, mutations altering the function of genes are now shown to be an important factor as well. That is a surprising finding."

Clustering mutations

Why are the de novo mutations that were found specifically clustered? Gilissen says: "There can be several explanations for that. Firstly, these genes show little natural variation. If such a gene is completely eliminated, a person may not be born. Only mutations located on very specific parts of the gene are viable. Consequently, only these mutations can be found. Another explanation can be that the mutations provide growth benefits to the sperm in which they develop. In that case, only these mutations would be able to survive."

New possibilities

The three newly-discovered genes playing a role in the

development of intellectual disabilities provide new diagnostic possibilities for patients. Gillissen says: "It is important that we have discovered a mechanism that has not yet been a focus of study. We expect this mechanism to play a role in a much larger proportion of patients with intellectual disabilities."

Reusable ruthenium-based catalyst could be a game-changer for the biomass industry -- ScienceDaily

Known for their outstanding versatility, primary amines (derivatives of ammonia) are industrially important compounds used in the preparation of a wide range of dyes, detergents and medicines. Although many attempts have been made to improve their synthesis using catalysts containing nickel, palladium and platinum, for example, few have succeeded in reducing the formation of secondary and tertiary amines and other undesired by-products.

Now, researchers at Tokyo Institute of Technology (Tokyo Tech) have developed a highly selective catalyst consisting of ruthenium nanoparticles supported on niobium pentoxide ($\text{Ru/Nb}_2\text{O}_5$). In a study published in the *Journal of the American Chemical Society*, the team demonstrated that $\text{Ru/Nb}_2\text{O}_5$ is capable of producing primary amines from carbonyl compounds with ammonia (NH_3) and dihydrogen (H_2), with negligible formation of by-

products.

The study compared the extent to which different catalysts could convert furfural to furfurylamine in a process known as reductive amination¹. This reaction is one of the most useful methods for producing primary amines on an industrial scale. The Ru/Nb₂O₅ catalyst outperformed all other types tested -- remarkably, a yield of 99% was attained when ammonia was used in excess quantity.

Even after three recycles, the Ru/Nb₂O₅ catalyst achieved consistent results, with consecutive yields of over 90%. The superior catalytic efficiency is thought to be due to ruthenium's weak electron-donating properties on the Nb₂O₅ surface.

Michikazu Hara of Tokyo Tech's Laboratory for Materials and Structures and his co-workers then explored how effectively the new catalyst could break down biomass (in the form of glucose) into 2,5-bis(aminomethyl)furan, a monomer for aramid production. Previous experiments using a nickel-based catalyst led to a yield of around 50% from glucose-derived feedstock (5-hydroxymethylfurfural). The new catalyst used in combination with a so-called

ruthenium-xantphos complex produced a yield of 93%. With little to no by-products observed, Ru/Nb₂O₅ represents a major breakthrough in the clean, large-scale production of biomass-derived materials.

Further studies to expand on these initial findings are already underway. By pushing the boundaries of material design, the researchers say that Ru/Nb₂O₅ may accelerate the production of environmentally friendly plastics, rubber and heat-resistant aramid fibers². In future, the Ru/Nb₂O₅ catalyst may also impact the development of novel anti-cancer drugs, anti-bacterials, pesticides, agrochemicals, fertilizers, bio-oils and biofuels.

Bit data goes anti-skyrmions -- ScienceDaily

Today's world, rapidly changing because of "big data," is encapsulated in trillions of tiny magnetic objects -- magnetic bits -- each of which stores one bit of data in magnetic disk drives. A group of scientists from the Max Planck Institutes in Halle and Dresden have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

Most digital data is stored in the cloud as magnetic bits within massive numbers of magnetic disk drives. Over the past several decades these magnetic bits have shrunk by many orders of magnitude, reaching limits where the boundaries of these magnetic regions can have special properties. In some special materials these boundaries -- "magnetic domain walls" -- can be described as being topological. What this means is that these walls can be thought of as having a special

magical cloak -- what is referred to by scientists as "topological protection." An important consequence is that such magnetic walls are more stable to perturbations than similar magnetic bits without topological protection that are formed in conventional magnetic materials. Thus, these "topological" magnetic objects could be especially useful for storing "1"s and "0"s, the basic elements of digital data.

One such object is a "magnetic skyrmion" which is a tiny magnetic region, perhaps tens to hundreds of atoms wide, separated from a surrounding magnetic region by a chiral domain wall. Until recently only one type of skyrmion has been found in which it is surrounded by a chiral domain wall that takes the same form in all directions. But there have been predictions of several other types of skyrmions that were not yet observed. Now in a paper published in *Nature*, scientists from Prof. Stuart Parkin's NISE department at the Max Planck Institute for Microstructure Physics in Halle, Germany, have found a second class of skyrmions, what are called "anti-skyrmions," in materials synthesized in Prof. Claudia Felser's Solid State Chemistry Department at the Max Planck Institute for CPFS, Dresden, Germany.

The scientists from Halle and Dresden have found these tiny magnetic objects in a special class of versatile magnetic compounds called Heusler compounds that Claudia Felser and her colleagues have explored extensively over the past 20 years. Of these Heusler compounds, a tiny subset have just the right crystal symmetry to allow for the possibility of forming anti-skyrmions but not skyrmions. Using a highly sensitive transmission electron microscope at the Max Planck Institute for Microstructure Physics, Halle, that was specially modified to allow for the detection of tiny magnetic moments, anti-skyrmions were created and detected over a wide range of temperatures and magnetic fields. Most importantly, anti-skyrmions, both in ordered arrays and as isolated objects, could be seen even at room temperature and in zero magnetic fields.

The special cloaking properties of skyrmions makes them of great interest for a radically new form of solid-state memory -- the Racetrack Memory -- that was proposed by Stuart Parkin a decade ago. In Racetrack Memory digital data is encoded within magnetic domain walls that are packed closely within nanoscopic magnetic wires. One of the unique features of Racetrack Memory, which is distinct from all other

memories, is that the walls are moved around the nanowires themselves using recent discoveries in spin-orbitronics. Very short pulses of current move all the domain walls backwards and forwards along the nanowires. The walls -- the magnetic bits -- can be read and written by devices incorporated directly into the nanowires themselves, thereby eliminating any mechanical parts. Topologically protected magnetic walls are very promising for Racetrack Memory.

Thus, anti-skyrmions could be coming to Racetrack Memory soon! Going even beyond anti-skyrmions the next goal is the realization of a third class of skyrmions -- antiferromagnetic skyrmions -- which are tiny magnetic objects that actually have no net magnetic moment. They are magnetically almost invisible but have unique properties that make them of great interest.

- [Equatorial jet in Venusian atmosphere](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [Mouth clicks used in human echolocation captured in unprecedented detail](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [Reconstructing life at its beginning, cell by cell](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [Human bones in south Mexico: Stalagmite](#)

reveals their age as 13,000 years old [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

Yawning: Why is it so contagious and why should it matter? [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

Scents and social preference: Neuroscientists ID the roots of attraction [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

What changes when you warm the Antarctic Ocean just 1 degree? Lots [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Star-formation ‘fuel tanks’ found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

- [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

- [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

- [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

• [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

• [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

• [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce

winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

- [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

• [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

• [**Woolly rhino neck ribs provide clues about their decline and eventual extinction**](#) [周二, 29 8月 21:10]

A study reports on the incidence of abnormal cervical (neck) vertebrae in woolly rhinos, which strongly suggests a vulnerable condition in the species. Given the considerable birth defects that are associated with this condition, the researchers argue it is very possible that developmental abnormalities contributed towards the eventual extinction of these late Pleistocene rhinos.

• [**An alternative to wolf control to save endangered caribou**](#) [周二, 29 8月 21:10]

The iconic woodland caribou across North America face increasing predation pressures from wolves. A short-term solution to caribou conservation would be to kill wolves. But a new government policy looks at reducing the invasive species moose numbers propping up the wolf population. Researchers have now evaluated the effects of this policy on the caribou population.

• [**Moderate consumption of fats, carbohydrates best for health, international study shows**](#) [周二, 29 8月 21:10]

A diet that includes a moderate intake of fat and fruits and vegetables, and avoidance of high carbohydrates, is associated with lower risk of death, research with more than 135,000 people across five continents has shown.

• [**Complete remission of brain metastasis of difficult-to-treat tumor**](#) [周二, 29 8月 02:07]

Medical researchers report a remarkable treatment response in a patient participating in a clinical trial of a novel immune-system-based cancer

therapy.

• [**Algae fortifies coral reefs in past and present**](#) [周二, 29 8月 02:07]

The Great Barrier Reef, and most other large reefs around the world, owe their bulk in large part to a type of red algae that grows on corals and strengthens them. New research has found that ancient coral reefs were also bolstered by their bond with red algae, a finding that could help scientists better understand how reefs will respond to climate change.

• [**Galaxy 5 billion light-years away shows we live in a magnetic universe**](#) [周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

• [**Keeping pandas off endangered list ledge**](#) [周一, 28 8月 22:54]

Things aren't all black and white for giant pandas. The beloved Chinese icons have basked in good press lately -- their extinction risk status downgraded from 'endangered' to 'vulnerable,' their good fortunes have shown to rub off on their less charismatic forest neighbors that benefit from panda-centric conservation efforts.

• [**Eating triggers endorphin release in the brain**](#) [周一, 28 8月 22:27]

Researchers have revealed how eating stimulates brain's endogenous opioid system to signal pleasure and satiety.

• [**Oil and gas wells as a strong source of greenhouse gases**](#) [周一, 28 8月 22:27]

Boreholes in the North Sea could constitute a significantly more important source of methane, a strong greenhouse gas, than previously thought. Large amounts of methane are released from the sediments surrounding boreholes, probably over long periods of time.

• [**New ancient sea reptile found in Germany, the**](#)

earliest of its kind [周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

Statins linked to lower rates of breast cancer and mortality [周一, 28 8月 21:38]

A 14 year study in more than one million people has found that women with high cholesterol have significantly lower rates of breast cancer and improved mortality. The research suggests that statins are associated with lower rates of breast cancer and subsequent mortality.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

- [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- [**Lifestyle factors may affect how long individuals live free of disability**](#) [周五, 01 9月 22:46]

New research indicates that a healthy lifestyle may help reduce the duration of an individual's disabled period near the end of life.

- [**Genes fueling neuroblastoma spread now identified**](#) [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the

relationship between two genes that fuel the aggressive spread of neuroblastomas.

• [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

• [**Discovery may be key to obesity, Diabetes Rx**](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

• [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

• [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

• [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-

synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development path for PD.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**New findings on brain functional connectivity may lend insights into mental disorders**](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

- [**Chemo-boosting drug discovered for leukemia**](#) [周五, 01 9月 00:30]

Drugs developed to treat heart and blood vessel problems could be used in combination with chemotherapy to treat an aggressive form of adult leukemia, new research reveals.

- [**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

- [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra

finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Mind wandering is common during driving**](#) [周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were mind wandering, but need to do further work to clarify if it is dangerous during driving.

- [**Children's sleep quality linked to mothers' insomnia**](#) [周四, 31 8月 21:33]

Children sleep more poorly if their mothers suffer from insomnia symptoms – potentially affecting their mental wellbeing and development - according to new research. Nearly 200 school kids and their parents were studied, results indicating that children whose mothers have insomnia symptoms fall asleep later, get less sleep and spend less time in deep sleep. There appeared to be no link between fathers' insomnia symptoms and children's sleep.

- [**Little known theory could hold key to sporting success**](#) [周四, 31 8月 21:33]

An established but little known psychological theory is likely to improve performances across a range of activities, including sport, according to new research.

- [**Severe stress behind self-perceived memory problems**](#) [周四, 31 8月 21:33]

Stress, fatigue, and feeling like your memory is failing you. These are

the symptoms of a growing group of patients. Result – They may need help, but they are rarely entering the initial stages of dementia.

- [**New possibility of studying how Alzheimer's disease affects the brain at different ages**](#) [周四, 31 8月 21:33]

Alzheimer's disease can lead to several widely divergent symptoms and, so far, its various expressions have mainly been observed through the behavior and actions of patients. Researchers have now produced images showing the changes in the brain associated with these symptoms – a development which increases knowledge and could facilitate future diagnostics and treatment.

- [**First look at potentially deadly metabolic disorder that strikes infants**](#) [周四, 31 8月 21:32]

You may have never heard of congenital disorder of glycosylation, but parents whose children are born with forms of this rare -- and underreported -- metabolic disorder know all too well the dangers they pose, including developmental delay, failure to thrive, stroke-like symptoms, seizures and cerebellar dysfunction.

- [**Using DNA to predict schizophrenia, autism**](#) [周四, 31 8月 21:32]

A single amino acid substitution in the protein CX3CR1 may act as predictor for schizophrenia and autism, a multi-institute collaboration demonstrates.

- [**Faulty DNA repair depresses neural development**](#) [周四, 31 8月 21:32]

Researchers have discovered DNA polymerase ? (Pol?) deficiency in neural stem cells affects neuronal survival and neural network in the developing brain.

- [**A philosophical mythbuster**](#) [周四, 31 8月 21:32]

Cognitive neuroscience gives us a glimpse into our brain activity; it allows us to learn more about ourselves. Or do brain scans actually not say very much about who we are? A philosopher examines four myths about neuroscience and self-understanding.

- [**Alcohol abuse, dental conditions, mental health found to be causes of avoidable US emergency visits**](#) [周四, 31 8月 21:26]

Alcohol abuse, dental conditions, and mental health were found to be the main causes of avoidable emergency room visits in the US, a new report reveals.

- [**Love your beauty rest? You can thank these brain cells**](#) [周四, 31 8月 21:14]

Researchers report the unexpected presence of a type of neuron in the brains of mice that appears to play a central role in promoting sleep by turning 'off' wake-promoting neurons. The newly identified brain cells, located in a part of the hypothalamus called the zona incerta, they say, could offer novel drug targets to treat sleep disorders, such as insomnia and narcolepsy, caused by the dysfunction of sleep-regulating neurons.

- [**New Zealand researchers makes 'natural born killer' cell discovery**](#) [周四, 31 8月 21:14]

An unexpected role for a white blood cell called the Natural Killer (NK) cell -- a critical cell for ridding the body of infection and cancer, has been discovered. The NK cell is a 'vigilante' killer -- a white blood cell that destroys invaders and cancer cells through a process of 'identity card' checking. The researchers' new work shows that violent vigilante NK cells act as helper cells to start up the immune response.

- [**Fathers of American newborns keep getting older, study finds**](#) [周四, 31 8月 21:14]

While data on the moms of newborn American children has been abundant, equivalent data on dads hasn't -- a gap that scientists have now filled.

- [**E-cigarettes can help smokers quit, but there's a catch**](#) [周四, 31 8月 21:14]

Frequent e-cigarette use does help smokers quit -- a finding that researchers say supports the use of e-cigarettes as a cessation aid for

those trying to quit cigarette smoking. But, they note, an examination of a recent national survey uncovers important clues about who's successful at quitting and why.

- [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

- [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

- [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

- [**Eating protein three times a day could make our seniors stronger**](#) [周四, 31 8月 08:21]

Loss of muscle is an inevitable consequence of aging that can lead to frailty, falls or mobility problems. Eating enough protein is one way to remedy it, but it would seem that spreading protein equally among the three daily meals could be linked to greater mass and muscle strength in the elderly.

- [**Z-endoxifen shows promise as new treatment for common breast cancer type**](#) [周四, 31 8月 08:21]

Z-endoxifen, a potent derivative of the drug tamoxifen, could itself be a

new treatment for the most common form of breast cancer in women with metastatic disease, report investigators.

• [**Virus that causes mono may increase risk of MS for multiple races**](#) [周四, 31 8月 05:21]

Like whites, Hispanic and black people who have had mononucleosis, commonly known as mono, which is caused by Epstein-Barr virus, may have an increased risk of multiple sclerosis (MS), according to a new study.

• [**Concerns regarding radioactivity in migratory seafood negated**](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

• [**Breastfeeding reduces risk of endometriosis diagnosis**](#) [周四, 31 8月 03:55]

Women who breastfed for longer periods of time had significantly lower risk of being diagnosed with endometriosis, offering new insights into a condition that, up until now, has had very few known, modifiable risk factors, a new study concludes.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Improving earthquake resistance with a single crystal**](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

- [**Turning heat energy into a viable fuel source**](#) [周四, 31 8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode. It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

• [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

• [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

• [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

• [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

• [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung.

Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [**Environmental chemist flashes warning light on new nanoparticle**](#) [周四, 31 8月 02:12]

Layered BP's cytotoxicity is based on the fact that it generates reactive oxygen species (ROS), scientists have found. ROS are among the most potent cell-damaging agents known. Layered BP also disrupts cell membrane integrity in a particle-size-dependent manner.

• [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

• [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Dating? A magic formula to predict attraction is more elusive than ever**](#) [周四, 31 8月 01:22]

Dating websites often claim attraction between two people can be

predicted from the right combination of traits and preferences, but a new study casts doubt on that assertion. The study, which used speed dating data, found a computer could predict who is desirable and how much someone would desire others -- who's hot and who's not -- but it could not unravel the mystery of unique desire for a specific person.

- [**Robotic system monitors specific neurons**](#) [周四, 31 8月 00:49]

Engineers have devised a way to automate the process of patch-clamping, using a computer algorithm that analyzes microscope images and guides a robotic arm to the target cell to record its electrical activity.

- [**'Seeing' robot learns tricky technique for studying brain cells in mammals**](#) [周四, 31 8月 00:25]

Scientists have successfully taught robots to perform a challenging brain technique only previously mastered by a handful of humans.

- [**Machine-learning earthquake prediction in lab shows promise**](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

- [**Silicon solves problems for next-generation battery technology**](#) [周三, 30 8月 23:48]

Silicon -- the second most abundant element in the earth's crust -- shows great promise in Li-ion batteries, according to new research. By replacing graphite anodes with silicon, it is possible to quadruple anode capacity.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Electricity production: When enzymes rival platinum**](#) [周三, 30 8月 22:19]

Making a biocell that is as effective as a platinum fuel cell: that's the feat that researchers have achieved. Three years after making their first prototype biocell, the researchers have just reached a new milestone and increased its performance and stability. This biocell could, in the long run, offer an alternative to fuel cells that require rare and costly metals, such as platinum.

- [**New mini tool has massive implications**](#) [周三, 30 8月 21:43]

Researchers have created a miniaturized, portable version of a tool now capable of analyzing Mars' atmosphere -- and that's just one of its myriad possible uses.

- [**Making 3-D printing safer**](#) [周三, 30 8月 21:42]

Within the past decade, 3-D printers have gone from bulky, expensive curiosities to compact, more affordable consumer products. At the same time, concerns have emerged that nanoparticles released from the machines during use could affect consumers' health. Now researchers report a way to eliminate almost all nanoparticle emissions from some of these printers.

- [**Nanoparticles loaded with mRNA give disease-fighting properties to cells**](#) [周三, 30 8月 21:42]

A new biomedical tool using nanoparticles that deliver transient gene changes to targeted cells could make therapies for a variety of diseases -- including cancer, diabetes and HIV -- faster and cheaper to develop, and more customizable.

- [**Adoption of robotics into a hospital's daily operations requires broad cooperation**](#) [周三, 30 8月 21:42]

Investigators studied the implementation of a logistics robot system at the Seinäjoki Central Hospital in South Ostrobothnia. The aim was to reduce transportation costs, improve the availability of supplies and alleviate congestion on hospital hallways by running deliveries around the clock on every day of the week.

- [**Nano chip system measures light from single bacterial cell to enable chemical detection**](#) [周三, 30 8月

21:42]

Researchers have created a nanophotonic chip system using lasers and bacteria to observe fluorescence emitted from a single bacterial cell. The novel system paves the way for an efficient and portable on-chip system for diverse cell-based sensing applications, such as detecting chemicals in real-time.

- [**NASA's Lunar mission captures solar eclipse as seen from the moon**](#) [周三, 30 8月 04:45]

LRO captured an image of the Moon's shadow over a large region of the United States, centered just north of Nashville, Tennessee.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

- [**Tiny nanopackages built out of DNA help scientists peek at how neurons work**](#) [周三, 30 8月 01:22]

Scientists have designed a way to use microscopic capsules made out of DNA to deliver a payload of tiny molecules directly into a cell. The technique gives scientists an opportunity to understand certain interactions among cells that have previously been hard to track.

- [**Brain stimulation for children with learning difficulties?**](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- [**Photosynthesis discovery could help design more efficient artificial solar cells**](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

[Scientists power past solar efficiency records](#) [周二, 29]

8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

- [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

- [**Coming soon to Montreal: The infrastructure cost of climate change**](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

[**More research needed on effects of maternal stress in wild animals**](#) [周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes to their survival.

[**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

[**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

[**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

[**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles

from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

[**Protein transport channel offers new target for thwarting pathogen**](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

[**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

[**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

[**Antidepressants found in fish brains in Great Lakes region**](#) [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

[**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did

they make it 200,000 years ago? Archaeologists have discovered three possible ways.

• [**Record-low 2016 Antarctic sea ice due to 'perfect storm' of tropical, polar conditions**](#) [周四, 31 8月 21:26]

The sudden, unexpected nosedive in Antarctic sea ice last year was due to a unique one-two punch from atmospheric conditions both in the tropical Pacific Ocean and around the South Pole.

• [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

• [**Forensic science techniques help discover new molecular fossils**](#) [周四, 31 8月 21:14]

Researchers believe they have found new molecular fossils of archaea using a method of analysis commonly used in forensic science.

• [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

• [**American pika disappears from large area of California's Sierra Nevada mountains**](#) [周四, 31 8月 08:21]

The American pika, a small mammal adapted to high altitudes and cold temperatures, has died out from a 165-square-mile span of habitat in California's northern Sierra Nevada mountains, and the cause appears to be climate change. Researchers surveyed pika habitat throughout the north Lake Tahoe area and found that pikas had disappeared from an area that stretches from near Tahoe City to Truckee, more than 10 miles away, and includes Mount Pluto.

• [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [**Profitable cooperation: Ants protect and fertilize plants**](#) [周四, 31 8月 08:21]

Biologists describe how the waste left by ants on plant leaves serves as a valuable fertilizer for the plants -- handed on a silver platter.

• [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

• [**Concerns regarding radioactivity in migratory seafood negated**](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

• [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

• [**Tracking down the whale-shark highway**](#) [周四, 31 8月 03:55]

Researchers recently discovered that whale sharks in the Eastern Tropical Pacific follow fronts -- the dynamic boundaries between warm and cold ocean waters.

- [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

- [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

- [**A big difference between Asian and African elephants is diet**](#) [周四, 31 8月 01:22]

New research has shown that there are significant differences between the Asian and the African forest elephant -- and it isn't just about size and the shape of their ears. It is about what they eat and how they affect

forest ecosystems.

- [Otters learn by copying each other](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

- [Fungal spore 'death clouds' key in gypsy moth fight](#) [周四, 31 8月 00:49]

A fungus known to decimate populations of gypsy moths creates 'death clouds' of spores that can travel more than 40 miles to potentially infect populations of invasive moths, according to a new study.

- [When making decisions, monkeys use different brain areas to weigh value and availability](#) [周四, 31 8月 00:26]

Seventeenth-century mathematician Blaise Pascal first introduced the idea of expected value, which is reached by multiplying the value of something (how much it's wanted or needed) with the probability that we might be able to obtain it. Now some very 21st century research is showing for the first time in monkeys which parts of the brain are involved in the two-pronged decision-making process that determines this expected value.

- [Hidden deep in the brain, a map that guides animals' movements](#) [周四, 31 8月 00:26]

New research has revealed that deep in the brain, in a structure called striatum, all possible movements that an animal can do are represented in a map of neural activity. If we think of neural activity as the coordinates of this map, then similar movements have similar coordinates, being represented closer in the map, while actions that are more different have more distant coordinates and are further away.

- [Infested fossil worms show ancient examples of symbiosis](#) [周四, 31 8月 00:11]

One of the earliest examples of two invertebrate species living together in a symbiotic relationship has been found in 520-million-year-old fossils from China. The fossils show two species of marine worms with

other, smaller worm-like animals attached to the outer surface of their body.

• [**New clue may reveal the fate of famous French explorer**](#) [周三, 30 8月 23:48]

An anthropologist may have stumbled across a clue to resolving one of the most enduring mysteries of Pacific history - the fate of famous French navigator, Jean François de Galaup, Comte de La Pérouse who disappeared in 1788.

• [**Hope for improving protection of the reticulated python**](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

• [**Soybean rust develops 'rolling' epidemics as spores travel north**](#) [周三, 30 8月 23:47]

Although Midwestern soybean growers have yet to experience the brunt of soybean rust, growers in the southern United States are very familiar with the disease. Every year, the fungus slowly moves northward from its winter home in southern Florida and the Gulf Coast states, and eventually reaches Illinois soybean fields -- often just before harvest.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

- [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills,

according to a new article

• [**Federal preemption of taxes on state and local sugar-sweetened beverages is not warranted**](#) [周四, 31 8月 00:49]

Federal and state government can alter or hinder state and local activity through a legal mechanism called preemption -- when a higher level of government blocks the action of a lower level of government. A new study evaluates whether it could be used to block taxes on sugar-sweetened beverages.

• [**Hope for improving protection of the reticulated python**](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

• [**Researchers raise health concerns about off-road vehicles and inhalation of asbestos**](#) [周三, 30 8月 23:47]

Preventing injuries may not be the only reason children shouldn't use off-road vehicles (ORVs). In a new study, public health scientists raise concerns that people who use ORVs in many regions of the country may face exposure to hazardous mineral fibers.

• [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

• [**Leaf sensors can tell farmers when crops need to**](#)

[be watered](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

• [Methane emissions tackled with gas-guzzling bacteria](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

• [Conservation hindered by geographical mismatches between capacity, need](#) [周三, 30 8月 21:45]

Geographical mismatches between conservation needs and expertise may hinder global conservation goals, new research suggests.

• [Shared custody equals less stress for children](#) [周三, 30 8月 21:42]

Children who live full time with one parent are more likely to feel stressed than children in shared custody situations. The benefit holds regardless of the level of conflict between the parents or between parent and child.

• [Brain stimulation for children with learning difficulties?](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

• [Photosynthesis discovery could help design more efficient artificial solar cells](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

• [Lively tunes boost sales in crowded stores](#) [周二, 29 8月 23:38]

If a store is crowded, people tend to buy more if the sound system is playing a fast-paced song rather than a ballad. That's what a team of researchers found in a field experiment across a chain of grocery convenience stores in Northern Europe.

• [**Mental health linked to retirement savings**](#) [周二, 29 8月 23:38]

The question of how mental health status affects decisions regarding retirement savings is becoming a pressing issue in the United States. Key factors contributing to this issue include the tenuous state of the Social Security system, greater use of defined-contribution pension plans by employers, longer lifespans, and the rise of depression and other mental health issues in older Americans.

• [**Origins of autism: Abnormalities in sensory processing at six months**](#) [周二, 29 8月 23:38]

The origins of autism remain mysterious. What areas of the brain are involved, and when do the first signs appear? New findings brings us closer to understanding the pathology of autism, and the point at which it begins to take shape in the human brain. Such knowledge will allow earlier interventions in the future and better outcomes for autistic children.

• [**Analysis identifies where commercial customers might benefit from energy storage**](#) [周二, 29 8月 23:38]

Commercial electricity customers who are subject to high demand charges may be able to reduce overall costs by using battery energy storage to manage demand, according to research.

• [**Inattentive kids show worse grades in later life**](#) [周二, 29 8月 21:50]

Researchers found that inattentiveness in childhood was linked to worse academic performance up to 10 years later in children with and without ADHD, even when they accounted for the children's intellectual ability. The results highlight the long-term effects that childhood inattention can have on academic performance, and suggest that parents and teachers should address inattentiveness in childhood.

• [**Americans' risk of needing nursing home care is higher than previously estimated**](#) [周二, 29 8月 04:41]

One worry Americans face as they grow older is the possibility of needing nursing home care and paying for the associated costs. A new study finds that the average American's lifetime risk of using a nursing home is substantially greater than previously believed, but the financial costs will be affordable for most people.

• [**Self-identifying as disabled and developing pride in disability aid overall well-being**](#) [周二, 29 8月 04:41]

Experiencing stigma, the severity of a disability and a person's age and income level help determine whether someone with an impairment considers themselves to be a person with a disability, and experiencing stigma predicts whether those individuals will ultimately develop disability pride, new research shows.

• [**Romance and affection top most popular sexual behaviors**](#) [周二, 29 8月 02:07]

Researchers have published a new US nationally representative study of sexual behavior, the first of its kind to capture a wide range of diverse sexual behaviors not previously examined in the general population.

• [**Nanoparticles pollution rises 30 percent when flex-fuel cars switch from bio to fossil**](#) [周二, 29 8月 00:45]

Use of ethanol in vehicles reduces pollution by nanoparticles, a study shows. Levels of ultrafine particulate matter in São Paulo City, Brazil, increased by up to 30 percent at times when ethanol prices rose and consumption fell.

• [**Preventing overcrowding in emergency rooms**](#) [周二, 29 8月 00:45]

A new study identifies four key strategies to reduce overcrowding in emergency rooms. The study concludes that engaged executive leadership can alleviate the problem when combined with a data-driven approach and coordination across the hospital from housekeepers to the CEO. Crowding in emergency rooms has been associated with

decreased patient satisfaction and even death.

- [**'Marrying up' is now easier for men, improves their economic well-being, study finds**](#) [周一, 28 8月 22:54]

As the number of highly educated women has increased in recent decades, the chances of 'marrying up' have increased significantly for men and decreased for women, according to a new study.

- [**Popularity outranks strategy in supply chain integration decisions**](#) [周一, 28 8月 22:27]

Conscious comparison and indirect copying increase the similarity of supply chain management practices of peer group companies, sometimes at the cost of quality and operating culture.

- [**Deforestation in Cambodia linked to higher risk of ill health in young children**](#) [周一, 28 8月 21:41]

New research findings suggest the importance of considering health impacts when assessing trade-offs in land use planning.

- [**Expectations for all-day schools are too high**](#) [周一, 28 8月 21:39]

Children in the German-speaking part of Switzerland who utilize extended education offerings in the first two years of primary school generally perform no better in school than other children, an project has found. Overall, the research shows that all-day schools do not fulfil all the expectations people place in them.

- [**After Hurricane Katrina, personal debt fell for those worst hit, but at a cost**](#) [周一, 28 8月 21:37]

After Hurricane Katrina devastated New Orleans a dozen years ago, there was a sharp and immediate drop in personal debt among residents living in city's most flooded blocks, according to a new study.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Mouth clicks used in human echolocation captured in unprecedented detail](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [First hints of possible water content on TRAPPIST-1 planets](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [How Neanderthals made the very first glue](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [How certain ants snap their jaws shut in the blink of an eye](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided

advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

• [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

• [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

[**Do squirrels teach bears to cross the railroad?**](#)

[**Grizzlies dig squirrel middens for grains**](#) [周三, 30 8月 22:34]

Grains have been reported to regularly trickle from hopper cars travelling via the railway through Canada's Banff and Yoho National Parks. As a result, the local red squirrels collect and bury the spilled seeds in their winter larders, which are sometimes discovered by hungry grizzly bears. Grain-conditioned bears may frequent the railway more often than usual, resulting in increased mortality by trains strikes.

[**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

[**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

[**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

[**Say hello to the 3-D Obama ant**](#) [周三, 30 8月 21:42]

Three new ant species named in honor of key figures in conservation -- Barack Obama, Ken Saro-Wiwa, and E.O. Wilson -- are immortalized as 3-D virtual avatars.

[**Why does rubbing a balloon on your hair make**](#)

[**it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

• [**High-tech electronics made from autumn leaves**](#)

[周二, 29 8月 23:38]

Northern China's roadsides are peppered with deciduous phoenix trees, producing an abundance of fallen leaves in autumn. These leaves are generally burned in the colder season, exacerbating the country's air pollution problem. Investigators in Shandong, China, recently discovered a new method to convert this organic waste matter into a porous carbon material that can be used to produce high-tech electronics.

• [**Galaxy 5 billion light-years away shows we live in a magnetic universe**](#) [周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

• [**New ancient sea reptile found in Germany, the earliest of its kind**](#) [周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

• [**Largest Ichthyosaurus was pregnant mother**](#) [周一, 28 8月 21:37]

Scientists have discovered the largest Ichthyosaurus on record and found it was pregnant at the time of death.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

- [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

- [**Intellectual disabilities caused by protein defect**](#) [周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- [**Lifestyle factors may affect how long individuals live free of disability**](#) [周五, 01 9月 22:46]

New research indicates that a healthy lifestyle may help reduce the duration of an individual's disabled period near the end of life.

- [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon

called superrotation.

- [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

- [**Genes fueling neuroblastoma spread now identified**](#) [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the relationship between two genes that fuel the aggressive spread of neuroblastomas.

- [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

- [**New genetic risk factor for developing autism spectrum disorder identified**](#) [周五, 01 9月 06:03]

A new systematic analysis has been applied to a cohort of 2,300 families who have a single child affected with autism. The study focused on identifying and characterizing low-lying genetic mutations that may have been missed in previous research, given these mutations are only present in a fraction of the bulk DNA of an individual.

- [**Coming soon to Montreal: The infrastructure cost of climate change**](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

- [**New boarding procedures, smaller cabin size**](#)

[may limit infection on planes](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

• [Insect eyes inspire new solar cell design](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

• [Discovery may be key to obesity, Diabetes Rx](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

• [Measuring the cost of quality measurement](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [More research needed on effects of maternal stress in wild animals](#) [周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes to their survival.

• [Mouth clicks used in human echolocation captured in unprecedented detail](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their

mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

• [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

• [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

• [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

• [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development path for PD.

• [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [**Nature gem within the city: What grows in the biodiversity-rich Bukit Nanas Forest Reserve**](#) [周五, 01 9月 02:05]

Being the oldest of its kind in Malaysia, Bukit Nanas Forest Reserve is a nature enclave, lying in the center of the busy capital city Kuala Lumpur. Researchers have now teamed up to publish an extensive checklist of the flora of this urban nature enclave, while making use of the innovative 'ecosystem inventory' template.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

- [**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

- [**Protein transport channel offers new target for**](#)

[thwarting pathogen](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

• [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

• [New findings on brain functional connectivity may lend insights into mental disorders](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

• [Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

• [Chemo-boosting drug discovered for leukemia](#) [周五, 01 9月 00:30]

Drugs developed to treat heart and blood vessel problems could be used in combination with chemotherapy to treat an aggressive form of adult leukemia, new research reveals.

• [Yawning: Why is it so contagious and why should it matter?](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

[Scents and social preference: Neuroscientists ID the roots of attraction](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

[What changes when you warm the Antarctic Ocean just 1 degree? Lots](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

[Bacterial protein acts as aphrodisiac for choanoflagellates](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same

species.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Newly emerged superbug discovered**](#) [周四, 31 8月 22:15]

Scientists have discovered a newly emerged superbug, hyper-resistant

and hypervirulent *Klebsiella pneumoniae*, which may cause untreatable and fatal infections in relatively healthy individuals and will pose enormous threat to human health.

- **[Why are coyote populations difficult to control?](#)**

[周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

- **[Beta blockers have positive effect in pulmonary arterial hypertension, researchers find](#)**

[周四, 31 8月 22:14]

A common heart disease medication, beta blockers, may help treat pulmonary arterial hypertension (PAH), a debilitating lung disease, researchers have found. Caused by high blood pressure in the pulmonary arteries, PAH is a progressive disease which usually leads to right-sided heart failure and death within five to seven years of diagnosis. Right-sided heart failure is the leading cause of death in PAH patients.

- **[Antidepressants found in fish brains in Great Lakes region](#)**

[周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

- **[Untreated sleep apnea shown to raise metabolic and cardiovascular stress](#)**

[周四, 31 8月 22:14]

Sleep apnea, left untreated for even a few days, can increase blood sugar and fat levels, stress hormones and blood pressure, according to a new study of sleeping subjects. This research adds further support for the consistent use of continuous positive airway pressure, a machine that increases air pressure in the throat to keep the airway open during sleep.

- **[Mind wandering is common during driving](#)**

[周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were

mind wandering, but need to do further work to clarify if it is dangerous during driving.

Cognitive fatigue after TBI linked with activation of caudate: Findings underscore the role of the caudate nucleus in the mechanism of cognitive fatigue in traumatic brain injury -- ScienceDaily

Kessler Foundation researchers have authored a new article that further elucidates the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI). The article, "Cognitive fatigue in individuals with traumatic brain injury is associated with caudate activation," was published online on August 21, 2017, in *Scientific Reports*. The authors are Glenn Wylie, DPhil, Ekaterina Dobryakova, PhD, John DeLuca, PhD, Nancy Chiaravalloti, PhD, of Kessler Foundation, and K. Essad of Dartmouth College Medical School.

Individuals with neurological damage often report difficulties with cognitive fatigue, a subjective lack of mental energy that is perceived to interfere with daily

activities. Because of poor correlation between self-reports of cognitive fatigue and tests of cognitive performance, scientists are looking at more objective measures, such as correlations with neuroimaging findings. In the Kessler study, brain activation patterns were compared in 22 individuals with moderate to severe TBI and 20 healthy controls. Both groups performed tasks of working memory during functional MRI imaging of the brain; the TBI group reported more fatigue, although performance was comparable between the groups. The results showed that the experience of self-reported fatigue is associated with activation changes in the caudate nucleus of the basal ganglia.

"These results are consistent with findings in our related research in the multiple sclerosis (MS) population," said Dr. Wylie, the lead author, "which suggests that the TBI and MS populations share a mechanism for cognitive fatigue." This has important implications for the development of effective treatments. "This study points to the caudate nucleus as a likely target for clinical interventions to alleviate fatigue," explained Dr. Wylie, who is associate director of Neuroscience Research and the Rocco Ortenzio Neuroimaging Center at Kessler Foundation.

Drug may curb female infertility from cancer treatments -- ScienceDaily

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

Women who are treated for cancer with radiation or certain chemotherapy drugs are commonly rendered sterile. According to a 2006 study from Weill Cornell Medicine, nearly 40 percent of all female breast cancer survivors experience premature ovarian failure, in which they lose normal function of their ovaries and often become infertile.

Women are born with a lifetime reserve of oocytes, or immature eggs, but those oocytes are among the most sensitive cells in the body and may be wiped out by such cancer treatments.

The current study, published Aug. 1 in the journal *Genetics*, was led by John Schimenti, Cornell's James Law Professor of Genetics in the Departments of Biomedical Sciences and Molecular Biology and

Genetics. It builds on his 2014 research that identified a so-called checkpoint protein (CHK2) that becomes activated when oocytes are damaged by radiation.

CHK2 functions in a pathway that eliminates oocytes with DNA damage, a natural function to protect against giving birth to offspring bearing new mutations. When the researchers irradiated mice lacking the CHK2 gene, the oocytes survived, eventually repaired the DNA damage, and the mice gave birth to healthy pups.

The new study explored whether the checkpoint 2 pathway could be chemically inhibited.

"It turns out there were pre-existing CHK2 inhibitor drugs that were developed, ironically enough, for cancer treatment, but they turned out not to be very useful for treating cancer," said Schimenti, the paper's senior author. Vera Rinaldi, a graduate student in Schimenti's lab, is the paper's first author. "By giving mice the inhibitor drug, a small molecule, it essentially mimicked the knockout of the checkpoint gene."

By inhibiting the checkpoint pathway, the oocytes were not killed by radiation and remained fertile, enabling birth of normal pups.

"The one major concern," Schimenti said, "is that even though these irradiated oocytes led to the birth of healthy mouse pups, it's conceivable that they harbor mutations that will become manifested in a generation or two, because we are circumventing an evolutionarily important mechanism of genetic quality control. This needs to be investigated by genome sequencing."

When doctors recognize the need for oocyte-damaging cancer treatments, women may have their oocytes or even ovarian tissue removed and frozen, but this practice delays treatment. Also, when women run out of oocytes, women's bodies naturally undergo menopause, as their hormonal systems shift.

"That is a serious dilemma and emotional issue," Schimenti said, "when you layer a cancer diagnosis on top of the prospect of having permanent life-altering effects as a result of chemotherapy, and must face the urgent decision of delaying treatment to freeze oocytes at the risk of one's own life."

The study sets a precedent for co-administering this or related drugs and starting cancer therapy simultaneously, though such interventions would first require lengthy human trials.

"While humans and mice have different physiologies, and there is much work to be done to determine safe and effective dosages for people, it is clear that we have the proof of principle for this approach," Schimenti said.

Ewelina Bolcun-Filas, a former postdoctoral associate in Schimenti's lab and an assistant professor at The Jackson Laboratory in Bar Harbor, Maine, is the paper's corresponding author.

Intellectual disabilities caused by protein defect -- ScienceDaily

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers from Radboudumc discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results published in the *American Journal of Human Genetics* on 31 August 2017 show that these changes in function play a more prominent role than previously thought.

Genes are responsible for protein production in cells. A common cause of intellectual disabilities is a de novo mutation (i.e. a mutation present in a child, but not in its parents) damaging a gene so severely that it is no longer able to produce functional proteins. The resulting protein defect will cause illness. In a number of disease-related genes, it is shown that a de novo

mutation does not eliminate the gene, but probably alters its function. These mutations are only located on specific parts of the gene.

Change in function

In order to find out how often this mechanism is involved, researchers from Radboudumc have combined the gene mutations in Dutch patients with a large international database comprising de novo mutations in patients. This research project was led by geneticist Christian Gilissen. "With our method, we were able to detect genes in which mutations not so much eliminate as affect the gene in another way. We found fifteen genes in which mutations cluster closely together, twelve of which being associated with developmental disorders. We also found three new genes that are likely to play a role in the development of intellectual disabilities as well," according to Gilissen.

Interactions

The de novo mutations that were found only change a very small part of a protein. The function of the protein remains largely, but not entirely the same. Gilissen

says: "The mutations are more likely to affect superficial parts of the proteins. These disturb interactions with other proteins and cause problems. Although mutations eliminating genes were often thought to be the main cause of intellectual disabilities, mutations altering the function of genes are now shown to be an important factor as well. That is a surprising finding."

Clustering mutations

Why are the de novo mutations that were found specifically clustered? Gilissen says: "There can be several explanations for that. Firstly, these genes show little natural variation. If such a gene is completely eliminated, a person may not be born. Only mutations located on very specific parts of the gene are viable. Consequently, only these mutations can be found. Another explanation can be that the mutations provide growth benefits to the sperm in which they develop. In that case, only these mutations would be able to survive."

New possibilities

The three newly-discovered genes playing a role in the

development of intellectual disabilities provide new diagnostic possibilities for patients. Gillissen says: "It is important that we have discovered a mechanism that has not yet been a focus of study. We expect this mechanism to play a role in a much larger proportion of patients with intellectual disabilities."

Reusable ruthenium-based catalyst could be a game-changer for the biomass industry -- ScienceDaily

Known for their outstanding versatility, primary amines (derivatives of ammonia) are industrially important compounds used in the preparation of a wide range of dyes, detergents and medicines. Although many attempts have been made to improve their synthesis using catalysts containing nickel, palladium and platinum, for example, few have succeeded in reducing the formation of secondary and tertiary amines and other undesired by-products.

Now, researchers at Tokyo Institute of Technology (Tokyo Tech) have developed a highly selective catalyst consisting of ruthenium nanoparticles supported on niobium pentoxide (Ru/Nb₂O₅). In a study published in the *Journal of the American Chemical Society*, the team demonstrated that Ru/Nb₂O₅ is capable of producing primary amines from carbonyl compounds with ammonia (NH₃) and dihydrogen (H₂), with negligible formation of by-

products.

The study compared the extent to which different catalysts could convert furfural to furfurylamine in a process known as reductive amination¹. This reaction is one of the most useful methods for producing primary amines on an industrial scale. The Ru/Nb₂O₅ catalyst outperformed all other types tested -- remarkably, a yield of 99% was attained when ammonia was used in excess quantity.

Even after three recycles, the Ru/Nb₂O₅ catalyst achieved consistent results, with consecutive yields of over 90%. The superior catalytic efficiency is thought to be due to ruthenium's weak electron-donating properties on the Nb₂O₅ surface.

Michikazu Hara of Tokyo Tech's Laboratory for Materials and Structures and his co-workers then explored how effectively the new catalyst could break down biomass (in the form of glucose) into 2,5-bis(aminomethyl)furan, a monomer for aramid production. Previous experiments using a nickel-based catalyst led to a yield of around 50% from glucose-derived feedstock (5-hydroxymethylfurfural). The new catalyst used in combination with a so-called

ruthenium-xantphos complex produced a yield of 93%. With little to no by-products observed, Ru/Nb₂O₅ represents a major breakthrough in the clean, large-scale production of biomass-derived materials.

Further studies to expand on these initial findings are already underway. By pushing the boundaries of material design, the researchers say that Ru/Nb₂O₅ may accelerate the production of environmentally friendly plastics, rubber and heat-resistant aramid fibers². In future, the Ru/Nb₂O₅ catalyst may also impact the development of novel anti-cancer drugs, anti-bacterials, pesticides, agrochemicals, fertilizers, bio-oils and biofuels.

Bit data goes anti-skyrmions -- ScienceDaily

Today's world, rapidly changing because of "big data," is encapsulated in trillions of tiny magnetic objects -- magnetic bits -- each of which stores one bit of data in magnetic disk drives. A group of scientists from the Max Planck Institutes in Halle and Dresden have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

Most digital data is stored in the cloud as magnetic bits within massive numbers of magnetic disk drives. Over the past several decades these magnetic bits have shrunk by many orders of magnitude, reaching limits where the boundaries of these magnetic regions can have special properties. In some special materials these boundaries -- "magnetic domain walls" -- can be described as being topological. What this means is that these walls can be thought of as having a special

magical cloak -- what is referred to by scientists as "topological protection." An important consequence is that such magnetic walls are more stable to perturbations than similar magnetic bits without topological protection that are formed in conventional magnetic materials. Thus, these "topological" magnetic objects could be especially useful for storing "1"s and "0"s, the basic elements of digital data.

One such object is a "magnetic skyrmion" which is a tiny magnetic region, perhaps tens to hundreds of atoms wide, separated from a surrounding magnetic region by a chiral domain wall. Until recently only one type of skyrmion has been found in which it is surrounded by a chiral domain wall that takes the same form in all directions. But there have been predictions of several other types of skyrmions that were not yet observed. Now in a paper published in *Nature*, scientists from Prof. Stuart Parkin's NISE department at the Max Planck Institute for Microstructure Physics in Halle, Germany, have found a second class of skyrmions, what are called "anti-skyrmions," in materials synthesized in Prof. Claudia Felser's Solid State Chemistry Department at the Max Planck Institute for CPFS, Dresden, Germany.

The scientists from Halle and Dresden have found these tiny magnetic objects in a special class of versatile magnetic compounds called Heusler compounds that Claudia Felser and her colleagues have explored extensively over the past 20 years. Of these Heusler compounds, a tiny subset have just the right crystal symmetry to allow for the possibility of forming anti-skyrmions but not skyrmions. Using a highly sensitive transmission electron microscope at the Max Planck Institute for Microstructure Physics, Halle, that was specially modified to allow for the detection of tiny magnetic moments, anti-skyrmions were created and detected over a wide range of temperatures and magnetic fields. Most importantly, anti-skyrmions, both in ordered arrays and as isolated objects, could be seen even at room temperature and in zero magnetic fields.

The special cloaking properties of skyrmions makes them of great interest for a radically new form of solid-state memory -- the Racetrack Memory -- that was proposed by Stuart Parkin a decade ago. In Racetrack Memory digital data is encoded within magnetic domain walls that are packed closely within nanoscopic magnetic wires. One of the unique features of Racetrack Memory, which is distinct from all other

memories, is that the walls are moved around the nanowires themselves using recent discoveries in spin-orbitronics. Very short pulses of current move all the domain walls backwards and forwards along the nanowires. The walls -- the magnetic bits -- can be read and written by devices incorporated directly into the nanowires themselves, thereby eliminating any mechanical parts. Topologically protected magnetic walls are very promising for Racetrack Memory.

Thus, anti-skyrmions could be coming to Racetrack Memory soon! Going even beyond anti-skyrmions the next goal is the realization of a third class of skyrmions -- antiferromagnetic skyrmions -- which are tiny magnetic objects that actually have no net magnetic moment. They are magnetically almost invisible but have unique properties that make them of great interest.

- [Equatorial jet in Venusian atmosphere](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [Mouth clicks used in human echolocation captured in unprecedented detail](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [Reconstructing life at its beginning, cell by cell](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [Human bones in south Mexico: Stalagmite](#)

reveals their age as 13,000 years old [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

Yawning: Why is it so contagious and why should it matter? [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

Scents and social preference: Neuroscientists ID the roots of attraction [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

What changes when you warm the Antarctic Ocean just 1 degree? Lots [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

- [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas,

the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

- [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

- [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

- [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

- [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go

through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

• [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

• [**Patient plays saxophone while surgeons remove brain tumor**](#) [周三, 30 8月 22:36]

Music is not only a major part of Dan Fabbio's life, as a music teacher it is his livelihood. So when doctors discovered a tumor located in the part of his brain responsible for music function, he began a long journey that involved a team of physicians, scientists, and a music professor and culminated with him awake and playing a saxophone as surgeons operated on his brain.

• [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples

and archaeology. The study shows that the earthworks were once important ritual communication spaces.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

- [**Century-old seal pelts reveal changes in Ross Sea ecosystem**](#) [周三, 30 8月 21:43]

Scientists sampled a pile of frozen pelts left in a hut by Antarctic explorers for Weddell seal tissue from a century ago, at the very start of human activities in Antarctica. By using sophisticated isotope analysis to compare samples from modern and century-old seals, they were able to investigate human impacts on the Antarctic ecosystem.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

- [**Sense of smell is key factor in bird navigation, new study shows**](#) [周二, 29 8月 23:38]

How do birds navigate over long distances? This complex question has been the subject of debate and controversy among scientists for decades, with Earth's magnetic field and the bird's own sense of smell among the factors said to play a part. Now, researchers from the universities of Oxford, Barcelona and Pisa have shown in a new experiment that olfaction -- or sense of smell -- is almost certainly a key factor in long-distance oceanic navigation, eliminating previous misgivings about this hypoth...

- [**Woolly rhino neck ribs provide clues about their decline and eventual extinction**](#) [周二, 29 8月 21:10]

A study reports on the incidence of abnormal cervical (neck) vertebrae in woolly rhinos, which strongly suggests a vulnerable condition in the species. Given the considerable birth defects that are associated with this condition, the researchers argue it is very possible that developmental abnormalities contributed towards the eventual extinction of these late Pleistocene rhinos.

- [**An alternative to wolf control to save endangered caribou**](#) [周二, 29 8月 21:10]

The iconic woodland caribou across North America face increasing predation pressures from wolves. A short-term solution to caribou conservation would be to kill wolves. But a new government policy looks at reducing the invasive species moose numbers propping up the wolf population. Researchers have now evaluated the effects of this policy on the caribou population.

- [**Moderate consumption of fats, carbohydrates best for health, international study shows**](#) [周二, 29 8月 21:10]

21:10]

A diet that includes a moderate intake of fat and fruits and vegetables, and avoidance of high carbohydrates, is associated with lower risk of death, research with more than 135,000 people across five continents has shown.

• [**Complete remission of brain metastasis of difficult-to-treat tumor**](#) [周二, 29 8月 02:07]

Medical researchers report a remarkable treatment response in a patient participating in a clinical trial of a novel immune-system-based cancer therapy.

• [**Algae fortifies coral reefs in past and present**](#) [周二, 29 8月 02:07]

The Great Barrier Reef, and most other large reefs around the world, owe their bulk in large part to a type of red algae that grows on corals and strengthens them. New research has found that ancient coral reefs were also bolstered by their bond with red algae, a finding that could help scientists better understand how reefs will respond to climate change.

• [**Galaxy 5 billion light-years away shows we live in a magnetic universe**](#) [周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

• [**Keeping pandas off endangered list ledge**](#) [周一, 28 8月 22:54]

Things aren't all black and white for giant pandas. The beloved Chinese icons have basked in good press lately -- their extinction risk status downgraded from 'endangered' to 'vulnerable,' their good fortunes have shown to rub off on their less charismatic forest neighbors that benefit from panda-centric conservation efforts.

• [**Compounds in cocoa may help delay onset of type 2 diabetes**](#) [周一, 28 8月 22:27]

What if eating chocolate helped prevent and treat diabetes? It's crazy

enough to laugh off. But here's the thing: Researchers have discovered certain compounds found in cocoa can actually help your body release more insulin and respond to increased blood glucose better. Insulin is the hormone that manages glucose, the blood sugar that reaches unhealthy levels in diabetes.

• [**Eating triggers endorphin release in the brain**](#) [周一, 28 8月 22:27]

Researchers have revealed how eating stimulates brain's endogenous opioid system to signal pleasure and satiety.

• [**Oil and gas wells as a strong source of greenhouse gases**](#) [周一, 28 8月 22:27]

Boreholes in the North Sea could constitute a significantly more important source of methane, a strong greenhouse gas, than previously thought. Large amounts of methane are released from the sediments surrounding boreholes, probably over long periods of time.

• [**New ancient sea reptile found in Germany, the earliest of its kind**](#) [周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

• [**Statins linked to lower rates of breast cancer and mortality**](#) [周一, 28 8月 21:38]

A 14 year study in more than one million people has found that women with high cholesterol have significantly lower rates of breast cancer and improved mortality. The research suggests that statins are associated with lower rates of breast cancer and subsequent mortality.

• [**Air temperature is external trigger for heart attack**](#) [周一, 28 8月 21:38]

A 16-year study in more than 280,000 patients has suggested that air temperature is an external trigger for heart attack. The average number of heart attacks per day was significantly higher during seasons with colder outdoor temperatures as compared to warmer.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

- [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

- [**Intellectual disabilities caused by protein defect**](#)

[周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

• [**Lifestyle factors may affect how long individuals live free of disability**](#) [周五, 01 9月 22:46]

New research indicates that a healthy lifestyle may help reduce the duration of an individual's disabled period near the end of life.

• [**Genes fueling neuroblastoma spread now identified**](#) [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the relationship between two genes that fuel the aggressive spread of neuroblastomas.

• [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

• [**New genetic risk factor for developing autism spectrum disorder identified**](#) [周五, 01 9月 06:03]

A new systematic analysis has been applied to a cohort of 2,300 families who have a single child affected with autism. The study focused on identifying and characterizing low-lying genetic mutations that may have been missed in previous research, given these mutations are only present in a fraction of the bulk DNA of an individual.

• [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

• [**Discovery may be key to obesity, Diabetes Rx**](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

• [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

• [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

• [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

• [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development

path for PD.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**New findings on brain functional connectivity may lend insights into mental disorders**](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

- [**Chemo-boosting drug discovered for leukemia**](#) [周五, 01 9月 00:30]

Drugs developed to treat heart and blood vessel problems could be used in combination with chemotherapy to treat an aggressive form of adult leukemia, new research reveals.

- [**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

- [**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship

attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

- [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Newly emerged superbug discovered**](#) [周四, 31 8月 22:15]

Scientists have discovered a newly emerged superbug, hyper-resistant and hypervirulent *Klebsiella pneumoniae*, which may cause untreatable and fatal infections in relatively healthy individuals and will pose enormous threat to human health.

- [**Beta blockers have positive effect in pulmonary arterial hypertension, researchers find**](#) [周四, 31 8月 22:14]

A common heart disease medication, beta blockers, may help treat pulmonary arterial hypertension (PAH), a debilitating lung disease, researchers have found. Caused by high blood pressure in the pulmonary arteries, PAH is a progressive disease which usually leads to right-sided heart failure and death within five to seven years of diagnosis. Right-

sided heart failure is the leading cause of death in PAH patients.

- [**Untreated sleep apnea shown to raise metabolic and cardiovascular stress**](#) [周四, 31 8月 22:14]

Sleep apnea, left untreated for even a few days, can increase blood sugar and fat levels, stress hormones and blood pressure, according to a new study of sleeping subjects. This research adds further support for the consistent use of continuous positive airway pressure, a machine that increases air pressure in the throat to keep the airway open during sleep.

- [**Mind wandering is common during driving**](#) [周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were mind wandering, but need to do further work to clarify if it is dangerous during driving.

- [**Children's sleep quality linked to mothers' insomnia**](#) [周四, 31 8月 21:33]

Children sleep more poorly if their mothers suffer from insomnia symptoms – potentially affecting their mental wellbeing and development - according to new research. Nearly 200 school kids and their parents were studied, results indicating that children whose mothers have insomnia symptoms fall asleep later, get less sleep and spend less time in deep sleep. There appeared to be no link between fathers' insomnia symptoms and children's sleep.

- [**Little known theory could hold key to sporting success**](#) [周四, 31 8月 21:33]

An established but little known psychological theory is likely to improve performances across a range of activities, including sport, according to new research.

- [**Severe stress behind self-perceived memory problems**](#) [周四, 31 8月 21:33]

Stress, fatigue, and feeling like your memory is failing you. These are the symptoms of a growing group of patients. Result – They may need help, but they are rarely entering the initial stages of dementia.

- [**New possibility of studying how Alzheimer's disease affects the brain at different ages**](#) [周四, 31 8月 21:33]

Alzheimer's disease can lead to several widely divergent symptoms and, so far, its various expressions have mainly been observed through the behavior and actions of patients. Researchers have now produced images showing the changes in the brain associated with these symptoms – a development which increases knowledge and could facilitate future diagnostics and treatment.

- [**First look at potentially deadly metabolic disorder that strikes infants**](#) [周四, 31 8月 21:32]

You may have never heard of congenital disorder of glycosylation, but parents whose children are born with forms of this rare -- and underreported -- metabolic disorder know all too well the dangers they pose, including developmental delay, failure to thrive, stroke-like symptoms, seizures and cerebellar dysfunction.

- [**Using DNA to predict schizophrenia, autism**](#) [周四, 31 8月 21:32]

A single amino acid substitution in the protein CX3CR1 may act as predictor for schizophrenia and autism, a multi-institute collaboration demonstrates.

- [**Faulty DNA repair depresses neural development**](#) [周四, 31 8月 21:32]

Researchers have discovered DNA polymerase β (Pol β) deficiency in neural stem cells affects neuronal survival and neural network in the developing brain.

- [**A philosophical mythbuster**](#) [周四, 31 8月 21:32]

Cognitive neuroscience gives us a glimpse into our brain activity; it allows us to learn more about ourselves. Or do brain scans actually not say very much about who we are? A philosopher examines four myths

about neuroscience and self-understanding.

- [**Alcohol abuse, dental conditions, mental health found to be causes of avoidable US emergency visits**](#) [周四, 31 8月 21:26]

Alcohol abuse, dental conditions, and mental health were found to be the main causes of avoidable emergency room visits in the US, a new report reveals.

- [**Love your beauty rest? You can thank these brain cells**](#) [周四, 31 8月 21:14]

Researchers report the unexpected presence of a type of neuron in the brains of mice that appears to play a central role in promoting sleep by turning 'off' wake-promoting neurons. The newly identified brain cells, located in a part of the hypothalamus called the zona incerta, they say, could offer novel drug targets to treat sleep disorders, such as insomnia and narcolepsy, caused by the dysfunction of sleep-regulating neurons.

- [**New Zealand researchers makes 'natural born killer' cell discovery**](#) [周四, 31 8月 21:14]

An unexpected role for a white blood cell called the Natural Killer (NK) cell -- a critical cell for ridding the body of infection and cancer, has been discovered. The NK cell is a 'vigilante' killer -- a white blood cell that destroys invaders and cancer cells through a process of 'identity card' checking. The researchers' new work shows that violent vigilante NK cells act as helper cells to start up the immune response.

- [**Perfect mannequins a turnoff for some consumers**](#) [周四, 31 8月 21:14]

Mannequins' long legs, tiny waistlines and perfect busts can sour some shoppers on the products they're wearing, especially consumers who don't like the look of their own bodies.

- [**Fathers of American newborns keep getting older, study finds**](#) [周四, 31 8月 21:14]

While data on the moms of newborn American children has been

abundant, equivalent data on dads hasn't -- a gap that scientists have now filled.

- [**E-cigarettes can help smokers quit, but there's a catch**](#) [周四, 31 8月 21:14]

Frequent e-cigarette use does help smokers quit -- a finding that researchers say supports the use of e-cigarettes as a cessation aid for those trying to quit cigarette smoking. But, they note, an examination of a recent national survey uncovers important clues about who's successful at quitting and why.

- [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

- [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

- [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

- [**Eating protein three times a day could make our seniors stronger**](#) [周四, 31 8月 08:21]

Loss of muscle is an inevitable consequence of aging that can lead to frailty, falls or mobility problems. Eating enough protein is one way to

remedy it, but it would seem that spreading protein equally among the three daily meals could be linked to greater mass and muscle strength in the elderly.

- [**Z-endoxifen shows promise as new treatment for common breast cancer type**](#) [周四, 31 8月 08:21]

Z-endoxifen, a potent derivative of the drug tamoxifen, could itself be a new treatment for the most common form of breast cancer in women with metastatic disease, report investigators.

- [**Virus that causes mono may increase risk of MS for multiple races**](#) [周四, 31 8月 05:21]

Like whites, Hispanic and black people who have had mononucleosis, commonly known as mono, which is caused by Epstein-Barr virus, may have an increased risk of multiple sclerosis (MS), according to a new study.

- [**Concerns regarding radioactivity in migratory seafood negated**](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

- [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

- [**Breastfeeding reduces risk of endometriosis diagnosis**](#) [周四, 31 8月 03:55]

Women who breastfed for longer periods of time had significantly lower risk of being diagnosed with endometriosis, offering new insights into a

condition that, up until now, has had very few known, modifiable risk factors, a new study concludes.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Improving earthquake resistance with a single crystal**](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

- [**Turning heat energy into a viable fuel source**](#) [周四, 31 8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode. It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

- [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

- [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

• [**New bar set for water-splitting, CO2-splitting techniques**](#) [周四, 31 8月 02:13]

Researchers have significantly boosted the efficiency of two techniques, for splitting water to create hydrogen gas and splitting carbon dioxide to create carbon monoxide. The products are valuable feedstock for clean energy and chemical manufacturing applications.

• [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [**Environmental chemist flashes warning light on new nanoparticle**](#) [周四, 31 8月 02:12]

Layered BP's cytotoxicity is based on the fact that it generates reactive oxygen species (ROS), scientists have found. ROS are among the most potent cell-damaging agents known. Layered BP also disrupts cell membrane integrity in a particle-size-dependent manner.

• [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

• [**Artificial intelligence analyzes gravitational lenses 10 million times faster**](#) [周四, 31 8月 01:22]

Researchers have for the first time shown that neural networks -- a form of artificial intelligence -- can accurately analyze the complex

distortions in spacetime known as gravitational lenses 10 million times faster than traditional methods.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Dating? A magic formula to predict attraction is more elusive than ever**](#) [周四, 31 8月 01:22]

Dating websites often claim attraction between two people can be predicted from the right combination of traits and preferences, but a new study casts doubt on that assertion. The study, which used speed dating data, found a computer could predict who is desirable and how much someone would desire others -- who's hot and who's not -- but it could not unravel the mystery of unique desire for a specific person.

- [**Robotic system monitors specific neurons**](#) [周四, 31 8月 00:49]

Engineers have devised a way to automate the process of patch-clamping, using a computer algorithm that analyzes microscope images and guides a robotic arm to the target cell to record its electrical activity.

- [**'Seeing' robot learns tricky technique for studying brain cells in mammals**](#) [周四, 31 8月 00:25]

Scientists have successfully taught robots to perform a challenging brain technique only previously mastered by a handful of humans.

- [**Machine-learning earthquake prediction in lab**](#)

[shows promise](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

• [Silicon solves problems for next-generation battery technology](#) [周三, 30 8月 23:48]

Silicon -- the second most abundant element in the earth's crust -- shows great promise in Li-ion batteries, according to new research. By replacing graphite anodes with silicon, it is possible to quadruple anode capacity.

• [What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

• [Stroke patient improvement with a brain-computer interface](#) [周三, 30 8月 22:35]

It is possible for stroke patients to improve motor function using special training involving connecting brain signals with a computer, research shows.

• [Leaf sensors can tell farmers when crops need to be watered](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

• [New robot rolls with the rules of pedestrian conduct](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Electricity production: When enzymes rival platinum**](#) [周三, 30 8月 22:19]

Making a biocell that is as effective as a platinum fuel cell: that's the feat that researchers have achieved. Three years after making their first prototype biocell, the researchers have just reached a new milestone and increased its performance and stability. This biocell could, in the long run, offer an alternative to fuel cells that require rare and costly metals, such as platinum.

- [**New significance of unheralded chemical reactions**](#) [周三, 30 8月 21:45]

Researchers reveal new significance to a decades-old chemical reaction theory, increasing our understanding of the interaction of gases, relevant to combustion and planetary atmospheres.

- [**New mini tool has massive implications**](#) [周三, 30 8月 21:43]

Researchers have created a miniaturized, portable version of a tool now capable of analyzing Mars' atmosphere -- and that's just one of its myriad possible uses.

- [**Making 3-D printing safer**](#) [周三, 30 8月 21:42]

Within the past decade, 3-D printers have gone from bulky, expensive curiosities to compact, more affordable consumer products. At the same time, concerns have emerged that nanoparticles released from the machines during use could affect consumers' health. Now researchers report a way to eliminate almost all nanoparticle emissions from some of these printers.

- [**Nanoparticles loaded with mRNA give disease-fighting properties to cells**](#) [周三, 30 8月 21:42]

A new biomedical tool using nanoparticles that deliver transient gene changes to targeted cells could make therapies for a variety of diseases -- including cancer, diabetes and HIV -- faster and cheaper to develop, and more customizable.

- [**Adoption of robotics into a hospital's daily operations requires broad cooperation**](#) [周三, 30 8月 21:42]

Investigators studied the implementation of a logistics robot system at the Seinäjoki Central Hospital in South Ostrobothnia. The aim was to reduce transportation costs, improve the availability of supplies and alleviate congestion on hospital hallways by running deliveries around the clock on every day of the week.

- [**Nano chip system measures light from single bacterial cell to enable chemical detection**](#) [周三, 30 8月 21:42]

Researchers have created a nanophotonic chip system using lasers and bacteria to observe fluorescence emitted from a single bacterial cell. The novel system paves the way for an efficient and portable on-chip system for diverse cell-based sensing applications, such as detecting chemicals in real-time.

- [**NASA's Lunar mission captures solar eclipse as seen from the moon**](#) [周三, 30 8月 04:45]

LRO captured an image of the Moon's shadow over a large region of the United States, centered just north of Nashville, Tennessee.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

- [**Chemist synthesizes pure graphene**](#) [周三, 30 8月 01:53]

A chemist has patented a one-of-a-kind process for exfoliating graphene in its pure (unoxidized) form, as well as manufacturing innovative graphene nanocomposites that have potential uses in a variety of applications, including desalination of brackish water.

- [**Tiny nanopackages built out of DNA help scientists peek at how neurons work**](#) [周三, 30 8月 01:22]

Scientists have designed a way to use microscopic capsules made out of DNA to deliver a payload of tiny molecules directly into a cell. The technique gives scientists an opportunity to understand certain interactions among cells that have previously been hard to track.

- [**Scientists move graphene closer to transistor applications**](#) [周三, 30 8月 01:14]

Scientists were able to successfully manipulate the electronic structure of graphene, which may enable the fabrication of graphene transistors -- faster and more reliable than existing silicon-based transistors.

- [**Brain stimulation for children with learning difficulties?**](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- [**Photosynthesis discovery could help design more efficient artificial solar cells**](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

- [**Clamping down on causality by probing laser cavities**](#) [周二, 29 8月 23:39]

By monitoring the optical response of an externally probed laser cavity before and after gain clamping, researchers reveal the underlying mechanisms driving the cavity's responses.

[Scientists power past solar efficiency records](#) [周二, 29]

8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

- [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

- [**Coming soon to Montreal: The infrastructure cost of climate change**](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

• [**More research needed on effects of maternal stress in wild animals**](#) [周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes to their survival.

• [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

• [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

• [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

• [**Nature gem within the city: What grows in the biodiversity-rich Bukit Nanas Forest Reserve**](#) [周五, 01 9月 02:05]

Being the oldest of its kind in Malaysia, Bukit Nanas Forest Reserve is a nature enclave, lying in the center of the busy capital city Kuala Lumpur. Researchers have now teamed up to publish an extensive checklist of the flora of this urban nature enclave, while making use of the innovative 'ecosystem inventory' template.

. [**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

. [**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

. [**Protein transport channel offers new target for thwarting pathogen**](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

. [**Fossil footprints challenge established theories of human evolution**](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

- [**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**Bacterial protein acts as aphrodisiac for choanoflagellates**](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same species.

- [**Why are coyote populations difficult to control?**](#) [周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

- [**Antidepressants found in fish brains in Great Lakes region**](#) [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and

several other fish common to the Great Lakes region, scientists say.

• [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

• [**Record-low 2016 Antarctic sea ice due to 'perfect storm' of tropical, polar conditions**](#) [周四, 31 8月 21:26]

The sudden, unexpected nosedive in Antarctic sea ice last year was due to a unique one-two punch from atmospheric conditions both in the tropical Pacific Ocean and around the South Pole.

• [**X-ray footprinting solves mystery of metal-breathing protein**](#) [周四, 31 8月 21:26]

Scientists have discovered the details of an unconventional coupling between a bacterial protein and a mineral that allows the bacterium to breathe when oxygen is not available.

• [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

• [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

• [**Forensic science techniques help discover new molecular fossils**](#) [周四, 31 8月 21:14]

Researchers believe they have found new molecular fossils of archaea using a method of analysis commonly used in forensic science.

- [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

- [**American pika disappears from large area of California's Sierra Nevada mountains**](#) [周四, 31 8月 08:21]

The American pika, a small mammal adapted to high altitudes and cold temperatures, has died out from a 165-square-mile span of habitat in California's northern Sierra Nevada mountains, and the cause appears to be climate change. Researchers surveyed pika habitat throughout the north Lake Tahoe area and found that pikas had disappeared from an area that stretches from near Tahoe City to Truckee, more than 10 miles away, and includes Mount Pluto.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Profitable cooperation: Ants protect and fertilize plants**](#) [周四, 31 8月 08:21]

Biologists describe how the waste left by ants on plant leaves serves as a valuable fertilizer for the plants -- handed on a silver platter.

- [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

- [**Concerns regarding radioactivity in migratory**](#)

[seafood negated](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

• [Protecting the guardians](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

• [Tracking down the whale-shark highway](#) [周四, 31 8月 03:55]

Researchers recently discovered that whale sharks in the Eastern Tropical Pacific follow fronts -- the dynamic boundaries between warm and cold ocean waters.

• [Bioengineering a functional vascularized lung scaffold](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [Peptide mass fingerprinting can identify whale species based solely on their baleen](#) [周四, 31 8月 02:12]

Peptide mass fingerprinting accurately identified 10 species of whales from their baleen alone, according to a new study.

• [Gut bacteria that 'talk' to human cells may lead to new treatments](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by

altering human metabolism.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

- [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

- [**A big difference between Asian and African elephants is diet**](#) [周四, 31 8月 01:22]

New research has shown that there are significant differences between the Asian and the African forest elephant -- and it isn't just about size and the shape of their ears. It is about what they eat and how they affect forest ecosystems.

- [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

- [**Fungal spore 'death clouds' key in gypsy moth fight**](#) [周四, 31 8月 00:49]

A fungus known to decimate populations of gypsy moths creates 'death clouds' of spores that can travel more than 40 miles to potentially infect

populations of invasive moths, according to a new study.

- [**When making decisions, monkeys use different brain areas to weigh value and availability**](#) [周四, 31 8月 00:26]

Seventeenth-century mathematician Blaise Pascal first introduced the idea of expected value, which is reached by multiplying the value of something (how much it's wanted or needed) with the probability that we might be able to obtain it. Now some very 21st century research is showing for the first time in monkeys which parts of the brain are involved in the two-pronged decision-making process that determines this expected value.

- [**Hidden deep in the brain, a map that guides animals' movements**](#) [周四, 31 8月 00:26]

New research has revealed that deep in the brain, in a structure called striatum, all possible movements that an animal can do are represented in a map of neural activity. If we think of neural activity as the coordinates of this map, then similar movements have similar coordinates, being represented closer in the map, while actions that are more different have more distant coordinates and are further away.

- [**Periodic table of ecological niches could aid in predicting effects of climate change**](#) [周四, 31 8月 00:25]

A group of ecologists has started creating a periodic table of ecological niches similar to chemistry's periodic table. It will be a critical resource for scientists seeking to understand how a warming climate may be spurring changes in species around the globe.

- [**Machine-learning earthquake prediction in lab shows promise**](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

- [**Infested fossil worms show ancient examples of symbiosis**](#) [周四, 31 8月 00:11]

One of the earliest examples of two invertebrate species living together in a symbiotic relationship has been found in 520-million-year-old fossils from China. The fossils show two species of marine worms with other, smaller worm-like animals attached to the outer surface of their body.

• [**New clue may reveal the fate of famous French explorer**](#) [周三, 30 8月 23:48]

An anthropologist may have stumbled across a clue to resolving one of the most enduring mysteries of Pacific history - the fate of famous French navigator, Jean François de Galaup, Comte de La Pérouse who disappeared in 1788.

• [**Hope for improving protection of the reticulated python**](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

• [**Soybean rust develops 'rolling' epidemics as spores travel north**](#) [周三, 30 8月 23:47]

Although Midwestern soybean growers have yet to experience the brunt of soybean rust, growers in the southern United States are very familiar with the disease. Every year, the fungus slowly moves northward from its winter home in southern Florida and the Gulf Coast states, and eventually reaches Illinois soybean fields -- often just before harvest.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

- [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

- [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry,

according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

• [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

• [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

• [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

• [**Federal preemption of taxes on state and local sugar-sweetened beverages is not warranted**](#) [周四, 31 8月 00:49]

Federal and state government can alter or hinder state and local activity through a legal mechanism called preemption -- when a higher level of government blocks the action of a lower level of government. A new study evaluates whether it could be used to block taxes on sugar-sweetened beverages.

• [**Hope for improving protection of the reticulated python**](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of

populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

• **[Researchers raise health concerns about off-road vehicles and inhalation of asbestos](#)** [周三, 30 8月 23:47]

Preventing injuries may not be the only reason children shouldn't use off-road vehicles (ORVs). In a new study, public health scientists raise concerns that people who use ORVs in many regions of the country may face exposure to hazardous mineral fibers.

• **[Is changing languages effortful for bilingual speakers? Depends on the situation](#)** [周三, 30 8月 22:37]

Research on the neurobiology of bilingualism has suggested that switching languages is inherently effortful, requiring executive control to manage cognitive functions, but a new study shows this is only the case when speakers are prompted, or forced, to do so.

• **[Shifting school start times could contribute \\$83 billion to US economy within a decade](#)** [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

• **[Leaf sensors can tell farmers when crops need to be watered](#)** [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

• **[Methane emissions tackled with gas-guzzling bacteria](#)** [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- [**Conservation hindered by geographical mismatches between capacity, need**](#) [周三, 30 8月 21:45]

Geographical mismatches between conservation needs and expertise may hinder global conservation goals, new research suggests.

- [**Shared custody equals less stress for children**](#) [周三, 30 8月 21:42]

Children who live full time with one parent are more likely to feel stressed than children in shared custody situations. The benefit holds regardless of the level of conflict between the parents or between parent and child.

- [**Brain stimulation for children with learning difficulties?**](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- [**Exclusion from school can trigger long-term psychiatric illness**](#) [周三, 30 8月 00:45]

Excluding children from school may lead to long-term psychiatric problems and psychological distress, a study of thousands of children has shown.

- [**Where's the line? Managing extreme speech on social media**](#) [周三, 30 8月 00:45]

A new study shows that while people tend to dislike extreme speech on social media, there is less support for outright censorship. Instead, people believe sites need to do a better job promoting healthy discourse online.

- [**Photosynthesis discovery could help design more**](#)

[efficient artificial solar cells](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

• [Scientists power past solar efficiency records](#) [周二, 29 8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

• [Lively tunes boost sales in crowded stores](#) [周二, 29 8月 23:38]

If a store is crowded, people tend to buy more if the sound system is playing a fast-paced song rather than a ballad. That's what a team of researchers found in a field experiment across a chain of grocery convenience stores in Northern Europe.

• [Mental health linked to retirement savings](#) [周二, 29 8月 23:38]

The question of how mental health status affects decisions regarding retirement savings is becoming a pressing issue in the United States. Key factors contributing to this issue include the tenuous state of the Social Security system, greater use of defined-contribution pension plans by employers, longer lifespans, and the rise of depression and other mental health issues in older Americans.

• [Origins of autism: Abnormalities in sensory processing at six months](#) [周二, 29 8月 23:38]

The origins of autism remain mysterious. What areas of the brain are involved, and when do the first signs appear? New findings brings us closer to understanding the pathology of autism, and the point at which it begins to take shape in the human brain. Such knowledge will allow earlier interventions in the future and better outcomes for autistic children.

• [Analysis identifies where commercial customers might benefit from energy storage](#) [周二, 29 8月 23:38]

Commercial electricity customers who are subject to high demand charges may be able to reduce overall costs by using battery energy storage to manage demand, according to research.

• **[Inattentive kids show worse grades in later life](#)** [周二, 29 8月 21:50]

Researchers found that inattentiveness in childhood was linked to worse academic performance up to 10 years later in children with and without ADHD, even when they accounted for the children's intellectual ability. The results highlight the long-term effects that childhood inattention can have on academic performance, and suggest that parents and teachers should address inattentiveness in childhood.

• **[Doping in sports: Official tests fail to pick up majority of cases](#)** [周二, 29 8月 21:09]

A new scientific study has found that doping is far more common in professional sport than the rates suggested by blood and urine tests of the athletes.

• **[Cutbacks in foreign aid for HIV treatment would produce great harm, generate few savings](#)** [周二, 29 8月 06:34]

Proposed reductions in US foreign aid would have a devastating impact on HIV treatment and prevention programs in countries receiving such aid, an international team of investigators reports.

• **[Dispersants improved air quality for responders at Deepwater Horizon](#)** [周二, 29 8月 04:41]

A recent study adds a new dimension to the controversial decision to inject large amounts of chemical dispersants immediately above the crippled oil well at the seafloor during the Deepwater Horizon disaster in 2010.

• **[Americans' risk of needing nursing home care is higher than previously estimated](#)** [周二, 29 8月 04:41]

One worry Americans face as they grow older is the possibility of needing nursing home care and paying for the associated costs. A new study finds that the average American's lifetime risk of using a nursing home is substantially greater than previously believed, but the financial costs will be affordable for most people.

- [**Self-identifying as disabled and developing pride in disability aid overall well-being**](#) [周二, 29 8月 04:41]

Experiencing stigma, the severity of a disability and a person's age and income level help determine whether someone with an impairment considers themselves to be a person with a disability, and experiencing stigma predicts whether those individuals will ultimately develop disability pride, new research shows.

- [**Romance and affection top most popular sexual behaviors**](#) [周二, 29 8月 02:07]

Researchers have published a new US nationally representative study of sexual behavior, the first of its kind to capture a wide range of diverse sexual behaviors not previously examined in the general population.

- [**Nanoparticles pollution rises 30 percent when flex-fuel cars switch from bio to fossil**](#) [周二, 29 8月 00:45]

Use of ethanol in vehicles reduces pollution by nanoparticles, a study shows. Levels of ultrafine particulate matter in São Paulo City, Brazil, increased by up to 30 percent at times when ethanol prices rose and consumption fell.

- [**Preventing overcrowding in emergency rooms**](#) [周二, 29 8月 00:45]

A new study identifies four key strategies to reduce overcrowding in emergency rooms. The study concludes that engaged executive leadership can alleviate the problem when combined with a data-driven approach and coordination across the hospital from housekeepers to the CEO. Crowding in emergency rooms has been associated with decreased patient satisfaction and even death.

- [**'Marrying up' is now easier for men, improves their economic well-being, study finds**](#) [周一, 28 8月 22:54]

As the number of highly educated women has increased in recent decades, the chances of 'marrying up' have increased significantly for men and decreased for women, according to a new study.

- [**Popularity outranks strategy in supply chain**](#)

[integration decisions](#) [周一, 28 8月 22:27]

Conscious comparison and indirect copying increase the similarity of supply chain management practices of peer group companies, sometimes at the cost of quality and operating culture.

• [Deforestation in Cambodia linked to higher risk of ill health in young children](#) [周一, 28 8月 21:41]

New research findings suggest the importance of considering health impacts when assessing trade-offs in land use planning.

• [Expectations for all-day schools are too high](#) [周一, 28 8月 21:39]

Children in the German-speaking part of Switzerland who utilize extended education offerings in the first two years of primary school generally perform no better in school than other children, an project has found. Overall, the research shows that all-day schools do not fulfil all the expectations people place in them.

• [After Hurricane Katrina, personal debt fell for those worst hit, but at a cost](#) [周一, 28 8月 21:37]

After Hurricane Katrina devastated New Orleans a dozen years ago, there was a sharp and immediate drop in personal debt among residents living in city's most flooded blocks, according to a new study.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided

advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

- [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

- [**Do squirrels teach bears to cross the railroad?**](#)

- [**Grizzlies dig squirrel middens for grains**](#) [周三, 30 8月 22:34]

Grains have been reported to regularly trickle from hopper cars travelling via the railway through Canada's Banff and Yoho National Parks. As a result, the local red squirrels collect and bury the spilled seeds in their winter larders, which are sometimes discovered by hungry grizzly bears. Grain-conditioned bears may frequent the railway more often than usual, resulting in increased mortality by trains strikes.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

- [**Say hello to the 3-D Obama ant**](#) [周三, 30 8月 21:42]

Three new ant species named in honor of key figures in conservation -- Barack Obama, Ken Saro-Wiwa, and E.O. Wilson -- are immortalized as 3-D virtual avatars.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

• [**New species of crab with unusual outgrowths has its name written in the stars**](#) [周二, 29 8月 23:38]

A new 'star crab' has been collected from red coral beds in Taiwan and reefs in the Philippines. This astonishing creature is distinct with its carapace and chelipeds covered in pointy protrusions, which become rounder and mushroom-shaped with age to resemble star-like outgrowths and granules.

• [**High-tech electronics made from autumn leaves**](#) [周二, 29 8月 23:38]

Northern China's roadsides are peppered with deciduous phoenix trees, producing an abundance of fallen leaves in autumn. These leaves are generally burned in the colder season, exacerbating the country's air pollution problem. Investigators in Shandong, China, recently discovered a new method to convert this organic waste matter into a porous carbon material that can be used to produce high-tech electronics.

• [**Galaxy 5 billion light-years away shows we live in a magnetic universe**](#) [周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

• [**New ancient sea reptile found in Germany, the earliest of its kind**](#) [周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

• [**Largest Ichthyosaurus was pregnant mother**](#) [周一, 28 8月 21:37]

Scientists have discovered the largest Ichthyosaurus on record and found it was pregnant at the time of death.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

- [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

- [**Intellectual disabilities caused by protein defect**](#) [周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

- **[Reusable ruthenium-based catalyst could be a game-changer for the biomass industry](#)** [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- **[Bit data goes anti-skyrmions](#)** [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- **[Etosis phenomenon discovered in human blood monocytes](#)** [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- **[Lifestyle factors may affect how long individuals live free of disability](#)** [周五, 01 9月 22:46]

New research indicates that a healthy lifestyle may help reduce the duration of an individual's disabled period near the end of life.

- **[Can corals survive climate change?](#)** [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

- **[Molecules move faster near sticky surfaces](#)** [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- **[Equatorial jet in Venusian atmosphere](#)** [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon

called superrotation.

- [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

- [**Genes fueling neuroblastoma spread now identified**](#) [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the relationship between two genes that fuel the aggressive spread of neuroblastomas.

- [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

- [**New genetic risk factor for developing autism spectrum disorder identified**](#) [周五, 01 9月 06:03]

A new systematic analysis has been applied to a cohort of 2,300 families who have a single child affected with autism. The study focused on identifying and characterizing low-lying genetic mutations that may have been missed in previous research, given these mutations are only present in a fraction of the bulk DNA of an individual.

- [**Coming soon to Montreal: The infrastructure cost of climate change**](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

- [**New boarding procedures, smaller cabin size**](#)

[may limit infection on planes](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

• [Insect eyes inspire new solar cell design](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

• [Discovery may be key to obesity, Diabetes Rx](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

• [Measuring the cost of quality measurement](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [More research needed on effects of maternal stress in wild animals](#) [周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes to their survival.

• [Mouth clicks used in human echolocation captured in unprecedented detail](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their

mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

• [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

• [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

• [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

• [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development path for PD.

• [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

• [**Nature gem within the city: What grows in the biodiversity-rich Bukit Nanas Forest Reserve**](#) [周五, 01 9月 02:05]

Being the oldest of its kind in Malaysia, Bukit Nanas Forest Reserve is a nature enclave, lying in the center of the busy capital city Kuala Lumpur. Researchers have now teamed up to publish an extensive checklist of the flora of this urban nature enclave, while making use of the innovative 'ecosystem inventory' template.

• [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

• [**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

• [**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

• [**Protein transport channel offers new target for**](#)

[thwarting pathogen](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

• [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

• [New findings on brain functional connectivity may lend insights into mental disorders](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

• [Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

• [Chemo-boosting drug discovered for leukemia](#) [周五, 01 9月 00:30]

Drugs developed to treat heart and blood vessel problems could be used in combination with chemotherapy to treat an aggressive form of adult leukemia, new research reveals.

• [Yawning: Why is it so contagious and why should it matter?](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

[**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

[**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

[**Bacterial protein acts as aphrodisiac for choanoflagellates**](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same

species.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Newly emerged superbug discovered**](#) [周四, 31 8月 22:15]

Scientists have discovered a newly emerged superbug, hyper-resistant

and hypervirulent *Klebsiella pneumoniae*, which may cause untreatable and fatal infections in relatively healthy individuals and will pose enormous threat to human health.

- **[Why are coyote populations difficult to control?](#)**

[周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

- **[Beta blockers have positive effect in pulmonary arterial hypertension, researchers find](#)**

[周四, 31 8月 22:14]

A common heart disease medication, beta blockers, may help treat pulmonary arterial hypertension (PAH), a debilitating lung disease, researchers have found. Caused by high blood pressure in the pulmonary arteries, PAH is a progressive disease which usually leads to right-sided heart failure and death within five to seven years of diagnosis. Right-sided heart failure is the leading cause of death in PAH patients.

- **[Antidepressants found in fish brains in Great Lakes region](#)**

[周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

- **[Untreated sleep apnea shown to raise metabolic and cardiovascular stress](#)**

[周四, 31 8月 22:14]

Sleep apnea, left untreated for even a few days, can increase blood sugar and fat levels, stress hormones and blood pressure, according to a new study of sleeping subjects. This research adds further support for the consistent use of continuous positive airway pressure, a machine that increases air pressure in the throat to keep the airway open during sleep.

- **[Mind wandering is common during driving](#)**

[周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were

mind wandering, but need to do further work to clarify if it is dangerous during driving.

Cognitive fatigue after TBI linked with activation of caudate: Findings underscore the role of the caudate nucleus in the mechanism of cognitive fatigue in traumatic brain injury -- ScienceDaily

Kessler Foundation researchers have authored a new article that further elucidates the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI). The article, "Cognitive fatigue in individuals with traumatic brain injury is associated with caudate activation," was published online on August 21, 2017, in *Scientific Reports*. The authors are Glenn Wylie, DPhil, Ekaterina Dobryakova, PhD, John DeLuca, PhD, Nancy Chiaravalloti, PhD, of Kessler Foundation, and K. Essad of Dartmouth College Medical School.

Individuals with neurological damage often report difficulties with cognitive fatigue, a subjective lack of mental energy that is perceived to interfere with daily

activities. Because of poor correlation between self-reports of cognitive fatigue and tests of cognitive performance, scientists are looking at more objective measures, such as correlations with neuroimaging findings. In the Kessler study, brain activation patterns were compared in 22 individuals with moderate to severe TBI and 20 healthy controls. Both groups performed tasks of working memory during functional MRI imaging of the brain; the TBI group reported more fatigue, although performance was comparable between the groups. The results showed that the experience of self-reported fatigue is associated with activation changes in the caudate nucleus of the basal ganglia.

"These results are consistent with findings in our related research in the multiple sclerosis (MS) population," said Dr. Wylie, the lead author, "which suggests that the TBI and MS populations share a mechanism for cognitive fatigue." This has important implications for the development of effective treatments. "This study points to the caudate nucleus as a likely target for clinical interventions to alleviate fatigue," explained Dr. Wylie, who is associate director of Neuroscience Research and the Rocco Ortenzio Neuroimaging Center at Kessler Foundation.

Drug may curb female infertility from cancer treatments -- ScienceDaily

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

Women who are treated for cancer with radiation or certain chemotherapy drugs are commonly rendered sterile. According to a 2006 study from Weill Cornell Medicine, nearly 40 percent of all female breast cancer survivors experience premature ovarian failure, in which they lose normal function of their ovaries and often become infertile.

Women are born with a lifetime reserve of oocytes, or immature eggs, but those oocytes are among the most sensitive cells in the body and may be wiped out by such cancer treatments.

The current study, published Aug. 1 in the journal *Genetics*, was led by John Schimenti, Cornell's James Law Professor of Genetics in the Departments of Biomedical Sciences and Molecular Biology and

Genetics. It builds on his 2014 research that identified a so-called checkpoint protein (CHK2) that becomes activated when oocytes are damaged by radiation.

CHK2 functions in a pathway that eliminates oocytes with DNA damage, a natural function to protect against giving birth to offspring bearing new mutations. When the researchers irradiated mice lacking the CHK2 gene, the oocytes survived, eventually repaired the DNA damage, and the mice gave birth to healthy pups.

The new study explored whether the checkpoint 2 pathway could be chemically inhibited.

"It turns out there were pre-existing CHK2 inhibitor drugs that were developed, ironically enough, for cancer treatment, but they turned out not to be very useful for treating cancer," said Schimenti, the paper's senior author. Vera Rinaldi, a graduate student in Schimenti's lab, is the paper's first author. "By giving mice the inhibitor drug, a small molecule, it essentially mimicked the knockout of the checkpoint gene."

By inhibiting the checkpoint pathway, the oocytes were not killed by radiation and remained fertile, enabling birth of normal pups.

"The one major concern," Schimenti said, "is that even though these irradiated oocytes led to the birth of healthy mouse pups, it's conceivable that they harbor mutations that will become manifested in a generation or two, because we are circumventing an evolutionarily important mechanism of genetic quality control. This needs to be investigated by genome sequencing."

When doctors recognize the need for oocyte-damaging cancer treatments, women may have their oocytes or even ovarian tissue removed and frozen, but this practice delays treatment. Also, when women run out of oocytes, women's bodies naturally undergo menopause, as their hormonal systems shift.

"That is a serious dilemma and emotional issue," Schimenti said, "when you layer a cancer diagnosis on top of the prospect of having permanent life-altering effects as a result of chemotherapy, and must face the urgent decision of delaying treatment to freeze oocytes at the risk of one's own life."

The study sets a precedent for co-administering this or related drugs and starting cancer therapy simultaneously, though such interventions would first require lengthy human trials.

"While humans and mice have different physiologies, and there is much work to be done to determine safe and effective dosages for people, it is clear that we have the proof of principle for this approach," Schimenti said.

Ewelina Bolcun-Filas, a former postdoctoral associate in Schimenti's lab and an assistant professor at The Jackson Laboratory in Bar Harbor, Maine, is the paper's corresponding author.

Intellectual disabilities caused by protein defect -- ScienceDaily

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers from Radboudumc discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results published in the *American Journal of Human Genetics* on 31 August 2017 show that these changes in function play a more prominent role than previously thought.

Genes are responsible for protein production in cells. A common cause of intellectual disabilities is a de novo mutation (i.e. a mutation present in a child, but not in its parents) damaging a gene so severely that it is no longer able to produce functional proteins. The resulting protein defect will cause illness. In a number of disease-related genes, it is shown that a de novo

mutation does not eliminate the gene, but probably alters its function. These mutations are only located on specific parts of the gene.

Change in function

In order to find out how often this mechanism is involved, researchers from Radboudumc have combined the gene mutations in Dutch patients with a large international database comprising de novo mutations in patients. This research project was led by geneticist Christian Gilissen. "With our method, we were able to detect genes in which mutations not so much eliminate as affect the gene in another way. We found fifteen genes in which mutations cluster closely together, twelve of which being associated with developmental disorders. We also found three new genes that are likely to play a role in the development of intellectual disabilities as well," according to Gilissen.

Interactions

The de novo mutations that were found only change a very small part of a protein. The function of the protein remains largely, but not entirely the same. Gilissen

says: "The mutations are more likely to affect superficial parts of the proteins. These disturb interactions with other proteins and cause problems. Although mutations eliminating genes were often thought to be the main cause of intellectual disabilities, mutations altering the function of genes are now shown to be an important factor as well. That is a surprising finding."

Clustering mutations

Why are the de novo mutations that were found specifically clustered? Gilissen says: "There can be several explanations for that. Firstly, these genes show little natural variation. If such a gene is completely eliminated, a person may not be born. Only mutations located on very specific parts of the gene are viable. Consequently, only these mutations can be found. Another explanation can be that the mutations provide growth benefits to the sperm in which they develop. In that case, only these mutations would be able to survive."

New possibilities

The three newly-discovered genes playing a role in the

development of intellectual disabilities provide new diagnostic possibilities for patients. Gillissen says: "It is important that we have discovered a mechanism that has not yet been a focus of study. We expect this mechanism to play a role in a much larger proportion of patients with intellectual disabilities."

Reusable ruthenium-based catalyst could be a game-changer for the biomass industry -- ScienceDaily

Known for their outstanding versatility, primary amines (derivatives of ammonia) are industrially important compounds used in the preparation of a wide range of dyes, detergents and medicines. Although many attempts have been made to improve their synthesis using catalysts containing nickel, palladium and platinum, for example, few have succeeded in reducing the formation of secondary and tertiary amines and other undesired by-products.

Now, researchers at Tokyo Institute of Technology (Tokyo Tech) have developed a highly selective catalyst consisting of ruthenium nanoparticles supported on niobium pentoxide (Ru/Nb₂O₅). In a study published in the *Journal of the American Chemical Society*, the team demonstrated that Ru/Nb₂O₅ is capable of producing primary amines from carbonyl compounds with ammonia (NH₃) and dihydrogen (H₂), with negligible formation of by-

products.

The study compared the extent to which different catalysts could convert furfural to furfurylamine in a process known as reductive amination¹. This reaction is one of the most useful methods for producing primary amines on an industrial scale. The Ru/Nb₂O₅ catalyst outperformed all other types tested -- remarkably, a yield of 99% was attained when ammonia was used in excess quantity.

Even after three recycles, the Ru/Nb₂O₅ catalyst achieved consistent results, with consecutive yields of over 90%. The superior catalytic efficiency is thought to be due to ruthenium's weak electron-donating properties on the Nb₂O₅ surface.

Michikazu Hara of Tokyo Tech's Laboratory for Materials and Structures and his co-workers then explored how effectively the new catalyst could break down biomass (in the form of glucose) into 2,5-bis(aminomethyl)furan, a monomer for aramid production. Previous experiments using a nickel-based catalyst led to a yield of around 50% from glucose-derived feedstock (5-hydroxymethylfurfural). The new catalyst used in combination with a so-called

ruthenium-xantphos complex produced a yield of 93%. With little to no by-products observed, Ru/Nb₂O₅ represents a major breakthrough in the clean, large-scale production of biomass-derived materials.

Further studies to expand on these initial findings are already underway. By pushing the boundaries of material design, the researchers say that Ru/Nb₂O₅ may accelerate the production of environmentally friendly plastics, rubber and heat-resistant aramid fibers². In future, the Ru/Nb₂O₅ catalyst may also impact the development of novel anti-cancer drugs, anti-bacterials, pesticides, agrochemicals, fertilizers, bio-oils and biofuels.

Bit data goes anti-skyrmions -- ScienceDaily

Today's world, rapidly changing because of "big data," is encapsulated in trillions of tiny magnetic objects -- magnetic bits -- each of which stores one bit of data in magnetic disk drives. A group of scientists from the Max Planck Institutes in Halle and Dresden have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

Most digital data is stored in the cloud as magnetic bits within massive numbers of magnetic disk drives. Over the past several decades these magnetic bits have shrunk by many orders of magnitude, reaching limits where the boundaries of these magnetic regions can have special properties. In some special materials these boundaries -- "magnetic domain walls" -- can be described as being topological. What this means is that these walls can be thought of as having a special

magical cloak -- what is referred to by scientists as "topological protection." An important consequence is that such magnetic walls are more stable to perturbations than similar magnetic bits without topological protection that are formed in conventional magnetic materials. Thus, these "topological" magnetic objects could be especially useful for storing "1"s and "0"s, the basic elements of digital data.

One such object is a "magnetic skyrmion" which is a tiny magnetic region, perhaps tens to hundreds of atoms wide, separated from a surrounding magnetic region by a chiral domain wall. Until recently only one type of skyrmion has been found in which it is surrounded by a chiral domain wall that takes the same form in all directions. But there have been predictions of several other types of skyrmions that were not yet observed. Now in a paper published in *Nature*, scientists from Prof. Stuart Parkin's NISE department at the Max Planck Institute for Microstructure Physics in Halle, Germany, have found a second class of skyrmions, what are called "anti-skyrmions," in materials synthesized in Prof. Claudia Felser's Solid State Chemistry Department at the Max Planck Institute for CPFS, Dresden, Germany.

The scientists from Halle and Dresden have found these tiny magnetic objects in a special class of versatile magnetic compounds called Heusler compounds that Claudia Felser and her colleagues have explored extensively over the past 20 years. Of these Heusler compounds, a tiny subset have just the right crystal symmetry to allow for the possibility of forming anti-skyrmions but not skyrmions. Using a highly sensitive transmission electron microscope at the Max Planck Institute for Microstructure Physics, Halle, that was specially modified to allow for the detection of tiny magnetic moments, anti-skyrmions were created and detected over a wide range of temperatures and magnetic fields. Most importantly, anti-skyrmions, both in ordered arrays and as isolated objects, could be seen even at room temperature and in zero magnetic fields.

The special cloaking properties of skyrmions makes them of great interest for a radically new form of solid-state memory -- the Racetrack Memory -- that was proposed by Stuart Parkin a decade ago. In Racetrack Memory digital data is encoded within magnetic domain walls that are packed closely within nanoscopic magnetic wires. One of the unique features of Racetrack Memory, which is distinct from all other

memories, is that the walls are moved around the nanowires themselves using recent discoveries in spin-orbitronics. Very short pulses of current move all the domain walls backwards and forwards along the nanowires. The walls -- the magnetic bits -- can be read and written by devices incorporated directly into the nanowires themselves, thereby eliminating any mechanical parts. Topologically protected magnetic walls are very promising for Racetrack Memory.

Thus, anti-skyrmions could be coming to Racetrack Memory soon! Going even beyond anti-skyrmions the next goal is the realization of a third class of skyrmions -- antiferromagnetic skyrmions -- which are tiny magnetic objects that actually have no net magnetic moment. They are magnetically almost invisible but have unique properties that make them of great interest.

- [Equatorial jet in Venusian atmosphere](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [Mouth clicks used in human echolocation captured in unprecedented detail](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [Reconstructing life at its beginning, cell by cell](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [Human bones in south Mexico: Stalagmite](#)

[reveals their age as 13,000 years old](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

[Yawning: Why is it so contagious and why should it matter?](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

[What changes when you warm the Antarctic Ocean just 1 degree? Lots](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

[First hints of possible water content on TRAPPIST-1 planets](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

[How Neanderthals made the very first glue](#) [周四, 31 8月

21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

- [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

- [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

- [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

- [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for

thousands of years, and then building back up to become full-fledged novae once more.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

- [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

- [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

- [**Patient plays saxophone while surgeons remove brain tumor**](#) [周三, 30 8月 22:36]

Music is not only a major part of Dan Fabbio's life, as a music teacher it is his livelihood. So when doctors discovered a tumor located in the part of his brain responsible for music function, he began a long journey that involved a team of physicians, scientists, and a music professor and culminated with him awake and playing a saxophone as surgeons operated on his brain.

- [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once

important ritual communication spaces.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

- [**Century-old seal pelts reveal changes in Ross Sea ecosystem**](#) [周三, 30 8月 21:43]

Scientists sampled a pile of frozen pelts left in a hut by Antarctic explorers for Weddell seal tissue from a century ago, at the very start of human activities in Antarctica. By using sophisticated isotope analysis to compare samples from modern and century-old seals, they were able to investigate human impacts on the Antarctic ecosystem.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material --

changes in the microstructure -- can control how the material becomes electrically charged through friction.

- [**Sense of smell is key factor in bird navigation, new study shows**](#) [周二, 29 8月 23:38]

How do birds navigate over long distances? This complex question has been the subject of debate and controversy among scientists for decades, with Earth's magnetic field and the bird's own sense of smell among the factors said to play a part. Now, researchers from the universities of Oxford, Barcelona and Pisa have shown in a new experiment that olfaction -- or sense of smell -- is almost certainly a key factor in long-distance oceanic navigation, eliminating previous misgivings about this hypoth...

- [**Woolly rhino neck ribs provide clues about their decline and eventual extinction**](#) [周二, 29 8月 21:10]

A study reports on the incidence of abnormal cervical (neck) vertebrae in woolly rhinos, which strongly suggests a vulnerable condition in the species. Given the considerable birth defects that are associated with this condition, the researchers argue it is very possible that developmental abnormalities contributed towards the eventual extinction of these late Pleistocene rhinos.

- [**An alternative to wolf control to save endangered caribou**](#) [周二, 29 8月 21:10]

The iconic woodland caribou across North America face increasing predation pressures from wolves. A short-term solution to caribou conservation would be to kill wolves. But a new government policy looks at reducing the invasive species moose numbers propping up the wolf population. Researchers have now evaluated the effects of this policy on the caribou population.

- [**Moderate consumption of fats, carbohydrates best for health, international study shows**](#) [周二, 29 8月 21:10]

A diet that includes a moderate intake of fat and fruits and vegetables,

and avoidance of high carbohydrates, is associated with lower risk of death, research with more than 135,000 people across five continents has shown.

- [**Complete remission of brain metastasis of difficult-to-treat tumor**](#) [周二, 29 8月 02:07]

Medical researchers report a remarkable treatment response in a patient participating in a clinical trial of a novel immune-system-based cancer therapy.

- [**Algae fortifies coral reefs in past and present**](#) [周二, 29 8月 02:07]

The Great Barrier Reef, and most other large reefs around the world, owe their bulk in large part to a type of red algae that grows on corals and strengthens them. New research has found that ancient coral reefs were also bolstered by their bond with red algae, a finding that could help scientists better understand how reefs will respond to climate change.

- [**Galaxy 5 billion light-years away shows we live in a magnetic universe**](#) [周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

- [**Keeping pandas off endangered list ledge**](#) [周一, 28 8月 22:54]

Things aren't all black and white for giant pandas. The beloved Chinese icons have basked in good press lately -- their extinction risk status downgraded from 'endangered' to 'vulnerable,' their good fortunes have shown to rub off on their less charismatic forest neighbors that benefit from panda-centric conservation efforts.

- [**Compounds in cocoa may help delay onset of type 2 diabetes**](#) [周一, 28 8月 22:27]

What if eating chocolate helped prevent and treat diabetes? It's crazy enough to laugh off. But here's the thing: Researchers have discovered

certain compounds found in cocoa can actually help your body release more insulin and respond to increased blood glucose better. Insulin is the hormone that manages glucose, the blood sugar that reaches unhealthy levels in diabetes.

- [**Eating triggers endorphin release in the brain**](#) [周一, 28 8月 22:27]

Researchers have revealed how eating stimulates brain's endogenous opioid system to signal pleasure and satiety.

- [**Oil and gas wells as a strong source of greenhouse gases**](#) [周一, 28 8月 22:27]

Boreholes in the North Sea could constitute a significantly more important source of methane, a strong greenhouse gas, than previously thought. Large amounts of methane are released from the sediments surrounding boreholes, probably over long periods of time.

- [**New ancient sea reptile found in Germany, the earliest of its kind**](#) [周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

- [**Statins linked to lower rates of breast cancer and mortality**](#) [周一, 28 8月 21:38]

A 14 year study in more than one million people has found that women with high cholesterol have significantly lower rates of breast cancer and improved mortality. The research suggests that statins are associated with lower rates of breast cancer and subsequent mortality.

- [**Air temperature is external trigger for heart attack**](#) [周一, 28 8月 21:38]

A 16-year study in more than 280,000 patients has suggested that air temperature is an external trigger for heart attack. The average number of heart attacks per day was significantly higher during seasons with colder outdoor temperatures as compared to warmer.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

- [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

- [**Intellectual disabilities caused by protein defect**](#)

[周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

• [**Lifestyle factors may affect how long individuals live free of disability**](#) [周五, 01 9月 22:46]

New research indicates that a healthy lifestyle may help reduce the duration of an individual's disabled period near the end of life.

• [**Genes fueling neuroblastoma spread now identified**](#) [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the relationship between two genes that fuel the aggressive spread of neuroblastomas.

• [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

• [**New genetic risk factor for developing autism spectrum disorder identified**](#) [周五, 01 9月 06:03]

A new systematic analysis has been applied to a cohort of 2,300 families who have a single child affected with autism. The study focused on identifying and characterizing low-lying genetic mutations that may have been missed in previous research, given these mutations are only present in a fraction of the bulk DNA of an individual.

• [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

• [**Discovery may be key to obesity, Diabetes Rx**](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

• [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

• [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

• [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

• [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development

path for PD.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**New findings on brain functional connectivity may lend insights into mental disorders**](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

- [**Chemo-boosting drug discovered for leukemia**](#) [周五, 01 9月 00:30]

Drugs developed to treat heart and blood vessel problems could be used in combination with chemotherapy to treat an aggressive form of adult leukemia, new research reveals.

- [**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

- [**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship

attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

- [**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- [**Newly emerged superbug discovered**](#) [周四, 31 8月 22:15]

Scientists have discovered a newly emerged superbug, hyper-resistant and hypervirulent *Klebsiella pneumoniae*, which may cause untreatable and fatal infections in relatively healthy individuals and will pose enormous threat to human health.

- [**Beta blockers have positive effect in pulmonary arterial hypertension, researchers find**](#) [周四, 31 8月 22:14]

A common heart disease medication, beta blockers, may help treat pulmonary arterial hypertension (PAH), a debilitating lung disease, researchers have found. Caused by high blood pressure in the pulmonary arteries, PAH is a progressive disease which usually leads to right-sided heart failure and death within five to seven years of diagnosis. Right-

sided heart failure is the leading cause of death in PAH patients.

- [**Untreated sleep apnea shown to raise metabolic and cardiovascular stress**](#) [周四, 31 8月 22:14]

Sleep apnea, left untreated for even a few days, can increase blood sugar and fat levels, stress hormones and blood pressure, according to a new study of sleeping subjects. This research adds further support for the consistent use of continuous positive airway pressure, a machine that increases air pressure in the throat to keep the airway open during sleep.

- [**Mind wandering is common during driving**](#) [周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were mind wandering, but need to do further work to clarify if it is dangerous during driving.

- [**Children's sleep quality linked to mothers' insomnia**](#) [周四, 31 8月 21:33]

Children sleep more poorly if their mothers suffer from insomnia symptoms – potentially affecting their mental wellbeing and development - according to new research. Nearly 200 school kids and their parents were studied, results indicating that children whose mothers have insomnia symptoms fall asleep later, get less sleep and spend less time in deep sleep. There appeared to be no link between fathers' insomnia symptoms and children's sleep.

- [**Little known theory could hold key to sporting success**](#) [周四, 31 8月 21:33]

An established but little known psychological theory is likely to improve performances across a range of activities, including sport, according to new research.

- [**Severe stress behind self-perceived memory problems**](#) [周四, 31 8月 21:33]

Stress, fatigue, and feeling like your memory is failing you. These are the symptoms of a growing group of patients. Result – They may need help, but they are rarely entering the initial stages of dementia.

- [**New possibility of studying how Alzheimer's disease affects the brain at different ages**](#) [周四, 31 8月 21:33]

Alzheimer's disease can lead to several widely divergent symptoms and, so far, its various expressions have mainly been observed through the behavior and actions of patients. Researchers have now produced images showing the changes in the brain associated with these symptoms – a development which increases knowledge and could facilitate future diagnostics and treatment.

- [**First look at potentially deadly metabolic disorder that strikes infants**](#) [周四, 31 8月 21:32]

You may have never heard of congenital disorder of glycosylation, but parents whose children are born with forms of this rare -- and underreported -- metabolic disorder know all too well the dangers they pose, including developmental delay, failure to thrive, stroke-like symptoms, seizures and cerebellar dysfunction.

- [**Using DNA to predict schizophrenia, autism**](#) [周四, 31 8月 21:32]

A single amino acid substitution in the protein CX3CR1 may act as predictor for schizophrenia and autism, a multi-institute collaboration demonstrates.

- [**Faulty DNA repair depresses neural development**](#) [周四, 31 8月 21:32]

Researchers have discovered DNA polymerase β (Pol β) deficiency in neural stem cells affects neuronal survival and neural network in the developing brain.

- [**A philosophical mythbuster**](#) [周四, 31 8月 21:32]

Cognitive neuroscience gives us a glimpse into our brain activity; it allows us to learn more about ourselves. Or do brain scans actually not say very much about who we are? A philosopher examines four myths

about neuroscience and self-understanding.

- [**Alcohol abuse, dental conditions, mental health found to be causes of avoidable US emergency visits**](#) [周四, 31 8月 21:26]

Alcohol abuse, dental conditions, and mental health were found to be the main causes of avoidable emergency room visits in the US, a new report reveals.

- [**Love your beauty rest? You can thank these brain cells**](#) [周四, 31 8月 21:14]

Researchers report the unexpected presence of a type of neuron in the brains of mice that appears to play a central role in promoting sleep by turning 'off' wake-promoting neurons. The newly identified brain cells, located in a part of the hypothalamus called the zona incerta, they say, could offer novel drug targets to treat sleep disorders, such as insomnia and narcolepsy, caused by the dysfunction of sleep-regulating neurons.

- [**New Zealand researchers makes 'natural born killer' cell discovery**](#) [周四, 31 8月 21:14]

An unexpected role for a white blood cell called the Natural Killer (NK) cell -- a critical cell for ridding the body of infection and cancer, has been discovered. The NK cell is a 'vigilante' killer -- a white blood cell that destroys invaders and cancer cells through a process of 'identity card' checking. The researchers' new work shows that violent vigilante NK cells act as helper cells to start up the immune response.

- [**Perfect mannequins a turnoff for some consumers**](#) [周四, 31 8月 21:14]

Mannequins' long legs, tiny waistlines and perfect busts can sour some shoppers on the products they're wearing, especially consumers who don't like the look of their own bodies.

- [**Fathers of American newborns keep getting older, study finds**](#) [周四, 31 8月 21:14]

While data on the moms of newborn American children has been

abundant, equivalent data on dads hasn't -- a gap that scientists have now filled.

- [**E-cigarettes can help smokers quit, but there's a catch**](#) [周四, 31 8月 21:14]

Frequent e-cigarette use does help smokers quit -- a finding that researchers say supports the use of e-cigarettes as a cessation aid for those trying to quit cigarette smoking. But, they note, an examination of a recent national survey uncovers important clues about who's successful at quitting and why.

- [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

- [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

- [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

- [**Eating protein three times a day could make our seniors stronger**](#) [周四, 31 8月 08:21]

Loss of muscle is an inevitable consequence of aging that can lead to frailty, falls or mobility problems. Eating enough protein is one way to

remedy it, but it would seem that spreading protein equally among the three daily meals could be linked to greater mass and muscle strength in the elderly.

- [**Z-endoxifen shows promise as new treatment for common breast cancer type**](#) [周四, 31 8月 08:21]

Z-endoxifen, a potent derivative of the drug tamoxifen, could itself be a new treatment for the most common form of breast cancer in women with metastatic disease, report investigators.

- [**Virus that causes mono may increase risk of MS for multiple races**](#) [周四, 31 8月 05:21]

Like whites, Hispanic and black people who have had mononucleosis, commonly known as mono, which is caused by Epstein-Barr virus, may have an increased risk of multiple sclerosis (MS), according to a new study.

- [**Concerns regarding radioactivity in migratory seafood negated**](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

- [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

- [**Breastfeeding reduces risk of endometriosis diagnosis**](#) [周四, 31 8月 03:55]

Women who breastfed for longer periods of time had significantly lower risk of being diagnosed with endometriosis, offering new insights into a

condition that, up until now, has had very few known, modifiable risk factors, a new study concludes.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Improving earthquake resistance with a single crystal**](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

- [**Turning heat energy into a viable fuel source**](#) [周四, 31 8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode. It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

- [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

- [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

• [**New bar set for water-splitting, CO2-splitting techniques**](#) [周四, 31 8月 02:13]

Researchers have significantly boosted the efficiency of two techniques, for splitting water to create hydrogen gas and splitting carbon dioxide to create carbon monoxide. The products are valuable feedstock for clean energy and chemical manufacturing applications.

• [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [**Environmental chemist flashes warning light on new nanoparticle**](#) [周四, 31 8月 02:12]

Layered BP's cytotoxicity is based on the fact that it generates reactive oxygen species (ROS), scientists have found. ROS are among the most potent cell-damaging agents known. Layered BP also disrupts cell membrane integrity in a particle-size-dependent manner.

• [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

• [**Artificial intelligence analyzes gravitational lenses 10 million times faster**](#) [周四, 31 8月 01:22]

Researchers have for the first time shown that neural networks -- a form of artificial intelligence -- can accurately analyze the complex

distortions in spacetime known as gravitational lenses 10 million times faster than traditional methods.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Dating? A magic formula to predict attraction is more elusive than ever**](#) [周四, 31 8月 01:22]

Dating websites often claim attraction between two people can be predicted from the right combination of traits and preferences, but a new study casts doubt on that assertion. The study, which used speed dating data, found a computer could predict who is desirable and how much someone would desire others -- who's hot and who's not -- but it could not unravel the mystery of unique desire for a specific person.

- [**Robotic system monitors specific neurons**](#) [周四, 31 8月 00:49]

Engineers have devised a way to automate the process of patch-clamping, using a computer algorithm that analyzes microscope images and guides a robotic arm to the target cell to record its electrical activity.

- [**'Seeing' robot learns tricky technique for studying brain cells in mammals**](#) [周四, 31 8月 00:25]

Scientists have successfully taught robots to perform a challenging brain technique only previously mastered by a handful of humans.

- [**Machine-learning earthquake prediction in lab**](#)

[shows promise](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

• [Silicon solves problems for next-generation battery technology](#) [周三, 30 8月 23:48]

Silicon -- the second most abundant element in the earth's crust -- shows great promise in Li-ion batteries, according to new research. By replacing graphite anodes with silicon, it is possible to quadruple anode capacity.

• [What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

• [Stroke patient improvement with a brain-computer interface](#) [周三, 30 8月 22:35]

It is possible for stroke patients to improve motor function using special training involving connecting brain signals with a computer, research shows.

• [Leaf sensors can tell farmers when crops need to be watered](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

• [New robot rolls with the rules of pedestrian conduct](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Electricity production: When enzymes rival platinum**](#) [周三, 30 8月 22:19]

Making a biocell that is as effective as a platinum fuel cell: that's the feat that researchers have achieved. Three years after making their first prototype biocell, the researchers have just reached a new milestone and increased its performance and stability. This biocell could, in the long run, offer an alternative to fuel cells that require rare and costly metals, such as platinum.

- [**New significance of unheralded chemical reactions**](#) [周三, 30 8月 21:45]

Researchers reveal new significance to a decades-old chemical reaction theory, increasing our understanding of the interaction of gases, relevant to combustion and planetary atmospheres.

- [**New mini tool has massive implications**](#) [周三, 30 8月 21:43]

Researchers have created a miniaturized, portable version of a tool now capable of analyzing Mars' atmosphere -- and that's just one of its myriad possible uses.

- [**Making 3-D printing safer**](#) [周三, 30 8月 21:42]

Within the past decade, 3-D printers have gone from bulky, expensive curiosities to compact, more affordable consumer products. At the same time, concerns have emerged that nanoparticles released from the machines during use could affect consumers' health. Now researchers report a way to eliminate almost all nanoparticle emissions from some of these printers.

- [**Nanoparticles loaded with mRNA give disease-fighting properties to cells**](#) [周三, 30 8月 21:42]

A new biomedical tool using nanoparticles that deliver transient gene changes to targeted cells could make therapies for a variety of diseases -- including cancer, diabetes and HIV -- faster and cheaper to develop, and more customizable.

- [**Adoption of robotics into a hospital's daily operations requires broad cooperation**](#) [周三, 30 8月 21:42]

Investigators studied the implementation of a logistics robot system at the Seinäjoki Central Hospital in South Ostrobothnia. The aim was to reduce transportation costs, improve the availability of supplies and alleviate congestion on hospital hallways by running deliveries around the clock on every day of the week.

- [**Nano chip system measures light from single bacterial cell to enable chemical detection**](#) [周三, 30 8月 21:42]

Researchers have created a nanophotonic chip system using lasers and bacteria to observe fluorescence emitted from a single bacterial cell. The novel system paves the way for an efficient and portable on-chip system for diverse cell-based sensing applications, such as detecting chemicals in real-time.

- [**NASA's Lunar mission captures solar eclipse as seen from the moon**](#) [周三, 30 8月 04:45]

LRO captured an image of the Moon's shadow over a large region of the United States, centered just north of Nashville, Tennessee.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

- [**Chemist synthesizes pure graphene**](#) [周三, 30 8月 01:53]

A chemist has patented a one-of-a-kind process for exfoliating graphene in its pure (unoxidized) form, as well as manufacturing innovative graphene nanocomposites that have potential uses in a variety of applications, including desalination of brackish water.

- [**Tiny nanopackages built out of DNA help scientists peek at how neurons work**](#) [周三, 30 8月 01:22]

Scientists have designed a way to use microscopic capsules made out of DNA to deliver a payload of tiny molecules directly into a cell. The technique gives scientists an opportunity to understand certain interactions among cells that have previously been hard to track.

- [**Scientists move graphene closer to transistor applications**](#) [周三, 30 8月 01:14]

Scientists were able to successfully manipulate the electronic structure of graphene, which may enable the fabrication of graphene transistors -- faster and more reliable than existing silicon-based transistors.

- [**Brain stimulation for children with learning difficulties?**](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- [**Photosynthesis discovery could help design more efficient artificial solar cells**](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

- [**Clamping down on causality by probing laser cavities**](#) [周二, 29 8月 23:39]

By monitoring the optical response of an externally probed laser cavity before and after gain clamping, researchers reveal the underlying mechanisms driving the cavity's responses.

[Scientists power past solar efficiency records](#) [周二, 29]

8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

- [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

- [**Coming soon to Montreal: The infrastructure cost of climate change**](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

• [**More research needed on effects of maternal stress in wild animals**](#) [周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes to their survival.

• [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

• [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

• [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

• [**Nature gem within the city: What grows in the biodiversity-rich Bukit Nanas Forest Reserve**](#) [周五, 01 9月 02:05]

Being the oldest of its kind in Malaysia, Bukit Nanas Forest Reserve is a nature enclave, lying in the center of the busy capital city Kuala Lumpur. Researchers have now teamed up to publish an extensive checklist of the flora of this urban nature enclave, while making use of the innovative 'ecosystem inventory' template.

. [**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

. [**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

. [**Protein transport channel offers new target for thwarting pathogen**](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

. [**Fossil footprints challenge established theories of human evolution**](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- **[Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old](#)** [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

- **[What changes when you warm the Antarctic Ocean just 1 degree? Lots](#)** [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- **[Bacterial protein acts as aphrodisiac for choanoflagellates](#)** [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same species.

- **[Why are coyote populations difficult to control?](#)** [周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

- **[Antidepressants found in fish brains in Great Lakes region](#)** [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and

several other fish common to the Great Lakes region, scientists say.

• [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

• [**Record-low 2016 Antarctic sea ice due to 'perfect storm' of tropical, polar conditions**](#) [周四, 31 8月 21:26]

The sudden, unexpected nosedive in Antarctic sea ice last year was due to a unique one-two punch from atmospheric conditions both in the tropical Pacific Ocean and around the South Pole.

• [**X-ray footprinting solves mystery of metal-breathing protein**](#) [周四, 31 8月 21:26]

Scientists have discovered the details of an unconventional coupling between a bacterial protein and a mineral that allows the bacterium to breathe when oxygen is not available.

• [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

• [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

• [**Forensic science techniques help discover new molecular fossils**](#) [周四, 31 8月 21:14]

Researchers believe they have found new molecular fossils of archaea using a method of analysis commonly used in forensic science.

- [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

- [**American pika disappears from large area of California's Sierra Nevada mountains**](#) [周四, 31 8月 08:21]

The American pika, a small mammal adapted to high altitudes and cold temperatures, has died out from a 165-square-mile span of habitat in California's northern Sierra Nevada mountains, and the cause appears to be climate change. Researchers surveyed pika habitat throughout the north Lake Tahoe area and found that pikas had disappeared from an area that stretches from near Tahoe City to Truckee, more than 10 miles away, and includes Mount Pluto.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Profitable cooperation: Ants protect and fertilize plants**](#) [周四, 31 8月 08:21]

Biologists describe how the waste left by ants on plant leaves serves as a valuable fertilizer for the plants -- handed on a silver platter.

- [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

- [**Concerns regarding radioactivity in migratory**](#)

[seafood negated](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from migratory marine predators following Fukushima nuclear disaster.

• [Protecting the guardians](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

• [Tracking down the whale-shark highway](#) [周四, 31 8月 03:55]

Researchers recently discovered that whale sharks in the Eastern Tropical Pacific follow fronts -- the dynamic boundaries between warm and cold ocean waters.

• [Bioengineering a functional vascularized lung scaffold](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [Peptide mass fingerprinting can identify whale species based solely on their baleen](#) [周四, 31 8月 02:12]

Peptide mass fingerprinting accurately identified 10 species of whales from their baleen alone, according to a new study.

• [Gut bacteria that 'talk' to human cells may lead to new treatments](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by

altering human metabolism.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

- [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

- [**A big difference between Asian and African elephants is diet**](#) [周四, 31 8月 01:22]

New research has shown that there are significant differences between the Asian and the African forest elephant -- and it isn't just about size and the shape of their ears. It is about what they eat and how they affect forest ecosystems.

- [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

- [**Fungal spore 'death clouds' key in gypsy moth fight**](#) [周四, 31 8月 00:49]

A fungus known to decimate populations of gypsy moths creates 'death clouds' of spores that can travel more than 40 miles to potentially infect

populations of invasive moths, according to a new study.

- [**When making decisions, monkeys use different brain areas to weigh value and availability**](#) [周四, 31 8月 00:26]

Seventeenth-century mathematician Blaise Pascal first introduced the idea of expected value, which is reached by multiplying the value of something (how much it's wanted or needed) with the probability that we might be able to obtain it. Now some very 21st century research is showing for the first time in monkeys which parts of the brain are involved in the two-pronged decision-making process that determines this expected value.

- [**Hidden deep in the brain, a map that guides animals' movements**](#) [周四, 31 8月 00:26]

New research has revealed that deep in the brain, in a structure called striatum, all possible movements that an animal can do are represented in a map of neural activity. If we think of neural activity as the coordinates of this map, then similar movements have similar coordinates, being represented closer in the map, while actions that are more different have more distant coordinates and are further away.

- [**Periodic table of ecological niches could aid in predicting effects of climate change**](#) [周四, 31 8月 00:25]

A group of ecologists has started creating a periodic table of ecological niches similar to chemistry's periodic table. It will be a critical resource for scientists seeking to understand how a warming climate may be spurring changes in species around the globe.

- [**Machine-learning earthquake prediction in lab shows promise**](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

- [**Infested fossil worms show ancient examples of symbiosis**](#) [周四, 31 8月 00:11]

One of the earliest examples of two invertebrate species living together in a symbiotic relationship has been found in 520-million-year-old fossils from China. The fossils show two species of marine worms with other, smaller worm-like animals attached to the outer surface of their body.

• [New clue may reveal the fate of famous French explorer](#) [周三, 30 8月 23:48]

An anthropologist may have stumbled across a clue to resolving one of the most enduring mysteries of Pacific history - the fate of famous French navigator, Jean François de Galaup, Comte de La Pérouse who disappeared in 1788.

• [Hope for improving protection of the reticulated python](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

• [Soybean rust develops 'rolling' epidemics as spores travel north](#) [周三, 30 8月 23:47]

Although Midwestern soybean growers have yet to experience the brunt of soybean rust, growers in the southern United States are very familiar with the disease. Every year, the fungus slowly moves northward from its winter home in southern Florida and the Gulf Coast states, and eventually reaches Illinois soybean fields -- often just before harvest.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

- [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

- [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry,

according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

• [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

• [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

• [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

• [**Federal preemption of taxes on state and local sugar-sweetened beverages is not warranted**](#) [周四, 31 8月 00:49]

Federal and state government can alter or hinder state and local activity through a legal mechanism called preemption -- when a higher level of government blocks the action of a lower level of government. A new study evaluates whether it could be used to block taxes on sugar-sweetened beverages.

• [**Hope for improving protection of the reticulated python**](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of

populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

- **[Researchers raise health concerns about off-road vehicles and inhalation of asbestos](#)** [周三, 30 8月 23:47]

Preventing injuries may not be the only reason children shouldn't use off-road vehicles (ORVs). In a new study, public health scientists raise concerns that people who use ORVs in many regions of the country may face exposure to hazardous mineral fibers.

- **[Is changing languages effortful for bilingual speakers? Depends on the situation](#)** [周三, 30 8月 22:37]

Research on the neurobiology of bilingualism has suggested that switching languages is inherently effortful, requiring executive control to manage cognitive functions, but a new study shows this is only the case when speakers are prompted, or forced, to do so.

- **[Shifting school start times could contribute \\$83 billion to US economy within a decade](#)** [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

- **[Leaf sensors can tell farmers when crops need to be watered](#)** [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

- **[Methane emissions tackled with gas-guzzling bacteria](#)** [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- **[Conservation hindered by geographical mismatches between capacity, need](#)** [周三, 30 8月 21:45]

Geographical mismatches between conservation needs and expertise may hinder global conservation goals, new research suggests.

- **[Shared custody equals less stress for children](#)** [周三, 30 8月 21:42]

Children who live full time with one parent are more likely to feel stressed than children in shared custody situations. The benefit holds regardless of the level of conflict between the parents or between parent and child.

- **[Brain stimulation for children with learning difficulties?](#)** [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- **[Exclusion from school can trigger long-term psychiatric illness](#)** [周三, 30 8月 00:45]

Excluding children from school may lead to long-term psychiatric problems and psychological distress, a study of thousands of children has shown.

- **[Where's the line? Managing extreme speech on social media](#)** [周三, 30 8月 00:45]

A new study shows that while people tend to dislike extreme speech on social media, there is less support for outright censorship. Instead, people believe sites need to do a better job promoting healthy discourse online.

- **[Photosynthesis discovery could help design more](#)**

[efficient artificial solar cells](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

• [Scientists power past solar efficiency records](#) [周二, 29 8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

• [Lively tunes boost sales in crowded stores](#) [周二, 29 8月 23:38]

If a store is crowded, people tend to buy more if the sound system is playing a fast-paced song rather than a ballad. That's what a team of researchers found in a field experiment across a chain of grocery convenience stores in Northern Europe.

• [Mental health linked to retirement savings](#) [周二, 29 8月 23:38]

The question of how mental health status affects decisions regarding retirement savings is becoming a pressing issue in the United States. Key factors contributing to this issue include the tenuous state of the Social Security system, greater use of defined-contribution pension plans by employers, longer lifespans, and the rise of depression and other mental health issues in older Americans.

• [Origins of autism: Abnormalities in sensory processing at six months](#) [周二, 29 8月 23:38]

The origins of autism remain mysterious. What areas of the brain are involved, and when do the first signs appear? New findings brings us closer to understanding the pathology of autism, and the point at which it begins to take shape in the human brain. Such knowledge will allow earlier interventions in the future and better outcomes for autistic children.

• [Analysis identifies where commercial customers might benefit from energy storage](#) [周二, 29 8月 23:38]

Commercial electricity customers who are subject to high demand charges may be able to reduce overall costs by using battery energy storage to manage demand, according to research.

• [**Inattentive kids show worse grades in later life**](#) [周二, 29 8月 21:50]

Researchers found that inattentiveness in childhood was linked to worse academic performance up to 10 years later in children with and without ADHD, even when they accounted for the children's intellectual ability. The results highlight the long-term effects that childhood inattention can have on academic performance, and suggest that parents and teachers should address inattentiveness in childhood.

• [**Doping in sports: Official tests fail to pick up majority of cases**](#) [周二, 29 8月 21:09]

A new scientific study has found that doping is far more common in professional sport than the rates suggested by blood and urine tests of the athletes.

• [**Cutbacks in foreign aid for HIV treatment would produce great harm, generate few savings**](#) [周二, 29 8月 06:34]

Proposed reductions in US foreign aid would have a devastating impact on HIV treatment and prevention programs in countries receiving such aid, an international team of investigators reports.

• [**Dispersants improved air quality for responders at Deepwater Horizon**](#) [周二, 29 8月 04:41]

A recent study adds a new dimension to the controversial decision to inject large amounts of chemical dispersants immediately above the crippled oil well at the seafloor during the Deepwater Horizon disaster in 2010.

• [**Americans' risk of needing nursing home care is higher than previously estimated**](#) [周二, 29 8月 04:41]

One worry Americans face as they grow older is the possibility of needing nursing home care and paying for the associated costs. A new study finds that the average American's lifetime risk of using a nursing home is substantially greater than previously believed, but the financial costs will be affordable for most people.

- [**Self-identifying as disabled and developing pride in disability aid overall well-being**](#) [周二, 29 8月 04:41]

Experiencing stigma, the severity of a disability and a person's age and income level help determine whether someone with an impairment considers themselves to be a person with a disability, and experiencing stigma predicts whether those individuals will ultimately develop disability pride, new research shows.

- [**Romance and affection top most popular sexual behaviors**](#) [周二, 29 8月 02:07]

Researchers have published a new US nationally representative study of sexual behavior, the first of its kind to capture a wide range of diverse sexual behaviors not previously examined in the general population.

- [**Nanoparticles pollution rises 30 percent when flex-fuel cars switch from bio to fossil**](#) [周二, 29 8月 00:45]

Use of ethanol in vehicles reduces pollution by nanoparticles, a study shows. Levels of ultrafine particulate matter in São Paulo City, Brazil, increased by up to 30 percent at times when ethanol prices rose and consumption fell.

- [**Preventing overcrowding in emergency rooms**](#) [周二, 29 8月 00:45]

A new study identifies four key strategies to reduce overcrowding in emergency rooms. The study concludes that engaged executive leadership can alleviate the problem when combined with a data-driven approach and coordination across the hospital from housekeepers to the CEO. Crowding in emergency rooms has been associated with decreased patient satisfaction and even death.

- [**'Marrying up' is now easier for men, improves their economic well-being, study finds**](#) [周一, 28 8月 22:54]

As the number of highly educated women has increased in recent decades, the chances of 'marrying up' have increased significantly for men and decreased for women, according to a new study.

- [**Popularity outranks strategy in supply chain**](#)

[integration decisions](#) [周一, 28 8月 22:27]

Conscious comparison and indirect copying increase the similarity of supply chain management practices of peer group companies, sometimes at the cost of quality and operating culture.

[Deforestation in Cambodia linked to higher risk of ill health in young children](#) [周一, 28 8月 21:41]

New research findings suggest the importance of considering health impacts when assessing trade-offs in land use planning.

[Expectations for all-day schools are too high](#) [周一, 28 8月 21:39]

Children in the German-speaking part of Switzerland who utilize extended education offerings in the first two years of primary school generally perform no better in school than other children, an project has found. Overall, the research shows that all-day schools do not fulfil all the expectations people place in them.

[After Hurricane Katrina, personal debt fell for those worst hit, but at a cost](#) [周一, 28 8月 21:37]

After Hurricane Katrina devastated New Orleans a dozen years ago, there was a sharp and immediate drop in personal debt among residents living in city's most flooded blocks, according to a new study.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Mouth clicks used in human echolocation captured in unprecedented detail](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [First hints of possible water content on TRAPPIST-1 planets](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [How Neanderthals made the very first glue](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [How certain ants snap their jaws shut in the blink of an eye](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided

advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

• [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

• [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

• [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

• [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

• [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

• [**Say hello to the 3-D Obama ant**](#) [周三, 30 8月 21:42]

Three new ant species named in honor of key figures in conservation -- Barack Obama, Ken Saro-Wiwa, and E.O. Wilson -- are immortalized as 3-D virtual avatars.

• [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

• [**New species of crab with unusual outgrowths has its name written in the stars**](#) [周二, 29 8月 23:38]

A new 'star crab' has been collected from red coral beds in Taiwan and

reefs in the Philippines. This astonishing creature is distinct with its carapace and chelipeds covered in pointy protrusions, which become rounder and mushroom-shaped with age to resemble star-like outgrowths and granules.

• [High-tech electronics made from autumn leaves](#)

[周二, 29 8月 23:38]

Northern China's roadsides are peppered with deciduous phoenix trees, producing an abundance of fallen leaves in autumn. These leaves are generally burned in the colder season, exacerbating the country's air pollution problem. Investigators in Shandong, China, recently discovered a new method to convert this organic waste matter into a porous carbon material that can be used to produce high-tech electronics.

• [Galaxy 5 billion light-years away shows we live in a magnetic universe](#)

[周二, 29 8月 00:45]

A chance combination of a gravitational lens and polarized waves coming from a distant quasar gave astronomers the tool needed to make a measurement important to understanding the origin of magnetic fields in galaxies.

• [New ancient sea reptile found in Germany, the earliest of its kind](#)

[周一, 28 8月 21:39]

A previously unrecognized 132 million-year-old fossilized sea monster from northern Germany has been identified.

• [Largest Ichthyosaurus was pregnant mother](#)

[周一, 28 8月 21:37]

Scientists have discovered the largest Ichthyosaurus on record and found it was pregnant at the time of death.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Scientists discover brain area which can be targeted for treatment in patients with schizophrenia who 'hear voices'**](#) [周二, 05 9月 06:17]

For the first time, scientists have precisely identified and targeted an area of the brain which is involved in 'hearing voices,' experienced by many patients with schizophrenia. They have been able to show in a controlled trial that targeting this area with magnetic pulses can improve the condition in some patients.

- [**Diverse landscapes are more productive and adapt better to climate change**](#) [周二, 05 9月 04:56]

Ecosystems with high biodiversity are more productive and stable towards annual fluctuations in environmental conditions than those with a low diversity of species. They also adapt better to climate-driven environmental changes. These are the key findings environmental scientists made in a study of about 450 landscapes harboring 2,200 plants and animal species.

- [**Schizophrenia, memory deficits: Solving the mystery behind a most stubborn symptom**](#) [周二, 05 9月 00:04]

Disruptions to the brain's internal GPS result in some of the severe

memory deficits seen in schizophrenia. The new study in mouse models of the disorder marks the first time that schizophrenia's effects have been observed with such precision and clarity. The findings offer a promising entry point for attacking a near-universal and debilitating symptom of schizophrenia, memory deficits, which has thus far withstood all forms of treatment.

- [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

- [**Mysterious protein-folding molecule could trigger metabolic disorders**](#) [周二, 05 9月 00:04]

A molecule with few known functions can trigger the cell's response to unfolded proteins and perpetuate metabolic disease, report researchers.

- [**Superfly flight simulator helps unravel navigation in the brain**](#) [周二, 05 9月 00:04]

Researchers have identified two independent pathways in the fly brain that are integrated to allow successful navigation during flight. The study combined a flight simulator designed for flies with imaging of active neurons to show that landmark locations are processed separately in the fly brain from self-motion.

- [**New fluorescent dyes could advance biological imaging**](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

- [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

• [**Team gathers unprecedented data on atmosphere's organic chemistry**](#) [周二, 05 9月 00:04]

Teams of scientists have carried out the most detailed, extended observations of atmospheric chemistry ever attempted in one place, in patch of ponderosa pine forest in Colorado, and found previously unmeasured compounds.

• [**Study in early stage breast cancer shows that even small tumors can be aggressive**](#) [周一, 04 9月 21:38]

Even small tumors can be aggressive, according to a study in patients with early stage breast cancer. Researchers found that nearly one in four small tumors were aggressive and patients benefited from chemotherapy. Aggressive tumors could be identified by a 70-gene signature.

• [**Financial stress is associated with migraine, if you have specific circadian gene variants**](#) [周一, 04 9月 21:38]

People with a specific variation in the CLOCK gene have more migraines under financial stress. This work shows the effect of the genetics of circadian rhythms on migraine.

• [**Indigenous storytelling is a new asset for biocultural conservation**](#) [周一, 04 9月 21:36]

Some of the areas hosting most of the world's biodiversity are those inhabited by indigenous peoples. In the same way that biodiversity is being eroded, so is the world's cultural diversity. As a result, there have been several calls to promote biocultural conservation approaches that sustain both biodiversity and indigenous cultures.

• [**Stellar corpse sheds light on origin of cosmic rays**](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation

streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

• [Multi-mechanism approach to treating neonatal hypoxic ischemia](#) [周一, 04 9月 21:34]

Male sex is a risk factor for worse outcome following neonatal insult, including hypoxic ischemia. While N-acetylcysteine and hypothermia promote functional improvement in female rodents, similar improvement in males requires the addition of vitamin D, report investigators. Multi-mechanism approaches are needed to treat neonatal hypoxic ischemia, and those approaches appear to be different depending on sex.

• [Is ADHD really a sleep problem?](#) [周一, 04 9月 21:34]

Around 75 percent of children and adults with attention deficit hyperactivity disorder (ADHD) also have sleep problems, but until now these have been thought to be separate issues. Now a in a pulling together of the latest research, Scientists are proposing of a new theory which says that much of ADHD may in fact be a problem associated with lack of regular circadian sleep.

• [Pilot study shows that neurofeedback may help treatment-resistant depression](#) [周一, 04 9月 21:34]

A small pilot study has indicated that neurofeedback -- where patients concentrate on modifying their own brainwave patterns -- has potential to treat many of the 100 million people worldwide who suffer from treatment-resistant depression (TRD). This is the first time that neurofeedback has been shown to improve both individual symptoms and overall recovery in TRD.

• [Alterations in blood-based miRNA in veterans affected with combat-related PTSD](#) [周一, 04 9月 21:34]

A small pilot study shows that Individuals affected with PTSD (post-

traumatic stress disorder) demonstrate changes in microRNA (miRNA) molecules associated with gene regulation. A controlled study, involving military personnel on deployment to a combat zone in Afghanistan, provided evidence for the role of blood-based miRNAs as candidate biomarkers for symptoms of PTSD.

- [**Heavy alcohol use alters brain functioning differently in young men and women**](#) [周一, 04 9月 21:34]

Scientists have found that brain functions in young men and women are changed by long-term alcohol use, but that these changes are significantly different in men and women. This indicates not only that young people might be at increased risk of long-term harm from alcohol use, but also that the risks are probably different in men and in women, with men possibly more at risk.

- [**Reindeer grazing protects tundra plant diversity in a warming climate**](#) [周一, 04 9月 21:34]

Climate warming reduces the number of plant species in the tundra, but plant-eating animals, such as reindeer and voles, can turn this negative effect into something positive.

- [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

- [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals. New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

• [**Cleanliness is next to sexiness for golden-collared manakins in Panama**](#) [周六, 02 9月 01:55]

Juvenile male Golden-collared Manakins on extra testosterone cleaned up their display area before performing for females, according to research at the Smithsonian Tropical Research Institute (STRI) in Panama published in Animal Behavior. Female manakins got more aggressive when given testosterone.

• [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

• [**Earthworms at the root of sugar maple decline**](#) [周六, 02 9月 00:51]

Non-native worms are eating up the forest floor, causing sugar maples to die back and perhaps harming other forest dwellers, a new study suggests.

• [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

• [**Intellectual disabilities caused by protein defect**](#) [周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

• [**Reusable ruthenium-based catalyst could be a**](#)

[game-changer for the biomass industry](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

• [Bit data goes anti-skyrmions](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

• [Etosis phenomenon discovered in human blood monocytes](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

• [Molecules move faster near sticky surfaces](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

• [Virus hijacks cell's transportation system](#) [周五, 01 9月 21:39]

A deadly tick-borne virus uses the host neuron's transportation system to move their RNA, resulting in the local reproduction of the virus and severe neurological symptoms.

• [Equatorial jet in Venusian atmosphere](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

• [Breastfeeding may help prevent children's asthma exacerbations later in life](#) [周五, 01 9月 21:38]

An analysis of children with asthma, those who had been breastfed had a 45 percent lower risk of asthma exacerbations later in life compared

with children who had not been breastfed.

• [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

• [**Nature imagery calms prisoners**](#) [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

• [**Adipose tissue may affect cancer development in multiple ways**](#) [周五, 01 9月 21:38]

Adipose tissue, or fat, may influence the development of cancer in diverse ways, depending on the type of fat and the location in the body.

• [**The 'reality' of accent change**](#) [周五, 01 9月 21:38]

A new study of how accents change over differing periods of time demonstrates the limited impact of intense social interactions in isolated environments, and surprisingly large differences among people in how susceptible their accents are to change.

• [**Fungal infections reduce frogs' tolerance of heat**](#) [周五, 01 9月 06:05]

Fungal diseases are increasing in animals, which might have serious consequences for wildlife living in a hotter world, said a scientist. A new study shows that fungal infections reduced the heat tolerance of frogs by up to 4 degrees Celsius.

• [**Panama's native tree species excel in infertile tropical soils**](#) [周五, 01 9月 06:03]

Scientists confirm that native tree species performed very well in field trials and would be preferable to teak in the poor soils of the Panama

Canal watershed.

- [**Genes fueling neuroblastoma spread now identified**](#) [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the relationship between two genes that fuel the aggressive spread of neuroblastomas.

- [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

- [**New genetic risk factor for developing autism spectrum disorder identified**](#) [周五, 01 9月 06:03]

A new systematic analysis has been applied to a cohort of 2,300 families who have a single child affected with autism. The study focused on identifying and characterizing low-lying genetic mutations that may have been missed in previous research, given these mutations are only present in a fraction of the bulk DNA of an individual.

- [**Method speeds up time to analyze complex microscopic images**](#) [周五, 01 9月 03:13]

Researchers who typically required a week of effort to dissect cryo-electron tomography images of the 3-D structure of a single cell will now be able to do it in about an hour thanks to a new automated method.

- [**Coming soon to Montreal: The infrastructure cost of climate change**](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

- [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

• [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

• [**Discovery may be key to obesity, Diabetes Rx**](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

• [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

Scientists discover brain area which can be targeted for treatment in patients with schizophrenia who 'hear voices' -- ScienceDaily

For the first time, scientists have precisely identified and targeted an area of the brain which is involved in "hearing voices," experienced by many patients with schizophrenia. They have been able to show in a controlled trial that targeting this area with magnetic pulses can improve the condition in some patients. This early clinical work is presented at the ECNP conference in Paris on Tuesday 5th September, with later publication in *Schizophrenia Bulletin**.

"This is the first controlled trial to precisely determine an anatomically defined brain area where high frequency magnetic pulses can improve the hearing of voices," said lead researcher, Professor Sonia Dollfus (University of Caen, CHU, France).

Schizophrenia is a serious long-term mental health problem. People with schizophrenia experience a range

of symptoms, which may include delusions, muddled thoughts and hallucinations. One of the best-known is hearing voices, also known as Auditory Verbal Hallucination (AVH), which around 70% of people with schizophrenia experience at some point. These voices, may be 'heard' as having a variety of different characteristics, for example as internal or external, friendly or threatening, they may be continuously present or present only occasionally, and so on.

Transcranial Magnetic Stimulation (TMS) has been suggested as a possible way of treating the hearing of voices in schizophrenia. TMS uses magnetic pulses to the brain, and has been shown to be effective in several psychiatric conditions. However, there is a lack of controlled trials to show that TMS works effectively with AVH sufferers.

The French research team worked with 26 patients who received active TMS treatment, and 33 as a control group, who received sham (placebo) treatment. The researchers interviewed the patients using a standard protocol -- the Auditory Hallucinations Rating Scale -- which revealed most of the characteristic features of the voices which they were hearing. The treated patients received a series of 20 Hz high-frequency

magnetic pulses over 2 sessions a day for 2 days. Using magnetic resonance imaging (MRI), the pulses were targeted at a specific brain area in the temporal lobe, which is associated with language (the exact area is the crossing of the projection of the ascending branch of the left lateral sulcus and the left superior temporal sulcus)

After 2 weeks, the patients were re-evaluated. The researchers found that 34.6% of the patients being treated by TMS showed a significant response, whereas only 9.1% of patients in the sham group responded ('significant response' was defined as a more than 30% decrease in the Total Auditory Hallucinations Rating Scale score).

Professor Sonia Dollfus said: "Auditory Verbal Hallucinations, or "hearing voices" can be a disturbing symptom of schizophrenia, both for patients and for those close to sufferers. This is the first controlled trial to show an improvement in these patients by targeting a specific area of the brain and using high frequency TMS. This means two things; firstly it seems that we now can say with some certainty that we have found a specific anatomical area of the brain associated with auditory verbal hallucinations in schizophrenia.

Secondly, we have shown that treatment with high frequency TMS makes a difference to at least some sufferers, although there is a long way to go before we will know if TMS is the best route to treat these patients in the long-term."

Commenting, Professor Andreas Meyer-Lindenberg, Central Institute of Mental Health, Mannheim and member of the ECNP executive board, said: "This work builds on previous studies that have shown a critical role of excessive activity of subregions of the temporal lobe in the generation of voice hallucinations in schizophrenia. To move this into treatment, controlled trial such as the one by Dollfus and coworkers are important. While response rates were moderate, TMS is a welcome addition to the therapeutic repertoire especially for patients who do not respond to medication."

*This work has been accepted in the peer-reviewed journal Schizophrenia Bulletin: The Journal of Psychoses and Related Disorders. The exact publication date has still to be determined.

Diverse landscapes are more productive and adapt better to climate change -- ScienceDaily

Ecosystems with high biodiversity are more productive and stable towards annual fluctuations in environmental conditions than those with a low diversity of species. They also adapt better to climate-driven environmental changes. These are the key findings environmental scientists at the University of Zurich made in a study of about 450 landscapes harbouring 2,200 plants and animal species.

The dramatic, worldwide loss of biodiversity is one of today's greatest environmental problems. The loss of species diversity affects important ecosystems on which humans depend. Previous research predominantly addressed short-term effects of biodiversity in small experimental plots planted with few randomly selected plant species. These studies have shown that species-poor plant assemblages function less well and produce less biomass than species rich systems.

Extensive study with about 2,200 species in 450 landscapes

Researchers participating in the University Research Priority Programme "Global Change and Biodiversity" of the University of Zurich now demonstrate similar positive effects of biodiversity in real-world ecosystems in which mechanisms different from the ones in artificial experimental plots are at play. Using 450 different 1-km² landscapes that spanned the entire area of Switzerland, they investigated the role of the diversity of plant, bird and butterfly species for the production of biomass, which was estimated from satellite data.

Biodiversity is important for the functioning of complex, natural ecosystems

"Our results show that biodiversity plays an essential role for the functioning of extensive natural landscapes that consist of different ecosystem types such as forests, meadows or urban areas," study leader Pascal Niklaus from Department of Evolutionary Biology and Environmental Studies says. The analyses showed that landscapes with a greater biodiversity were more productive and that their productivity showed a lower

year-to-year variation.

Biodiversity promoted the adaptation of landscapes

The satellite data analysed by the scientists revealed that the annual growing period increased in length throughout the last 16 years, an effect that can be explained by climate warming. The prolongation in growing season was considerably larger in more biodiverse landscapes. These relations were robust and remained important even when a range of other drivers such as temperature, rainfall, solar irradiation, topography, of the specific composition of the landscapes were considered. "This indicates that landscapes with high biodiversity can adapt better and faster to changing environmental conditions," Niklaus concludes.

Schizophrenia, memory deficits: Solving the mystery behind a most stubborn symptom: Biological origins of a core symptom of schizophrenia, new study in mice reveals -- ScienceDaily

A team of Columbia scientists has found that disruptions to the brain's center for spatial navigation -- its internal GPS -- result in some of the severe memory deficits seen in schizophrenia. The new study in mouse models of the disorder marks the first time that schizophrenia's effects have been observed in the behavior of living animals -- and at the level of individual brain cells -- with such high-resolution, precision and clarity. The findings offer a promising entry point for attacking a near-universal and debilitating symptom of schizophrenia, memory deficits, which has thus far withstood all forms of treatment.

The results of this study were published in *Nature*

Neuroscience.

"An almost intractably complex disorder, schizophrenia is nearly impossible to fully treat -- in large part because it acts as two disorders in one," said Joseph Gogos, MD, PhD, a principal investigator at Columbia's Mortimer B. Zuckerman Mind Brain Behavior Institute and the paper's co-senior author.

"On one hand, you have paranoia, hallucinations and delusions; while on the other you have severe memory deficits. Antipsychotic drugs, which treat the first class of symptoms, are entirely ineffective when dealing with the second. The reasons for this are simple: we do not yet understand what happens in the brains of schizophrenia patients.

Cracking schizophrenia's code must therefore start with deciphering its biological origins, says Dr. Gogos, who is also professor of physiology, cellular biophysics and neuroscience at Columbia University Medical Center (CUMC). This has led to a recent focus on the memory impairments that are so common among schizophrenia patients. In this new study, Dr. Gogos teamed up with Attila Losonczy, MD, PhD, a fellow Zuckerman Institute principal investigator, to investigate episodic memory, which is severely impaired in cases of

schizophrenia.

"Episodic memory is the brain's repository of information about the past; a way of traveling backwards to recall a specific moment in time," said Dr. Losonczy, who was also a senior author. "This type of memory is critical for learning about and functioning in everyday life."

For this study, the team focused on a brain region called CA1, located in the hippocampus, which plays a role in both navigation and in episodic memory. Physical alterations to CA1 have been previously reported among schizophrenia patients. CA1 is home to place cells, which collectively form internal maps in the brain critical for navigating one's present surroundings. The CA1 place cells also encode the spatial aspects of episodic memories, such as where you were when you last saw your best friend, or the place your parents always kept the holiday decorations.

"Recent advances in imaging technologies now give us the power to watch the activity of hundreds of place cells in the CA1 in real time while an animal forms and recalls memories," said Dr. Losonczy, who is also an associate professor of neuroscience at CUMC. "We

developed experiments to record CA1 activity in mice that were genetically modified to mimic schizophrenia, and compared them to normal, healthy mice."

The researchers placed both groups of animals on a treadmill under a high-resolution, two-photon microscope, where they were exposed to a variety of sights, sounds and smells (including a water reward placed at unmarked locations on the treadmill). These experiments were designed to test the animals' ability to navigate a new environment, remember how to navigate a familiar one and adapt quickly when that environment was altered.

The two groups of mice showed striking differences in behavior and in cell activity. While both groups could successfully navigate a new environment, the schizophrenia-like mice had more trouble remembering familiar environments from day to day, as well as adapting when aspects of that environment changed. By simultaneously tracking the animals' place cells via the two-photon microscope, the team spotted the difference.

"When the healthy mice approached something familiar, such as water, their place cells fired with

increasing intensity, and then quieted down as the animals moved away," explained Dr. Losonczy. "And when we moved the location of the water, and gave the animals a chance to relearn where it was, the activity of their place cells reflected the new location."

But the brains of the schizophrenia-like mice were different. Their place cells did not shift when the water reward was moved. The brain cells' lack of adaptability, the scientists argue, could reflect a key and more general mechanism of memory deficits in schizophrenia. It could also represent a new target for drug intervention.

"These studies are helping to build an understanding of a disorder that has remained a biological mystery," said Dr. Gogos. "By pinpointing schizophrenia's many causes, we are opening up multiple points of intervention to slow, halt and even prevent the disorder -- which stands to dramatically improve the lives of patients and their families."

Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests -- ScienceDaily

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth.

However, the findings of a new Harvard Medical School study published Sept. 4 in the journal *Nature Neuroscience* cast doubt on this longstanding view.

Working with macaques temporarily deprived of seeing faces while growing up, a Harvard Medical School team led by neurobiologists Margaret Livingstone, Michael Arcaro, and Peter Schade has found that regions of the brain that are key to facial recognition form only through experience and are absent in primates who don't encounter faces while growing up.

The finding, the researchers say, sheds light on a range

of neuro-developmental conditions, including those in which people can't distinguish between different faces or autism, marked by aversion to looking at faces.

Most importantly, however, the study underscores the critical formative role of early experiences on normal sensory and cognitive development, the scientists say.

Livingstone, the Takeda Professor of Neurobiology at Harvard Medical School, explains that macaques -- a close evolutionary relative to humans, and a model system for studying human brain development -- form clusters of neurons responsible for recognizing faces in an area of the brain called the superior temporal sulcus by 200 days of age. The relative location of these brain regions, or patches, are similar across primate species.

That knowledge, combined with the fact that infants seem to preferentially track faces early in development, led to the longstanding belief that facial recognition must be inborn, she said. However, both humans and primates also develop areas in the brain that respond to visual stimuli they haven't encountered for as long during evolution, including buildings and text. The latter observation puts a serious wrench in the theory that facial recognition is inborn.

To better understand the basis for facial recognition, Livingstone, along with postdoctoral fellow Arcaro and research assistant Schade, raised two groups of macaques. The first one, the control group, had a typical upbringing, spending time in early infancy with their mothers and then with other juvenile macaques, as well as with human handlers. The other group grew up raised by humans who bottle-fed them, played with and cuddled them -- all while the humans wore welding masks. For the first year of their lives, the macaques never saw a face -- human or otherwise. At the end of the trial, all macaques were put in social groups with fellow macaques and allowed to see both human and primate faces.

When both groups of macaques were 200 days old, the researchers used functional MRI to look at brain images measuring the presence of facial recognition patches and other specialized areas, such as those responsible for recognizing hands, objects, scenes and bodies.

The macaques who had typical upbringing had consistent "recognition" areas in their brains for each of these categories. Those who'd grown up never seeing faces had developed areas of the brain

associated with all categories except faces.

Next, the researchers showed both groups images of humans or primates. As expected, the control group preferentially gazed at the faces in those images. In contrast, the macaques raised without facial exposure looked preferentially at the hands. The hand domain in their brains, Livingstone said, was disproportionately large compared to the other domains.

The findings suggest that sensory deprivation has a selective effect on the way the brain wires itself. The brain seems to become very good at recognizing things that an individual sees often, Livingstone said, and poor at recognizing things that it never or rarely sees.

"What you look at is what you end up 'installing' in the brain's machinery to be able to recognize," she added.

Normal development of these brain regions could be key to explaining a wide variety of disorders, the researchers said. One such disorder is developmental prosopagnosia -- a condition in which people are born with the inability to recognize familiar faces, even their own, due to the failure of the brain's facial recognition machinery to develop properly. Likewise, Livingstone

said, some of the social deficits that develop in people with autism spectrum disorders may be a side effect stemming from the lack of experiences that involve looking at faces, which children with these disorders tend to avoid. The findings suggest that interventions to encourage early exposure to faces may assuage the social deficits that stem from lack of such experiences during early development, the team said.

Mysterious protein-folding molecule could trigger metabolic disorders -- ScienceDaily

The cell's response to unfolded or misfolded proteins could be a cause, rather than a consequence, of metabolic disorders, report researchers at the Medical University of South Carolina (MUSC) in an article published online ahead of print on September 4, 2017 by *Nature Structural & Molecular Biology*. The researchers identified a little-known molecule as the trigger for this response.

There are links between protein-folding problems at the cellular level and a range of metabolic disorders, though it is unclear if those problems are causes or manifestations of such disorders. This study provides evidence that problems with protein folding contribute to certain metabolic disorders, according to Zihai Li, M.D., Ph.D., chair of the Department of Microbiology and Immunology at the MUSC Hollings Cancer Center and principal investigator on the project. Feng Hong, M.D., Ph.D., in the Department of Microbiology and

Immunology, is lead author on the paper.

"The unfolded protein response in the cell plays important roles in aging and in many diseases, such as cancer, diabetes and neurodegenerative disease," says Li. "Our study has uncovered a novel mechanism that triggers this response."

When improperly folded molecules are encountered in cells, the unfolded protein response (UPR) is activated within the endoplasmic reticulum (ER). The ER is in charge of molecular quality control, making sure proteins, lipids and other molecules are folded properly before the cell attempts to use them for metabolic processes. Here, a master protein called grp78 is in contact with three main signaling hubs that make up the control center of the UPR. When an unfolded or misfolded protein is encountered by grp78, it breaks contact with those sensors and activates the UPR. The UPR then refolds or disposes of such molecules before they are shipped to the parts of the cell that need them.

There is a wrinkle in the UPR, however. When too many unfolded proteins build up, the UPR senses that the cell has become overstressed and activates programs to recycle the cell. Yet if a number of cells

experience such stress and are similarly retired, whole organs can suffer. This appears to be where the CNPY2 molecule exerts influence during the development of metabolic problems, according to experiments performed by Li and his group.

CNPY2 has been known for some time to reside within the ER, but its function there has remained a mystery. To start, mice without CNPY2 were generated to see how they would grow. Although the rodents were slightly smaller, they were otherwise normal. Important differences appeared, however, when they were fed small amounts of tunicamycin, a known inducer of the UPR. Control mice exhibited signs of liver stress and activation of PERK, one of the three main UPR sensors, while the livers of knockout mice remained stress-free. This was the first sign that CNPY2 could be involved in metabolic stress in the liver.

To test this idea more directly, the researchers fed mice a high-fat diet for several weeks. Those that lacked CNPY2 were again protected, this time from the development of hepatic steatosis, an early sign of non-alcoholic fatty liver disease that develops in people who consume a diet high in fat.

Next the researchers looked at the molecular basis of these observations. If their hypothesis was correct, they would confirm that CNPY2 was required for the development of liver problems as a result of a diet high in fat. At the molecular level, this would mean that CNPY2 interacts directly with one of the UPR sensors, which the researchers suggested would be PERK.

The investigators examined mouse cells with and without CNPY2 and isolated the PERK protein, and its downstream signaling molecule, CHOP, within them. This interestingly named PERK-CHOP pathway, which is a major enabler of liver stress when the UPR is induced, was not activated in cells without CNPY2. When they added CNPY2 back to those cells, suddenly the pathway was restored. Protein isolation experiments confirmed their hypothesis that CNPY2 and PERK interacted closely when the UPR was again induced by the drug tunicamycin.

In addition, the master protein grp78 that regulates all three main UPR sensors interacted with CNPY2 under normal conditions. But when the UPR drug was added, grp78 left CNPY2 able to interact closely with PERK, which finally activated the PERK-CHOP pathway. Last, they found that the PERK-CHOP pathway, when

activated by free CNPY2, further increased levels of CNPY2 in the liver. In other words, CNPY2 was able to further reinforce itself once activated.

Taken together, the team's experiments showed that CNPY2 powerfully sustains cellular stress when the unfolded protein response becomes active, providing a link between the UPR and the development of metabolic problems in the liver.

This opens an opportunity, according to Hong "This novel finding has raised the possibility of developing new treatments for metabolic diseases by targeting CNPY2," says Hong.

· [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

· [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

· [**Stellar corpse sheds light on origin of cosmic rays**](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

· [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and

uranium came to be, physicists report.

- [**Equatorial jet in Venusan atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [**Fossil footprints challenge established theories of human evolution**](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

[**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

[**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

[**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

[**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three

planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

- [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

- [**Star-formation 'fuel tanks' found around distant**](#)

[**galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

• [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

• [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

• [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

• [**Shaking up the fish family tree: 'Living fossil' not as old as we thought**](#) [周四, 31 8月 01:22]

Polypterids are weird and puzzling African fish that have perplexed biologists since they were discovered during Napoleon's expedition to Egypt in the late 1700s.

- [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation)

influence marine species diversity around islands.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

• [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

• [**Patient plays saxophone while surgeons remove brain tumor**](#) [周三, 30 8月 22:36]

Music is not only a major part of Dan Fabbio's life, as a music teacher it is his livelihood. So when doctors discovered a tumor located in the part of his brain responsible for music function, he began a long journey that involved a team of physicians, scientists, and a music professor and culminated with him awake and playing a saxophone as surgeons operated on his brain.

• [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the

southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

- [**Century-old seal pelts reveal changes in Ross Sea ecosystem**](#) [周三, 30 8月 21:43]

Scientists sampled a pile of frozen pelts left in a hut by Antarctic explorers for Weddell seal tissue from a century ago, at the very start of human activities in Antarctica. By using sophisticated isotope analysis to compare samples from modern and century-old seals, they were able to investigate human impacts on the Antarctic ecosystem.

- [**Why does rubbing a balloon on your hair make**](#)

it stick? [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

Sense of smell is key factor in bird navigation, new study shows [周二, 29 8月 23:38]

How do birds navigate over long distances? This complex question has been the subject of debate and controversy among scientists for decades, with Earth's magnetic field and the bird's own sense of smell among the factors said to play a part. Now, researchers from the universities of Oxford, Barcelona and Pisa have shown in a new experiment that olfaction -- or sense of smell -- is almost certainly a key factor in long-distance oceanic navigation, eliminating previous misgivings about this hypoth...

Woolly rhino neck ribs provide clues about their decline and eventual extinction [周二, 29 8月 21:10]

A study reports on the incidence of abnormal cervical (neck) vertebrae in woolly rhinos, which strongly suggests a vulnerable condition in the species. Given the considerable birth defects that are associated with this condition, the researchers argue it is very possible that developmental abnormalities contributed towards the eventual extinction of these late Pleistocene rhinos.

An alternative to wolf control to save endangered caribou [周二, 29 8月 21:10]

The iconic woodland caribou across North America face increasing predation pressures from wolves. A short-term solution to caribou conservation would be to kill wolves. But a new government policy looks at reducing the invasive species moose numbers propping up the wolf population. Researchers have now evaluated the effects of this policy on the caribou population.

Moderate consumption of fats, carbohydrates

[best for health, international study shows](#) [周二, 29 8月

21:10]

A diet that includes a moderate intake of fat and fruits and vegetables, and avoidance of high carbohydrates, is associated with lower risk of death, research with more than 135,000 people across five continents has shown.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Scientists discover brain area which can be targeted for treatment in patients with schizophrenia who 'hear voices'**](#) [周二, 05 9月 06:17]

For the first time, scientists have precisely identified and targeted an area of the brain which is involved in 'hearing voices,' experienced by many patients with schizophrenia. They have been able to show in a controlled trial that targeting this area with magnetic pulses can improve the condition in some patients.

- [**Schizophrenia, memory deficits: Solving the mystery behind a most stubborn symptom**](#) [周二, 05 9月 00:04]

Disruptions to the brain's internal GPS result in some of the severe memory deficits seen in schizophrenia. The new study in mouse models of the disorder marks the first time that schizophrenia's effects have been observed with such precision and clarity. The findings offer a promising entry point for attacking a near-universal and debilitating symptom of schizophrenia, memory deficits, which has thus far withstood all forms of treatment.

- [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt

on this longstanding view.

- [**Mysterious protein-folding molecule could trigger metabolic disorders**](#) [周二, 05 9月 00:04]

A molecule with few known functions can trigger the cell's response to unfolded proteins and perpetuate metabolic disease, report researchers.

- [**Superfly flight simulator helps unravel navigation in the brain**](#) [周二, 05 9月 00:04]

Researchers have identified two independent pathways in the fly brain that are integrated to allow successful navigation during flight. The study combined a flight simulator designed for flies with imaging of active neurons to show that landmark locations are processed separately in the fly brain from self-motion.

- [**New fluorescent dyes could advance biological imaging**](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

- [**Study in early stage breast cancer shows that even small tumors can be aggressive**](#) [周一, 04 9月 21:38]

Even small tumors can be aggressive, according to a study in patients with early stage breast cancer. Researchers found that nearly one in four small tumors were aggressive and patients benefited from chemotherapy. Aggressive tumors could be identified by a 70-gene signature.

- [**Financial stress is associated with migraine, if you have specific circadian gene variants**](#) [周一, 04 9月 21:38]

People with a specific variation in the CLOCK gene have more migraines under financial stress. This work shows the effect of the genetics of circadian rhythms on migraine.

- [**Indigenous storytelling is a new asset for**](#)

[biocultural conservation](#) [周一, 04 9月 21:36]

Some of the areas hosting most of the world's biodiversity are those inhabited by indigenous peoples. In the same way that biodiversity is being eroded, so is the world's cultural diversity. As a result, there have been several calls to promote biocultural conservation approaches that sustain both biodiversity and indigenous cultures.

[Multi-mechanism approach to treating neonatal hypoxic ischemia](#) [周一, 04 9月 21:34]

Male sex is a risk factor for worse outcome following neonatal insult, including hypoxic ischemia. While N-acetylcysteine and hypothermia promote functional improvement in female rodents, similar improvement in males requires the addition of vitamin D, report investigators. Multi-mechanism approaches are needed to treat neonatal hypoxic ischemia, and those approaches appear to be different depending on sex.

[Is ADHD really a sleep problem?](#) [周一, 04 9月 21:34]

Around 75 percent of children and adults with attention deficit hyperactivity disorder (ADHD) also have sleep problems, but until now these have been thought to be separate issues. Now a in a pulling together of the latest research, Scientists are proposing of a new theory which says that much of ADHD may in fact be a problem associated with lack of regular circadian sleep.

[Pilot study shows that neurofeedback may help treatment-resistant depression](#) [周一, 04 9月 21:34]

A small pilot study has indicated that neurofeedback -- where patients concentrate on modifying their own brainwave patterns -- has potential to treat many of the 100 million people worldwide who suffer from treatment-resistant depression (TRD). This is the first time that neurofeedback has been shown to improve both individual symptoms and overall recovery in TRD.

[Alterations in blood-based miRNA in veterans affected with combat-related PTSD](#) [周一, 04 9月 21:34]

A small pilot study shows that Individuals affected with PTSD (post-traumatic stress disorder) demonstrate changes in microRNA (miRNA) molecules associated with gene regulation. A controlled study, involving military personnel on deployment to a combat zone in Afghanistan, provided evidence for the role of blood-based miRNAs as candidate biomarkers for symptoms of PTSD.

• [**Heavy alcohol use alters brain functioning differently in young men and women**](#) [周一, 04 9月 21:34]

Scientists have found that brain functions in young men and women are changed by long-term alcohol use, but that these changes are significantly different in men and women. This indicates not only that young people might be at increased risk of long-term harm from alcohol use, but also that the risks are probably different in men and in women, with men possibly more at risk.

• [**Cleanliness is next to sexiness for golden-collared manakins in Panama**](#) [周六, 02 9月 01:55]

Juvenile male Golden-collared Manakins on extra testosterone cleaned up their display area before performing for females, according to research at the Smithsonian Tropical Research Institute (STRI) in Panama published in *Animal Behavior*. Female manakins got more aggressive when given testosterone.

• [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

• [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

[Intellectual disabilities caused by protein defect](#)

[周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

[Etosis phenomenon discovered in human blood monocytes](#)

[周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

[Lifestyle factors may affect how long individuals live free of disability](#)

[周五, 01 9月 22:46]

New research indicates that a healthy lifestyle may help reduce the duration of an individual's disabled period near the end of life.

[Virus hijacks cell's transportation system](#)

[周五, 01 9月 21:39]

A deadly tick-borne virus uses the host neuron's transportation system to move their RNA, resulting in the local reproduction of the virus and severe neurological symptoms.

[Breastfeeding may help prevent children's asthma exacerbations later in life](#)

[周五, 01 9月 21:38]

An analysis of children with asthma, those who had been breastfed had a 45 percent lower risk of asthma exacerbations later in life compared with children who had not been breastfed.

[Nature imagery calms prisoners](#)

[周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a

maximum-security prison, a little easier to bear.

- [**Adipose tissue may affect cancer development in multiple ways**](#) [周五, 01 9月 21:38]

Adipose tissue, or fat, may influence the development of cancer in diverse ways, depending on the type of fat and the location in the body.

- [**The 'reality' of accent change**](#) [周五, 01 9月 21:38]

A new study of how accents change over differing periods of time demonstrates the limited impact of intense social interactions in isolated environments, and surprisingly large differences among people in how susceptible their accents are to change.

- [**Genes fueling neuroblastoma spread now identified**](#) [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the relationship between two genes that fuel the aggressive spread of neuroblastomas.

- [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

- [**New genetic risk factor for developing autism spectrum disorder identified**](#) [周五, 01 9月 06:03]

A new systematic analysis has been applied to a cohort of 2,300 families who have a single child affected with autism. The study focused on identifying and characterizing low-lying genetic mutations that may have been missed in previous research, given these mutations are only present in a fraction of the bulk DNA of an individual.

- [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for

the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

• [**Discovery may be key to obesity, Diabetes Rx**](#) [周五, 01 9月 03:12]

Research has demonstrated the potential of a protein to treat or prevent metabolic diseases including obesity and diabetes.

• [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

• [**New source for brain's development discovered**](#) [周五, 01 9月 02:13]

An unexpected source for the brain's development has been discovered by researchers, a finding that offers new insights into the building of the nervous system.

• [**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

• [**Drugs targeting the beta2-adrenoreceptor linked to Parkinson's disease**](#) [周五, 01 9月 02:12]

Researchers want to prevent alpha-synuclein from accumulating in the brain. To do so, the team searched for drugs that turn down alpha-synuclein production. They then tested the drugs in mice and stem cells and studied in data from the health records of millions of people living in Norway. The results of their efforts, point to a new drug development path for PD.

• [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

• [**BCG jab may protect against TB for nearly twice as long as previously thought**](#) [周五, 01 9月 01:42]

The world's only licensed tuberculosis (TB) vaccine could offer protection against the disease for nearly twice as long as previously thought, according to new research.

• [**New findings on brain functional connectivity may lend insights into mental disorders**](#) [周五, 01 9月 01:13]

Ongoing advances in understanding the functional connections within the brain are producing exciting insights into how the brain circuits function together to support human behavior — and may lead to new discoveries in the development and treatment of psychiatric disorders, according to a review.

• [**Chemo-boosting drug discovered for leukemia**](#) [周五, 01 9月 00:30]

Drugs developed to treat heart and blood vessel problems could be used in combination with chemotherapy to treat an aggressive form of adult leukemia, new research reveals.

• [**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

[**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

[**Songbird study shows how estrogen may stop infection-induced brain inflammation**](#) [周四, 31 8月 23:30]

Estrogen synthesis, a process naturally occurring in the brains of zebra finches, may also fight off neuroinflammation caused by infection that occurs elsewhere in the body, new research indicates.

[**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

[**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

• [**Newly emerged superbug discovered**](#) [周四, 31 8月 22:15]

Scientists have discovered a newly emerged superbug, hyper-resistant and hypervirulent *Klebsiella pneumoniae*, which may cause untreatable and fatal infections in relatively healthy individuals and will pose enormous threat to human health.

• [**Beta blockers have positive effect in pulmonary arterial hypertension, researchers find**](#) [周四, 31 8月 22:14]

A common heart disease medication, beta blockers, may help treat pulmonary arterial hypertension (PAH), a debilitating lung disease, researchers have found. Caused by high blood pressure in the pulmonary arteries, PAH is a progressive disease which usually leads to right-sided heart failure and death within five to seven years of diagnosis. Right-sided heart failure is the leading cause of death in PAH patients.

• [**Untreated sleep apnea shown to raise metabolic and cardiovascular stress**](#) [周四, 31 8月 22:14]

Sleep apnea, left untreated for even a few days, can increase blood sugar and fat levels, stress hormones and blood pressure, according to a new study of sleeping subjects. This research adds further support for the consistent use of continuous positive airway pressure, a machine that increases air pressure in the throat to keep the airway open during sleep.

• [**Mind wandering is common during driving**](#) [周四, 31 8月 22:14]

Scientists have investigated mind wandering in volunteers during a driving simulation. Astonishingly, during the simulation, the volunteers reported mind wandering 70 percent of the time. The researchers could identify specific changes in brain patterns when the volunteers were mind wandering, but need to do further work to clarify if it is dangerous during driving.

• [**Children's sleep quality linked to mothers' insomnia**](#) [周四, 31 8月 21:33]

Children sleep more poorly if their mothers suffer from insomnia symptoms – potentially affecting their mental wellbeing and

development - according to new research. Nearly 200 school kids and their parents were studied, results indicating that children whose mothers have insomnia symptoms fall asleep later, get less sleep and spend less time in deep sleep. There appeared to be no link between fathers' insomnia symptoms and children's sleep.

[Little known theory could hold key to sporting success](#) [周四, 31 8月 21:33]

An established but little known psychological theory is likely to improve performances across a range of activities, including sport, according to new research.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**New fluorescent dyes could advance biological imaging**](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

- [**Stellar corpse sheds light on origin of cosmic rays**](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

- [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based

fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Method speeds up time to analyze complex microscopic images**](#) [周五, 01 9月 03:13]

Researchers who typically required a week of effort to dissect cryo-electron tomography images of the 3-D structure of a single cell will now be able to do it in about an hour thanks to a new automated method.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that

uses flash memory, the kind of memory used in most smartphones.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**Aerospace test goes green with alternative to explosives**](#) [周四, 31 8月 22:14]

Scientists have successfully demonstrated a new, more environmentally friendly method to test a rocket part to ensure its avionics can withstand the shock from stage separation during flight.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Improving earthquake resistance with a single crystal**](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

- [**Turning heat energy into a viable fuel source**](#) [周四, 31 8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode.

It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

- [**Good as gold**](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

- [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

- [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

- [**New bar set for water-splitting, CO2-splitting techniques**](#) [周四, 31 8月 02:13]

Researchers have significantly boosted the efficiency of two techniques,

for splitting water to create hydrogen gas and splitting carbon dioxide to create carbon monoxide. The products are valuable feedstock for clean energy and chemical manufacturing applications.

- [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

- [**Environmental chemist flashes warning light on new nanoparticle**](#) [周四, 31 8月 02:12]

Layered BP's cytotoxicity is based on the fact that it generates reactive oxygen species (ROS), scientists have found. ROS are among the most potent cell-damaging agents known. Layered BP also disrupts cell membrane integrity in a particle-size-dependent manner.

- [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

- [**Artificial intelligence analyzes gravitational lenses 10 million times faster**](#) [周四, 31 8月 01:22]

Researchers have for the first time shown that neural networks -- a form of artificial intelligence -- can accurately analyze the complex distortions in spacetime known as gravitational lenses 10 million times faster than traditional methods.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Dating? A magic formula to predict attraction is more elusive than ever**](#) [周四, 31 8月 01:22]

Dating websites often claim attraction between two people can be predicted from the right combination of traits and preferences, but a new study casts doubt on that assertion. The study, which used speed dating data, found a computer could predict who is desirable and how much someone would desire others -- who's hot and who's not -- but it could not unravel the mystery of unique desire for a specific person.

- [**Robotic system monitors specific neurons**](#) [周四, 31 8月 00:49]

Engineers have devised a way to automate the process of patch-clamping, using a computer algorithm that analyzes microscope images and guides a robotic arm to the target cell to record its electrical activity.

- [**'Seeing' robot learns tricky technique for studying brain cells in mammals**](#) [周四, 31 8月 00:25]

Scientists have successfully taught robots to perform a challenging brain technique only previously mastered by a handful of humans.

- [**Machine-learning earthquake prediction in lab shows promise**](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

- [**Silicon solves problems for next-generation battery technology**](#) [周三, 30 8月 23:48]

Silicon -- the second most abundant element in the earth's crust -- shows great promise in Li-ion batteries, according to new research. By replacing graphite anodes with silicon, it is possible to quadruple anode capacity.

- [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Stroke patient improvement with a brain-computer interface**](#) [周三, 30 8月 22:35]

It is possible for stroke patients to improve motor function using special training involving connecting brain signals with a computer, research shows.

- [**Leaf sensors can tell farmers when crops need to be watered**](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea**](#)

[creature's swimming style](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

• [Electricity production: When enzymes rival platinum](#) [周三, 30 8月 22:19]

Making a biocell that is as effective as a platinum fuel cell: that's the feat that researchers have achieved. Three years after making their first prototype biocell, the researchers have just reached a new milestone and increased its performance and stability. This biocell could, in the long run, offer an alternative to fuel cells that require rare and costly metals, such as platinum.

• [Integrated quantum optical circuits soon a reality](#) [周三, 30 8月 21:49]

A research group in quantum nano photonics has developed a new method that represents a significant step toward enabling optical quantum information processing on a chip.

• [New significance of unheralded chemical reactions](#) [周三, 30 8月 21:45]

Researchers reveal new significance to a decades-old chemical reaction theory, increasing our understanding of the interaction of gases, relevant to combustion and planetary atmospheres.

• [New mini tool has massive implications](#) [周三, 30 8月 21:43]

Researchers have created a miniaturized, portable version of a tool now capable of analyzing Mars' atmosphere -- and that's just one of its myriad possible uses.

• [Making 3-D printing safer](#) [周三, 30 8月 21:42]

Within the past decade, 3-D printers have gone from bulky, expensive curiosities to compact, more affordable consumer products. At the same time, concerns have emerged that nanoparticles released from the machines during use could affect consumers' health. Now researchers report a way to eliminate almost all nanoparticle emissions from some of

these printers.

- [**Nanoparticles loaded with mRNA give disease-fighting properties to cells**](#) [周三, 30 8月 21:42]

A new biomedical tool using nanoparticles that deliver transient gene changes to targeted cells could make therapies for a variety of diseases -- including cancer, diabetes and HIV -- faster and cheaper to develop, and more customizable.

- [**Adoption of robotics into a hospital's daily operations requires broad cooperation**](#) [周三, 30 8月 21:42]

Investigators studied the implementation of a logistics robot system at the Seinäjoki Central Hospital in South Ostrobothnia. The aim was to reduce transportation costs, improve the availability of supplies and alleviate congestion on hospital hallways by running deliveries around the clock on every day of the week.

- [**Nano chip system measures light from single bacterial cell to enable chemical detection**](#) [周三, 30 8月 21:42]

Researchers have created a nanophotonic chip system using lasers and bacteria to observe fluorescence emitted from a single bacterial cell. The novel system paves the way for an efficient and portable on-chip system for diverse cell-based sensing applications, such as detecting chemicals in real-time.

- [**NASA's Lunar mission captures solar eclipse as seen from the moon**](#) [周三, 30 8月 04:45]

LRO captured an image of the Moon's shadow over a large region of the United States, centered just north of Nashville, Tennessee.

- [**Why does rubbing a balloon on your hair make it stick?**](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

[Chemist synthesizes pure graphene](#) [周三, 30 8月 01:53]

A chemist has patented a one-of-a-kind process for exfoliating graphene in its pure (unoxidized) form, as well as manufacturing innovative graphene nanocomposites that have potential uses in a variety of applications, including desalination of brackish water.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Diverse landscapes are more productive and adapt better to climate change**](#) [周二, 05 9月 04:56]

Ecosystems with high biodiversity are more productive and stable towards annual fluctuations in environmental conditions than those with a low diversity of species. They also adapt better to climate-driven environmental changes. These are the key findings environmental scientists made in a study of about 450 landscapes harboring 2,200 plants and animal species.

- [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

- [**Team gathers unprecedented data on atmosphere's organic chemistry**](#) [周二, 05 9月 00:04]

Teams of scientists have carried out the most detailed, extended observations of atmospheric chemistry ever attempted in one place, in patch of ponderosa pine forest in Colorado, and found previously unmeasured compounds.

- [**Indigenous storytelling is a new asset for biocultural conservation**](#) [周一, 04 9月 21:36]

Some of the areas hosting most of the world's biodiversity are those inhabited by indigenous peoples. In the same way that biodiversity is

being eroded, so is the world's cultural diversity. As a result, there have been several calls to promote biocultural conservation approaches that sustain both biodiversity and indigenous cultures.

- [**Reindeer grazing protects tundra plant diversity in a warming climate**](#) [周一, 04 9月 21:34]

Climate warming reduces the number of plant species in the tundra, but plant-eating animals, such as reindeer and voles, can turn this negative effect into something positive.

- [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals. New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

- [**Earthworms at the root of sugar maple decline**](#) [周六, 02 9月 00:51]

Non-native worms are eating up the forest floor, causing sugar maples to die back and perhaps harming other forest dwellers, a new study suggests.

- [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

- [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

- [**Virus hijacks cell's transportation system**](#) [周五, 01 9月 21:39]

A deadly tick-borne virus uses the host neuron's transportation system to move their RNA, resulting in the local reproduction of the virus and severe neurological symptoms.

• [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

• [**Nature imagery calms prisoners**](#) [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

• [**Fungal infections reduce frogs' tolerance of heat**](#)

[周五, 01 9月 06:05]

Fungal diseases are increasing in animals, which might have serious consequences for wildlife living in a hotter world, said a scientist. A new study shows that fungal infections reduced the heat tolerance of frogs by up to 4 degrees Celsius.

• [**Panama's native tree species excel in infertile tropical soils**](#) [周五, 01 9月 06:03]

Scientists confirm that native tree species performed very well in field trials and would be preferable to teak in the poor soils of the Panama Canal watershed.

• [**Coming soon to Montreal: The infrastructure cost of climate change**](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

• [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

[**More research needed on effects of maternal stress in wild animals**](#) [周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes to their survival.

[**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

[**Does indoor spraying help prevent dengue?**](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

[**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

• [**Nature gem within the city: What grows in the biodiversity-rich Bukit Nanas Forest Reserve**](#) [周五, 01 9月 02:05]

Being the oldest of its kind in Malaysia, Bukit Nanas Forest Reserve is a nature enclave, lying in the center of the busy capital city Kuala Lumpur. Researchers have now teamed up to publish an extensive checklist of the flora of this urban nature enclave, while making use of the innovative 'ecosystem inventory' template.

• [**Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs**](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

• [**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

• [**Protein transport channel offers new target for thwarting pathogen**](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

• [**Fossil footprints challenge established theories of human evolution**](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the

established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

- [**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**Bacterial protein acts as aphrodisiac for choanoflagellates**](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same species.

- [**New molecules, innovation, value**](#) [周四, 31 8月 23:30]

Scientists are proposing a new model for creating, applying and commercializing chemicals made from corn stalks, wood chips and other sources of biomass.

- [**Why are coyote populations difficult to control?**](#)

[周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

- [**Antidepressants found in fish brains in Great Lakes region**](#) [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Record-low 2016 Antarctic sea ice due to 'perfect storm' of tropical, polar conditions**](#) [周四, 31 8月 21:26]

The sudden, unexpected nosedive in Antarctic sea ice last year was due to a unique one-two punch from atmospheric conditions both in the tropical Pacific Ocean and around the South Pole.

- [**X-ray footprinting solves mystery of metal-breathing protein**](#) [周四, 31 8月 21:26]

Scientists have discovered the details of an unconventional coupling between a bacterial protein and a mineral that allows the bacterium to breathe when oxygen is not available.

- [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived,

biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

• [**Forensic science techniques help discover new molecular fossils**](#) [周四, 31 8月 21:14]

Researchers believe they have found new molecular fossils of archaea using a method of analysis commonly used in forensic science.

• [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

• [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [**Profitable cooperation: Ants protect and fertilize plants**](#) [周四, 31 8月 08:21]

Biologists describe how the waste left by ants on plant leaves serves as a valuable fertilizer for the plants -- handed on a silver platter.

• [**Jordan faces likelihood of much more frequent long and severe droughts**](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

• [**Concerns regarding radioactivity in migratory seafood negated**](#) [周四, 31 8月 03:55]

New research shows negligible risk from consumption of meat from

migratory marine predators following Fukushima nuclear disaster.

• [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

• [**Tracking down the whale-shark highway**](#) [周四, 31 8月 03:55]

Researchers recently discovered that whale sharks in the Eastern Tropical Pacific follow fronts -- the dynamic boundaries between warm and cold ocean waters.

• [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [**Peptide mass fingerprinting can identify whale species based solely on their baleen**](#) [周四, 31 8月 02:12]

Peptide mass fingerprinting accurately identified 10 species of whales from their baleen alone, according to a new study.

• [**Gut bacteria that 'talk' to human cells may lead to new treatments**](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

• [**Shaking up the fish family tree: 'Living fossil'**](#)

not as old as we thought [周四, 31 8月 01:22]

Polypterids are weird and puzzling African fish that have perplexed biologists since they were discovered during Napoleon's expedition to Egypt in the late 1700s.

Monkeys with Parkinson's disease benefit from human stem cells [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- . [Nature imagery calms prisoners](#) [周五, 01 9月 21:38]
Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.
- . [New boarding procedures, smaller cabin size may limit infection on planes](#) [周五, 01 9月 03:13]
During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.
- . [Measuring the cost of quality measurement](#) [周五, 01 9月 03:12]
Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.
- . [Study reveals ways collegiate sports venues can achieve 'zero waste'](#) [周五, 01 9月 02:13]
A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could

be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- **[People become more economically conservative when angered](#)** [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- **[How reading and writing with your child boost more than just literacy](#)** [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

- **[Three policies to improve children's language development](#)** [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

- **[Jordan faces likelihood of much more frequent long and severe droughts](#)** [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

- **[Federal preemption of taxes on state and local sugar-sweetened beverages is not warranted](#)** [周四, 31 8月 00:49]

Federal and state government can alter or hinder state and local activity through a legal mechanism called preemption -- when a higher level of government blocks the action of a lower level of government. A new study evaluates whether it could be used to block taxes on sugar-sweetened beverages.

- **[Hope for improving protection of the reticulated python](#)** [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

- **[Researchers raise health concerns about off-road vehicles and inhalation of asbestos](#)** [周三, 30 8月 23:47]

Preventing injuries may not be the only reason children shouldn't use off-road vehicles (ORVs). In a new study, public health scientists raise concerns that people who use ORVs in many regions of the country may face exposure to hazardous mineral fibers.

- **[Is changing languages effortful for bilingual speakers? Depends on the situation](#)** [周三, 30 8月 22:37]

Research on the neurobiology of bilingualism has suggested that switching languages is inherently effortful, requiring executive control to manage cognitive functions, but a new study shows this is only the case when speakers are prompted, or forced, to do so.

- **[Shifting school start times could contribute \\$83 billion to US economy within a decade](#)** [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

- **[Leaf sensors can tell farmers when crops need to be watered](#)** [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance

of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

- [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

- [**Conservation hindered by geographical mismatches between capacity, need**](#) [周三, 30 8月 21:45]

Geographical mismatches between conservation needs and expertise may hinder global conservation goals, new research suggests.

- [**Shared custody equals less stress for children**](#) [周三, 30 8月 21:42]

Children who live full time with one parent are more likely to feel stressed than children in shared custody situations. The benefit holds regardless of the level of conflict between the parents or between parent and child.

- [**Brain stimulation for children with learning difficulties?**](#) [周三, 30 8月 00:47]

Applying a brain stimulation method, which was previously suggested to enhance mathematical learning in healthy adults, may improve the performance of children with mathematical learning difficulties, according to an exploratory study.

- [**Exclusion from school can trigger long-term psychiatric illness**](#) [周三, 30 8月 00:45]

Excluding children from school may lead to long-term psychiatric problems and psychological distress, a study of thousands of children has shown.

- [**Where's the line? Managing extreme speech on social media**](#) [周三, 30 8月 00:45]

A new study shows that while people tend to dislike extreme speech on social media, there is less support for outright censorship. Instead, people believe sites need to do a better job promoting healthy discourse online.

- [**Photosynthesis discovery could help design more efficient artificial solar cells**](#) [周三, 30 8月 00:44]

A natural process that occurs during photosynthesis could lead to the design of more efficient artificial solar cells, according to researchers.

- [**Scientists power past solar efficiency records**](#) [周二, 29 8月 23:39]

The high potential of silicon-based multijunction solar cells has now been demonstrated through new research.

- [**Lively tunes boost sales in crowded stores**](#) [周二, 29 8月 23:38]

If a store is crowded, people tend to buy more if the sound system is playing a fast-paced song rather than a ballad. That's what a team of researchers found in a field experiment across a chain of grocery convenience stores in Northern Europe.

- [**Mental health linked to retirement savings**](#) [周二, 29 8月 23:38]

The question of how mental health status affects decisions regarding retirement savings is becoming a pressing issue in the United States. Key factors contributing to this issue include the tenuous state of the Social Security system, greater use of defined-contribution pension plans by employers, longer lifespans, and the rise of depression and other mental health issues in older Americans.

- [**Origins of autism: Abnormalities in sensory processing at six months**](#) [周二, 29 8月 23:38]

The origins of autism remain mysterious. What areas of the brain are involved, and when do the first signs appear? New findings brings us closer to understanding the pathology of autism, and the point at which it begins to take shape in the human brain. Such knowledge will allow earlier interventions in the future and better outcomes for autistic children.

- [**Analysis identifies where commercial customers might benefit from energy storage**](#) [周二, 29 8月 23:38]

Commercial electricity customers who are subject to high demand charges may be able to reduce overall costs by using battery energy storage to manage demand, according to research.

- [**Inattentive kids show worse grades in later life**](#) [周二, 29 8月 21:50]

Researchers found that inattentiveness in childhood was linked to worse academic performance up to 10 years later in children with and without ADHD, even when they accounted for the children's intellectual ability. The results highlight the long-term effects that childhood inattention can have on academic performance, and suggest that parents and teachers should address inattentiveness in childhood.

- [**Doping in sports: Official tests fail to pick up majority of cases**](#) [周二, 29 8月 21:09]

A new scientific study has found that doping is far more common in professional sport than the rates suggested by blood and urine tests of the athletes.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals. New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

- [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

• [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

• [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce

winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

- [**Do squirrels teach bears to cross the railroad?**](#)

- [**Grizzlies dig squirrel middens for grains**](#) [周三, 30 8月 22:34]

Grains have been reported to regularly trickle from hopper cars travelling via the railway through Canada's Banff and Yoho National Parks. As a result, the local red squirrels collect and bury the spilled seeds in their winter larders, which are sometimes discovered by hungry grizzly bears. Grain-conditioned bears may frequent the railway more often than usual, resulting in increased mortality by trains strikes.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

- [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

• [Say hello to the 3-D Obama ant](#) [周三, 30 8月 21:42]

Three new ant species named in honor of key figures in conservation -- Barack Obama, Ken Saro-Wiwa, and E.O. Wilson -- are immortalized as 3-D virtual avatars.

• [Why does rubbing a balloon on your hair make it stick?](#) [周三, 30 8月 01:53]

New research indicates that tiny holes and cracks in a material -- changes in the microstructure -- can control how the material becomes electrically charged through friction.

• [New species of crab with unusual outgrowths has its name written in the stars](#) [周二, 29 8月 23:38]

A new 'star crab' has been collected from red coral beds in Taiwan and reefs in the Philippines. This astonishing creature is distinct with its carapace and chelipeds covered in pointy protrusions, which become rounder and mushroom-shaped with age to resemble star-like outgrowths and granules.

• [High-tech electronics made from autumn leaves](#) [周二, 29 8月 23:38]

Northern China's roadsides are peppered with deciduous phoenix trees, producing an abundance of fallen leaves in autumn. These leaves are generally burned in the colder season, exacerbating the country's air pollution problem. Investigators in Shandong, China, recently discovered a new method to convert this organic waste matter into a porous carbon material that can be used to produce high-tech electronics.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

• [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

• [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

• [**New, ultra-rare gene mutations implicated in eating disorders**](#) [周三, 06 9月 01:45]

A combination of whole exome sequencing, machine learning, and network analysis, has identified new, ultra-rare gene mutations within specific biological pathways that may contribute to eating disorders, according to a study.

• [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

• [**Could switchgrass help China's air quality?**](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

• [**Test of cervical mucus may reveal pregnant women's risk of going into labor too early**](#) [周三, 06 9月 01:45]

A new approach to evaluating the risk of preterm birth has been proposed by analyzing the properties of cervical mucus. The researchers found that cervical mucus from women who delivered their babies early, before 37 weeks, was very different from that of women who delivered

later.

- [**More durable, less expensive fuel cells**](#) [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative to internal combustion engines because they produce power through electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

- [**Boosting a lipid fuel makes mice less sensitive to the cold**](#) [周三, 06 9月 00:57]

Humans, like other animals, become more sensitive to cold with age. Now, scientists report that delivering a single dose of a nutritional supplement called L-carnitine to older mice restores a youthful ability to adapt to the cold. After treatment, they tolerate chilly conditions that would ordinarily trigger hypothermia. The supplement works by boosting levels of a newly discovered fuel source for brown fat, or “good fat”.

- [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

- [**Building a morphogen gradient by simple diffusion in a growing plant leaf**](#) [周三, 06 9月 00:33]

The research team has shown that a transcriptional co-activator ANGUSTIFOLIA3 (AN3) forms a signaling gradient along the leaf proximal-to-distal axis to determine cell-proliferation domain.

- [**Human-made reefs: A compelling diving alternative**](#) [周三, 06 9月 00:33]

Researchers have examined diving habits and behavior around Eilat's

natural and artificial reefs. According to study, the average diver density at the artificial reef was higher than at the two nearby natural knolls, and the Tamar reef effectively diverts divers from natural knolls. Secondly, the study found that regarding attitudes toward natural versus artificial reefs, divers consider the artificial reefs more appropriate for training, but they feel less relaxed around them.

• [Discovery of boron on Mars adds to evidence for habitability](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

• ['Extreme' telescopes find the second-fastest-spinning pulsar](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

• [Genome of threatened northern spotted owl assembled](#) [周二, 05 9月 23:14]

A charismatic owl iconic to Pacific Coast forests is no longer ruling the roost, and scientists now have another tool for understanding its decline. Researchers have assembled the California Academy of Sciences' first-ever animal genome after sequencing the DNA of the northern spotted owl (*Strix occidentalis caurina*). Academy scientists and collaborators extensively mapped the bird's genetic material to better understand how this threatened forest dweller is interacting with non-native owls invad...

• [Cannot sleep due to stress? Here is the cure](#) [周二, 05 9月 23:13]

Everyone empirically knows that stressful events certainly affect sound sleep. Scientists have found that the active component rich in sugarcane and other natural products may ameliorate stress and help having sound sleep.

- [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

- [**When not to eat your kids**](#) [周二, 05 9月 23:07]

Even though it is known to be a cannibal, the mangrove rivulus or killifish of the Americas will never eat one of its own embryos, even if it is hungry. This slender amphibious fish can recognize its own kin, even if these are still in the embryonic stage, according to new research.

- [**Prenatal lack of omega-3 and omega-6 fatty acids linked to schizophrenic symptoms in mice**](#) [周二, 05 9月 22:44]

Researchers have discovered a process through which changes in nutrition during early mouse pregnancy lead to offspring that develop schizophrenic-like symptoms as adults. The study shows how deprivation of two polyunsaturated fatty acids during early gestation can have long lasting effects on offspring through specific epigenetic changes in gene expression.

- [**'Bee' informed: Public interest exceeds understanding in bee conservation**](#) [周二, 05 9月 22:44]

Many people have heard bee populations are declining due to such threats as colony collapse disorder, pesticides and habitat loss. And many understand bees are critical to plant pollination. Yet, according to a study, few are aware of the wide diversity of bees and other pollinators beyond such species as honeybees. Because conservation efforts require substantial public support, outreach is needed to help people understand bee declines and how to protect pollinators.

- [**Gene related to brain damage in pre-term infants identified**](#) [周二, 05 9月 22:44]

A gene has been identified by researchers that is thought to be associated with the types of brain damage that can be caused by pre-

term birth.

- [**Life in the fast lane: How plants avoid traffic**](#)

- [**jams**](#) [周二, 05 9月 22:43]

Scientists have discovered how plants ingeniously avoid internal traffic jams.

- [**Discovery of dynamic seasonal changes in color perception**](#) [周二, 05 9月 21:38]

In many areas, the environment fluctuates greatly depending on the season, and animals living in those areas must adapt to the changing environment. A research group has found that color perception of Medaka, a small fish inhabiting rice fields and streams, varies greatly according to seasonal changes.

- [**Hop, skip, run, leap: Unpredictability boosts survival for bipedal desert rodents**](#) [周二, 05 9月 21:36]

Sometimes it pays to be unpredictable. A new study shows that when bipedal desert rodents called jerboas are being chased, sudden changes in direction, gait and speed help them elude hungry predators and likely give them a competitive edge over their quadrupedal neighbors.

- [**Zika virus kills brain cancer stem cells**](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

- [**Link found between cognitive fatigue and effort and reward**](#) [周二, 05 9月 21:36]

Injury and disease of the brain increase the likelihood of cognitive fatigue, which can be disabling. Researchers are studying the mechanisms of cognitive fatigue, toward the goal of developing effective interventions.

- [**Was the primordial soup a hearty pre-protein**](#)

[**stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

[operate nuclear pores](#) [周一, 04 9月 21:36]

Nuclear pore complexes are tiny channels where the exchange of substances between the cell nucleus and the cytoplasm takes place. Scientists report on startling new research that might overturn established models of nuclear transport regulation. Their study reveals how shuttling proteins known as importins control the function of nuclear pores – as opposed to the view that nuclear pores control the shuttling of importins.

• [Indigenous storytelling is a new asset for biocultural conservation](#) [周一, 04 9月 21:36]

Some of the areas hosting most of the world's biodiversity are those inhabited by indigenous peoples. In the same way that biodiversity is being eroded, so is the world's cultural diversity. As a result, there have been several calls to promote biocultural conservation approaches that sustain both biodiversity and indigenous cultures.

• [Stellar corpse sheds light on origin of cosmic rays](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

Humans still evolving, large-scale study of genetic data shows: Researchers find a drop in some harmful genetic mutations in longer-lived people -- ScienceDaily

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers at Columbia University find that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

Researchers further find that sets of genetic mutations that predispose people to heart disease, high cholesterol, obesity, and asthma, also appear less often in people who lived longer and whose genes are therefore more likely to be passed down and spread through the population. The results are published in the Sept. 5 issue of *PLOS Biology*.

"It's a subtle signal, but we find genetic evidence that

natural selection is happening in modern human populations," said study coauthor Joseph Pickrell, an evolutionary geneticist at Columbia and New York Genome Center.

New favorable traits evolve when genetic mutations arise that offer a survival edge. As the survivors of each generation pass on those beneficial mutations, the mutations and their adaptive traits become more common in the general population. Though it may take millions of years for complex traits to evolve, say allowing humans to walk on two legs, evolution itself happens with each generation as adaptive mutations become more frequent in the population.

The genomic revolution has allowed biologists to see the natural selection process in action by making the genetic blueprint of hundreds of thousands of people available for comparison. By tracking the relative rise and fall of specific mutations across generations of people, researchers can infer which traits are spreading or dwindling.

The researchers analyzed the genomes of 60,000 people of European ancestry genotyped by Kaiser Permanente in California, and 150,000 people in

Britain genotyped through the U.K. Biobank. To compensate for the relative lack of old people in the Biobank, the researchers used the participants' parents' age at death as a proxy as they looked for the influence of specific mutations on survival.

Two population-level mutation shifts stood out. In women over 70, researchers saw a drop in the frequency of the ApoE4 gene linked to Alzheimer's, consistent with earlier research showing that women with one or two copies of the gene tend to die well before those without it. Researchers saw a similar drop, starting in middle age, in the frequency of a mutation in the CHRNA3 gene associated with heavy smoking in men.

The researchers were surprised to find just two common mutations across the entire human genome that heavily influence survival. The high power of their analysis should have detected other variants had they existed, they said. This suggests that selection has purged similar variants from the population, even those that act later in life like the ApoE4 and CHRNA3 genes.

"It may be that men who don't carry these harmful

mutations can have more children, or that men and women who live longer can help with their grandchildren, improving their chance of survival," said study coauthor Molly Przeworski, an evolutionary biologist at Columbia.

Most traits are determined by dozens to hundreds of mutations, and even in a large sample like this one, their effect on survival can be hard to see, researchers said. To get around this, they examined sets of mutations associated with 42 common traits, from height to BMI, or body mass index, and for each individual in the study, determined what value of the trait they would predict based on their genetics, and whether it influenced survival.

They found that a predisposition for high cholesterol and LDL "bad" cholesterol, high body mass index or BMI, and heart disease was linked to shorter life spans. To a lesser extent, a predisposition for asthma was also linked to earlier death.

They also found that those genetically predisposed to delayed puberty and child-bearing lived longer -- a one-year puberty delay lowered the death rate by 3 to 4 percent in both men and women; a one-year

childbearing delay lowered the death rate by 6 percent in women.

Researchers take the results as evidence that genetic variants that influence fertility are evolving in some U.S. and Britain populations. But they caution that environment plays a role, too, so that traits that are desirable now may not be in other populations or in the future.

"The environment is constantly changing," said the study's lead author, Hakhamenesh Mostafavi, a graduate student at Columbia. "A trait associated with a longer lifespan in one population today may no longer be helpful several generations from now or even in other modern day populations."

The study may be the first to take a direct look at how the human genome is evolving in a period as short as one or two generations. As more people agree to have their genomes sequenced and studied, researchers hope that information about how long they lived, and the number of kids and grandkids they had, can reveal further clues about how the human species is currently evolving.

Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests -- ScienceDaily

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research published in the open access journal *BMC Public Health*. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

Dr Eleni Papadopoulou, lead author from the Norwegian Institute of Public Health, said: "The concern for harm to the fetus caused by radio frequency electromagnetic fields, such as those emitted by mobile phones, is mainly driven by reports from experimental animal studies with inconsistent results. Even though this is an observational study, our findings do not support the hypothesis of adverse effects on child's language, communication and motor

skills due to the use of mobile phone during pregnancy."

The researchers analysed data from a large Norwegian population-based pregnancy cohort study called MoBa, which involves a range of data collected from mothers and children during and after pregnancy. Data used in this study included 45,389 mother-child pairs for whom self-reported questionnaire data was available on maternal mobile phone use and neurodevelopment follow ups of the children at ages 3 and 5.

Professor Jan Alexander, senior author from the Norwegian Institute of Public Health, said: "Our investigation revealed for the first time that maternal mobile phone use may actually have a positive impact. More specifically, mobile phone use in pregnancy was associated with lower risk of the child having low language and motor skills at 3 years of age. Although we adjusted for important socio-demographic characteristics as well as maternal personality and psychological factors, we think this protective effect is more likely to be explained by factors not measured in this study having an impact on the mobile phone use and child's neurodevelopment, rather than the maternal mobile phone use in itself."

The researchers found that children born to mobile phone users had a 27% lower risk of having lower sentence complexity, 14% lower risk of incomplete grammar and 31% lower risk of having moderate language delay at age 3, compared to children of mothers who reported no mobile phone use. They also found that children born to mobile phone users had an 18% lower risk of low motor skills at age 3, compared to children born to non-users of mobile phones. The beneficial effects remained even after adjusting for relevant confounders and were also relative to the level of reported mobile phone use by the mother.

Professor Alexander said: "Our large study provides evidence that pregnant women's use of cell phone is not associated with risk of harming neurodevelopment of the fetus. The beneficial effects we report should be interpreted with caution due to the limitations common in observational studies, but our findings should at least alleviate any concern mothers have about using their mobile phone while pregnant."

Research shows how DNA molecules cross nanopores: Study could inform biosensors, manufacturing, and more -- ScienceDaily

Research presented in a new paper co-authored by Northwestern University associate professor of mechanical engineering Sandip Ghosal sheds new light on how polymers cross tiny pores ten thousand times smaller than a human hair.

These findings could propel a deeper understanding of the biophysics of living cells, the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

In the paper published Aug. 30 in *Nature Communications*, Ghosal and his co-authors present data showing how the speed of DNA changes as it enters or exits a nanopore. Surprisingly, the experiment showed that DNA molecules move faster as they enter a nanopore (forward translocation) and slower when

they exit (backward translocation).

What's happening with the DNA, Ghosal explains, is something familiar to mechanical engineers: a concept called "buckling," studied by great scientific minds like Leonhard Euler and Daniel Bernoulli more than two centuries ago, but rarely studied at the molecular level.

Ghosal and his collaborators concluded that DNA molecules buckle under the influence of compressive forces when entering the nanopore, but are pulled straight by tensile forces when moving in the opposite direction. The resulting difference in the geometric configuration results in greater hydrodynamic drag on the molecule in the latter case.

The study was motivated by a desire to understand, in detail, the mechanics of a DNA molecule's passage through a nanopore, a subject of rich scientific curiosity and conjecture.

"We wanted to know what is happening to the DNA and why," says Ghosal, who also holds a courtesy appointment in the Department of Engineering Sciences and Applied Mathematics.

Rather than simply determining the DNA's average speed of translocation, Ghosal's U.K.-based collaborators -- Ulrich F. Keyser, Maria Ricci, Kaikai Chen from the University of Cambridge, and Nicholas A.W. Bell, now of the University of Oxford -designed an innovative experiment to reveal the actual variation of the DNA's speed by inserting markers along the DNA molecule. This "DNA ruler" allowed the researchers to measure the speed of translocation at each instant. To then collect large amounts of data within a relatively short time period, the researchers repeatedly flipped the voltage across the pore, sending the DNA in and out of the nanopore in a "ping-pong" mode.

The group's work builds on the "resistive pulse" technique introduced nearly 20 years ago for detecting and characterizing single molecules. That idea has since been applied to a variety of research, including the search for an ultra-fast method of DNA sequencing and the effort to rapidly measure the mechanical properties of cells.

Ghosal describes his team's work as a potential "first step in extending the resistive pulse method to determining the mechanical characteristics of

polymers."

Though Ghosal admits the work itself is purely curiosity-driven research designed to probe what more can be done with the resistive pulse technique, the findings could nevertheless have real-world applications in any area where the measurement of polymer properties is important.

"Each polymer has a characteristic load at which it will buckle and, therefore, the difference between the forward and backward translocation times provide a way of gauging the bending rigidity of polymers," Ghosal said. "It is incredibly exciting that we can now observe this," Ghosal says.

Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives -- ScienceDaily

Postpartum depression is often associated with mothers, but a new study shows that fathers face a higher risk of experiencing it themselves if their testosterone levels drop nine months after their children are born.

The same study revealed that a father's low testosterone may also affect his partner -- but in an unexpectedly positive way. Women whose partners had lower levels of testosterone postpartum reported fewer symptoms of depression themselves nine and 15 months after birth.

High testosterone levels had the opposite effect. Fathers whose levels spiked faced a greater risk of experiencing stress due to parenting and a greater risk of acting hostile- such as showing emotional, verbal or physical aggression -- toward their partners.

The study was published in the journal *Hormones and*

Behavior on Sept. 1. The findings support prior studies that show men have biological responses to fatherhood, said Darby Saxbe, the study's lead author and an assistant professor of psychology at USC Dornsife College of Letters, Arts and Sciences.

"We often think of motherhood as biologically driven because many mothers have biological connections to their babies through breastfeeding and pregnancy." Saxbe said. "We don't usually think of fatherhood in the same biological terms. We are still figuring out the biology of what makes dads tick.

"We know that fathers contribute a lot to child-rearing and that on the whole, kids do better if they are raised in households with a father present," she added. "So, it is important to figure out how to support fathers and what factors explain why some fathers are very involved in raising their children while some are absent."

Saxbe worked with a team of researchers from USC, University of California at Los Angeles and Northwestern University.

A snapshot of paternal postpartum depression

For the study, the researchers examined data from 149 couples in the Community Child Health Research Network. The study by the National Institute for Child Health and Human Development involves sites across the country, but the data for this study came from Lake County, Illinois, north of Chicago.

Mothers in the study were 18 to 40 years old; African-American, white or Latina; and low-income. They were recruited when they gave birth to their first, second or third child. Mothers could invite the baby's father to participate in the study as well. Of the fathers who participated and provided testosterone data, 95 percent were living with the mothers.

Interviewers visited couples three times in the first two years after birth: around two months after the child was born, about nine months after birth and about 15 months after birth.

At the nine-month visit, researchers gave the fathers saliva sample kits. Dads took samples three times a day -- morning, midday and evening -- to monitor their testosterone levels.

Participants responded to questions about depressive

symptoms based on a widely-used measure, the Edinburgh Postnatal Depression. They also reported on their relationship satisfaction, parenting stress and whether they were experiencing any intimate partner aggression. Higher scores on those measures signaled greater depression, more stress, more dissatisfaction and greater aggression.

Relatively few participants -- fathers and mothers -- were identified as clinically depressed, which is typical of a community sample that reflects the general population. Instead of using clinical diagnoses, the researchers looked at the number of depressive symptoms endorsed by each participant.

Men's testosterone levels were linked with both their own and their partners' depressive symptoms -- but in opposing directions for men and for women.

For example, lower testosterone was associated with more symptoms in dads, but fewer symptoms in moms. The link between their partners' testosterone levels and their own depression was mediated by relationship satisfaction. If they were paired with lower-testosterone partners, women reported greater satisfaction with their relationship, which in turn helped reduce their

depressive symptoms.

"It may be that the fathers with lower testosterone were spending more time caring for the baby or that they had hormone profiles that were more synced up with mothers," she said. "For mothers, we know that social support buffers the risk of postpartum depression."

Fathers with higher testosterone levels reported more parenting stress, and their partners reported more relationship aggression .

To measure parenting stress, parents were asked how strongly they related to a set of 36 items from the Parenting Stress Index-Short Form. They responded to statements such as "I feel trapped by my responsibilities as a parent" and "My child makes more demands on me than most children." A high number of "yes" responses signaled stress.

Relationship satisfaction questions were based on another widely-used tool, the Dyadic Adjustment Scale. Parents responded to 32 items inquiring about their relationship satisfaction, including areas of disagreement or their degree of closeness and affection. Higher scores signaled greater dissatisfaction.

Mothers also answered questions from another scientific questionnaire, the HITS (Hurts, Insults, and Threats Scale), reporting whether they had experienced any physical hurt, insult, threats and screaming over the past year. They also were asked if their partners restricted activities such as spending money, visiting family or friends or going places that they needed to go.

"Those are risk factors that can contribute to depression over the long term," Saxbe said.

Treating fathers with postpartum depression

Although doctors may try to address postpartum depression in fathers by providing testosterone supplements, Saxbe said that the study's findings indicate a boost could worsen the family's stress.

"One take-away from this study is that supplementing is not a good idea for treating fathers with postpartum depression," she said. "Low testosterone during the postpartum period may be a normal and natural adaptation to parenthood."

She said studies have shown that physical fitness and

adequate sleep can improve both mood and help balance hormone levels.

In addition, both mothers and fathers should be aware of the signs of postpartum depression and be willing to seek support and care, Saxbe said. Talk therapy can help dads -- or moms -- gain insight into their emotions and find better strategies for managing their moods.

"We tend to think of postpartum depression as a mom thing," Saxbe said. "It's not. It's a real condition that might be linked to hormones and biology."

Aeroices: Newly discovered ultralow-density ice: Researchers from Japan have discovered a new form of ice crystal from theoretical modeling of its formation under negative pressure -- ScienceDaily

Water has many ice phases that form under different pressure and temperature conditions. The effects of positive pressure have been explored extensively, with the results somewhat predictable: As the pressure increases, so does the density of the ice.

Much less is known, however, about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals. The researchers, from Okayama University in Japan, report their findings this week in *The Journal of Chemical Physics*, from AIP

Publishing.

"Our research, which surveys an entire negative-pressure region for the first time, provides a significant stepping stone in exploring this vast and intricate territory on the phase diagram," said Masakazu Matsumoto, associate professor at the Research Institute for Interdisciplinary Science at Okayama University and a co-author of the paper. "Ices with lower density than normal ice are also found to be manifold [of many kinds]."

The discovery is expected to accelerate the understanding of the fundamental properties and behavior of water in nanotubes and other nanopores, as well as in biomolecules.

Seventeen ice phases have been found experimentally, each one numbered in the order of its discovery. Only two ices have lower density than normal ice.

In 2014, a research team discovered an ice phase that forms under negative pressure: ice XVI. The molecules of the ice form a zeolite structure, a 3-D crystalline cage, in which guest molecules or atoms are trapped inside. The guest molecules (neon particles in this

case) were removed, resulting in a stable, ultralow density ice at high negative pressures. Using a similar technique, another group of researchers discovered ice XVII in 2016.

The researchers at Okayama University mapped out all the possible ice phases that might still be left to explore in the negative pressure region. Knowing that the structure of silica (SiO_2) and ice are common, they retrieved 200 silica zeolites from the Zeolite Database, which is administered through the International Zeolite Association. More than 300 structures were evaluated overall.

The researchers rearranged the atoms in the SiO_2 structure, removing the two oxygen atoms and replacing the silicon atom in each molecule with one oxygen atom. Then, the hydrogen atoms were added so that the structure obeyed the ice rule.

In the density range that is only around half that of liquid water ($\sim 0.5 \text{ g/cm}^3$), the researchers showed that the newly discovered ice phase is more stable than any zeolite ice investigated so far. The researchers simulated even less dense ice structures -- between 0 and 0.5 grams per cubic centimeter -- by adding

polyhedral building blocks to the zeolitic frameworks to make the structure sparser while satisfying the structural rule for ice.

"These new structures are the aeroices," said Matsumoto, "and they can be more stable than any zeolitic ice at certain thermodynamic conditions under negative pressure."

All Top News

Top science stories featured on ScienceDaily's home page.

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

- [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

- [**The sniff test of self-recognition confirmed: Dogs**](#)

[have self-awareness](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

• [Zika virus kills brain cancer stem cells](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

• [Was the primordial soup a hearty pre-protein stew?](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

• [Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

• [More 'losers' than 'winners' predicted for Southern Ocean seafloor animals](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

• [Stellar corpse sheds light on origin of cosmic rays](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation

streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

- [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

- [**Metallurgy likely has more than one birthplace**](#) [周五, 01 9月 23:36]

When and where did humans invent metal smelting? Scientists have found the answer to this long-debated question in the history of technology. Metallurgy does not have a single origin but probably arose at various locations at about the same time. The experts reached this conclusion after re-examining the 8,500-year-old copper slag and analysing the chemical composition of other copper artefacts from the Stone Age settlement of Çatalhöyük in the Near East.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Paleontologist aids in new discovery 33 years after finding fossil**](#) [周五, 01 9月 06:05]

The fossilized plesiosaur Sankar Chatterjee found in 1984 is giving scientists a new understanding of convergent evolution between reptiles and mammals.

- [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert

echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

• [Reconstructing life at its beginning, cell by cell](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

• [Fossil footprints challenge established theories of human evolution](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

• [Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

• [Yawning: Why is it so contagious and why should it matter?](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

- [**Scents and social preference: Neuroscientists ID the roots of attraction**](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

- [**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

• [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

• [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

• [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [**Star-formation 'fuel tanks' found around distant galaxies**](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

• [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

• [**Protecting the guardians**](#) [周四, 31 8月 03:55]

A guardian gene that protects against type 1 diabetes and other autoimmune diseases exerts its pancreas-shielding effects by altering the gut microbiota. Experiments in mice born with the protective gene show that exposure to antibiotics during critical windows of development fuels risk for type 1 diabetes and leads to loss of genetic protection by altering the gut microbiota. Scientists say the findings underscore the importance of avoiding antibiotic use during late pregnancy and early infancy.

• [Bioengineering a functional vascularized lung scaffold](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

• [Gut bacteria that 'talk' to human cells may lead to new treatments](#) [周四, 31 8月 02:12]

Scientists developed a method to genetically engineer gut bacteria to produce molecules that have the potential to treat certain disorders by altering human metabolism.

• [Shaking up the fish family tree: 'Living fossil' not as old as we thought](#) [周四, 31 8月 01:22]

Polypterids are weird and puzzling African fish that have perplexed biologists since they were discovered during Napoleon's expedition to Egypt in the late 1700s.

• [Scientists recover nova first spotted 600 years ago by Korean astrologers](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged

novae once more.

- [**Monkeys with Parkinson's disease benefit from human stem cells**](#) [周四, 31 8月 01:22]

Japanese neurosurgeons report two new strategies to improve outcomes of iPS cell-based therapies for Parkinson's disease in monkey brains. The findings are a key step for patient recruitment of the first iPS cell-based therapy to treat neurodegenerative diseases.

- [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

- [**Volcanic eruptions drove ancient global warming event**](#) [周四, 31 8月 01:22]

A natural global warming event that took place 56 million years ago was triggered almost entirely by volcanic eruptions that occurred as Greenland separated from Europe during the opening of the North Atlantic Ocean, according to new research.

- [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

- [**Uncovering factors that shape sea life**](#) [周四, 31 8月 01:22]

Researchers have proposed a new conceptual model of island biogeography for marine organisms -- a theory that explores how different processes (like sea level fluctuations and geographic isolation) influence marine species diversity around islands.

- [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each

other, new research shows.

- [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Shifting school start times could contribute \\$83 billion to US economy within a decade**](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

- [**Patient plays saxophone while surgeons remove brain tumor**](#) [周三, 30 8月 22:36]

Music is not only a major part of Dan Fabbio's life, as a music teacher it is his livelihood. So when doctors discovered a tumor located in the part of his brain responsible for music function, he began a long journey that involved a team of physicians, scientists, and a music professor and culminated with him awake and playing a saxophone as surgeons operated on his brain.

- [**Understanding ancient geometric earthworks in southwestern Amazonia**](#) [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

· [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

· [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

· [**Methane emissions tackled with gas-guzzling bacteria**](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

· [**Fossil whales' teeth shows what ferocious predators they were**](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

· [**Century-old seal pelts reveal changes in Ross Sea ecosystem**](#) [周三, 30 8月 21:43]

Scientists sampled a pile of frozen pelts left in a hut by Antarctic explorers for Weddell seal tissue from a century ago, at the very start of human activities in Antarctica. By using sophisticated isotope analysis to compare samples from modern and century-old seals, they were able to investigate human impacts on the Antarctic ecosystem.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness

after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

• [**New, ultra-rare gene mutations implicated in eating disorders**](#) [周三, 06 9月 01:45]

A combination of whole exome sequencing, machine learning, and network analysis, has identified new, ultra-rare gene mutations within specific biological pathways that may contribute to eating disorders, according to a study.

• [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

• [**Test of cervical mucus may reveal pregnant women's risk of going into labor too early**](#) [周三, 06 9月 01:45]

A new approach to evaluating the risk of preterm birth has been proposed by analyzing the properties of cervical mucus. The researchers found that cervical mucus from women who delivered their babies early, before 37 weeks, was very different from that of women who delivered later.

• [**Boosting a lipid fuel makes mice less sensitive to the cold**](#) [周三, 06 9月 00:57]

Humans, like other animals, become more sensitive to cold with age. Now, scientists report that delivering a single dose of a nutritional supplement called L-carnitine to older mice restores a youthful ability to adapt to the cold. After treatment, they tolerate chilly conditions that would ordinarily trigger hypothermia. The supplement works by boosting levels of a newly discovered fuel source for brown fat, or “good fat”.

• [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated

with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

• [**Cannot sleep due to stress? Here is the cure**](#) [周二, 05 9月 23:13]

Everyone empirically knows that stressful events certainly affect sound sleep. Scientists have found that the active component rich in sugarcane and other natural products may ameliorate stress and help having sound sleep.

• [**Prenatal lack of omega-3 and omega-6 fatty acids linked to schizophrenic symptoms in mice**](#) [周二, 05 9月 22:44]

Researchers have discovered a process through which changes in nutrition during early mouse pregnancy lead to offspring that develop schizophrenic-like symptoms as adults. The study shows how deprivation of two polyunsaturated fatty acids during early gestation can have long lasting effects on offspring through specific epigenetic changes in gene expression.

• [**Gene related to brain damage in pre-term infants identified**](#) [周二, 05 9月 22:44]

A gene has been identified by researchers that is thought to be associated with the types of brain damage that can be caused by pre-term birth.

• [**Zika virus kills brain cancer stem cells**](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

• [**Link found between cognitive fatigue and effort and reward**](#) [周二, 05 9月 21:36]

Injury and disease of the brain increase the likelihood of cognitive fatigue, which can be disabling. Researchers are studying the mechanisms of cognitive fatigue, toward the goal of developing

effective interventions.

- [**PSA screening significantly reduces the risk for death from prostate cancer**](#) [周二, 05 9月 06:17]

After differences in implementation and settings were accounted for, two important prostate cancer screening trials provide compatible evidence that screening reduces prostate cancer mortality.

- [**Scientists discover brain area which can be targeted for treatment in patients with schizophrenia who 'hear voices'**](#) [周二, 05 9月 06:17]

For the first time, scientists have precisely identified and targeted an area of the brain which is involved in 'hearing voices,' experienced by many patients with schizophrenia. They have been able to show in a controlled trial that targeting this area with magnetic pulses can improve the condition in some patients.

- [**Epileptic brain activity in widely used lab mice**](#) [周二, 05 9月 01:19]

Multiple laboratories have observed unusual neural activity resembling epilepsy in some lines of genetically modified mice widely used in neuroscience research. The authors caution that this activity is easy to miss and presents potential challenges for using these animals to study the healthy brain.

- [**Schizophrenia, memory deficits: Solving the mystery behind a most stubborn symptom**](#) [周二, 05 9月 00:04]

Disruptions to the brain's internal GPS result in some of the severe memory deficits seen in schizophrenia. The new study in mouse models of the disorder marks the first time that schizophrenia's effects have been observed with such precision and clarity. The findings offer a promising entry point for attacking a near-universal and debilitating symptom of schizophrenia, memory deficits, which has thus far withstood all forms of treatment.

- [**Face value: Brain's ability to recognize faces is**](#)

[shaped through repeated exposure, study suggests](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

· [Mysterious protein-folding molecule could trigger metabolic disorders](#) [周二, 05 9月 00:04]

A molecule with few known functions can trigger the cell's response to unfolded proteins and perpetuate metabolic disease, report researchers.

· [Superfly flight simulator helps unravel navigation in the brain](#) [周二, 05 9月 00:04]

Researchers have identified two independent pathways in the fly brain that are integrated to allow successful navigation during flight. The study combined a flight simulator designed for flies with imaging of active neurons to show that landmark locations are processed separately in the fly brain from self-motion.

· [New fluorescent dyes could advance biological imaging](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

· [Diabetes and heart disease linked by genes, reveals study](#) [周二, 05 9月 00:04]

In a large analysis of genetic data, a team has first looked into what causes type 2 diabetes (T2D) and second clarified how T2D and coronary heart disease (CHD) -- the two diseases that are the leading cause of global morbidity and mortality, are linked.

· [Study in early stage breast cancer shows that even small tumors can be aggressive](#) [周一, 04 9月 21:38]

Even small tumors can be aggressive, according to a study in patients with early stage breast cancer. Researchers found that nearly one in four small tumors were aggressive and patients benefited from chemotherapy. Aggressive tumors could be identified by a 70-gene signature.

• [**Financial stress is associated with migraine, if you have specific circadian gene variants**](#) [周一, 04 9月 21:38]

People with a specific variation in the CLOCK gene have more migraines under financial stress. This work shows the effect of the genetics of circadian rhythms on migraine.

• [**Rethinking serotonin could lead to a shift in psychiatric care**](#) [周一, 04 9月 21:37]

A better understanding of how a key chemical messenger acts in the brain could lead to a radical shift in psychiatric care, according to a new research paper.

• [**Exercising during pregnancy is good for mother, baby, research confirms**](#) [周一, 04 9月 21:36]

Researchers have clarified doubts over the physical activity recommended during pregnancy. Their work highlights how exercise should be taken not only by healthy, previously active women, but that it is also a good time to adopt a healthy lifestyle. There are clear advantages for both the mother and baby.

• [**The point of release is the key: Identification of a key molecule for the neurotransmitter release in synapses**](#) [周一, 04 9月 21:36]

The contact areas between nerve cells are called synapses. What happens there lies at the heart of communication between nerve cells. Communication starts with the release of chemical messengers known as neurotransmitters at these synapses. Neurotransmitter-containing synaptic vesicles are involved in this release process, and these vesicles fuse with the cell membrane. This fusion occurs at a specific location

within the synapse rather than just anywhere at random. Scientists have succeeded in i...

- **[Indigenous storytelling is a new asset for biocultural conservation](#)** [周一, 04 9月 21:36]

Some of the areas hosting most of the world's biodiversity are those inhabited by indigenous peoples. In the same way that biodiversity is being eroded, so is the world's cultural diversity. As a result, there have been several calls to promote biocultural conservation approaches that sustain both biodiversity and indigenous cultures.

- **[Multi-mechanism approach to treating neonatal hypoxic ischemia](#)** [周一, 04 9月 21:34]

Male sex is a risk factor for worse outcome following neonatal insult, including hypoxic ischemia. While N-acetylcysteine and hypothermia promote functional improvement in female rodents, similar improvement in males requires the addition of vitamin D, report investigators. Multi-mechanism approaches are needed to treat neonatal hypoxic ischemia, and those approaches appear to be different depending on sex.

- **[Is ADHD really a sleep problem?](#)** [周一, 04 9月 21:34]

Around 75 percent of children and adults with attention deficit hyperactivity disorder (ADHD) also have sleep problems, but until now these have been thought to be separate issues. Now a in a pulling together of the latest research, Scientists are proposing of a new theory which says that much of ADHD may in fact be a problem associated with lack of regular circadian sleep.

- **[Pilot study shows that neurofeedback may help treatment-resistant depression](#)** [周一, 04 9月 21:34]

A small pilot study has indicated that neurofeedback -- where patients concentrate on modifying their own brainwave patterns -- has potential to treat many of the 100 million people worldwide who suffer from treatment-resistant depression (TRD). This is the first time that neurofeedback has been shown to improve both individual symptoms

and overall recovery in TRD.

- [**Alterations in blood-based miRNA in veterans affected with combat-related PTSD**](#) [周一, 04 9月 21:34]

A small pilot study shows that Individuals affected with PTSD (post-traumatic stress disorder) demonstrate changes in microRNA (miRNA) molecules associated with gene regulation. A controlled study, involving military personnel on deployment to a combat zone in Afghanistan, provided evidence for the role of blood-based miRNAs as candidate biomarkers for symptoms of PTSD.

- [**Heavy alcohol use alters brain functioning differently in young men and women**](#) [周一, 04 9月 21:34]

Scientists have found that brain functions in young men and women are changed by long-term alcohol use, but that these changes are significantly different in men and women. This indicates not only that young people might be at increased risk of long-term harm from alcohol use, but also that the risks are probably different in men and in women, with men possibly more at risk.

- [**Researchers review the clinical potential of senolytic drugs on aging**](#) [周一, 04 9月 21:34]

Researchers are moving closer to realizing the clinical potential of drugs that have previously been shown to support healthy aging in animals. Aging experts say that, if proven to be effective and safe in humans, these drugs could be 'transformative' by preventing or delaying chronic conditions as a group instead of one at a time.

- [**Cleanliness is next to sexiness for golden-collared manakins in Panama**](#) [周六, 02 9月 01:55]

Juvenile male Golden-collared Manakins on extra testosterone cleaned up their display area before performing for females, according to research at the Smithsonian Tropical Research Institute (STRI) in Panama published in Animal Behavior. Female manakins got more aggressive when given testosterone.

• [**Cognitive fatigue after TBI linked with activation of caudate**](#) [周六, 02 9月 00:51]

Researchers have further elucidated the mechanisms for cognitive fatigue, a disabling symptom that affects many individuals after traumatic brain injury (TBI).

• [**Drug may curb female infertility from cancer treatments**](#) [周六, 02 9月 00:51]

An existing drug may one day protect premenopausal women from life-altering infertility that commonly follows cancer treatments, according to a new study.

• [**Intellectual disabilities caused by protein defect**](#)

[周五, 01 9月 23:36]

Intellectual disabilities are often caused by a mutation that damages a gene, preventing the associated protein from functioning properly. However, a mutation can also change the function of a gene. As a result, the gene in question acts in a completely different way. Researchers discovered this mechanism in fifteen genes playing a role in the development of intellectual disabilities. Their research results show that these changes in function play a more prominent role than previously thought.

• [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

• [**Lifestyle factors may affect how long individuals live free of disability**](#) [周五, 01 9月 22:46]

New research indicates that a healthy lifestyle may help reduce the duration of an individual's disabled period near the end of life.

• [**Vaccines save 20 million lives, \\$350 billion in poor countries since 2001**](#) [周五, 01 9月 22:10]

Vaccination efforts made in the world's poorest countries since 2001

will have prevented 20 million deaths and saved \$350 billion in health-care costs by 2020, according to a new study.

- **[Virus hijacks cell's transportation system](#)** [周五, 01 9月 21:39]

A deadly tick-borne virus uses the host neuron's transportation system to move their RNA, resulting in the local reproduction of the virus and severe neurological symptoms.

- **[Breastfeeding may help prevent children's asthma exacerbations later in life](#)** [周五, 01 9月 21:38]

An analysis of children with asthma, those who had been breastfed had a 45 percent lower risk of asthma exacerbations later in life compared with children who had not been breastfed.

- **[Nature imagery calms prisoners](#)** [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

- **[Adipose tissue may affect cancer development in multiple ways](#)** [周五, 01 9月 21:38]

Adipose tissue, or fat, may influence the development of cancer in diverse ways, depending on the type of fat and the location in the body.

- **[The 'reality' of accent change](#)** [周五, 01 9月 21:38]

A new study of how accents change over differing periods of time demonstrates the limited impact of intense social interactions in isolated environments, and surprisingly large differences among people in how susceptible their accents are to change.

- **[Genes fueling neuroblastoma spread now identified](#)** [周五, 01 9月 06:03]

For the first time, researchers present data on how nervous system tumors, called neuroblastomas, spread. Their paper clarifies the relationship between two genes that fuel the aggressive spread of

neuroblastomas.

• [**Asthma medicine halves risk of Parkinson's**](#) [周五, 01 9

月 06:03]

Using data gathered from 100 million Norwegian prescriptions, researchers have found that asthma medicine can halve a patient's risk of developing Parkinson's disease.

• [**New genetic risk factor for developing autism spectrum disorder identified**](#) [周五, 01 9月 06:03]

A new systematic analysis has been applied to a cohort of 2,300 families who have a single child affected with autism. The study focused on identifying and characterizing low-lying genetic mutations that may have been missed in previous research, given these mutations are only present in a fraction of the bulk DNA of an individual.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**More durable, less expensive fuel cells**](#) [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative to internal combustion engines because they produce power through

electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

- [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

- [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

- [**New fluorescent dyes could advance biological imaging**](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

- [**Equation reveals the characteristics of quantum chaos**](#) [周一, 04 9月 21:37]

Researchers have now succeeded in formulating a mathematical result that provides an exact answer to the question of how chaos actually behaves. The researchers have analyzed chaotic states at the atomic

level.

- [**Like a revolving door: How shuttling proteins operate nuclear pores**](#) [周一, 04 9月 21:36]

Nuclear pore complexes are tiny channels where the exchange of substances between the cell nucleus and the cytoplasm takes place. Scientists report on startling new research that might overturn established models of nuclear transport regulation. Their study reveals how shuttling proteins known as importins control the function of nuclear pores – as opposed to the view that nuclear pores control the shuttling of importins.

- [**Stellar corpse sheds light on origin of cosmic rays**](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

- [**Algorithm unlocks smartwatches that learn your every move**](#) [周一, 04 9月 21:34]

Scientists have invented a new algorithm that enables smartwatches to detect and record your every move, without being told beforehand what to look for.

- [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the

production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Astronomer's study finds 10 times fewer house-sized near earth objects in solar system**](#) [周五, 01 9月 22:09]

The surprising results of an astronomer's new study find that there are 3.5 million house-sized meteoroids whose orbits bring them close enough to Earth to pose potential impact hazards -- ten times fewer than previously thought.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

- [**Method speeds up time to analyze complex microscopic images**](#) [周五, 01 9月 03:13]

Researchers who typically required a week of effort to dissect cryo-electron tomography images of the 3-D structure of a single cell will now be able to do it in about an hour thanks to a new automated method.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**Aerospace test goes green with alternative to explosives**](#) [周四, 31 8月 22:14]

Scientists have successfully demonstrated a new, more environmentally friendly method to test a rocket part to ensure its avionics can withstand the shock from stage separation during flight.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Improving earthquake resistance with a single crystal**](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月

21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

• [Turning heat energy into a viable fuel source](#) [周四, 31 8月 21:14]

8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode. It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

• [Robot learns to follow orders like Alexa](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

• [Good as gold](#) [周四, 31 8月 08:21]

Few experiences invoke as much anxiety as a call from your doctor saying 'you need to come back for more tests.' Your imagination goes wild and suddenly a routine medical screening becomes a minefield of potential life-threatening diseases. It's highly likely, however, that you have fallen victim to a false positive -- a result that, despite the accuracy of the test, erroneously yields an affirmative result that points toward illness. To increase the accuracy of medical screening and reduce the i...

• [Gold nanoparticles fry cancer on glowing mice](#) [周四, 31 8月 08:21]

四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

• [Star-formation 'fuel tanks' found around distant galaxies](#) [周四, 31 8月 05:25]

Astronomers have studied six distant starburst galaxies and discovered that five of them are surrounded by turbulent reservoirs of hydrogen gas, the fuel for future star formation.

- [**Toward a smart graphene membrane to desalinate water**](#) [周四, 31 8月 05:23]

A simple, sturdy graphene-based hybrid desalination membrane can provide clean water for agriculture and possibly human consumption.

- [**New bar set for water-splitting, CO2-splitting techniques**](#) [周四, 31 8月 02:13]

Researchers have significantly boosted the efficiency of two techniques, for splitting water to create hydrogen gas and splitting carbon dioxide to create carbon monoxide. The products are valuable feedstock for clean energy and chemical manufacturing applications.

- [**Bioengineering a functional vascularized lung scaffold**](#) [周四, 31 8月 02:12]

A team of researchers is the first to successfully bioengineer a functional lung with perfusable and healthy vasculature in an ex vivo rodent lung. Their new approach allows the removal of the pulmonary epithelium while maintaining the viability and function of the vascular network and the lung matrix.

- [**Environmental chemist flashes warning light on new nanoparticle**](#) [周四, 31 8月 02:12]

Layered BP's cytotoxicity is based on the fact that it generates reactive oxygen species (ROS), scientists have found. ROS are among the most potent cell-damaging agents known. Layered BP also disrupts cell membrane integrity in a particle-size-dependent manner.

- [**Scientists recover nova first spotted 600 years ago by Korean astrologers**](#) [周四, 31 8月 01:22]

A new study pinpoints the location of a nova first spotted by Korean astrologers almost 600 years ago that now undergoes smaller-scale 'dwarf nova' eruptions. The work supports that idea that novae go through a very long-term life cycle after erupting, fading to obscurity for thousands of years, and then building back up to become full-fledged novae once more.

• [**Artificial intelligence analyzes gravitational lenses 10 million times faster**](#) [周四, 31 8月 01:22]

Researchers have for the first time shown that neural networks -- a form of artificial intelligence -- can accurately analyze the complex distortions in spacetime known as gravitational lenses 10 million times faster than traditional methods.

• [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Dating? A magic formula to predict attraction is more elusive than ever**](#) [周四, 31 8月 01:22]

Dating websites often claim attraction between two people can be predicted from the right combination of traits and preferences, but a new study casts doubt on that assertion. The study, which used speed dating data, found a computer could predict who is desirable and how much someone would desire others -- who's hot and who's not -- but it could not unravel the mystery of unique desire for a specific person.

• [**Robotic system monitors specific neurons**](#) [周四, 31 8月 00:49]

Engineers have devised a way to automate the process of patch-clamping, using a computer algorithm that analyzes microscope images and guides a robotic arm to the target cell to record its electrical activity.

• [**'Seeing' robot learns tricky technique for studying brain cells in mammals**](#) [周四, 31 8月 00:25]

Scientists have successfully taught robots to perform a challenging brain technique only previously mastered by a handful of humans.

- [**Machine-learning earthquake prediction in lab shows promise**](#) [周四, 31 8月 00:25]

By listening to the acoustic signal emitted by a laboratory-created earthquake, a computer science approach using machine learning can predict the time remaining before the fault fails.

- [**Silicon solves problems for next-generation battery technology**](#) [周三, 30 8月 23:48]

Silicon -- the second most abundant element in the earth's crust -- shows great promise in Li-ion batteries, according to new research. By replacing graphite anodes with silicon, it is possible to quadruple anode capacity.

- [**What lit up the universe? Black holes may have punctured darkened galaxies, allowing light to escape**](#) [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

- [**Stroke patient improvement with a brain-computer interface**](#) [周三, 30 8月 22:35]

It is possible for stroke patients to improve motor function using special training involving connecting brain signals with a computer, research shows.

- [**Leaf sensors can tell farmers when crops need to be watered**](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

- [**New robot rolls with the rules of pedestrian conduct**](#) [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

- [**Robot probes mystery of prehistoric sea creature's swimming style**](#) [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

- [**Could switchgrass help China's air quality?**](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

- [**Building a morphogen gradient by simple diffusion in a growing plant leaf**](#) [周三, 06 9月 00:33]

The research team has shown that a transcriptional co-activator ANGUSTIFOLIA3 (AN3) forms a signaling gradient along the leaf

proximal-to-distal axis to determine cell-proliferation domain.

• [**Human-made reefs: A compelling diving alternative**](#) [周三, 06 9月 00:33]

Researchers have examined diving habits and behavior around Eilat's natural and artificial reefs. According to study, the average diver density at the artificial reef was higher than at the two nearby natural knolls, and the Tamar reef effectively diverts divers from natural knolls. Secondly, the study found that regarding attitudes toward natural versus artificial reefs, divers consider the artificial reefs more appropriate for training, but they feel less relaxed around them.

• [**Genome of threatened northern spotted owl assembled**](#) [周二, 05 9月 23:14]

A charismatic owl iconic to Pacific Coast forests is no longer ruling the roost, and scientists now have another tool for understanding its decline. Researchers have assembled the California Academy of Sciences' first-ever animal genome after sequencing the DNA of the northern spotted owl (*Strix occidentalis caurina*). Academy scientists and collaborators extensively mapped the bird's genetic material to better understand how this threatened forest dweller is interacting with non-native owls invad...

• [**Cannot sleep due to stress? Here is the cure**](#) [周二, 05 9月 23:13]

Everyone empirically knows that stressful events certainly affect sound sleep. Scientists have found that the active component rich in sugarcane and other natural products may ameliorate stress and help having sound sleep.

• [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

• [**When not to eat your kids**](#) [周二, 05 9月 23:07]

Even though it is known to be a cannibal, the mangrove rivulus or killifish of the Americas will never eat one of its own embryos, even if it is hungry. This slender amphibious fish can recognize its own kin, even if these are still in the embryonic stage, according to new research.

- [**'Bee' informed: Public interest exceeds understanding in bee conservation**](#) [周二, 05 9月 22:44]

Many people have heard bee populations are declining due to such threats as colony collapse disorder, pesticides and habitat loss. And many understand bees are critical to plant pollination. Yet, according to a study, few are aware of the wide diversity of bees and other pollinators beyond such species as honeybees. Because conservation efforts require substantial public support, outreach is needed to help people understand bee declines and how to protect pollinators.

- [**Life in the fast lane: How plants avoid traffic jams**](#) [周二, 05 9月 22:43]

Scientists have discovered how plants ingeniously avoid internal traffic jams.

- [**Discovery of dynamic seasonal changes in color perception**](#) [周二, 05 9月 21:38]

In many areas, the environment fluctuates greatly depending on the season, and animals living in those areas must adapt to the changing environment. A research group has found that color perception of Medaka, a small fish inhabiting rice fields and streams, varies greatly according to seasonal changes.

- [**Hop, skip, run, leap: Unpredictability boosts survival for bipedal desert rodents**](#) [周二, 05 9月 21:36]

Sometimes it pays to be unpredictable. A new study shows that when bipedal desert rodents called jerboas are being chased, sudden changes in direction, gait and speed help them elude hungry predators and likely give them a competitive edge over their quadrupedal neighbors.

- [**Was the primordial soup a hearty pre-protein**](#)

[stew?](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

• [Diverse landscapes are more productive and adapt better to climate change](#) [周二, 05 9月 04:56]

Ecosystems with high biodiversity are more productive and stable towards annual fluctuations in environmental conditions than those with a low diversity of species. They also adapt better to climate-driven environmental changes. These are the key findings environmental scientists made in a study of about 450 landscapes harboring 2,200 plants and animal species.

• [More 'losers' than 'winners' predicted for Southern Ocean seafloor animals](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

• [Team gathers unprecedented data on atmosphere's organic chemistry](#) [周二, 05 9月 00:04]

Teams of scientists have carried out the most detailed, extended observations of atmospheric chemistry ever attempted in one place, in patch of ponderosa pine forest in Colorado, and found previously unmeasured compounds.

• [Like a revolving door: How shuttling proteins operate nuclear pores](#) [周一, 04 9月 21:36]

Nuclear pore complexes are tiny channels where the exchange of substances between the cell nucleus and the cytoplasm takes place. Scientists report on startling new research that might overturn established models of nuclear transport regulation. Their study reveals how shuttling proteins known as importins control the function of

nuclear pores – as opposed to the view that nuclear pores control the shuttling of importins.

- [**Indigenous storytelling is a new asset for biocultural conservation**](#) [周一, 04 9月 21:36]

Some of the areas hosting most of the world's biodiversity are those inhabited by indigenous peoples. In the same way that biodiversity is being eroded, so is the world's cultural diversity. As a result, there have been several calls to promote biocultural conservation approaches that sustain both biodiversity and indigenous cultures.

- [**Reindeer grazing protects tundra plant diversity in a warming climate**](#) [周一, 04 9月 21:34]

Climate warming reduces the number of plant species in the tundra, but plant-eating animals, such as reindeer and voles, can turn this negative effect into something positive.

- [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals. New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

- [**Earthworms at the root of sugar maple decline**](#) [周六, 02 9月 00:51]

Non-native worms are eating up the forest floor, causing sugar maples to die back and perhaps harming other forest dwellers, a new study suggests.

- [**Metallurgy likely has more than one birthplace**](#) [周五, 01 9月 23:36]

When and where did humans invent metal smelting? Scientists have found the answer to this long-debated question in the history of technology. Metallurgy does not have a single origin but probably arose

at various locations at about the same time. The experts reached this conclusion after re-examining the 8,500-year-old copper slag and analysing the chemical composition of other copper artefacts from the Stone Age settlement of Çatalhöyük in the Near East.

• [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

• [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

• [**Virus hijacks cell's transportation system**](#) [周五, 01 9月 21:39]

A deadly tick-borne virus uses the host neuron's transportation system to move their RNA, resulting in the local reproduction of the virus and severe neurological symptoms.

• [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

• [**Nature imagery calms prisoners**](#) [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

• [**Paleontologist aids in new discovery 33 years after finding fossil**](#) [周五, 01 9月 06:05]

The fossilized plesiosaur Sankar Chatterjee found in 1984 is giving

scientists a new understanding of convergent evolution between reptiles and mammals.

- [**Fungal infections reduce frogs' tolerance of heat**](#)

[周五, 01 9月 06:05]

Fungal diseases are increasing in animals, which might have serious consequences for wildlife living in a hotter world, said a scientist. A new study shows that fungal infections reduced the heat tolerance of frogs by up to 4 degrees Celsius.

- [**Panama's native tree species excel in infertile tropical soils**](#)

[周五, 01 9月 06:03]

Scientists confirm that native tree species performed very well in field trials and would be preferable to teak in the poor soils of the Panama Canal watershed.

- [**Coming soon to Montreal: The infrastructure cost of climate change**](#)

[周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

- [**Insect eyes inspire new solar cell design**](#)

[周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

- [**More research needed on effects of maternal stress in wild animals**](#)

[周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes to their survival.

- [**Study reveals ways collegiate sports venues can**](#)

[achieve 'zero waste'](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

. [Does indoor spraying help prevent dengue?](#) [周五, 01 9月 02:13]

The prevention of dengue, the most prevalent mosquito-borne virus in the world, relies heavily on controlling mosquito populations, as the currently available dengue vaccine is only partially effective. Indoor spraying -- which involves spraying of insecticides inside houses -- has the potential to be a key part of those prevention efforts, researchers report.

. [Reconstructing life at its beginning, cell by cell](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

. [Nature gem within the city: What grows in the biodiversity-rich Bukit Nanas Forest Reserve](#) [周五, 01 9月 02:05]

Being the oldest of its kind in Malaysia, Bukit Nanas Forest Reserve is a nature enclave, lying in the center of the busy capital city Kuala Lumpur. Researchers have now teamed up to publish an extensive checklist of the flora of this urban nature enclave, while making use of the innovative 'ecosystem inventory' template.

. [Cross-kingdom regulation of honeybee caste development by dietary plant miRNAs](#) [周五, 01 9月 02:05]

Honeybee larvae develop into workers but not queens, in part, because their diet of beebread/pollen is enriched in plant miRNAs. While miRNAs are generally negative regulators of gene expression in

eukaryotes, they also negatively regulate larval development when honeybee larvae consume beebread/pollen and take up plant miRNAs.

• [**Pinpointing the sources of trans-pacific dust**](#) [周五, 01 9月 02:05]

Airborne dust from Asia travels across the Pacific passport-free, carrying pollution, building soil, and coloring sunsets thousands of miles from its source. Identifying that source is important for understanding atmospheric circulation, contaminant pathways, and climate. But collecting enough airborne dust to pinpoint its source is challenging. Now, a team of researchers has developed a way to match microscopic quartz grains to the desert they blew in from.

• [**Protein transport channel offers new target for thwarting pathogen**](#) [周五, 01 9月 01:42]

A bacterium that attacks people suffering from chronic lung disease and compromised immune systems could be halted by disrupting the distribution channels the organism uses to access the nutrient-rich cytoplasm of its host cell.

• [**Fossil footprints challenge established theories of human evolution**](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

• [**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

• [**What changes when you warm the Antarctic Ocean just 1 degree? Lots**](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

• [**Bacterial protein acts as aphrodisiac for choanoflagellates**](#) [周五, 01 9月 00:30]

Researchers investigating how single-celled organisms evolved to become multicellular stumbled across a strange phenomenon during their experiments: Single-celled eukaryotes called choanoflagellates, which are the closest living relatives to animals, begin to sexually reproduce in response to a protein produced by bacteria. Why this happens in natural settings is still unclear, though they speculate that it could help the choanoflagellates easily mate with others from the same species.

• [**New molecules, innovation, value**](#) [周四, 31 8月 23:30]

Scientists are proposing a new model for creating, applying and commercializing chemicals made from corn stalks, wood chips and other sources of biomass.

• [**Why are coyote populations difficult to control?**](#) [周四, 31 8月 22:15]

Conventional wisdom suggests that coyote control efforts actually result in an increase in the number of coyotes due to increasing litter sizes and pregnancy rates among individuals that survive.

• [**Antidepressants found in fish brains in Great Lakes region**](#) [周四, 31 8月 22:14]

Human antidepressants are building up in the brains of bass, walleye and several other fish common to the Great Lakes region, scientists say.

• [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**PSA screening significantly reduces the risk for death from prostate cancer**](#) [周二, 05 9月 06:17]

After differences in implementation and settings were accounted for, two important prostate cancer screening trials provide compatible evidence that screening reduces prostate cancer mortality.

- [**Vaccines save 20 million lives, \\$350 billion in poor countries since 2001**](#) [周五, 01 9月 22:10]

Vaccination efforts made in the world's poorest countries since 2001 will have prevented 20 million deaths and saved \$350 billion in health-care costs by 2020, according to a new study.

- [**Nature imagery calms prisoners**](#) [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

- [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

- [**Measuring the cost of quality measurement**](#) [周五, 01 9月

03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

• [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

• [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

• [**How reading and writing with your child boost more than just literacy**](#) [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

• [**Three policies to improve children's language development**](#) [周四, 31 8月 21:14]

Bilingual children from low-income homes are at greater risk of falling behind their peers in developing the appropriate language skills for their age group, leading to poorer academic achievement over time. A new article addresses how inequality impacts children's language development and details policies that can intervene.

• [**Jordan faces likelihood of much more frequent**](#)

[long and severe droughts](#) [周四, 31 8月 08:21]

Jordan is among the world's most water-poor nations, and a new, comprehensive analysis of regional drought and land-use changes in upstream Syria suggests the conditions could get significantly worse.

[Federal preemption of taxes on state and local sugar-sweetened beverages is not warranted](#) [周四, 31 8月 00:49]

Federal and state government can alter or hinder state and local activity through a legal mechanism called preemption -- when a higher level of government blocks the action of a lower level of government. A new study evaluates whether it could be used to block taxes on sugar-sweetened beverages.

[Hope for improving protection of the reticulated python](#) [周三, 30 8月 23:48]

Trading in skins of the reticulated python is such a lucrative business that illegal exports are rising sharply and existing trade restrictions are being circumvented on a large scale. This is endangering the stability of populations. Therefore, researchers are developing genetic methods for tracking down individual origins and potential trade routes of the skins.

[Researchers raise health concerns about off-road vehicles and inhalation of asbestos](#) [周三, 30 8月 23:47]

Preventing injuries may not be the only reason children shouldn't use off-road vehicles (ORVs). In a new study, public health scientists raise concerns that people who use ORVs in many regions of the country may face exposure to hazardous mineral fibers.

[Is changing languages effortful for bilingual speakers? Depends on the situation](#) [周三, 30 8月 22:37]

Research on the neurobiology of bilingualism has suggested that switching languages is inherently effortful, requiring executive control to manage cognitive functions, but a new study shows this is only the case when speakers are prompted, or forced, to do so.

[Shifting school start times could contribute \\$83](#)

[billion to US economy within a decade](#) [周三, 30 8月 22:36]

RAND Corporation and RAND Europe have released the first-ever analysis of the economic implications of a shift in school start times in the US. The study shows that a nationwide move to 8.30 a.m. could lead to an economic gain of \$83 billion to the US economy within a decade. The gains projected through the study's economic model would be realized through the higher academic and professional performance of students, and reduced car crash rates.

• [Leaf sensors can tell farmers when crops need to be watered](#) [周三, 30 8月 22:34]

Plant-based sensors that measure the thickness and electrical capacitance of leaves show great promise for telling farmers when to activate their irrigation systems, preventing both water waste and parched plants, according to researchers.

• [Methane emissions tackled with gas-guzzling bacteria](#) [周三, 30 8月 21:45]

Methane-oxidizing bacteria -- key organisms responsible for greenhouse gas mitigation -- are more flexible and resilient than previously thought, an international research has shown.

• [Conservation hindered by geographical mismatches between capacity, need](#) [周三, 30 8月 21:45]

Geographical mismatches between conservation needs and expertise may hinder global conservation goals, new research suggests.

• [Shared custody equals less stress for children](#) [周三, 30 8月 21:42]

Children who live full time with one parent are more likely to feel stressed than children in shared custody situations. The benefit holds regardless of the level of conflict between the parents or between parent and child.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals. New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

- [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

• [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

• [**How certain ants snap their jaws shut in the blink of an eye**](#) [周四, 31 8月 08:21]

Few victims stand a chance against the formidable mandibles of a trap-jaw ant. In conflicts between predators and prey, speed is a decided advantage, and evolution has given these insects an edge with spring-loaded jaws that snap shut with astonishing speed. Biologists have now provided the first mechanical description of the jaws of a little-known group of trap-jaw ants.

• [**Gold nanoparticles fry cancer on glowing mice**](#) [周四, 31 8月 08:21]

A new study takes a new approach to killing cancer: Why not fry it into oblivion with vibrating gold nanoparticles?

• [**Motorized molecules drill through cells**](#) [周四, 31 8月 01:22]

Motorized molecules that target diseased cells may deliver drugs to or kill the cells by drilling into the cell membranes. Scientists have demonstrated them on cancer and other cells.

• [**Acting like a muscle, nano-sized device lifts 165 times its own weight**](#) [周四, 31 8月 01:22]

Engineers have discovered a simple, economical way to make a nano-sized device that can match the friendly neighborhood Avenger, on a much smaller scale. Their creation weighs 1.6 milligrams (about as much as five poppy seeds) and can lift 265 milligrams (the weight of about 825 poppy seeds) hundreds of times in a row.

• [**Otters learn by copying each other**](#) [周四, 31 8月 01:11]

Otters can learn how to solve puzzles by watching and copying each other, new research shows.

• [**What lit up the universe? Black holes may have**](#)

punctured darkened galaxies, allowing light to escape [周三, 30 8月 23:48]

Researchers have a new explanation for how the universe changed from darkness to light. They propose that black holes within galaxies produce winds strong enough to fling out matter that punctures holes in galaxies, allowing light to escape.

Understanding ancient geometric earthworks in southwestern Amazonia [周三, 30 8月 22:34]

Researchers examine pre-colonial geometric earthworks in the southwestern Amazonia from the point of view of indigenous peoples and archaeology. The study shows that the earthworks were once important ritual communication spaces.

Do squirrels teach bears to cross the railroad?

Grizzlies dig squirrel middens for grains [周三, 30 8月 22:34]

Grains have been reported to regularly trickle from hopper cars travelling via the railway through Canada's Banff and Yoho National Parks. As a result, the local red squirrels collect and bury the spilled seeds in their winter larders, which are sometimes discovered by hungry grizzly bears. Grain-conditioned bears may frequent the railway more often than usual, resulting in increased mortality by train strikes.

New robot rolls with the rules of pedestrian conduct [周三, 30 8月 22:34]

Engineers have designed an autonomous robot with 'socially aware navigation,' that can keep pace with foot traffic while observing these general codes of pedestrian conduct.

Robot probes mystery of prehistoric sea creature's swimming style [周三, 30 8月 22:26]

A new study has shed light on the swimming style of plesiosaurs by creating a robot to mimic its movements.

Fossil whales' teeth shows what ferocious

[predators they were](#) [周三, 30 8月 21:45]

The feeding habits of the whale -- the world's biggest animal -- have evolved to filter feeding, shows new international research. Ancient whales appear to have been ferocious predators, investigators explain.

. [Say hello to the 3-D Obama ant](#) [周三, 30 8月 21:42]

Three new ant species named in honor of key figures in conservation -- Barack Obama, Ken Saro-Wiwa, and E.O. Wilson -- are immortalized as 3-D virtual avatars.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**'Vampires' may have been real people with this blood disorder**](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [**Sleep may help eyewitnesses from choosing innocent suspects**](#) [周四, 07 9月 02:49]

Sleep may influence an eyewitness's ability to correctly pick a guilty person out of a police lineup, indicates a new study.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**Concussions in women: Rates, symptoms and recovery are different than men**](#) [周四, 07 9月 02:32]

Females tend to report more symptoms -- and more severe ones -- and may also take longer to recover from brain injuries than their male counterparts.

- [**Synthetic version of popular anticoagulant poised for clinical trials**](#) [周四, 07 9月 02:32]

A synthetic version of low molecular weight heparin is poised for clinical trials and development as a drug for patients with clotting disorders, and those undergoing procedures such as kidney dialysis, heart bypass surgery, stent implantation, and knee and hip replacement.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

- [**Blindness study shows how gene causes middle-age sight loss**](#) [周三, 06 9月 22:37]

Chemical changes in the eye that can lead to blindness have been identified by scientists, report investigators.

- [**Substance in coffee delays onset of diabetes in laboratory mice**](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

- [**New strategy for vaccinating pregnant mothers against malaria holds promise for protecting infants**](#) [周三, 06 9月 22:37]

A mother and infant in Malawi have the same repertoire of antibodies to *Plasmodium falciparum*, the malaria parasite. That suggests that

boosting the mother's immune response to malaria, as via vaccination, will result in better protection for the infant.

- [**Supercharging silicon batteries**](#) [周三, 06 9月 22:36]

Scientists have designed a novel silicon-based anode to provide lithium batteries with increased power and better stability.

- [**Quantum tech has its sights set on human biochemistry**](#) [周三, 06 9月 22:36]

Scientists have developed a new tool for imaging life at the nanoscale that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.

- [**Cloud formation suppressed by biogenic organic emissions**](#) [周三, 06 9月 22:36]

Evidence has been found that near-ground biogenic emissions of organics suppress cloud formation in cool-temperate forests in autumn, providing clues to how global warming will affect cloud formation and the overall climate.

- [**Colon of patients with IBS reacts differently to bacteria**](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

- [**Unraveling a major cause of sea ice retreat in the Arctic Ocean**](#) [周三, 06 9月 22:36]

Quantitative analysis has evidenced the acceleration system of melting ice: dark water surfaces absorb more heat than white ice surfaces, thus melting ice and making more water surfaces in the Arctic Ocean.

- [**Green light for ultra-fine display colors**](#) [周三, 06 9月 22:36]

Chemical engineers have succeeded in generating ultra-pure green light for the first time. The new light-emitting diode will pave the way for visibly improved color quality in a new generation of ultra-high definition displays for TVs and smartphones.

- [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

- [**Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens**](#) [周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

- [**Protein that extends life of yeast cells**](#) [周三, 06 9月 22:35]

To understand and control aging is the aspiration of many scientists. Researchers have now discovered that the protein Gcn4 decreases protein synthesis and extends the life of yeast cells. Understanding how individual genes affect lifespan opens new ways to control the aging process and the occurrence of aging-related diseases.

- [**Bacteria responsible for legionellosis modulates the host cell metabolism to its advantage**](#) [周三, 06 9月 22:35]

The bacterial pathogen *Legionella pneumophila* has developed a specific strategy to target the host cell mitochondria, the organelles in charge of cellular bioenergetics, scientists have shown. New work provides precious information on how a pathogen manipulates the cellular metabolism to replicate intracellularly, and proposes a new concept of protection of host cells from *Legionella*-induced mitochondrial changes in order to fight infection.

- [**New tool for characterizing quantum simulators**](#) [周三, 06 9月 22:35]

Physicists are developing quantum simulators, to help solve problems that are beyond the reach of conventional computers. However, they

first need new tools to ensure that the simulators work properly. Researchers have now implemented a new technique in the laboratory that can be used to efficiently characterize the complex states of quantum simulators. The technique could become a new standard tool for characterizing quantum simulators.

[Keychain detector could catch food allergens before it's too late](#) [周三, 06 9月 22:35]

For kids and adults with food allergies, a restaurant outing can be a fraught experience. Even when care is taken, freshly prepared or packaged meals can accidentally become cross-contaminated with an offending food and trigger a reaction. Now researchers report the development of a new portable allergen-detection system -- including a keychain analyzer -- that could help prevent trips to the emergency room.

[Art courses could help medical students become better clinical observers](#) [周三, 06 9月 22:35]

In an effort to explore ways to improve clinical observation skills among medical students, researchers found significant improvement in observational recognition skills among students who took an art observation course and demonstrated that art training could help teach medical students to become better clinical observers.

[Research dog helps scientists save endangered carnivores](#) [周三, 06 9月 22:35]

Scat-sniffing research dogs are helping scientists map out a plan to save reclusive jaguars, pumas, bush dogs and other endangered carnivores in the increasingly fragmented forests of northeastern Argentina, according to a new study.

[Will mallards hybridize their cousins out of existence?](#) [周三, 06 9月 22:35]

Mallards -- the familiar ducks of city parks -- are one of a group of closely related species, many of which are far less common. Interbreeding can threaten the genetic distinctiveness of those other

species and cause concern for their conservation. A new study investigates hybridization between mallards and mottled ducks, a species adapted for life in coastal marshes, and finds that while hybridization rates are currently low, human activity could cause them to rise in the future.

[**Parkinson's severity assessed through drawing**](#) [周三, 06 9月 22:35]

Researchers asked volunteers to draw a spiral on a sheet of paper. By analyzing how long it took them to draw the spiral and how hard they pressed on the paper with the pen, the team could not only tell which volunteers had Parkinson's disease, they could also tell how severe it was. Doctors could use the automated system in their surgery to easily diagnose the disease or keep track of the progress of existing patients.

[**Flip-flop qubits: Radical new quantum computing design invented**](#) [周三, 06 9月 22:35]

Engineers have invented a radical new architecture for quantum computing, based on novel 'flip-flop qubits,' that promises to make the large-scale manufacture of quantum chips dramatically cheaper -- and easier -- than thought possible. The new chip design allows for a silicon quantum processor that can be scaled up without the precise placement of atoms required in other approaches.

[**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

[**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will

move off and start hunting.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

- [**Superhuman 'night' vision during the total eclipse?**](#) [周三, 06 9月 04:40]

It was dark as night during the recent total solar eclipse, yet people and objects were easier to see than on a typical moonless night. Scientists have discovered a possible biological explanation -- the presence (or absence) of a protein in the retina known as a GABA receptor.

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics

manufacturing and food processing, and the design of biosensors.

• [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

• [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

• [**New, ultra-rare gene mutations implicated in eating disorders**](#) [周三, 06 9月 01:45]

A combination of whole exome sequencing, machine learning, and network analysis, has identified new, ultra-rare gene mutations within specific biological pathways that may contribute to eating disorders, according to a study.

• [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

• [**Could switchgrass help China's air quality?**](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

• [**Test of cervical mucus may reveal pregnant women's risk of going into labor too early**](#) [周三, 06 9月 01:45]

A new approach to evaluating the risk of preterm birth has been proposed by analyzing the properties of cervical mucus. The researchers found that cervical mucus from women who delivered their babies early,

before 37 weeks, was very different from that of women who delivered later.

- **[More durable, less expensive fuel cells](#)** [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative to internal combustion engines because they produce power through electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

- **[Boosting a lipid fuel makes mice less sensitive to the cold](#)** [周三, 06 9月 00:57]

Humans, like other animals, become more sensitive to cold with age. Now, scientists report that delivering a single dose of a nutritional supplement called L-carnitine to older mice restores a youthful ability to adapt to the cold. After treatment, they tolerate chilly conditions that would ordinarily trigger hypothermia. The supplement works by boosting levels of a newly discovered fuel source for brown fat, or “good fat”.

- **[Contagious yawning more closely associated with perceptual sensitivity than empathy](#)** [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

- **[Building a morphogen gradient by simple diffusion in a growing plant leaf](#)** [周三, 06 9月 00:33]

The research team has shown that a transcriptional co-activator ANGUSTIFOLIA3 (AN3) forms a signaling gradient along the leaf proximal-to-distal axis to determine cell-proliferation domain.

- **[Human-made reefs: A compelling diving alternative](#)** [周三, 06 9月 00:33]

Researchers have examined diving habits and behavior around Eilat's natural and artificial reefs. According to study, the average diver density at the artificial reef was higher than at the two nearby natural knolls, and the Tamar reef effectively diverts divers from natural knolls. Secondly, the study found that regarding attitudes toward natural versus artificial reefs, divers consider the artificial reefs more appropriate for training, but they feel less relaxed around them.

- ['Waves' of neural activity give new clues about Alzheimer's](#) [周三, 06 9月 00:32]

While unconscious during deep sleep, millions of neurons' activity travels across the cerebral cortex. This phenomenon, known as slow waves, is related to the consolidation of memory. The European project called SloW Dyn, has now revealed anomalies in this activity in mice displaying a decline similar to Alzheimer's.

- [New evidence about how to prevent worsening pneumonia](#) [周三, 06 9月 00:32]

Sodium channels in the cells that line the tiny capillaries in our lungs play an important role in keeping those capillaries from leaking and potentially worsening conditions like pneumonia, scientists report.

- [Surgeons create 'vacuum' procedure to remove infected pacemaker](#) [周三, 06 9月 00:32]

Electrophysiologists get creative in removing infected pacemaker wires of a patient unable to have open heart surgery. He would have died if they didn't use a 'vacuum' typically used to remove foreign objects.

- [Discovery of boron on Mars adds to evidence for habitability](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [Glowing cancer tool illuminates benign, but dangerous, brain tumors during pituitary](#)

[surgery](#) [周三, 06 9月 00:32]

An experimental imaging tool that uses a targeted fluorescent dye successfully lit up the benign brain tumors of patients during removal surgery, allowing surgeons to identify tumor tissue, a new study shows.

. [Dig, dive, survive: Fruit fly larvae can make decisions about feeding that balance risk against benefit, biologists show](#) [周三, 06 9月 00:32]

We humans aren't the only creatures drawn by the smell of a good meal. Fruit fly larvae, it turns out, are equally susceptible to food scents, although the odors that attract them may not appeal to us.

'Vampires' may have been real people with this blood disorder: Dana-Farber/Boston Children's researchers and collaborators have identified a genetic mutation that may be responsible for vampire folklore -- ScienceDaily

Porphyrias, a group of eight known blood disorders, affect the body's molecular machinery for making heme, which is a component of the oxygen-transporting protein, hemoglobin. When heme binds with iron, it gives blood its hallmark red color.

The different genetic variations that affect heme production give rise to different clinical presentations of porphyria -- including one form that may be responsible for vampire folklore.

A clinical cause for nocturnal blood drinking?

Erythropoietic protoporphyria (EPP), the most

common kind of porphyria to occur in childhood, causes people's skin to become very sensitive to light. Prolonged exposure to sunshine can cause painful, disfiguring blisters.

"People with EPP are chronically anemic, which makes them feel very tired and look very pale with increased photosensitivity because they can't come out in the daylight," says Barry Paw MD, PhD, of the Dana-Farber/Boston Children's Cancer and Blood Disorders Center. "Even on a cloudy day, there's enough ultraviolet light to cause blistering and disfigurement of the exposed body parts, ears and nose."

Staying indoors during the day and receiving blood transfusions containing sufficient heme levels can help alleviate some of the disorder's symptoms. In ancient times, drinking animal blood and emerging only at night may have achieved a similar effect -- adding further fuel to the legend of vampires.

Now, Paw and his team of international investigators report -- in a paper in the *Proceedings of the National Academy of Sciences* (PNAS) -- a newly discovered genetic mutation that triggers EPP. It illuminates a novel biological mechanism potentially responsible for

stories of "vampires" and identifies a potential therapeutic target for treating EPP.

The nature of EPP's "supernatural" symptoms

To produce heme, the body goes through a process called porphyrin synthesis, which mainly occurs in the liver and bone marrow. Any genetic defects that impact this process can interrupt the body's ability to produce heme; the decreased heme production leads to a buildup of protoporphyrin components. In the case of EPP, type of protoporphyrin called protoporphrin IX accumulates in the red blood cells, plasma and sometimes the liver.

When protoporphrin IX is exposed to light, it produces chemicals that damage surrounding cells. As a result, people with EPP experience swelling, burning and redness of the skin after exposure to sunlight -- even trace amounts of sunlight that pass through window glass.

Some genetic pathways leading to build-up of protoporphyrin IX have already been described, but many cases of EPP remain unexplained. By performing deep gene sequencing on members of a family from

Northern France with EPP of a previously unknown genetic signature, Paw's team discovered a novel mutation of the gene CLPX, which plays a role in mitochondrial protein folding.

"This newly-discovered mutation really highlights the complex genetic network that underpins heme metabolism," says Paw, who was co-senior author on the study. "Loss-of-function mutations in any number of genes that are part of this network can result in devastating, disfiguring disorders."

Myth vs. reality

Paw suggests that identifying the various gene mutations that contribute to porphyria could pave the way for future therapies that could correct the faulty genes responsible for these related disorders.

"Although vampires aren't real, there is a real need for innovative therapies to improve the lives of people with porphyrias," says Paw.

Sleep may help eyewitnesses from choosing innocent suspects -- ScienceDaily

Sleep may influence an eyewitness's ability to correctly pick a guilty person out of a police lineup, indicates a study by Michigan State University researchers.

Published in *PLOS ONE*, the research found that eyewitnesses to a crime who sleep before being given a lineup are much less likely to pick an innocent person out of a lineup -- at least when the perpetrator is not in the lineup.

Some 70 percent of wrongful convictions in the United States are related to false eyewitness accounts. This study is the first scientific investigation into how sleep affects eyewitness memory of a crime, said lead author Michelle Stepan, a doctoral student in psychology.

"It's concerning that more people aren't making the correct decision during lineups; this suggests our memories are not super accurate and that's a problem

when you're dealing with the consequences of the criminal justice system," Stepan said. "Putting someone in jail is a big decision based on somebody's memory of a crime."

Stepan and Kimberly Fenn, associate professor of psychology and director of MSU's Sleep and Learning Lab, conducted an experiment in which about 200 participants watched a video of a crime (a man planting a bomb on a rooftop) and then, 12 hours later, viewed one of two computer lineups of six similar-looking people. One lineup included the perpetrator; the other lineup did not.

Some participants watched the crime video in the morning and viewed a lineup that night, with no sleep in between. Others watched the crime video at night and viewed a lineup the next morning, after sleeping.

When the perpetrator was not in the lineup, participants who had slept identified an innocent person 42 percent of the time -- compared to 66 percent for participants who had not slept.

"This is the most interesting finding of the study -- that individuals are less likely to choose an innocent

suspect after a period of sleep when the perpetrator is absent from the lineup," Fenn said. This is relevant, she added, because false convictions too often stem from an incorrect eyewitness identification of a suspect who did not commit the crime.

When the perpetrator was in the lineup, there was essentially no difference between the sleep and no-sleep groups' ability to choose the guilty man. Both groups correctly identified the perpetrator about 50 percent of the time.

"In other words," Fenn said, "sleep may not help you get the right guy, but it may help you keep an innocent individual out of jail."

The results could reflect both changes in memory strength and decision-making strategies after sleep.

The researchers believe participants who slept were more likely to use an "absolute strategy," in which they compare each person in the lineup to their memory of the suspect, while participants who didn't sleep were more likely to use a "relative strategy," in which they compare the people in the lineup to each other to determine who most resembles the perpetrator relative

to the others.

Using a relative strategy is believed to increase false identifications relative to an absolute strategy in perpetrator-absent lineups, Stepan said.

"These findings tell us that sleep likely impacts memory processes but that it might also impact how people search through a lineup, and those search strategies might be a critical factor when the perpetrator is not in the lineup," she said.

Fenn noted that the key findings of the study have since been replicated.

The MSU team is conducting research that further explores how sleep may directly or indirectly affect eyewitness memory.

Improved vaccine that protects against nine types of HPV is highly effective -- ScienceDaily

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer. And thanks to an international effort to improve the vaccine, the medical community is one step closer to preventing more HPV-associated diseases. The researchers, including those from Moffitt Cancer Center, published the final results of a study showing the newest vaccine is highly effective at preventing HPV infection and disease. The study was published this week in *The Lancet*.

HPV is an extremely common virus. It is estimated that by age 50, four out of five women have been infected with the virus at one point throughout their lifetimes. HPV causes ailments such as genital and anal warts

and, in some instances, continued infection can lead to the development of benign or cancerous growths of the cervix, vulva, vagina, anus, penis, tonsils, and base of the tongue. There are more than 100 types of HPV, but only approximately 13 types are associated with cancer development. HPV 16 and 18 alone are estimated to cause 70 percent of all cervical cancers.

Two existing HPV vaccines, Cervarix[®] and Gardasil[®], are effective at preventing disease caused by HPV types 16 and 18, while Gardasil also protects against genital warts caused by HPV 6 and 11. However, these vaccines do not protect against all HPV types that are associated with cancer. Scientists developed an improved vaccine called 9vHPV that targets HPV 16, 18, 6, and 11, and an additional 5 HPV types that are the next most commonly associated with cervical cancer (HPV 31, 33, 45, 52 and 58).

"Based on epidemiological studies, the 9vHPV vaccine could prevent approximately 90 percent of cervical cancer, 90 percent of HPV-related vulvar and vaginal cancer, 70 to 85 percent of high-grade cervical disease in females, and approximately 90 percent of HPV-related anal cancer and genital warts in males and females worldwide," explained Anna R. Giuliano,

Ph.D., Director of the Center for Infection Research in Cancer at Moffitt.

Researchers from 18 countries and 105 study sites conducted a phase 3 study to compare the activity of the new 9vHPV vaccine against the older vaccine that protected against four HPV types (Gardasil). The study randomized 14,215 women 16 to 26 years of age to either 9vHPV or Gardasil, and the study participants were medically followed for 6 years after vaccination.

The study found that the 9vHPV vaccine has long-term activity against HPV infection and disease. The 9vHPV vaccine reduced the risk of developing HPV 31/33/45/52/58-related cervical, vulvar, and vaginal disease by 97.7 percent when compared to Gardasil®, and the two vaccines had similar activity at preventing HPV 6/11/16/18-associated disease. The 9vHPV vaccine was also highly effective at reducing the risk of having HPV 31/33/45/52/58-associated cervical cell abnormalities, biopsies, and definitive therapies.

9vHPV, known as Gardasil 9, became available in 2015 to protect females and males ages 9 through 26 years against HPV-associated cancers and genital warts. Scientists hope its continued use will greatly

reduce the incidence and mortality of HPV-associated diseases.

"The 9vHPV vaccine is licensed in over 40 countries for the prevention of HPV-related anogenital cancers and pre-cancer, and genital warts. The results of this study support comprehensive vaccination programs and inform public health decision related to implementation," said Giuliano.

Concussions in women: Rates, symptoms and recovery are different than men -- ScienceDaily

Scientists have known for more than a decade that female athletes sustain concussions at a higher rate than males when playing sports with similar rules, such as soccer, basketball and baseball/softball. Females also tend to report more symptoms -- and more severe ones -- and may also take longer to recover from brain injuries than their male counterparts.

Despite that information, relatively little is known about how females experience concussions differently because there has been scant research on the topic. But scientists are trying to hoping to change that, says Dr. Mayumi Prins, a professor of neurosurgery at the David Geffen School of Medicine at UCLA and director of the UCLA Brain Injury Research Center education program.

"Most of the research in the past has focused on males, and there's been little basic science research done on

adolescents, females and concussions," Prins says, which means that the science on why girls may suffer more concussions and more prolonged symptoms is still uncertain.

But scientific research has shown that female and male brains differ in dozens of ways in activity patterns, anatomy, chemistry and physiology.

There are some reasons why concussions might affect female athletes and non-athletes differently than males. Those include hormonal issues, differences in how their upper bodies, particularly the muscles in the neck, react after collisions, and that females may be more likely than males to disclose concussion-related symptoms such as headaches, diminished social interaction or depression, Prins says.

For parents of children who participate in sports, Prins offers the following advice:

- While concussions in females are a serious concern, it's important to bear in mind that the relative risk of concussion is quite low compared to other activities of adolescents and young adults, such as driving, drugs, sexually transmitted diseases and

obesity. "There are other things besides concussion that children and young adults are at greater risk for," Prins says.

- Involvement in sports and athletic activities have been shown to benefit females in a variety of positive ways, such as development of positive body image, increasing bone density, psychological benefits.
- While the majority of females (and males) will recover from concussions in a week or two, some will have prolonged symptoms, a condition known as post-concussive syndrome and should seek medical assistance from a neurologist.
- Among adolescent women concussions can particularly affect feelings of social isolation and stress during a critical time of social development. "If you break a foot and are in a cast, everyone sees that and understands," Prins says. "But if you have a head injury, people may just look at you and pick up on some different behaviors and say 'What's wrong with you?' That can produce some social alienation, particularly in female athletes."

Synthetic version of popular anticoagulant poised for clinical trials - - ScienceDaily

A synthetic version of low molecular weight heparin is poised for clinical trials and development as a drug for patients with clotting disorders, and those undergoing procedures such as kidney dialysis, heart bypass surgery, stent implantation, and knee and hip replacement. Naturally derived low molecular weight heparin is extracted from pig intestines and the synthetic version offers several advantages: a synthesized version poses less risk for contamination in manufacturing, and, unlike its natural counterpart, it has been engineered to be safer for patients with poor kidney function and reversible in cases of complication.

Results of preclinical studies, which demonstrate the compounds' safety and efficacy in animal models of deep vein thrombosis and sickle cell disease, appear in the journal *Science Translational Medicine* today.

"This is at the cusp of clinical trials and commercial use. There is no question about the science; we have proven that this is a safer, more effective alternative to its natural counterpart, and what now determines its success or failure is the marketplace," said Robert Linhardt, the Ann and John H. Broadbent Jr. '59 Senior Constellation Professor of Biocatalysis and Metabolic Engineering at Rensselaer Polytechnic Institute (RPI), a member of the Rensselaer Center for Biotechnology and Interdisciplinary Studies (CBIS), and one of the inventors of the new drug.

Animal pharmacology and toxicology studies involved researchers at Loyola University Medical Center, the University of North Carolina at Chapel Hill (UNC), and Rensselaer. Researchers at Rensselaer -- which was involved in all previous stages of developing and manufacturing the compound -- assisted in synthesis by providing structural analysis of compounds manufactured at UNC, and tested at UNC and Loyola.

"We streamlined and altered the molecular structure of low molecular weight heparin in ways that vastly improve the function of the drug, and make it more cost-effective to synthesize, but also make it more of a challenge to analyze," said Xing Zhang, a post-doctoral

research associate in the Rensselaer Department of Chemistry and Chemical Biology working in the Linhardt Labs. "At Rensselaer, we developed sophisticated NMR and mass spectrometry techniques that ensure the high quality and purity of synthesis."

Heparin, which has been in use since the late 1930s, is an anticoagulant. There are three main types of heparin: unfractionated heparin, the more highly processed low molecular weight heparin (LMW) -- both of which are extracted from pig intestines -- and fondaparinux, a wholly synthetic ultra-low molecular weight heparin. Worldwide sales of heparin are estimated at \$4 billion annually, and LMW heparin makes up more than half the U.S. market for heparin.

In a 2014 paper published in *Nature Chemical Biology*, a team led by Linhardt and Jian Liu, a UNC professor and former student of Linhardt, announced creation of a synthetic version of LMW heparin. Synthesizing LMW heparin allowed them to make many improvements on the animal-derived form of the drug currently available. Up to 5 percent of patients receiving heparin experience some form of uncontrolled bleeding, but naturally derived LMW heparin does not fully respond to a protamine, a Food

and Drug Administration-approved antidote to unfractionated heparin. The researchers altered the molecular structure of the synthetic version so that it is neutralized by protamine. Naturally derived LMW is also cleared from the body through the kidneys so the researchers altered the synthetic version to make it safer for renally compromised patients.

The natural form of the heparin was in the spotlight in spring 2008 when more than 80 people died and hundreds of others suffered adverse reactions to it, leading to recalls of heparin in countries around the world. Authorities linked the problems to a contaminant in raw natural heparin coming from China. Linhardt has devoted his career to developing a safe, synthetic alternative to drugs like heparin to eliminate the risk of similar catastrophes.

The research was led by Liu, Linhardt, and Jawed Fareed, a professor of molecular pharmacology and therapeutics at Loyola University. "*Synthetic oligosaccharides can replace animal-sourced low-molecular weight heparins,*" appears in *Science Translational Medicine*, and was supported by the National Institutes of Health.

Linhardt's research is enabled by the vision of The New Polytechnic, an emerging paradigm for higher education which recognizes that global challenges and opportunities are so great they cannot be adequately addressed by even the most talented person working alone. Rensselaer serves as a crossroads for collaboration -- working with partners across disciplines, sectors, and geographic regions -- to address complex global challenges, using the most advanced tools and technologies, many of which are developed at Rensselaer. Research at Rensselaer addresses some of the world's most pressing technological challenges -- from energy security and sustainable development to biotechnology and human health. The New Polytechnic is transformative in the global impact of research, in its innovative pedagogy, and in the lives of students at Rensselaer.

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

• [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

• [**Mobile women were key to cultural exchange in Stone Age and Bronze Age Europe**](#) [周二, 05 9月 03:10]

At the end of the Stone Age and in the early Bronze Age, families were established in a surprising manner in the Lechtal, south of Augsburg, Germany. The majority of women probably came from Bohemia or Central Germany, while men usually remained in the region of their birth. This so-called patrilocal pattern combined with individual female mobility persisted over a period of 800 years during the transition from the Neolithic to the Early Bronze Age.

• [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

• [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

• [Stellar corpse sheds light on origin of cosmic rays](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

• [Physicists propose new theories of black holes from the very early universe](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

• [Metallurgy likely has more than one birthplace](#) [周五, 01 9月 23:36]

When and where did humans invent metal smelting? Scientists have found the answer to this long-debated question in the history of technology. Metallurgy does not have a single origin but probably arose at various locations at about the same time. The experts reached this conclusion after re-examining the 8,500-year-old copper slag and analysing the chemical composition of other copper artefacts from the Stone Age settlement of Çatalhöyük in the Near East.

• [Equatorial jet in Venusian atmosphere](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

• [Paleontologist aids in new discovery 33 years after finding fossil](#) [周五, 01 9月 06:05]

The fossilized plesiosaur Sankar Chatterjee found in 1984 is giving scientists a new understanding of convergent evolution between reptiles and mammals.

- [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [**Reconstructing life at its beginning, cell by cell**](#) [周五, 01 9月 02:12]

In a technological tour de force, scientists have created a virtual model of an early fly embryo. Its interactive interface allows researchers to explore the blueprint that underlies development at unprecedented spatial resolution and predict which cells express which genes.

- [**Fossil footprints challenge established theories of human evolution**](#) [周五, 01 9月 01:42]

Newly discovered human-like footprints from Crete may put the established narrative of early human evolution to the test. The footprints are approximately 5.7 million years old and were made at a time when previous research puts our ancestors in Africa -- with ape-like feet.

- [**Human bones in south Mexico: Stalagmite reveals their age as 13,000 years old**](#) [周五, 01 9月 01:12]

A prehistoric human skeleton found on the Yucatán Peninsula is at least 13,000 years old and most likely dates from a glacial period at the end of the most recent ice age, the late Pleistocene. A German-Mexican team of researchers has now dated the fossil skeleton based on a stalagmite that grew on the hip bone.

- [**Yawning: Why is it so contagious and why should it matter?**](#) [周五, 01 9月 00:30]

Feeling tired? Even if we aren't tired, why do we yawn if someone else

does? Experts have published research that suggests the human propensity for contagious yawning is triggered automatically by primitive reflexes in the primary motor cortex -- an area of the brain responsible for motor function. Their study is another stage in their research into the underlying biology of neuropsychiatric disorders and their search for new methods of treatment.

• [Scents and social preference: Neuroscientists ID the roots of attraction](#) [周五, 01 9月 00:30]

Culminating a series of studies stretching back eight years, biologists have identified the cellular and molecular basis for social preference, known in the animal kingdom as 'imprinting.' Through in vivo experiments, the researchers found the neurological roots of kinship attraction and aversion. They also employed genetics screening to find the regulators controlling this behavior. The study carries implications for understanding social attraction and aversion in a range of animals and humans.

• [What changes when you warm the Antarctic Ocean just 1 degree? Lots](#) [周五, 01 9月 00:30]

After warming a natural seabed in the Antarctic Ocean by just 1° or 2° Celsius, researchers observed massive impacts on a marine assemblage, as growth rates nearly doubled. The findings of what the researchers call the 'most realistic ocean warming experiment to date' show that the effects of future warming may far exceed expectations.

• [First hints of possible water content on TRAPPIST-1 planets](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

• [How Neanderthals made the very first glue](#) [周四, 31 8月

21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

• [**Apes' abilities misunderstood by decades of poor science**](#) [周四, 31 8月 21:14]

Hundreds of scientific studies over two decades have told us that apes are clever -- just not as clever as us. New analysis argues that what we think we know about apes' social intelligence is based on wishful thinking and flawed science.

• [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

• [**New hope for reef fish living in a high CO2 world**](#) [周四, 31 8月 21:14]

New research examining the possible impacts of ocean acidification provides fresh hope for the survival of reef fish.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**'Vampires' may have been real people with this blood disorder**](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [**Sleep may help eyewitnesses from choosing innocent suspects**](#) [周四, 07 9月 02:49]

Sleep may influence an eyewitness's ability to correctly pick a guilty person out of a police lineup, indicates a new study.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**Concussions in women: Rates, symptoms and recovery are different than men**](#) [周四, 07 9月 02:32]

Females tend to report more symptoms -- and more severe ones -- and may also take longer to recover from brain injuries than their male counterparts.

- [**Synthetic version of popular anticoagulant**](#)

[poised for clinical trials](#) [周四, 07 9月 02:32]

A synthetic version of low molecular weight heparin is poised for clinical trials and development as a drug for patients with clotting disorders, and those undergoing procedures such as kidney dialysis, heart bypass surgery, stent implantation, and knee and hip replacement.

• [How retractions significantly hurt scientists](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

• [Blindness study shows how gene causes middle-age sight loss](#) [周三, 06 9月 22:37]

Chemical changes in the eye that can lead to blindness have been identified by scientists, report investigators.

• [Substance in coffee delays onset of diabetes in laboratory mice](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

• [New strategy for vaccinating pregnant mothers against malaria holds promise for protecting infants](#) [周三, 06 9月 22:37]

A mother and infant in Malawi have the same repertoire of antibodies to Plasmodium falciparum, the malaria parasite. That suggests that boosting the mother's immune response to malaria, as via vaccination, will result in better protection for the infant.

• [Quantum tech has its sights set on human](#)

[biochemistry](#) [周三, 06 9月 22:36]

Scientists have developed a new tool for imaging life at the nanoscale that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.

· [Colon of patients with IBS reacts differently to bacteria](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

· [Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens](#) [周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

· [Protein that extends life of yeast cells](#) [周三, 06 9月 22:35]

To understand and control aging is the aspiration of many scientists. Researchers have now discovered that the protein Gcn4 decreases protein synthesis and extends the life of yeast cells. Understanding how individual genes affect lifespan opens new ways to control the aging process and the occurrence of aging-related diseases.

· [Bacteria responsible for legionellosis modulates the host cell metabolism to its advantage](#) [周三, 06 9月 22:35]

The bacterial pathogen *Legionella pneumophila* has developed a specific strategy to target the host cell mitochondria, the organelles in charge of cellular bioenergetics, scientists have shown. New work provides precious information on how a pathogen manipulates the cellular metabolism to replicate intracellularly, and proposes a new concept of protection of host cells from *Legionella*-induced mitochondrial changes

in order to fight infection.

- [**Keychain detector could catch food allergens before it's too late**](#) [周三, 06 9月 22:35]

For kids and adults with food allergies, a restaurant outing can be a fraught experience. Even when care is taken, freshly prepared or packaged meals can accidentally become cross-contaminated with an offending food and trigger a reaction. Now researchers report the development of a new portable allergen-detection system -- including a keychain analyzer -- that could help prevent trips to the emergency room.

- [**Art courses could help medical students become better clinical observers**](#) [周三, 06 9月 22:35]

In an effort to explore ways to improve clinical observation skills among medical students, researchers found significant improvement in observational recognition skills among students who took an art observation course and demonstrated that art training could help teach medical students to become better clinical observers.

- [**Parkinson's severity assessed through drawing**](#) [周三, 06 9月 22:35]

Researchers asked volunteers to draw a spiral on a sheet of paper. By analyzing how long it took them to draw the spiral and how hard they pressed on the paper with the pen, the team could not only tell which volunteers had Parkinson's disease, they could also tell how severe it was. Doctors could use the automated system in their surgery to easily diagnose the disease or keep track of the progress of existing patients.

- [**Superhuman 'night' vision during the total eclipse?**](#) [周三, 06 9月 04:40]

It was dark as night during the recent total solar eclipse, yet people and objects were easier to see than on a typical moonless night. Scientists have discovered a possible biological explanation -- the presence (or absence) of a protein in the retina known as a GABA receptor.

- [**Humans still evolving, large-scale study of**](#)

[genetic data shows](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

• [Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

• [Research shows how DNA molecules cross nanopores](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

• [Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

• [New, ultra-rare gene mutations implicated in eating disorders](#) [周三, 06 9月 01:45]

A combination of whole exome sequencing, machine learning, and network analysis, has identified new, ultra-rare gene mutations within specific biological pathways that may contribute to eating disorders, according to a study.

• [Eating meat linked to higher risk of diabetes](#) [周三, 06

9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

• [**Test of cervical mucus may reveal pregnant women's risk of going into labor too early**](#) [周三, 06 9月 01:45]

A new approach to evaluating the risk of preterm birth has been proposed by analyzing the properties of cervical mucus. The researchers found that cervical mucus from women who delivered their babies early, before 37 weeks, was very different from that of women who delivered later.

• [**Boosting a lipid fuel makes mice less sensitive to the cold**](#) [周三, 06 9月 00:57]

Humans, like other animals, become more sensitive to cold with age. Now, scientists report that delivering a single dose of a nutritional supplement called L-carnitine to older mice restores a youthful ability to adapt to the cold. After treatment, they tolerate chilly conditions that would ordinarily trigger hypothermia. The supplement works by boosting levels of a newly discovered fuel source for brown fat, or “good fat”.

• [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

• [**'Waves' of neural activity give new clues about Alzheimer's**](#) [周三, 06 9月 00:32]

While unconscious during deep sleep, millions of neurons' activity travels across the cerebral cortex. This phenomenon, known as slow waves, is related to the consolidation of memory. The European project called SloW Dyn, has now revealed anomalies in this activity in mice displaying a decline similar to Alzheimer's.

• [**New evidence about how to prevent worsening pneumonia**](#) [周三, 06 9月 00:32]

Sodium channels in the cells that line the tiny capillaries in our lungs play an important role in keeping those capillaries from leaking and potentially worsening conditions like pneumonia, scientists report.

• [**Surgeons create 'vacuum' procedure to remove infected pacemaker**](#) [周三, 06 9月 00:32]

Electrophysiologists get creative in removing infected pacemaker wires of a patient unable to have open heart surgery. He would have died if they didn't use a 'vacuum' typically used to remove foreign objects.

• [**Glowing cancer tool illuminates benign, but dangerous, brain tumors during pituitary surgery**](#) [周三, 06 9月 00:32]

An experimental imaging tool that uses a targeted fluorescent dye successfully lit up the benign brain tumors of patients during removal surgery, allowing surgeons to identify tumor tissue, a new study shows.

• [**Cannot sleep due to stress? Here is the cure**](#) [周二, 05 9月 23:13]

Everyone empirically knows that stressful events certainly affect sound sleep. Scientists have found that the active component rich in sugarcane and other natural products may ameliorate stress and help having sound sleep.

• [**Prenatal lack of omega-3 and omega-6 fatty acids linked to schizophrenic symptoms in mice**](#) [周二, 05 9月 22:44]

Researchers have discovered a process through which changes in nutrition during early mouse pregnancy lead to offspring that develop schizophrenic-like symptoms as adults. The study shows how deprivation of two polyunsaturated fatty acids during early gestation can have long lasting effects on offspring through specific epigenetic changes in gene expression.

• [**Gene related to brain damage in pre-term**](#)

infants identified [周二, 05 9月 22:44]

A gene has been identified by researchers that is thought to be associated with the types of brain damage that can be caused by pre-term birth.

Children with bone, joint infection often carry the same infectious bacteria in throat [周二, 05 9月 21:36]

The presence of the bacterium *Kingella kingae* in children's throats was strongly linked to bone and joint infection with the same bacterium, according to new research.

Zika virus kills brain cancer stem cells [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

Link found between cognitive fatigue and effort and reward [周二, 05 9月 21:36]

Injury and disease of the brain increase the likelihood of cognitive fatigue, which can be disabling. Researchers are studying the mechanisms of cognitive fatigue, toward the goal of developing effective interventions.

Scientists discover brain area which can be targeted for treatment in patients with schizophrenia who 'hear voices' [周二, 05 9月 06:17]

For the first time, scientists have precisely identified and targeted an area of the brain which is involved in 'hearing voices,' experienced by many patients with schizophrenia. They have been able to show in a controlled trial that targeting this area with magnetic pulses can improve the condition in some patients.

DNA and protein 'liquid biopsy' for early pancreatic cancer better than either alone [周二, 05 9月]

03:10]

Scientists say they have developed a blood test that spots tumor-specific DNA and protein biomarkers for early-stage pancreatic cancer.

• [Epileptic brain activity in widely used lab mice](#) [周

二, 05 9月 01:19]

Multiple laboratories have observed unusual neural activity resembling epilepsy in some lines of genetically modified mice widely used in neuroscience research. The authors caution that this activity is easy to miss and presents potential challenges for using these animals to study the healthy brain.

• [Schizophrenia, memory deficits: Solving the mystery behind a most stubborn symptom](#) [周二, 05 9月

00:04]

Disruptions to the brain's internal GPS result in some of the severe memory deficits seen in schizophrenia. The new study in mouse models of the disorder marks the first time that schizophrenia's effects have been observed with such precision and clarity. The findings offer a promising entry point for attacking a near-universal and debilitating symptom of schizophrenia, memory deficits, which has thus far withstood all forms of treatment.

• [Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

• [Mysterious protein-folding molecule could trigger metabolic disorders](#) [周二, 05 9月 00:04]

A molecule with few known functions can trigger the cell's response to unfolded proteins and perpetuate metabolic disease, report researchers.

• [Superfly flight simulator helps unravel navigation in the brain](#) [周二, 05 9月 00:04]

Researchers have identified two independent pathways in the fly brain that are integrated to allow successful navigation during flight. The study combined a flight simulator designed for flies with imaging of active neurons to show that landmark locations are processed separately in the fly brain from self-motion.

• [**New fluorescent dyes could advance biological imaging**](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

• [**Diabetes and heart disease linked by genes, reveals study**](#) [周二, 05 9月 00:04]

In a large analysis of genetic data, a team has first looked into what causes type 2 diabetes (T2D) and second clarified how T2D and coronary heart disease (CHD) -- the two diseases that are the leading cause of global morbidity and mortality, are linked.

• [**Study in early stage breast cancer shows that even small tumors can be aggressive**](#) [周一, 04 9月 21:38]

Even small tumors can be aggressive, according to a study in patients with early stage breast cancer. Researchers found that nearly one in four small tumors were aggressive and patients benefited from chemotherapy. Aggressive tumors could be identified by a 70-gene signature.

• [**Financial stress is associated with migraine, if you have specific circadian gene variants**](#) [周一, 04 9月 21:38]

People with a specific variation in the CLOCK gene have more migraines under financial stress. This work shows the effect of the genetics of circadian rhythms on migraine.

• [**Rethinking serotonin could lead to a shift in psychiatric care**](#) [周一, 04 9月 21:37]

A better understanding of how a key chemical messenger acts in the

brain could lead to a radical shift in psychiatric care, according to a new research paper.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [Supercharging silicon batteries](#) [周三, 06 9月 22:36]
Scientists have designed a novel silicon-based anode to provide lithium batteries with increased power and better stability.
- [Quantum tech has its sights set on human biochemistry](#) [周三, 06 9月 22:36]
Scientists have developed a new tool for imaging life at the nanoscale that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.
- [Green light for ultra-fine display colors](#) [周三, 06 9月 22:36]
Chemical engineers have succeeded in generating ultra-pure green light for the first time. The new light-emitting diode will pave the way for visibly improved color quality in a new generation of ultra-high definition displays for TVs and smartphones.
- [Accretion-powered pulsar reveals unique timing glitch](#) [周三, 06 9月 22:36]
The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'
- [New tool for characterizing quantum simulators](#) [周三, 06 9月 22:35]
Physicists are developing quantum simulators, to help solve problems that are beyond the reach of conventional computers. However, they first need new tools to ensure that the simulators work properly. Researchers have now implemented a new technique in the laboratory

that can be used to efficiently characterize the complex states of quantum simulators. The technique could become a new standard tool for characterizing quantum simulators.

- [**Keychain detector could catch food allergens before it's too late**](#) [周三, 06 9月 22:35]

For kids and adults with food allergies, a restaurant outing can be a fraught experience. Even when care is taken, freshly prepared or packaged meals can accidentally become cross-contaminated with an offending food and trigger a reaction. Now researchers report the development of a new portable allergen-detection system -- including a keychain analyzer -- that could help prevent trips to the emergency room.

- [**Flip-flop qubits: Radical new quantum computing design invented**](#) [周三, 06 9月 22:35]

Engineers have invented a radical new architecture for quantum computing, based on novel 'flip-flop qubits,' that promises to make the large-scale manufacture of quantum chips dramatically cheaper -- and easier -- than thought possible. The new chip design allows for a silicon quantum processor that can be scaled up without the precise placement of atoms required in other approaches.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

- [**Superhuman 'night' vision during the total eclipse?**](#) [周三, 06 9月 04:40]

It was dark as night during the recent total solar eclipse, yet people and objects were easier to see than on a typical moonless night. Scientists have discovered a possible biological explanation -- the presence (or absence) of a protein in the retina known as a GABA receptor.

- [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**More durable, less expensive fuel cells**](#) [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative to internal combustion engines because they produce power through electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

- [**Surgeons create 'vacuum' procedure to remove infected pacemaker**](#) [周三, 06 9月 00:32]

Electrophysiologists get creative in removing infected pacemaker wires of a patient unable to have open heart surgery. He would have died if

they didn't use a 'vacuum' typically used to remove foreign objects.

- [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [**Glowing cancer tool illuminates benign, but dangerous, brain tumors during pituitary surgery**](#) [周三, 06 9月 00:32]

An experimental imaging tool that uses a targeted fluorescent dye successfully lit up the benign brain tumors of patients during removal surgery, allowing surgeons to identify tumor tissue, a new study shows.

- [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

- [**When strangers can control our lights**](#) [周二, 05 9月 21:38]

Smart home products such as lamps controlled via mobile devices are becoming ever more popular in private households. We would, however, feel vulnerable in our own four walls if strangers suddenly started switching the lights in our homes on and off. Researchers have discovered security problems of this nature in smart lights manufactured by GE, IKEA, Philips and Osram.

- [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

- [**New fluorescent dyes could advance biological imaging**](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

- [**Equation reveals the characteristics of quantum chaos**](#) [周一, 04 9月 21:37]

Researchers have now succeeded in formulating a mathematical result that provides an exact answer to the question of how chaos actually behaves. The researchers have analyzed chaotic states at the atomic level.

- [**Like a revolving door: How shuttling proteins operate nuclear pores**](#) [周一, 04 9月 21:36]

Nuclear pore complexes are tiny channels where the exchange of substances between the cell nucleus and the cytoplasm takes place. Scientists report on startling new research that might overturn established models of nuclear transport regulation. Their study reveals how shuttling proteins known as importins control the function of nuclear pores – as opposed to the view that nuclear pores control the shuttling of importins.

- [**Stellar corpse sheds light on origin of cosmic rays**](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

- [**Algorithm unlocks smartwatches that learn your every move**](#) [周一, 04 9月 21:34]

Scientists have invented a new algorithm that enables smartwatches to

detect and record your every move, without being told beforehand what to look for.

- [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Astronomer's study finds 10 times fewer house-sized near earth objects in solar system**](#) [周五, 01 9月 22:09]

The surprising results of an astronomer's new study find that there are 3.5 million house-sized meteoroids whose orbits bring them close enough to Earth to pose potential impact hazards -- ten times fewer than previously thought.

- [**Molecules move faster near sticky surfaces**](#) [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

- [**Equatorial jet in Venusian atmosphere**](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon

called superrotation.

- [**Method speeds up time to analyze complex microscopic images**](#) [周五, 01 9月 03:13]

Researchers who typically required a week of effort to dissect cryo-electron tomography images of the 3-D structure of a single cell will now be able to do it in about an hour thanks to a new automated method.

- [**Insect eyes inspire new solar cell design**](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

- [**Drugs found to be more effective against depression than electric current**](#) [周五, 01 9月 02:05]

Medicinal therapy was found to be more than twice as effective as low-intensity brain stimulation in treating depression, according to a study.

- [**Caching system could make data centers more energy efficient**](#) [周四, 31 8月 23:52]

Researchers have developed a new system for data center caching that uses flash memory, the kind of memory used in most smartphones.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**Aerospace test goes green with alternative to explosives**](#) [周四, 31 8月 22:14]

Scientists have successfully demonstrated a new, more environmentally friendly method to test a rocket part to ensure its avionics can withstand

the shock from stage separation during flight.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

- [**Improving earthquake resistance with a single crystal**](#) [周四, 31 8月 21:26]

A new heating method for certain metals could lead to improved earthquake-resistant construction materials.

- [**Mass production of biodegradable plastic**](#) [周四, 31 8月 21:14]

Introducing a simple step to the production of plant-derived, biodegradable plastic could improve its properties while overcoming obstacles to manufacturing it commercially, says new research.

- [**Turning heat energy into a viable fuel source**](#) [周四, 31 8月 21:14]

A new device could one day turn the heat generated by a wide array of electronics into a usable fuel source. The device is a multicomponent, multilayered composite material called a van der Waals Schottky diode. It converts heat into electricity up to three times more efficiently than silicon -- a semiconductor material widely used in the electronics industry.

- [**Robot learns to follow orders like Alexa**](#) [周四, 31 8月 21:14]

Computer scientists have developed an Alexa-like system that allows robots to understand a wide range of commands that require contextual knowledge about objects and their environments. They've dubbed the system 'ComText,' for 'commands in context.'

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Substance in coffee delays onset of diabetes in laboratory mice**](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

- [**Cloud formation suppressed by biogenic organic emissions**](#) [周三, 06 9月 22:36]

Evidence has been found that near-ground biogenic emissions of organics suppress cloud formation in cool-temperate forests in autumn, providing clues to how global warming will affect cloud formation and the overall climate.

- [**Colon of patients with IBS reacts differently to bacteria**](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

- [**Unraveling a major cause of sea ice retreat in the Arctic Ocean**](#) [周三, 06 9月 22:36]

Quantitative analysis has evidenced the acceleration system of melting ice: dark water surfaces absorb more heat than white ice surfaces, thus

melting ice and making more water surfaces in the Arctic Ocean.

- [**Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens**](#)

[周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

- [**Protein that extends life of yeast cells**](#) [周三, 06 9月 22:35]

To understand and control aging is the aspiration of many scientists. Researchers have now discovered that the protein Gcn4 decreases protein synthesis and extends the life of yeast cells. Understanding how individual genes affect lifespan opens new ways to control the aging process and the occurrence of aging-related diseases.

- [**Bacteria responsible for legionellosis modulates the host cell metabolism to its advantage**](#) [周三, 06 9月 22:35]

The bacterial pathogen *Legionella pneumophila* has developed a specific strategy to target the host cell mitochondria, the organelles in charge of cellular bioenergetics, scientists have shown. New work provides precious information on how a pathogen manipulates the cellular metabolism to replicate intracellularly, and proposes a new concept of protection of host cells from *Legionella*-induced mitochondrial changes in order to fight infection.

- [**Research dog helps scientists save endangered carnivores**](#) [周三, 06 9月 22:35]

Scat-sniffing research dogs are helping scientists map out a plan to save reclusive jaguars, pumas, bush dogs and other endangered carnivores in the increasingly fragmented forests of northeastern Argentina, according to a new study.

- [**Will mallards hybridize their cousins out of**](#)

[existence?](#) [周三, 06 9月 22:35]

Mallards -- the familiar ducks of city parks -- are one of a group of closely related species, many of which are far less common. Interbreeding can threaten the genetic distinctiveness of those other species and cause concern for their conservation. A new study investigates hybridization between mallards and mottled ducks, a species adapted for life in coastal marshes, and finds that while hybridization rates are currently low, human activity could cause them to rise in the future.

• [Clever cockatoos bend hooks into straight wire to fish for food](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

• [Something to sneeze about: Democratic voting in African wild dog packs](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

• [Research shows how DNA molecules cross nanopores](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

• [Aeroices: Newly discovered ultralow-density ice](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now

theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

• [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

• [**Could switchgrass help China's air quality?**](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

• [**Building a morphogen gradient by simple diffusion in a growing plant leaf**](#) [周三, 06 9月 00:33]

The research team has shown that a transcriptional co-activator ANGUSTIFOLIA3 (AN3) forms a signaling gradient along the leaf proximal-to-distal axis to determine cell-proliferation domain.

• [**Human-made reefs: A compelling diving alternative**](#) [周三, 06 9月 00:33]

Researchers have examined diving habits and behavior around Eilat's natural and artificial reefs. According to study, the average diver density at the artificial reef was higher than at the two nearby natural knolls, and the Tamar reef effectively diverts divers from natural knolls. Secondly, the study found that regarding attitudes toward natural versus artificial reefs, divers consider the artificial reefs more appropriate for training, but they feel less relaxed around them.

• [**Dig, dive, survive: Fruit fly larvae can make decisions about feeding that balance risk against benefit, biologists show**](#) [周三, 06 9月 00:32]

We humans aren't the only creatures drawn by the smell of a good meal. Fruit fly larvae, it turns out, are equally susceptible to food scents, although the odors that attract them may not appeal to us.

• [**Genome of threatened northern spotted owl**](#)

[**assembled**](#) [周二, 05 9月 23:14]

A charismatic owl iconic to Pacific Coast forests is no longer ruling the roost, and scientists now have another tool for understanding its decline. Researchers have assembled the California Academy of Sciences' first-ever animal genome after sequencing the DNA of the northern spotted owl (*Strix occidentalis caurina*). Academy scientists and collaborators extensively mapped the bird's genetic material to better understand how this threatened forest dweller is interacting with non-native owls invading...

. [**Cannot sleep due to stress? Here is the cure**](#) [周二, 05 9月 23:13]

Everyone empirically knows that stressful events certainly affect sound sleep. Scientists have found that the active component rich in sugarcane and other natural products may ameliorate stress and help having sound sleep.

. [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

. [**When not to eat your kids**](#) [周二, 05 9月 23:07]

Even though it is known to be a cannibal, the mangrove rivulus or killifish of the Americas will never eat one of its own embryos, even if it is hungry. This slender amphibious fish can recognize its own kin, even if these are still in the embryonic stage, according to new research.

. [**'Bee' informed: Public interest exceeds understanding in bee conservation**](#) [周二, 05 9月 22:44]

Many people have heard bee populations are declining due to such threats as colony collapse disorder, pesticides and habitat loss. And many understand bees are critical to plant pollination. Yet, according to a study, few are aware of the wide diversity of bees and other pollinators beyond such species as honeybees. Because conservation efforts require substantial public support, outreach is needed to help people understand

bee declines and how to protect pollinators.

- **[Life in the fast lane: How plants avoid traffic](#)**

[jams](#) [周二, 05 9月 22:43]

Scientists have discovered how plants ingeniously avoid internal traffic jams.

- **[Discovery of dynamic seasonal changes in color perception](#)** [周二, 05 9月 21:38]

In many areas, the environment fluctuates greatly depending on the season, and animals living in those areas must adapt to the changing environment. A research group has found that color perception of Medaka, a small fish inhabiting rice fields and streams, varies greatly according to seasonal changes.

- **[Hop, skip, run, leap: Unpredictability boosts survival for bipedal desert rodents](#)** [周二, 05 9月 21:36]

Sometimes it pays to be unpredictable. A new study shows that when bipedal desert rodents called jerboas are being chased, sudden changes in direction, gait and speed help them elude hungry predators and likely give them a competitive edge over their quadrupedal neighbors.

- **[Was the primordial soup a hearty pre-protein stew?](#)** [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

- **[Diverse landscapes are more productive and adapt better to climate change](#)** [周二, 05 9月 04:56]

Ecosystems with high biodiversity are more productive and stable towards annual fluctuations in environmental conditions than those with a low diversity of species. They also adapt better to climate-driven environmental changes. These are the key findings environmental scientists made in a study of about 450 landscapes harboring 2,200

plants and animal species.

- [**Experts call for added focus on the impact of glacier mass loss on downstream systems**](#) [周二, 05 9月 03:10]

Researchers have warned of an 'urgent worldwide need' to address a broad spectrum of cascading impacts of glacier mass loss on downstream systems.

- [**Mobile women were key to cultural exchange in Stone Age and Bronze Age Europe**](#) [周二, 05 9月 03:10]

At the end of the Stone Age and in the early Bronze Age, families were established in a surprising manner in the Lechtal, south of Augsburg, Germany. The majority of women probably came from Bohemia or Central Germany, while men usually remained in the region of their birth. This so-called patrilocal pattern combined with individual female mobility persisted over a period of 800 years during the transition from the Neolithic to the Early Bronze Age.

- [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

- [**Team gathers unprecedented data on atmosphere's organic chemistry**](#) [周二, 05 9月 00:04]

Teams of scientists have carried out the most detailed, extended observations of atmospheric chemistry ever attempted in one place, in patch of ponderosa pine forest in Colorado, and found previously unmeasured compounds.

- [**Like a revolving door: How shuttling proteins operate nuclear pores**](#) [周一, 04 9月 21:36]

Nuclear pore complexes are tiny channels where the exchange of substances between the cell nucleus and the cytoplasm takes place. Scientists report on startling new research that might overturn

established models of nuclear transport regulation. Their study reveals how shuttling proteins known as importins control the function of nuclear pores – as opposed to the view that nuclear pores control the shuttling of importins.

- [**Indigenous storytelling is a new asset for biocultural conservation**](#) [周一, 04 9月 21:36]

Some of the areas hosting most of the world's biodiversity are those inhabited by indigenous peoples. In the same way that biodiversity is being eroded, so is the world's cultural diversity. As a result, there have been several calls to promote biocultural conservation approaches that sustain both biodiversity and indigenous cultures.

- [**Reindeer grazing protects tundra plant diversity in a warming climate**](#) [周一, 04 9月 21:34]

Climate warming reduces the number of plant species in the tundra, but plant-eating animals, such as reindeer and voles, can turn this negative effect into something positive.

- [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals. New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

- [**Earthworms at the root of sugar maple decline**](#) [周六, 02 9月 00:51]

Non-native worms are eating up the forest floor, causing sugar maples to die back and perhaps harming other forest dwellers, a new study suggests.

- [**Metallurgy likely has more than one birthplace**](#) [周五, 01 9月 23:36]

When and where did humans invent metal smelting? Scientists have

found the answer to this long-debated question in the history of technology. Metallurgy does not have a single origin but probably arose at various locations at about the same time. The experts reached this conclusion after re-examining the 8,500-year-old copper slag and analysing the chemical composition of other copper artefacts from the Stone Age settlement of Çatalhöyük in the Near East.

• [**Etosis phenomenon discovered in human blood monocytes**](#) [周五, 01 9月 22:46]

The first clear demonstration of etosis in human blood monocytes, a type of immune cell, has now been discovered by scientists.

• [**Can corals survive climate change?**](#) [周五, 01 9月 21:39]

Scientists have issued advice that more research is urgently required to determine whether corals can acclimate and adapt to the rapid pace of climate change.

• [**Virus hijacks cell's transportation system**](#) [周五, 01 9月 21:39]

A deadly tick-borne virus uses the host neuron's transportation system to move their RNA, resulting in the local reproduction of the virus and severe neurological symptoms.

• [**New light shed on photosynthesis**](#) [周五, 01 9月 21:38]

A team of scientists has taken us a step closer to unlocking the secrets of photosynthesis, and possibly to cleaner fuels. Their discovery describes the structure of a reaction center (from a heliobacterium) which preserves the characteristics of the ancestral one, and so provides new insight into the evolution of photosynthesis.

• [**Nature imagery calms prisoners**](#) [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

• [**Paleontologist aids in new discovery 33 years**](#)

[after finding fossil](#) [周五, 01 9月 06:05]

The fossilized plesiosaur Sankar Chatterjee found in 1984 is giving scientists a new understanding of convergent evolution between reptiles and mammals.

• [Fungal infections reduce frogs' tolerance of heat](#)

[周五, 01 9月 06:05]

Fungal diseases are increasing in animals, which might have serious consequences for wildlife living in a hotter world, said a scientist. A new study shows that fungal infections reduced the heat tolerance of frogs by up to 4 degrees Celsius.

• [Panama's native tree species excel in infertile tropical soils](#) [周五, 01 9月 06:03]

Scientists confirm that native tree species performed very well in field trials and would be preferable to teak in the poor soils of the Panama Canal watershed.

• [Coming soon to Montreal: The infrastructure cost of climate change](#) [周五, 01 9月 03:13]

The climate of Montreal is changing and will continue to do so at a rapidly increasing rate and with much more spatial variability in the future, according to new research.

• [Insect eyes inspire new solar cell design](#) [周五, 01 9月 03:12]

Packing tiny solar cells together, like micro-lenses in the compound eye of an insect, could help scientists overcome a major roadblock to the development of perovskite photovoltaics.

• [More research needed on effects of maternal stress in wild animals](#) [周五, 01 9月 03:12]

If a human mother is stressed while pregnant, research shows her child is much more likely to have emotional, cognitive or even physiological problems, such as attention deficit, hyperactivity, anxiety, language delay, obesity, diabetes and hypertension. Conversely, the results of maternal stress on the offspring of other animals -- particularly wildlife under threat from predators -- is believed to be positive, and contributes

to their survival.

[Study reveals ways collegiate sports venues can achieve 'zero waste'](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

- [**PSA screening significantly reduces the risk for death from prostate cancer**](#) [周二, 05 9月 06:17]

After differences in implementation and settings were accounted for, two important prostate cancer screening trials provide compatible evidence that screening reduces prostate cancer mortality.

- [**Vaccines save 20 million lives, \\$350 billion in poor countries since 2001**](#) [周五, 01 9月 22:10]

Vaccination efforts made in the world's poorest countries since 2001 will have prevented 20 million deaths and saved \$350 billion in health-care costs by 2020, according to a new study.

- [**Nature imagery calms prisoners**](#) [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

- [**New boarding procedures, smaller cabin size may limit infection on planes**](#) [周五, 01 9月 03:13]

During major epidemics, cramped airplane cabins are fertile ground for the spread of infection, but new research suggests changing routine boarding protocols could be a key to reducing rampant transmission of disease.

- [**Measuring the cost of quality measurement**](#) [周五, 01 9月 03:12]

Less than 2 decades after publication of the National Academy of Medicine's (formerly the Institute of Medicine) Crossing the Quality Chasm: A New Health System for the 21st Century, quality measurement has become routine and widespread throughout the US health care system.

- [**Study reveals ways collegiate sports venues can achieve 'zero waste'**](#) [周五, 01 9月 02:13]

A new study analyzing waste and recyclables during Mizzou's 2014 home football season demonstrates that by implementing several recommendations the team developed, such as offering better recycling receptacles and better sorting options for waste, sporting venues could be well on their way to achieving environmental benefits that exceed the standards for 'zero-waste' operations.

- [**People become more economically conservative when angered**](#) [周四, 31 8月 23:30]

People tend to lean more economically conservative when they're angry, according to a new article. Researchers came to the conclusion after running multiple studies that included more than 1,000 participants.

- [**How reading and writing with your child boost**](#)

more than just literacy [周四, 31 8月 22:21]

Children who read and write at home -- whether for assignments or just for fun -- are building long-term study and executive function skills, according to a new article

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**'Vampires' may have been real people with this blood disorder**](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

- [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals.

New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

- [**Mouth clicks used in human echolocation captured in unprecedented detail**](#) [周五, 01 9月 02:13]

Like some bats and marine mammals, people can develop expert echolocation skills, in which they produce a clicking sound with their mouths and listen to the reflected sound waves to 'see' their surroundings. A new study provides the first in-depth analysis of the mouth clicks used in human echolocation.

- [**First hints of possible water content on TRAPPIST-1 planets**](#) [周四, 31 8月 23:30]

Astronomers have been trying to determine whether there might be water on the seven Earth-sized planets orbiting the nearby dwarf star TRAPPIST-1. The results suggest that the outer planets of the system might still harbor substantial amounts of water. This includes the three planets within the habitable zone of the star, lending further weight to the possibility that they may indeed be habitable.

- [**How Neanderthals made the very first glue**](#) [周四, 31 8月 21:34]

The world's oldest known glue was made by Neanderthals. But how did they make it 200,000 years ago? Archaeologists have discovered three possible ways.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Eighteenth century nautical charts reveal coral loss**](#) [周五, 08 9月 02:27]

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**Researchers closer to uncovering a new feature in heart failure**](#) [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent

chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

• [Human skin cells transformed directly into motor neurons](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

• [Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find](#) [周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

• [New acid-free magnet recycling process created](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

• [SNAP benefits aren't enough to afford a healthy diet](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

• [Producing malaria treatment at large scales](#) [周五, 08 9月 00:56]

For the first time, production of the anti-malarial drug artemisinin has

been achieved at an industrial scale using genetically engineered moss. This offers new hope for stabilizing artemisinin supplies and combatting malaria.

- [**What makes alcoholics drink? Research shows it's more complex than supposed**](#) [周五, 08 9月 00:02]

What makes alcoholics drink? New research has found that in both men and women with alcohol dependence, the major factor predicting the amount of drinking seems to be a question of immediate mood. Surprisingly men with a history of depression were drinking less often than men who were not depressed. This probably means that alcohol treatment needs to be individually tailored.

- [**Scanning tunneling microscopy measurements identify active sites on catalyst surfaces**](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of

14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- **[Nutrition has benefits for brain network organization](#)** [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

- **[3-D-printed biomaterials that degrade on demand](#)** [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- **[Link between positive emotions and health depends on culture](#)** [周四, 07 9月 23:24]

Positive emotions are often seen as critical aspects of healthy living, but new research suggests that the link between emotion and health outcomes may vary by cultural context. The findings show that experiencing positive emotions is linked with better cardiovascular health in the US but not in Japan.

- **[Using antidepressants during pregnancy may affect your child's mental health](#)** [周四, 07 9月 23:24]

The use of antidepressants during pregnancy increases the risk of your child being diagnosed with a psychiatric disorder later in life, a study of almost one million Danish children shows. However, heritability also plays a part, according to the researchers.

- **[Biomarkers as predictive of sepsis as lengthy](#)**

[patient monitoring](#) [周四, 07 9月 23:23]

One measurement of key biomarkers in blood that characterize sepsis can give physicians as much information as hours of monitoring symptoms, a new study found.

[Connection between low oxygen levels, human gene discovered](#) [周四, 07 9月 23:23]

Researchers have established a link between hypoxia, a condition that reduces the flow of oxygen to tissues, and HOTAIR, a noncoding RNA or molecule that has been implicated in several types of cancer.

[You are what you think you eat](#) [周四, 07 9月 22:43]

Despite eating the same breakfast, made from the same ingredients, people consumed more calories throughout the day when they believed that one of the breakfasts was less substantial than the other, investigators have found.

[Fifty–fifty split best for children of divorce, study suggests](#) [周四, 07 9月 22:43]

Preschool children in joint physical custody have less psychological symptoms than those who live mostly or only with one parent after a separation. In a new study of 3,656 children, researchers show that 3–5-year-olds living alternately with their parents after a separation show less behavioral problems and psychological symptoms than those living mostly or only with one of the parents.

[Smartphone screen technology used to trick harmful bacteria](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

[Genes behind gestation length, preterm delivery](#)

identified [周四, 07 9月 22:39]

The genes that regulate gestational length and the likelihood of preterm delivery, have been identified in a study involving more than 50,000 women. An article describes the scientific breakthrough that can lead to improved health and survival among children.

• **Hidden Inca treasure: Remarkable new tree genus discovered in the Andes** [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

• **Ultraviolet light from superluminous supernova key to revealing explosion mechanism** [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

• **Sometimes you shouldn't say sorry** [周四, 07 9月 22:24]

Being socially rejected can be a painful emotional experience -- but being told sorry may not soften the blow, finds a new study. Contrary to popular belief, apologies increase hurt feelings and the need to express forgiveness, but do not increase feelings of forgiveness, for the person being rebuffed.

• **Fast magnetic writing of data** [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

• **Trigger for fatty liver in obesity** [周四, 07 9月 22:24]

Morbid obesity affects the liver: almost one-third of all adults suffer from chronic fatty liver disease, which can lead to infections and even trigger cancer. Researchers have now found a signaling pathway in cells that play an important role in the development of fatty liver disease.

- [**Algorithm reconstructs processes from individual images**](#) [周四, 07 9月 22:24]

Researchers have developed a new method for reconstructing continuous biological processes, such as disease progression, using image data.

- [**Australian Magpie 'dunks' its food before eating, researchers find**](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- [**Want your question answered quickly? Use gestures as well as words**](#) [周四, 07 9月 22:23]

When someone asks a question during a conversation, their conversation partner answers more quickly if the questioner also moves their hands or head to accompany their words. The study focuses on how gestures influence language processing.

- [**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

- [**Long-term opioid prescription use jumps threefold over 16-year period, study suggests**](#) [周四, 07 9月 22:23]

Opioid prescription use increased significantly between 1999 and 2014, new research has found, and that much of that increase stemmed from patients who'd been taking their medication for 90 days or longer.

- [**Increasing effective decision-making for coastal marine ecosystems**](#) [周四, 07 9月 22:23]

Marine restoration, rather than protection, might be the most cost-

effective solution for coastal marine ecosystems suffering from human activities, a new study has found. The study examined how to best benefit coastal marine ecosystems on limited conservation budgets, to help managers better understand the trade-offs.

- [**Breaking through the wall in bacterial membrane vesicle research**](#) [周四, 07 9月 21:36]

Researchers used advanced imaging techniques to investigate the formation of membrane vesicles in a Gram-positive bacterium, a process that is poorly understood, particularly in bacteria with thick cell walls. The consortium showed that membrane vesicle formation was triggered by an enzyme called endolysin that damages the cell wall to create holes that allow the release of membrane vesicles. This mechanism could be exploited for the mass production of bacterial vesicles.

- [**A tiny device offers insights to how cancer spreads**](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

- [**Uncovering the mechanism behind heart failure, mortality in sepsis**](#) [周四, 07 9月 21:36]

Of the nearly 1 million people in the US who are affected by sepsis annually, almost one-fifth die. Cardiovascular complications account for approximately 80 percent of those deaths. Now, researchers describe the mechanism underlying the loss of energy from heart dysfunction in sepsis, opening the way for the development of a new therapy that could save thousands of lives annually.

- [**Link established between a molecular driver of melanoma, novel therapeutic agent**](#) [周四, 07 9月 21:36]

Scientists have described a correlation between a key melanoma signaling pathway and a novel class of drugs being tested in the clinic as adjuvant therapy for advanced melanoma, providing useful information

for a more effective use of this type of treatment.

• [**How do close relationships lead to longer life?**](#) [周四, 07 9月 21:36]

While recent research has shown that loneliness can play a role in early death, psychologists are also concerned with the mechanisms by which social relationships and close personal ties affect health. New research offers an overview of the science and makes the case for psychological scientists to work together to make close relationships a public health priority.

• [**How monkey fights grow**](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

• [**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Drivers don't ignore a ringing phone but do ignore the risk**](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

• [**Improved stem cell transplantation therapies?**](#) [周四, 07 9月 21:36]

Researchers have demonstrated that hematopoietic stem cell (HSC) transplants can be improved by treatments that temporarily prevent the stem cells from dying. The approach could allow those in need of such

transplants, including leukemia and lymphoma patients, to be treated with fewer donor stem cells while limiting potential adverse side effects.

- [**Tooth trouble: Many middle-aged adults report dental pain, embarrassment and poor prevention**](#) [周四, 07 9月 21:36]

The dental health of middle-aged Americans faces a lot of problems right now, and an uncertain future to come, according to new national poll results. One in three Americans between the ages of 50 and 64 say they're embarrassed by the condition of their teeth, and that dental problems have caused pain or other problems in the past two years. Forty percent of those polled don't get regular cleanings or other preventive oral care.

- [**Ebola: Early immune response provides insight into vaccination**](#) [周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

- [**Discovery of genes linked to preterm birth in landmark study**](#) [周四, 07 9月 10:12]

A massive international DNA analysis of pregnant women has identified for the first time six gene regions that influence the length of pregnancy and the timing of birth. The findings may lead to new ways to prevent preterm birth and its consequences -- the leading cause of death among children under age 5 worldwide.

- [**A bioactive molecule may protect against congestive heart failure after heart attacks**](#) [周四, 07 9月 05:01]

Researchers show that giving mice a form of the fatty acid-derived

bioactive molecule called lipoxin improved heart function after a heart attack, as the lipoxin prompted early activation of the resolving phase of the immune response without altering the acute phase.

• [**Patient satisfaction with pain management linked to nurse staffing**](#) [周四, 07 9月 05:01]

Hospital patients' satisfaction with pain management is linked to nurse staffing, according to an article authored by nurse researchers from the Connell School of Nursing at Boston College and published in the journal Pain Management Nursing.

• [**New model for hard-to-study form of blindness paves way for future research**](#) [周四, 07 9月 05:01]

Researchers have created the first patient-derived laboratory model of macular degeneration, the leading cause of vision loss in older adults. With the new model, the team has identified possible drug targets for the disease, which they hope will help lead to an effective treatment.

• [**Bacterial in-fighting provides new treatment for hospital infections**](#) [周四, 07 9月 02:49]

A bacteria that is a leading cause of death worldwide from hospital acquired infections following antibiotic treatment looks set to be brought down through its own sibling rivalry.

Eighteenth century nautical charts reveal coral loss -- ScienceDaily

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs.

A new US and Australian study -- including research from The University of Queensland and the Australian Research Council Centre of Excellence in Coral Reef Studies -- compared early British charts to modern coral habitat maps to understand changes to reef environments.

UQ's Professor John Pandolfi said the study used information from surprisingly accurate 18th century nautical charts and satellite data to understand coral loss over more than two centuries in the Florida Keys.

"We found that some reefs had completely disappeared," Professor Pandolfi said.

The study was led by Loren McClenachan, Assistant Professor at Colby College, in Waterville, Maine,

USA.

Professor McClenachan said more than half of the coral reef habitat mapped in the 1770s was no longer there. In some areas, particularly near land, coral loss was closer to 90 per cent.

"We found near the shore, entire sections of reef are gone, but in contrast, most coral mapped further from land is still coral reef habitat today," she said.

This estimate of change over centuries added to modern observations of recent loss of living corals.

The marine scientists measured the loss of coral reef habitats across a large geographic area, while most studies look more closely at the loss of living coral from smaller sections of the reef.

"We found that reef used to exist in areas that today are not even classified as reef habitat anymore," Professor Pandolfi said.

"When you add this to the 75 per cent loss of living coral in the Keys at that finer scale, the magnitude of change is much greater than anyone thought."

This work was undertaken while Professor McClenachan was a visiting researcher in Professor Pandolfi's lab at UQ's School of Biological Sciences in Brisbane, Australia, while on sabbatical from Colby College.

The research revealed the precision of the early maps. Postdoctoral researcher at the Bigelow Laboratory for Ocean Sciences in East Boothbay, Maine Dr Benjamin Neal said the early chart makers represented the "Silicon Valley of their time."

"They had the best technology and they used it to create new information that conferred a lot of power," Dr Neal said.

"The maps were essential to expansion of the British Empire, and luckily for us, they also included a lot of useful ecological information."

Professor McClenachan said the findings had important conservation implications and pointed to a shifted spatial baseline.

"We tend to focus on known areas where we can measure change. That makes sense. Why would you

look for coral where you never knew it was?" she said.

The authors said when large-scale changes like this were overlooked, scientists could lose sight of past abundance, lowering expectations for conservation and recovery.

Discovery of chromosome motor supports DNA loop extrusion -- ScienceDaily

It is one of the great mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? For more than a century, we have known that DNA in the cell is comparable to a plate of spaghetti: a big jumble of intermingled strands. If a human cell wants to divide, it has to pack two metres of DNA into tidy little packages: chromosomes. This packing occurs using proteins called condensin, but how? When it comes to this question, scientists are split into two camps: the first argues that the protein works like a hook, randomly grasping somewhere in the jumble of DNA and tying it all together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. With an article published this week in *Science*, researchers from TU Delft, Heidelberg and Columbia University give the 'loop-extrusion camp' a significant boost: they demonstrate that condensin does indeed have the putative 'motor power' on board.

Condensation

As early as 1882, the biologist Walter Flemming recorded the process of 'condensation' of DNA. Looking through a microscope, he saw how a cell neatly organised the bundles of DNA and subsequently divided them into two new cells. However, the exact details of this process have remained a mystery for more than 100 years.

DNA loop creators

'There are different schools on this question within the field of cell biology', explains nanobiologist and head of research Cees Dekker from TU Delft's Kavli Institute. 'In recent years, the hypothesis that condensin extrudes loops has been winning ground, supported by computer simulations. The idea is that the ring-shaped condensin grabs the DNA and pulls it through its ring in a loop-like fashion. This is only possible if the protein has motor activity. One problem with this loop extrusion model was that, up until now, a motor function of this kind had not been detected. In addition, too much energy would be required to pull the loops through the ring, far more than the fuel usage that was observed for condensin', adds Prof Cees Dekker.

Motor function

In their article in *Science*, the researchers show for the first time that condensin does indeed have a motor function. They positioned DNA molecules that were stretched on a surface and added condensin proteins, each fitted with a light-emitting quantum dot to enable observation. 'We observed how condensin does indeed translocate along the DNA. This only happened if fuel was present, in this case the molecule ATP -- the petrol that powers all processes in a cell', explains Jorine Eeftens, graduate student at Delft and one of the first authors. 'The results also show that condensin takes extremely large steps on the DNA, and therefore needs significantly less ATP than previously thought'.

In the second stage of their research, the researchers replaced the light-emitting quantum dot on the condensin with a light-emitting string of DNA. They once again witnessed condensin moving in the same way. Condensin is therefore able to move a piece of DNA in relation to another, which corresponds with the idea of a loop being formed.

'The exact underlying mechanism, so the precise details of how the motor works, is still open to discussion. But

this discovery is certainly an enormous boost to the loop extrusion camp. We have also shown that the amount of energy used is a lot less than previously thought', says Cees Dekker.

Medical relevance

The research represents a significant step in the fundamental understanding of our cells, but it is also relevant for medical research. Problems with the protein family to which condensin belongs, the SMC proteins, are related to hereditary conditions such as Cornelia de Lange Syndrome. Condensin is also crucial in the organisation of the chromosomes during cell division, and errors in the process can result in cancer. A better understanding of these processes is vital for tracking down the molecular origins of serious illnesses.

Researchers closer to uncovering a new feature in heart failure -- ScienceDaily

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes, much like the plastic tip at the end of a shoelace protects it from unraveling. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

A team of researchers from Penn Medicine, in collaboration with the University of Connecticut, published their findings today in the *Journal of the American Heart Association*, building on a methods paper which was published recently in *Nature Protocols*. The team is the first to have developed a method for measuring the length of telomeres using human heart tissues.

"Once we had established the method for measuring the telomeres in heart cells, which was tricky because human cardiac cells are rarely taken from a living person, we acquired heart tissue samples from patients receiving heart transplants and organ donors in order to evaluate telomere length," said the study's lead researcher, Foteini Mourkioti, PhD, an assistant professor of Orthopaedic Surgery and Cell and Developmental Biology, and co-director of the Musculoskeletal Regeneration Program in the Penn Institute for Regenerative Medicine. "Using samples from the Penn Heart Tissue Biobank meant we were also able to acquire patient data for the samples, so we knew useful information like the patient's age, sex, and heart function."

Researchers were able to measure the telomeres in the samples of patients who had heart disease and those who did not, and group the findings into categories based on patients' age. They found that in the samples for healthy people, age did not play a role in telomere length, since the telomeres of both young and old healthy individuals were not affected. However, patients with heart failure had shorter telomeres regardless of their age. In comparing diseased and healthy samples, researchers were able to draw a

correlation between shorter telomeres and the presence of heart failure. Patients with the shortest telomeres in their cardiac cells also had the most severely decreased cardiac function. The team also found that the cardiomyocytes were the only heart cells affected by the telomere length in disease samples, but the telomere length of other cells within the same diseased heart samples were not different.

"This human tissue research is critical as it may open the door for future telomere preserving therapies to help protect heart failure patients" said co-author Kenneth B. Margulies, MD, a professor of Medicine and research director for Heart Failure and Transplantation. "While there is a need to better understand *how* heart disease induces telomere shortening, this is an important step in the research process, one that brings us closer to a better understanding of heart failure"

Leaning on this human data to inform basic science studies, Mourkioti and her team are now working to pinpoint pathways that specifically target cardiomyocytes, in order to track the disease progression and identify areas for therapeutic interventions that can later be tested in in-human

clinical trials. "The important thing is that we now have a new lead to follow and test how cardiac-specific telomere interventions can improve heart function" Mourkioti said.

Human skin cells transformed directly into motor neurons -- ScienceDaily

Scientists working to develop new treatments for neurodegenerative diseases have been stymied by the inability to grow human motor neurons in the lab. Motor neurons drive muscle contractions, and their damage underlies devastating diseases such as amyotrophic lateral sclerosis and spinal muscular atrophy, both of which ultimately lead to paralysis and early death.

In new research, scientists at Washington University School of Medicine in St. Louis have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state.

The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

The study is published Sept. 7 in the journal *Cell Stem Cell*.

Avoiding the stem cell phase eliminates ethical concerns raised when producing what are called pluripotent stem cells, which are similar to embryonic stem cells in their ability to become all adult cell types. And importantly, avoiding a stem cell state allows the resulting motor neurons to retain the age of the original skin cells and, therefore, the age of the patient. Maintaining the chronological age of these cells is vital when studying neurodegenerative diseases that develop in people at different ages and worsen over decades.

"In this study, we only used skin cells from healthy adults ranging in age from early 20s to late 60s," said senior author Andrew S. Yoo, PhD, an assistant professor of developmental biology. "Our research revealed how small RNA molecules can work with other cell signals called transcription factors to generate specific types of neurons, in this case motor neurons. In the future, we would like to study skin cells from patients with disorders of motor neurons. Our conversion process should model late-onset aspects of the disease using neurons derived from patients with the condition."

"Going back through a pluripotent stem cell phase is a bit like demolishing a house and building a new one from the ground up," Yoo said. "What we're doing is more like renovation. We change the interior but leave the original structure, which retains the characteristics of the aging adult neurons that we want to study."

The ability of scientists to convert human skin cells into other cell types, such as neurons, has the potential to enhance understanding of disease and lead to finding new ways to heal damaged tissues and organs, a field called regenerative medicine.

To convert skin cells into motor neurons, the researchers exposed the skin cells to molecular signals that are usually present at high levels in the brain. Past work by Yoo and his colleagues -- then at Stanford University -- showed that exposure to two short snippets of RNA turned human skin cells into neurons. These two microRNAs -- called miR-9 and miR-124 -- are involved with repackaging the genetic instructions of the cell.

In the new study, the researchers extensively characterized this repackaging process, detailing how skin cells reprogrammed into generic neurons then can

be guided into specific types of neurons. They found that genes involved in this process become poised for expression but remain inactive until the correct combination of molecules is provided. After much experimentation with multiple combinations, the researchers found that adding two more signals to the mix -- transcription factors called ISL1 and LHX3 -- turned the skin cells into spinal cord motor neurons in about 30 days.

The combination of signals -- microRNAs miR-9 and miR-124 plus transcription factors ISL1 and LHX3 -- tells the cell to fold up the genetic instructions for making skin and unfurl the instructions for making motor neurons, according to Yoo and the study's co-first authors, Daniel G. Abernathy and Matthew J. McCoy, doctoral students in Yoo's lab; and Woo Kyung Kim, PhD, a postdoctoral research associate.

Another past study from Yoo's team showed that exposure to the same two microRNAs, miR-9 and miR-124, plus a different mix of transcription factors could turn skin cells into a different type of neuron. In that case, the skin cells became striatal medium spiny neurons, which are affected in Huntington's disease -- an inherited, eventually fatal genetic disorder that

causes involuntary muscle movements and cognitive decline beginning in middle adulthood.

In the new study, the researchers said the converted motor neurons compared favorably to normal mouse motor neurons, in terms of the genes that are turned on and off and how they function. But the scientists can't be certain these cells are perfect matches for native human motor neurons since it's difficult to obtain samples of cultured motor neurons from adult individuals. Future work studying neuron samples donated from patients after death is required to determine how precisely these cells mimic native human motor neurons.

· [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

· [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

· [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

· [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils,

nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

[**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

[**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

[**How monkey fights grow**](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

[**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

[**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that

metacognition could have an evolutionary basis.

- [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

- [**Biologists slow aging, extend lifespan of fruit flies**](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

- [**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Eat fat, live longer?**](#) [周三, 06 9月 02:55]

As more people live into their 80s and 90s, researchers have delved into the issues of health and quality of life during aging. A recent mouse study sheds light on those questions by demonstrating that a high fat, or ketogenic, diet not only increases longevity, but improves physical strength.

- [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

- [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

- [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

- [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

- [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

- [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

- [**Zika virus kills brain cancer stem cells**](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

- [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

• [**Mobile women were key to cultural exchange in Stone Age and Bronze Age Europe**](#) [周二, 05 9月 03:10]

At the end of the Stone Age and in the early Bronze Age, families were established in a surprising manner in the Lechtal, south of Augsburg, Germany. The majority of women probably came from Bohemia or Central Germany, while men usually remained in the region of their birth. This so-called patrilocal pattern combined with individual female mobility persisted over a period of 800 years during the transition from the Neolithic to the Early Bronze Age.

• [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

• [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

• [**Stellar corpse sheds light on origin of cosmic rays**](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

• [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

• [Metallurgy likely has more than one birthplace](#) [周五, 01 9月 23:36]

When and where did humans invent metal smelting? Scientists have found the answer to this long-debated question in the history of technology. Metallurgy does not have a single origin but probably arose at various locations at about the same time. The experts reached this conclusion after re-examining the 8,500-year-old copper slag and analysing the chemical composition of other copper artefacts from the Stone Age settlement of Çatalhöyük in the Near East.

• [Equatorial jet in Venusian atmosphere](#) [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**Researchers closer to uncovering a new feature in heart failure**](#) [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons,

human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Producing malaria treatment at large scales**](#) [周五, 08 9月 00:56]

For the first time, production of the anti-malarial drug artemisinin has been achieved at an industrial scale using genetically engineered moss. This offers new hope for stabilizing artemisinin supplies and combatting malaria.

- [**What makes alcoholics drink? Research shows it's more complex than supposed**](#) [周五, 08 9月 00:02]

What makes alcoholics drink? New research has found that in both men and women with alcohol dependence, the major factor predicting the amount of drinking seems to be a question of immediate mood. Surprisingly men with a history of depression were drinking less often than men who were not depressed. This probably means that alcohol treatment needs to be individually tailored.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

[3-D-printed biomaterials that degrade on demand](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

[Link between positive emotions and health depends on culture](#) [周四, 07 9月 23:24]

Positive emotions are often seen as critical aspects of healthy living, but new research suggests that the link between emotion and health outcomes may vary by cultural context. The findings show that experiencing positive emotions is linked with better cardiovascular health in the US but not in Japan.

[Using antidepressants during pregnancy may affect your child's mental health](#) [周四, 07 9月 23:24]

The use of antidepressants during pregnancy increases the risk of your child being diagnosed with a psychiatric disorder later in life, a study of almost one million Danish children shows. However, heritability also plays a part, according to the researchers.

[Biomarkers as predictive of sepsis as lengthy patient monitoring](#) [周四, 07 9月 23:23]

One measurement of key biomarkers in blood that characterize sepsis can give physicians as much information as hours of monitoring symptoms, a new study found.

[Connection between low oxygen levels, human gene discovered](#) [周四, 07 9月 23:23]

Researchers have established a link between hypoxia, a condition that reduces the flow of oxygen to tissues, and HOTAIR, a noncoding RNA or molecule that has been implicated in several types of cancer.

[You are what you think you eat](#) [周四, 07 9月 22:43]

Despite eating the same breakfast, made from the same ingredients,

people consumed more calories throughout the day when they believed that one of the breakfasts was less substantial than the other, investigators have found.

- [**Fifty–fifty split best for children of divorce, study suggests**](#) [周四, 07 9月 22:43]

Preschool children in joint physical custody have less psychological symptoms than those who live mostly or only with one parent after a separation. In a new study of 3,656 children, researchers show that 3–5-year-olds living alternately with their parents after a separation show less behavioral problems and psychological symptoms than those living mostly or only with one of the parents.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Genes behind gestation length, preterm delivery identified**](#) [周四, 07 9月 22:39]

The genes that regulate gestational length and the likelihood of preterm delivery, have been identified in a study involving more than 50,000 women. An article describes the scientific breakthrough that can lead to improved health and survival among children.

- [**Sometimes you shouldn't say sorry**](#) [周四, 07 9月 22:24]

Being socially rejected can be a painful emotional experience -- but being told sorry may not soften the blow, finds a new study. Contrary to popular belief, apologies increase hurt feelings and the need to express forgiveness, but do not increase feelings of forgiveness, for the person being rebuffed.

- [**Trigger for fatty liver in obesity**](#) [周四, 07 9月 22:24]

Morbid obesity affects the liver: almost one-third of all adults suffer from chronic fatty liver disease, which can lead to infections and even trigger cancer. Researchers have now found a signaling pathway in cells that play an important role in the development of fatty liver disease.

• [**Want your question answered quickly? Use gestures as well as words**](#) [周四, 07 9月 22:23]

When someone asks a question during a conversation, their conversation partner answers more quickly if the questioner also moves their hands or head to accompany their words. The study focuses on how gestures influence language processing.

• [**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• [**Long-term opioid prescription use jumps threefold over 16-year period, study suggests**](#) [周四, 07 9月 22:23]

Opioid prescription use increased significantly between 1999 and 2014, new research has found, and that much of that increase stemmed from patients who'd been taking their medication for 90 days or longer.

• [**A tiny device offers insights to how cancer spreads**](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

• [**Uncovering the mechanism behind heart failure, mortality in sepsis**](#) [周四, 07 9月 21:36]

Of the nearly 1 million people in the US who are affected by sepsis

annually, almost one-fifth die. Cardiovascular complications account for approximately 80 percent of those deaths. Now, researchers describe the mechanism underlying the loss of energy from heart dysfunction in sepsis, opening the way for the development of a new therapy that could save thousands of lives annually.

• [**Link established between a molecular driver of melanoma, novel therapeutic agent**](#) [周四, 07 9月 21:36]

Scientists have described a correlation between a key melanoma signaling pathway and a novel class of drugs being tested in the clinic as adjuvant therapy for advanced melanoma, providing useful information for a more effective use of this type of treatment.

• [**How do close relationships lead to longer life?**](#) [周四, 07 9月 21:36]

While recent research has shown that loneliness can play a role in early death, psychologists are also concerned with the mechanisms by which social relationships and close personal ties affect health. New research offers an overview of the science and makes the case for psychological scientists to work together to make close relationships a public health priority.

• [**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Drivers don't ignore a ringing phone but do ignore the risk**](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone

task undertaken by drivers.

[Improved stem cell transplantation therapies?](#) [周四, 07 9月 21:36]

Researchers have demonstrated that hematopoietic stem cell (HSC) transplants can be improved by treatments that temporarily prevent the stem cells from dying. The approach could allow those in need of such transplants, including leukemia and lymphoma patients, to be treated with fewer donor stem cells while limiting potential adverse side effects.

[Tooth trouble: Many middle-aged adults report dental pain, embarrassment and poor prevention](#) [周四, 07 9月 21:36]

The dental health of middle-aged Americans faces a lot of problems right now, and an uncertain future to come, according to new national poll results. One in three Americans between the ages of 50 and 64 say they're embarrassed by the condition of their teeth, and that dental problems have caused pain or other problems in the past two years. Forty percent of those polled don't get regular cleanings or other preventive oral care.

[Ebola: Early immune response provides insight into vaccination](#) [周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

[Discovery of genes linked to preterm birth in landmark study](#) [周四, 07 9月 10:12]

A massive international DNA analysis of pregnant women has identified for the first time six gene regions that influence the length of pregnancy and the timing of birth. The findings may lead to new ways to prevent

preterm birth and its consequences -- the leading cause of death among children under age 5 worldwide.

- [**A bioactive molecule may protect against congestive heart failure after heart attacks**](#) [周四, 07 9月 05:01]

Researchers show that giving mice a form of the fatty acid-derived bioactive molecule called lipoxin improved heart function after a heart attack, as the lipoxin prompted early activation of the resolving phase of the immune response without altering the acute phase.

- [**Patient satisfaction with pain management linked to nurse staffing**](#) [周四, 07 9月 05:01]

Hospital patients' satisfaction with pain management is linked to nurse staffing, according to an article authored by nurse researchers from the Connell School of Nursing at Boston College and published in the journal Pain Management Nursing.

- [**New model for hard-to-study form of blindness paves way for future research**](#) [周四, 07 9月 05:01]

Researchers have created the first patient-derived laboratory model of macular degeneration, the leading cause of vision loss in older adults. With the new model, the team has identified possible drug targets for the disease, which they hope will help lead to an effective treatment.

- [**Bacterial in-fighting provides new treatment for hospital infections**](#) [周四, 07 9月 02:49]

A bacteria that is a leading cause of death worldwide from hospital acquired infections following antibiotic treatment looks set to be brought down through its own sibling rivalry.

- [**New device accurately identifies cancer in seconds**](#) [周四, 07 9月 02:49]

A team of scientists and engineers has invented a powerful tool that rapidly and accurately identifies cancerous tissue during surgery, delivering results in about 10 seconds. The MasSpec Pen is an innovative handheld instrument that gives surgeons precise diagnostic

information about what tissue to cut or preserve, helping improve treatment and reduce the chances of cancer recurrence.

- [**'Vampires' may have been real people with this blood disorder**](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [**Sleep may help eyewitnesses from choosing innocent suspects**](#) [周四, 07 9月 02:49]

Sleep may influence an eyewitness's ability to correctly pick a guilty person out of a police lineup, indicates a new study.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**Concussions in women: Rates, symptoms and recovery are different than men**](#) [周四, 07 9月 02:32]

Females tend to report more symptoms -- and more severe ones -- and may also take longer to recover from brain injuries than their male counterparts.

- [**Synthetic version of popular anticoagulant poised for clinical trials**](#) [周四, 07 9月 02:32]

A synthetic version of low molecular weight heparin is poised for clinical trials and development as a drug for patients with clotting disorders, and those undergoing procedures such as kidney dialysis, heart bypass surgery, stent implantation, and knee and hip replacement.

- [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

- [**Blindness study shows how gene causes middle-age sight loss**](#) [周三, 06 9月 22:37]

Chemical changes in the eye that can lead to blindness have been identified by scientists, report investigators.

- [**Substance in coffee delays onset of diabetes in laboratory mice**](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

- [**New strategy for vaccinating pregnant mothers against malaria holds promise for protecting infants**](#) [周三, 06 9月 22:37]

A mother and infant in Malawi have the same repertoire of antibodies to Plasmodium falciparum, the malaria parasite. That suggests that boosting the mother's immune response to malaria, as via vaccination, will result in better protection for the infant.

- [**Quantum tech has its sights set on human**](#)

[biochemistry](#) [周三, 06 9月 22:36]

Scientists have developed a new tool for imaging life at the nanoscale that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.

. [Colon of patients with IBS reacts differently to bacteria](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

. [Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens](#) [周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**New acid-free magnet recycling process created**](#)

[周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Scanning tunneling microscopy measurements identify active sites on catalyst surfaces**](#)

[周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

- [**Climate change for aliens**](#)

[周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Pluto features given first official names**](#)

[周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**3-D-printed biomaterials that degrade on**](#)

demand [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

• **Smartphone screen technology used to trick harmful bacteria** [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

• **Ultraviolet light from superluminous supernova key to revealing explosion mechanism** [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

• **Fast magnetic writing of data** [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

• **Intermittent electrical brain stimulation improves memory** [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

- [**A tiny device offers insights to how cancer spreads**](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

- [**Drivers don't ignore a ringing phone but do ignore the risk**](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

- [**New device accurately identifies cancer in seconds**](#) [周四, 07 9月 02:49]

A team of scientists and engineers has invented a powerful tool that rapidly and accurately identifies cancerous tissue during surgery, delivering results in about 10 seconds. The MasSpec Pen is an innovative handheld instrument that gives surgeons precise diagnostic information about what tissue to cut or preserve, helping improve treatment and reduce the chances of cancer recurrence.

- [**Supercharging silicon batteries**](#) [周三, 06 9月 22:36]

Scientists have designed a novel silicon-based anode to provide lithium batteries with increased power and better stability.

- [**Quantum tech has its sights set on human biochemistry**](#) [周三, 06 9月 22:36]

Scientists have developed a new tool for imaging life at the nanoscale that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.

- [**Green light for ultra-fine display colors**](#) [周三, 06 9月 22:36]

Chemical engineers have succeeded in generating ultra-pure green light for the first time. The new light-emitting diode will pave the way for visibly improved color quality in a new generation of ultra-high definition displays for TVs and smartphones.

- [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

- [**New tool for characterizing quantum simulators**](#) [周三, 06 9月 22:35]

Physicists are developing quantum simulators, to help solve problems that are beyond the reach of conventional computers. However, they first need new tools to ensure that the simulators work properly.

Researchers have now implemented a new technique in the laboratory that can be used to efficiently characterize the complex states of quantum simulators. The technique could become a new standard tool for characterizing quantum simulators.

- [**Keychain detector could catch food allergens before it's too late**](#) [周三, 06 9月 22:35]

For kids and adults with food allergies, a restaurant outing can be a fraught experience. Even when care is taken, freshly prepared or packaged meals can accidentally become cross-contaminated with an offending food and trigger a reaction. Now researchers report the development of a new portable allergen-detection system -- including a keychain analyzer -- that could help prevent trips to the emergency room.

- [**Flip-flop qubits: Radical new quantum computing design invented**](#) [周三, 06 9月 22:35]

Engineers have invented a radical new architecture for quantum computing, based on novel 'flip-flop qubits,' that promises to make the large-scale manufacture of quantum chips dramatically cheaper -- and easier -- than thought possible. The new chip design allows for a silicon

quantum processor that can be scaled up without the precise placement of atoms required in other approaches.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

- [**Superhuman 'night' vision during the total eclipse?**](#) [周三, 06 9月 04:40]

It was dark as night during the recent total solar eclipse, yet people and objects were easier to see than on a typical moonless night. Scientists have discovered a possible biological explanation -- the presence (or absence) of a protein in the retina known as a GABA receptor.

- [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices,

these ices have the lowest density of all known ice crystals.

- [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

- [**More durable, less expensive fuel cells**](#) [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative to internal combustion engines because they produce power through electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

- [**Nanoparticles limit damage in spinal cord injury**](#)

[周三, 06 9月 01:44]

After a spinal cord injury, significant secondary nerve damage is caused by inflammation and internal scarring that inhibits the ability of the nervous system to repair itself. A biodegradable nanoparticle injected after a spinal cord trauma prevented the inflammation and internal scarring that inhibits the repair process, reports a new study.

- [**Unique study tests fundamental laws of physics**](#) [周

三, 06 9月 00:54]

A study that will 'test our understanding of how the Universe works, particularly outside the relatively narrow confines of our planet' is being undertaken by an international team of researchers.

- [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

- [**Solubility study could impact energy, biology,**](#)

[environment](#) [周三, 06 9月 00:32]

Chemical engineers have used the most realistic computer model yet devised to simulate the precise atomic and molecular interactions that come into play when water mixes with alkanes, a family of hydrocarbons that includes methane, propane and other refined products.

• [Surgeons create 'vacuum' procedure to remove infected pacemaker](#) [周三, 06 9月 00:32]

Electrophysiologists get creative in removing infected pacemaker wires of a patient unable to have open heart surgery. He would have died if they didn't use a 'vacuum' typically used to remove foreign objects.

• [Discovery of boron on Mars adds to evidence for habitability](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

• [Glowing cancer tool illuminates benign, but dangerous, brain tumors during pituitary surgery](#) [周三, 06 9月 00:32]

An experimental imaging tool that uses a targeted fluorescent dye successfully lit up the benign brain tumors of patients during removal surgery, allowing surgeons to identify tumor tissue, a new study shows.

• ['Extreme' telescopes find the second-fastest-spinning pulsar](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

• [When strangers can control our lights](#) [周二, 05 9月 21:38]

Smart home products such as lamps controlled via mobile devices are becoming ever more popular in private households. We would, however, feel vulnerable in our own four walls if strangers suddenly started

switching the lights in our homes on and off. Researchers have discovered security problems of this nature in smart lights manufactured by GE, IKEA, Philips and Osram.

• [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

• [**New fluorescent dyes could advance biological imaging**](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

• [**Equation reveals the characteristics of quantum chaos**](#) [周一, 04 9月 21:37]

Researchers have now succeeded in formulating a mathematical result that provides an exact answer to the question of how chaos actually behaves. The researchers have analyzed chaotic states at the atomic level.

• [**Like a revolving door: How shuttling proteins operate nuclear pores**](#) [周一, 04 9月 21:36]

Nuclear pore complexes are tiny channels where the exchange of substances between the cell nucleus and the cytoplasm takes place. Scientists report on startling new research that might overturn established models of nuclear transport regulation. Their study reveals how shuttling proteins known as importins control the function of nuclear pores – as opposed to the view that nuclear pores control the shuttling of importins.

• [**Stellar corpse sheds light on origin of cosmic rays**](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

- [**Algorithm unlocks smartwatches that learn your every move**](#) [周一, 04 9月 21:34]

Scientists have invented a new algorithm that enables smartwatches to detect and record your every move, without being told beforehand what to look for.

- [**Physicists propose new theories of black holes from the very early universe**](#) [周六, 02 9月 01:55]

'Primordial black holes,' believed to have formed shortly after the Big Bang, might explain how heavy elements such as gold, platinum and uranium came to be, physicists report.

- [**Reusable ruthenium-based catalyst could be a game-changer for the biomass industry**](#) [周五, 01 9月 22:46]

Researchers have developed a highly efficient reusable catalyst for the production of primary amines. By cutting the amount of undesired by-products, the catalyst is set to revolutionize the production of bio-based fuels, pharmaceuticals, agricultural chemicals and more.

- [**Bit data goes anti-skyrmions**](#) [周五, 01 9月 22:46]

Scientists have discovered a new kind of magnetic nano-object in a novel material that could serve as a magnetic bit with cloaking properties to make a magnetic disk drive with no moving parts -- a Racetrack Memory -- a reality in the near future.

- [**Astronomer's study finds 10 times fewer house-sized near earth objects in solar system**](#) [周五, 01 9月 22:09]

The surprising results of a astronomer's new study find that there are 3.5 million house-sized meteoroids whose orbits bring them close enough to

Earth to pose potential impact hazards -- ten times fewer than previously thought.

• **[Molecules move faster near sticky surfaces](#)** [周五, 01 9月 21:39]

Molecules move faster as they get closer to adhesive surfaces, but this effect is not permanent.

• **[Equatorial jet in Venusian atmosphere](#)** [周五, 01 9月 21:38]

Observations by Japan's Venus climate orbiter Akatsuki have revealed an equatorial jet in the lower to middle cloud layer of the planet's atmosphere, a finding that could be pivotal to unraveling a phenomenon called superrotation.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Eighteenth century nautical charts reveal coral loss**](#) [周五, 08 9月 02:27]

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Hidden Inca treasure: Remarkable new tree genus discovered in the Andes**](#) [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

- [**Algorithm reconstructs processes from individual images**](#) [周四, 07 9月 22:24]

Researchers have developed a new method for reconstructing continuous biological processes, such as disease progression, using image data.

- [**Australian Magpie 'dunks' its food before eating, researchers find**](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- [**Increasing effective decision-making for coastal marine ecosystems**](#) [周四, 07 9月 22:23]

Marine restoration, rather than protection, might be the most cost-effective solution for coastal marine ecosystems suffering from human activities, a new study has found. The study examined how to best benefit coastal marine ecosystems on limited conservation budgets, to help managers better understand the trade-offs.

- [**Breaking through the wall in bacterial**](#)

[membrane vesicle research](#) [周四, 07 9月 21:36]

Researchers used advanced imaging techniques to investigate the formation of membrane vesicles in a Gram-positive bacterium, a process that is poorly understood, particularly in bacteria with thick cell walls. The consortium showed that membrane vesicle formation was triggered by an enzyme called endolysin that damages the cell wall to create holes that allow the release of membrane vesicles. This mechanism could be exploited for the mass production of bacterial vesicles.

• [How monkey fights grow](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

• [Ebola: Early immune response provides insight into vaccination](#) [周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

• [Bacterial in-fighting provides new treatment for hospital infections](#) [周四, 07 9月 02:49]

A bacteria that is a leading cause of death worldwide from hospital acquired infections following antibiotic treatment looks set to be brought down through its own sibling rivalry.

• [Pollen stays on bee bodies right where flowers need it for pollination](#) [周四, 07 9月 02:49]

After grooming, bees still have pollen on body parts that match the position of flower pollen-sacs and stigmas, according to a new study.

• [Monkey sees ... monkey knows?](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

- [**Substance in coffee delays onset of diabetes in laboratory mice**](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

- [**Cloud formation suppressed by biogenic organic emissions**](#) [周三, 06 9月 22:36]

Evidence has been found that near-ground biogenic emissions of organics suppress cloud formation in cool-temperate forests in autumn, providing clues to how global warming will affect cloud formation and the overall climate.

- [**Colon of patients with IBS reacts differently to bacteria**](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

- [**Unraveling a major cause of sea ice retreat in the Arctic Ocean**](#) [周三, 06 9月 22:36]

Quantitative analysis has evidenced the acceleration system of melting ice: dark water surfaces absorb more heat than white ice surfaces, thus melting ice and making more water surfaces in the Arctic Ocean.

- [**Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens**](#) [周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

• [**Protein that extends life of yeast cells**](#) [周三, 06 9月 22:35]

To understand and control aging is the aspiration of many scientists. Researchers have now discovered that the protein Gcn4 decreases protein synthesis and extends the life of yeast cells. Understanding how individual genes affect lifespan opens new ways to control the aging process and the occurrence of aging-related diseases.

• [**Bacteria responsible for legionellosis modulates the host cell metabolism to its advantage**](#) [周三, 06 9月 22:35]

The bacterial pathogen *Legionella pneumophila* has developed a specific strategy to target the host cell mitochondria, the organelles in charge of cellular bioenergetics, scientists have shown. New work provides precious information on how a pathogen manipulates the cellular metabolism to replicate intracellularly, and proposes a new concept of protection of host cells from *Legionella*-induced mitochondrial changes in order to fight infection.

• [**Research dog helps scientists save endangered carnivores**](#) [周三, 06 9月 22:35]

Scat-sniffing research dogs are helping scientists map out a plan to save reclusive jaguars, pumas, bush dogs and other endangered carnivores in the increasingly fragmented forests of northeastern Argentina, according to a new study.

• [**Will mallards hybridize their cousins out of existence?**](#) [周三, 06 9月 22:35]

Mallards -- the familiar ducks of city parks -- are one of a group of closely related species, many of which are far less common. Interbreeding can threaten the genetic distinctiveness of those other

species and cause concern for their conservation. A new study investigates hybridization between mallards and mottled ducks, a species adapted for life in coastal marshes, and finds that while hybridization rates are currently low, human activity could cause them to rise in the future.

• [**Biologists slow aging, extend lifespan of fruit flies**](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

• [**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

• [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

• [**Invasive plants change ecosystems from the bottom up**](#) [周三, 06 9月 02:56]

Even when two different Phragmite lineages are grown side-by-side in the same ecosystem, the bacterial communities in the soil differ dramatically. This is a discovery that will aid in understanding how plant invasions get started and the conditions necessary for their success.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

- [**Could switchgrass help China's air quality?**](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

- [**Oregon's marijuana legalization prompted big drop in sales in Washington's border counties**](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

- [**Birds choose mates with ornamental traits**](#) [周三, 06 9月 00:57]

A recurring theme in nature documentaries is that of choosy females selecting brightly colored males. A new study shows that, in monogamous mating systems, male birds may select their lifelong mates

in much the same way.

- [**First detailed decoding of complex finger millet genome**](#) [周三, 06 9月 00:56]

Finger millet has two important properties: The grain is rich in important minerals and resistant towards drought and heat. Thanks to a novel combination of state-of-the-art technologies, researchers were able to decode the large and extremely complex genome of finger millet in high quality for the first time. This represents a fundamental basis for improving food security in countries like India and parts of Africa.

- [**Cell marking opens up a window into the body**](#) [周三, 06 9月 00:35]

Researchers have developed new methods to track cells in mice which could help to reduce animal experiments.

- [**Building a morphogen gradient by simple diffusion in a growing plant leaf**](#) [周三, 06 9月 00:33]

The research team has shown that a transcriptional co-activator ANGUSTIFOLIA3 (AN3) forms a signaling gradient along the leaf proximal-to-distal axis to determine cell-proliferation domain.

- [**Human-made reefs: A compelling diving alternative**](#) [周三, 06 9月 00:33]

Researchers have examined diving habits and behavior around Eilat's natural and artificial reefs. According to study, the average diver density at the artificial reef was higher than at the two nearby natural knolls, and the Tamar reef effectively diverts divers from natural knolls. Secondly, the study found that regarding attitudes toward natural versus artificial reefs, divers consider the artificial reefs more appropriate for training, but they feel less relaxed around them.

- [**Warmer world may bring more local, less global, temperature variability**](#) [周三, 06 9月 00:32]

Many tropical or subtropical regions could see increases in naturally occurring temperature variability as Earth warms over coming decades, a new study suggests. These local changes could occur even though

Earth's global mean surface temperature variability will likely decrease because of less solar reflection from icecaps at high latitudes.

- [**Dig, dive, survive: Fruit fly larvae can make decisions about feeding that balance risk against benefit, biologists show**](#) [周三, 06 9月 00:32]

We humans aren't the only creatures drawn by the smell of a good meal. Fruit fly larvae, it turns out, are equally susceptible to food scents, although the odors that attract them may not appeal to us.

- [**Genome of threatened northern spotted owl assembled**](#) [周二, 05 9月 23:14]

A charismatic owl iconic to Pacific Coast forests is no longer ruling the roost, and scientists now have another tool for understanding its decline. Researchers have assembled the California Academy of Sciences' first-ever animal genome after sequencing the DNA of the northern spotted owl (*Strix occidentalis caurina*). Academy scientists and collaborators extensively mapped the bird's genetic material to better understand how this threatened forest dweller is interacting with non-native owls invading...

- [**Cannot sleep due to stress? Here is the cure**](#) [周二, 05 9月 23:13]

Everyone empirically knows that stressful events certainly affect sound sleep. Scientists have found that the active component rich in sugarcane and other natural products may ameliorate stress and help having sound sleep.

- [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

- [**When not to eat your kids**](#) [周二, 05 9月 23:07]

Even though it is known to be a cannibal, the mangrove rivulus or killifish of the Americas will never eat one of its own embryos, even if it

is hungry. This slender amphibious fish can recognize its own kin, even if these are still in the embryonic stage, according to new research.

- [**'Bee' informed: Public interest exceeds understanding in bee conservation**](#) [周二, 05 9月 22:44]

Many people have heard bee populations are declining due to such threats as colony collapse disorder, pesticides and habitat loss. And many understand bees are critical to plant pollination. Yet, according to a study, few are aware of the wide diversity of bees and other pollinators beyond such species as honeybees. Because conservation efforts require substantial public support, outreach is needed to help people understand bee declines and how to protect pollinators.

- [**Life in the fast lane: How plants avoid traffic jams**](#) [周二, 05 9月 22:43]

Scientists have discovered how plants ingeniously avoid internal traffic jams.

- [**Discovery of dynamic seasonal changes in color perception**](#) [周二, 05 9月 21:38]

In many areas, the environment fluctuates greatly depending on the season, and animals living in those areas must adapt to the changing environment. A research group has found that color perception of Medaka, a small fish inhabiting rice fields and streams, varies greatly according to seasonal changes.

- [**Hop, skip, run, leap: Unpredictability boosts survival for bipedal desert rodents**](#) [周二, 05 9月 21:36]

Sometimes it pays to be unpredictable. A new study shows that when bipedal desert rodents called jerboas are being chased, sudden changes in direction, gait and speed help them elude hungry predators and likely give them a competitive edge over their quadrupedal neighbors.

- [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of

life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

[Zika virus could be used to treat brain cancer patients, study suggests](#) [周二, 05 9月 21:35]

Recent outbreaks of Zika virus have revealed that the virus causes brain defects in unborn children. But researchers now report that the virus could eventually be used to target and kill cancer cells in the brain.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

• [**Oregon's marijuana legalization prompted big drop in sales in Washington's border counties**](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

• [**PSA screening significantly reduces the risk for death from prostate cancer**](#) [周二, 05 9月 06:17]

After differences in implementation and settings were accounted for, two important prostate cancer screening trials provide compatible evidence that screening reduces prostate cancer mortality.

• [**Vaccines save 20 million lives, \\$350 billion in poor countries since 2001**](#) [周五, 01 9月 22:10]

Vaccination efforts made in the world's poorest countries since 2001 will have prevented 20 million deaths and saved \$350 billion in health-care costs by 2020, according to a new study.

• [**Nature imagery calms prisoners**](#) [周五, 01 9月 21:38]

Sweeping shots of majestic landscapes. Glaciers, forests and waterfalls. New research shows that these images, shown to people deprived of access to nature, can reduce tension, help defuse anger and make some of the harshest environments, like a solitary confinement cellblock in a maximum-security prison, a little easier to bear.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Climate change for aliens](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [Australian Magpie 'dunks' its food before eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- ['Vampires' may have been real people with this blood disorder](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [Clever cockatoos bend hooks into straight wire to fish for food](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

· [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

· [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

· [**Bacteria act as aphrodisiac for the closest relatives of animals**](#) [周六, 02 9月 01:55]

Choanoflagellates are a ubiquitous but enigmatic one-celled ocean organism that may give clues to the origin of multicellularity in animals. New research has turned up a surprising kink in the organism's sex life: swarming and mating are triggered by a marine bacterium common in their environment. Researchers traced this response to a protein secreted by the bacteria. The choanos seem to be eavesdropping on bacteria to determine their life history.

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

• [**Better understanding of 'one of the most complex organs' for better lung treatments**](#) [周五, 08 9月 02:45]

Details of lung cell molecular pathways that promote or inhibit tissue regeneration have been reported by researchers. Their aim is to find new ways to treat lung disorders.

• [**Interrupting Parkinson's disease**](#) [周五, 08 9月 02:30]

Scientists have identified a toxic cascade that leads to neuronal degeneration in patients with Parkinson's disease and figured out how to interrupt it, reports a study. Intervening with an antioxidant early in the disease process may break the degenerative cycle and improve neuron function in Parkinson's, the study showed. Parkinson's is second most common neurodegenerative disorder.

• [**Mediterranean-style diet may eliminate need for reflux medications**](#) [周五, 08 9月 02:30]

A plant-based, Mediterranean-style diet has been shown to provide the same medical benefits for treating laryngopharyngeal reflux as popular reflux medications, according to new research.

• [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

• [**Why are fossilized hairs so rare?**](#) [周五, 08 9月 02:27]

When it comes to preserving body parts, fossilized hair is rare--five times rarer than feathers--despite being an important tool for understanding ancient species. This finding has researchers trying to determine if the lack of hair in the fossil record has to do with physical traits that might make it more difficult for hair to fossilize, or an issue with scientists' collection techniques that could lead to them missing important finds.

• [**Cilia: 'The bouncer' of bacteria**](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

• [**Eighteenth century nautical charts reveal coral loss**](#) [周五, 08 9月 02:27]

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

• [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

• [**Circadian clock's inner gears**](#) [周五, 08 9月 02:26]

A set of core clock proteins organize themselves into a handful of molecular machines that control the precise workings of the body's circadian rhythms, new research has found.

• [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its

replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

Researchers closer to uncovering a new feature in heart failure [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

Human skin cells transformed directly into motor neurons [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find [周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

New acid-free magnet recycling process created [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

• [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

• [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

• [**Producing malaria treatment at large scales**](#) [周五, 08 9月 00:56]

For the first time, production of the anti-malarial drug artemisinin has been achieved at an industrial scale using genetically engineered moss. This offers new hope for stabilizing artemisinin supplies and combatting malaria.

• [**Lignin: Much more valuable than just as waste**](#) [周五, 08 9月 00:03]

Lignin, a substance considered as a waste product in biomass and ethanol production, will now reach its proper value as bio-oil in new products.

• [**Aspirin tablets help unravel basic physics**](#) [周五, 08 9月 00:03]

Aspirin in form of small crystallites provides new insight into delicate motions of electrons and atomic nuclei. Set into molecular vibration by strong ultrashort far-infrared (terahertz) pulses, the nuclei oscillate much faster than for weak excitation. They gradually return to their intrinsic oscillation frequency, in parallel to the picosecond decay of electronic

motions. An analysis of the terahertz waves radiated from the moving particles by in-depth theory reveals the strongly coupled chara...

• [**What makes alcoholics drink? Research shows it's more complex than supposed**](#) [周五, 08 9月 00:02]

What makes alcoholics drink? New research has found that in both men and women with alcohol dependence, the major factor predicting the amount of drinking seems to be a question of immediate mood.

Surprisingly men with a history of depression were drinking less often than men who were not depressed. This probably means that alcohol treatment needs to be individually tailored.

• [**Scanning tunneling microscopy measurements identify active sites on catalyst surfaces**](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

• [**'Rubber material' discovered that could lead to scratch-proof paint for car**](#) [周五, 08 9月 00:02]

A stretchy miracle material has been discovered that could be used to create highly resistant smart devices and scratch-proof paint for cars, report investigators.

• [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

• [**Cellular tango: Immune and nerve cells work together to fight gut infections**](#) [周四, 07 9月 23:24]

Nerve cells in the gut play a crucial role in the body's ability to marshal

an immune response to infection, according to a new study.

• [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

• [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

• [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

• [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

• [**Link between positive emotions and health depends on culture**](#) [周四, 07 9月 23:24]

Positive emotions are often seen as critical aspects of healthy living, but new research suggests that the link between emotion and health outcomes may vary by cultural context. The findings show that experiencing positive emotions is linked with better cardiovascular

health in the US but not in Japan.

- [**Using antidepressants during pregnancy may affect your child's mental health**](#) [周四, 07 9月 23:24]

The use of antidepressants during pregnancy increases the risk of your child being diagnosed with a psychiatric disorder later in life, a study of almost one million Danish children shows. However, heritability also plays a part, according to the researchers.

- [**Biomarkers as predictive of sepsis as lengthy patient monitoring**](#) [周四, 07 9月 23:23]

One measurement of key biomarkers in blood that characterize sepsis can give physicians as much information as hours of monitoring symptoms, a new study found.

- [**Connection between low oxygen levels, human gene discovered**](#) [周四, 07 9月 23:23]

Researchers have established a link between hypoxia, a condition that reduces the flow of oxygen to tissues, and HOTAIR, a noncoding RNA or molecule that has been implicated in several types of cancer.

- [**You are what you think you eat**](#) [周四, 07 9月 22:43]

Despite eating the same breakfast, made from the same ingredients, people consumed more calories throughout the day when they believed that one of the breakfasts was less substantial than the other, investigators have found.

- [**Fifty-fifty split best for children of divorce, study suggests**](#) [周四, 07 9月 22:43]

Preschool children in joint physical custody have less psychological symptoms than those who live mostly or only with one parent after a separation. In a new study of 3,656 children, researchers show that 3–5-year-olds living alternately with their parents after a separation show less behavioral problems and psychological symptoms than those living mostly or only with one of the parents.

- [**Smartphone screen technology used to trick**](#)

[harmful bacteria](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

• [Academic argues for changes in the laws governing modern warfare](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

• [Genes behind gestation length, preterm delivery identified](#) [周四, 07 9月 22:39]

The genes that regulate gestational length and the likelihood of preterm delivery, have been identified in a study involving more than 50,000 women. An article describes the scientific breakthrough that can lead to improved health and survival among children.

• [Mixing and matching yeast DNA](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay faithful during cell replication.

• [Proteins keep a grip on cells](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

• [New dental imaging method uses squid ink to fish for gum disease](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the

dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Hidden Inca treasure: Remarkable new tree genus discovered in the Andes**](#) [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

- [**Ultraviolet light from superluminous supernova key to revealing explosion mechanism**](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

- [**Sometimes you shouldn't say sorry**](#) [周四, 07 9月 22:24]

Being socially rejected can be a painful emotional experience -- but being told sorry may not soften the blow, finds a new study. Contrary to popular belief, apologies increase hurt feelings and the need to express forgiveness, but do not increase feelings of forgiveness, for the person being rebuffed.

- [**Fast magnetic writing of data**](#) [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

- [**Trigger for fatty liver in obesity**](#) [周四, 07 9月 22:24]

Morbid obesity affects the liver: almost one-third of all adults suffer from chronic fatty liver disease, which can lead to infections and even trigger cancer. Researchers have now found a signaling pathway in cells that play an important role in the development of fatty liver disease.

- [**Algorithm reconstructs processes from**](#)

[individual images](#) [周四, 07 9月 22:24]

Researchers have developed a new method for reconstructing continuous biological processes, such as disease progression, using image data.

• [Australian Magpie 'dunks' its food before eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

• [Want your question answered quickly? Use gestures as well as words](#) [周四, 07 9月 22:23]

When someone asks a question during a conversation, their conversation partner answers more quickly if the questioner also moves their hands or head to accompany their words. The study focuses on how gestures influence language processing.

• [Intermittent electrical brain stimulation improves memory](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• [Long-term opioid prescription use jumps threefold over 16-year period, study suggests](#) [周四, 07 9月 22:23]

Opioid prescription use increased significantly between 1999 and 2014, new research has found, and that much of that increase stemmed from patients who'd been taking their medication for 90 days or longer.

Better understanding of 'one of the most complex organs' for better lung treatments -- ScienceDaily

Details of lung cell molecular pathways that promote or inhibit tissue regeneration were reported by researchers from the Perelman School of Medicine at the University of Pennsylvania in *Cell* this week. Their aim is to find new ways to treat lung disorders.

"We need better targets," said senior author Edward E. Morrisey, PhD, a professor of Cell and Developmental Biology, and director of the Penn Center for Pulmonary Biology. "All we have now are blunt sledge hammers that don't work" for conditions such as idiopathic pulmonary fibrosis (IPF), a lung disorder whose cause is poorly understood. Knowing the specific cells and pathways that promote repair and regeneration versus scar formation in the lung will help inform the development of more precise and effective therapies.

In 2012, the annual incidence of idiopathic pulmonary

fibrosis in the United States was 16 to 17 per 100,000 people. In the United States alone, that translates into 130,000 to 200,000 people affected by IPF. The lung tissue of a person with pulmonary fibrosis becomes damaged and scarred, with thick, stiff tissue making it difficult for the lungs to expand. As it worsens, the patient often has extreme shortness of breath, and the lung, once damaged, is unable to repair itself.

Chronic obstructive pulmonary disease (COPD) is more common than IPF and is characterized by the loss of gas exchange structures in the lungs called alveoli. In the United States, more than 30 million people are affected by COPD and it is quickly becoming a leading cause of disability and death in the world. The ability to balance regeneration of structures such as alveoli with scar formation is essential for proper maintenance of respiratory function.

"The lung is one of the most complex organs in the human body," Morrisey said, with dozens of cell types, each with specialized roles such as delivering oxygen and eliminating carbon dioxide from blood in the circulatory system (gas exchange). Other cells produce surfactant and mucous to lubricate air spaces for smooth expansion and contraction, and still others

create a barrier to pathogens and harmful pollution.

"The complicated structure of lungs is why it is difficult to quickly diagnose the exact type of lung disease a person may have with any certainty," he said. "Also, as there is considerable reserve capacity in our lungs most people are not diagnosed with lung diseases such as IPF until the disease has progressed significantly." This biological compensation mechanism means that a person could lose almost 50 percent of their lung function before feeling any symptoms.

There are many distinct types of lung disorders linked to different cell types, many of which have not been thoroughly studied. The complexity of the lung suggests that the ability to promote repair and regeneration versus contributing to disease-causing lesions may arise from very different cells. For this study, the team focused on mesenchymal cells, which are generally thought to play a supportive role in maintaining lung structure. They found five distinct cell types based on a suite of genes expressed by each. Of these five, they focused on two.

One cell type the Morrissey lab identified in the mouse

lung that governs self-renewal of cell populations is called the Mesenchymal Alveolar Niche Cell (MANC). These cells are critical for the regeneration of lung alveoli. The second cell type is called the Axin2+ Myofibrogenic Progenitor cell (AMP), which generates cells called myofibroblasts that form scar tissue after injury, and likely contribute to diseases such as IPF.

The team analyzed what molecules these two cell types secreted and their surface cell receptors and compared this information to databases of known secreted molecules and receptors on adjacent cells. "One of the most important functions of these cells is to balance the repair and regeneration response after injury which occurs often due to the lung's continual assault from the outside environment," Morrisey said.

The "good" MANCs are found in niches or compartments near the alveoli to promote renewal of gas-exchange cells. They may play a key role in maintaining the alveoli during the normal life span of the adult. Dysfunction or loss of MANCs may contribute to diseases such as COPD, which involves loss of alveoli and decreased lung function. The role of the "bad" AMPs is to form scar tissue during wound healing. However, AMPs may grow out of control,

potentially leading to diseases such as IPF.

Next, the researchers aim to identify these cell types in humans, working with associate professor of Surgery Edward Cantu, III, MD, the associate surgical director of Lung Transplantation. Morrissey says the Penn team wants to target MANCs for promoting regeneration while inhibiting AMPs to reduce the fibrotic response after injury. Knowing the detailed molecular differences between these two cell types should help in the next generation of targeted therapies such as nanomedicine.

Interrupting Parkinson's disease: Treating with antioxidants early in disease process may halt degeneration and improve neuronal function -- ScienceDaily

Northwestern Medicine scientists have identified a toxic cascade that leads to neuronal degeneration in patients with Parkinson's disease (PD) and figured out how to interrupt it, reports a study to be published September 7 in the journal *Science*.

Intervening with an antioxidant early in the disease process may break the degenerative cycle and improve neuron function in PD, the study showed.

The scientists also discovered that mouse models of PD didn't have the same abnormalities they found in human PD neurons, revealing the importance of studying human neurons to develop new therapies.

Dr. Dimitri Krainc, the Aaron Montgomery Ward Professor and chair of neurology at Northwestern

University Feinberg School of Medicine, is the study senior author. Lena Burbulla, a postdoctoral fellow in Krainc's laboratory, is first author.

The research was started about six years ago in Krainc's lab at Massachusetts General Hospital and Harvard Medical School and was completed in the last four years at Feinberg.

PD is the second most common neurodegenerative disorder, primarily caused by the death of dopamine-containing neurons in the substantia nigra, a region of the brain involved in motor control. While people naturally lose dopamine neurons as they age, patients with PD lose a much larger number of these neurons and the remaining cells are no longer able to compensate.

Understanding how and why these neurons die is an important step in identifying treatments, Krainc said. While previous research indicated that the cellular mechanism behind the cell death involved the mitochondria and lysosomes, how these two pathways converge in dopamine neurons to cause cell death remained unknown up until now.

Using human neurons from Parkinson's patients, Krainc and colleagues identified a toxic cascade of mitochondrial and lysosomal dysfunction initiated by an accumulation of oxidized dopamine and a protein called alpha-synuclein. Specifically, the current study demonstrated that an accumulation of oxidized dopamine depressed the activity of lysosomal glucocerebrosidase (GCase), an enzyme implicated in PD. That depression in turn weakened overall lysosomal function and contributed to degeneration of neurons.

The accretion of oxidized dopamine didn't just interfere with lysosomes, however. Krainc and his colleagues discovered that the dopamine also damaged the neurons' mitochondria by increasing mitochondrial oxidant stress. These dysfunctional mitochondria led to increased oxidized dopamine levels, creating a vicious cycle.

"The mitochondrial and lysosomal pathways are two critical pathways in disease development," said Krainc, who also is the director of the Center for Rare Neurological Diseases and a professor of neurological surgery and of physiology. "Combined with the alpha-synuclein accumulation, this study links the major

pathological features of PD."

Once they had catalogued this toxic cascade, Krainc and his colleagues began looking for ways to interrupt it.

"One of the key strategies that worked in our experiments is to treat dopamine neurons early in the toxic cascade with specific antioxidants that improve mitochondrial oxidant stress and lower oxidized dopamine," Krainc said. "With this approach, we found that we can attenuate or prevent the downstream toxic effects in human dopaminergic neurons."

This approach to interrupting the toxic cascade of oxidized dopamine may provide a target for the development of future therapies. However, identifying patients or subjects with early-stage neurodegeneration can be difficult, because damage has often occurred far before any symptoms are apparent, according to Krainc.

Consequently, genetic testing will be central to future diagnostic efforts. Causative genes are prime candidates for screening, while risk genes such as GBA1 are less conclusive but still important markers,

Krainc said. Early detection will also rely on brain imaging and other clinical signifiers.

Interestingly, when compared to human cellular models, mouse models of PD did not demonstrate the same toxic cascade, according to the study. Krainc and his colleagues showed this is due to differences in metabolism of dopamine between species, and underscored the importance of studying human neurons to discover new targets for drug development.

Mediterranean-style diet may eliminate need for reflux medications -- ScienceDaily

A plant-based, Mediterranean-style diet has been shown to provide the same medical benefits for treating laryngopharyngeal reflux as popular reflux medications. This is according to a study published in *JAMA Otolaryngology Head Neck Surgery* by researchers from Northwell Health's The Feinstein Institute for Medical Research and New York Medical College.

When compared to patients who took the traditional reflux medication, proton pump inhibitors (PPI), those patients who consumed a 90-95% whole food, plant-based, Mediterranean-style diet paired with alkaline water had the same if not better reduction in reflux symptoms. 62.6 percent of patients treated with a plant-based diet and alkaline water saw a six point reduction in their Reflux Symptom Index (RSI -- a measurement for the severity of reflux symptoms), compared to 54.1 percent reduction in patients taking PPI's. Though this

research only focused on those with laryngopharyngeal reflux, this same diet regimen has implications to help patients with gastro-esophageal acid reflux (also known as GERD).

Lead author of the study, Craig H. Zalvan, MD, FACS, chief of Otolaryngology and medical director of The Institute for Voice and Swallowing Disorders at Northwell Health's Phelps Hospital and researcher at the Feinstein Institute, said he was formerly one of the largest prescribers of PPI's in the region. Feeling that there had to be a better approach to treating reflux conditions like laryngopharyngeal reflux, he started to research alternatives.

"Although effective in some patients, I felt medication couldn't be the only method to treat reflux and recent studies reporting increased rates of stroke and heart attack, dementia and kidney damage from prolonged PPI use made me more certain," said Dr. Zalvan. "I did research and saw a lot of studies using plant-based diets to treat patients for many other chronic diseases, so I decided to develop a diet regimen to treat my laryngopharyngeal reflux patients. The results we found show we are heading in the right direction to treating reflux without medication."

The diet suggested by Dr. Zalvan consists of mostly fruits, vegetables, grains and nuts with near complete cessation of dairy and meats including beef, chicken, fish, eggs and pork. This is in addition to standard reflux diet precautions like avoiding coffee, tea, chocolate, soda, greasy and fried food, spicy foods, fatty foods and alcohol. Along with relieving reflux symptoms, Dr. Zalvan noted that many of his patients who were treated with a plant-based diet also experienced some weight loss and a reduction of symptoms and medication use from other medical conditions like high blood pressure and high cholesterol. Dr. Zalvan said that a plant-based diet approach with alkaline water and standard reflux precautions should either be attempted prior to the use of medication or with the short-term use of medication for more severe needs.

"Dr. Zalvan's approach of challenging assumptions in treatment norms epitomizes our view of medical research at the Feinstein Institute and Northwell Health," said Kevin J. Tracey, MD, president and CEO of the Feinstein Institute. "We are committed to developing novel strategies to benefit our patients in a way that positively impacts medical practice globally."

Ship exhaust makes oceanic thunderstorms more intense -- ScienceDaily

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

A new study mapping lightning around the globe finds lightning strokes occur nearly twice as often directly above heavily-trafficked shipping lanes in the Indian Ocean and the South China Sea than they do in areas of the ocean adjacent to shipping lanes that have similar climates.

The difference in lightning activity can't be explained by changes in the weather, according to the study's authors, who conclude that aerosol particles emitted in ship exhaust are changing how storm clouds form over the ocean.

The new study is the first to show ship exhaust can

alter thunderstorm intensity. The researchers conclude that particles from ship exhaust make cloud droplets smaller, lifting them higher in the atmosphere. This creates more ice particles and leads to more lightning.

The results provide some of the first evidence that humans are changing cloud formation on a nearly continual basis, rather than after a specific incident like a wildfire, according to the authors. Cloud formation can affect rainfall patterns and alter climate by changing how much sunlight clouds reflect to space.

"It's one of the clearest examples of how humans are actually changing the intensity of storm processes on Earth through the emission of particulates from combustion," said Joel Thornton, an atmospheric scientist at the University of Washington in Seattle and lead author of the new study in *Geophysical Research Letters*, a journal of the American Geophysical Union.

"It is the first time we have, literally, a smoking gun, showing over pristine ocean areas that the lightning amount is more than doubling," said Daniel Rosenfeld, an atmospheric scientist at the Hebrew University of Jerusalem who was not connected to the study. "The study shows, highly unambiguously, the relationship

between anthropogenic emissions -- in this case, from diesel engines -- on deep convective clouds."

Mapping lightning and exhaust

All combustion engines emit exhaust, which contains microscopic particles of soot and compounds of nitrogen and sulfur. These particles, known as aerosols, form the smog and haze typical of large cities. They also act as cloud condensation nuclei -- the seeds on which clouds form. Water vapor condenses around aerosols in the atmosphere, creating droplets that make up clouds.

Cargo ships crossing oceans emit exhaust continuously and scientists can use ship exhaust to better understand how aerosols affect cloud formation.

In the new study, co-author Katrina Virts, an atmospheric scientist at NASA Marshall Space Flight Center in Huntsville, Alabama, was analyzing data from the World Wide Lightning Location Network, a network of sensors that locates lightning strokes all over the globe, when she noticed a nearly straight line of lightning strokes across the Indian Ocean.

Virts and her colleagues compared the lightning location data to maps of ships' exhaust plumes from a global database of ship emissions. Looking at the locations of 1.5 billion lightning strokes from 2005 to 2016, the team found nearly twice as many lightning strokes on average over major routes ships take across the northern Indian Ocean, through the Strait of Malacca and into the South China Sea, compared to adjacent areas of the ocean that have similar climates.

More than \$5 trillion of world trade passes through the South China Sea every year and nearly 100,000 ships pass through the Strait of Malacca alone. Lightning is a measure of storm intensity, and the researchers detected the uptick in lightning at least as far back as 2005.

"All we had to do was make a map of where the lightning was enhanced and a map of where the ships are travelling and it was pretty obvious just from the co-location of both of those that the ships were somehow involved in enhancing lightning," Thornton said.

Forming cloud seeds

Water molecules need aerosols to condense into clouds. Where the atmosphere has few aerosol particles -- over the ocean, for instance -- water molecules have fewer particles to condense around, so cloud droplets are large.

When more aerosols are added to the air, like from ship exhaust, water molecules have more particles to collect around. More cloud droplets form, but they are smaller. Being lighter, these smaller droplets travel higher into the atmosphere and more of them reach the freezing line, creating more ice, which creates more lightning. Storm clouds become electrified when ice particles collide with each other and with unfrozen droplets in the cloud. Lightning is the atmosphere's way of neutralizing that built-up electric charge.

Ships burn dirtier fuels in the open ocean away from port, spewing more aerosols and creating even more lightning, Thornton said.

"I think it's a really exciting study because it's the most solid evidence I've seen that aerosol emissions can affect deep convective clouds and intensify them and increase their electrification," said Steven Sherwood, an atmospheric scientist at the University of New

South Wales in Sydney who was not connected to the study.

"We're emitting a lot of stuff into the atmosphere, including a lot of air pollution, particulate matter, and we don't know what it's doing to clouds," Sherwood said. "That's been a huge uncertainty for a long time. This study doesn't resolve that, but it gives us a foot in the door to be able to test our understanding in a way that will move us a step closer to resolving some of those bigger questions about what some of the general impacts are of our emissions on clouds."

Why are fossilized hairs so rare? -- ScienceDaily

When most people hear the word fossil, they probably think of gigantic leg bones or sharp teeth. But, given the right conditions, after an animal dies even delicate body coverings like skin, hair and feathers can be preserved.

New research led by The University of Texas at Austin has found that when it comes to preserving these body parts, fossilized hair is rare -- five times rarer than feathers -- despite being an important tool for understanding ancient species. This finding has researchers trying to determine if the lack of hair in the fossil record has to do with physical traits that might make it more difficult for hair to fossilize, or an issue with scientists' collection techniques that could lead to them missing important finds.

"This pattern of where and when we do find fossilized feathers and hairs can be used to inform where we look for future fossil discoveries," said first author Chad Eliason, a researcher at the Field Museum of Natural

History who conducted the research while a postdoctoral fellow at the UT Jackson School of Geosciences.

The study was published on Sept. 6 in the journal *Proceedings of the Royal Society B*. Co-authors include Julia Clarke, a professor in the Jackson School's Department of Geological Sciences who led the study, and three Jackson School undergraduate students, Leah Hudson, Taylor Watts and Hector Garza.

Fossils of body coverings contain unique data on the ecology and lifestyle of extinct animals, including what color they might have been. They also might affect our understanding of when kinds of body coverings, such as feathers and hair, evolved. In this study, the researchers used data on fossil type and age to determine that hair probably evolved much earlier than current fossil samples indicate.

Fossil beds that preserve soft tissues like hair and feathers are called lagerstatte ('fossil storehouses' in German) and are rare on their own. The researchers were interested in understanding how frequently different types of body coverings were found preserved in these exceptional sites, which include the Yixian

Formation in China and the Green River Formation in the western United States.

Eliason and his collaborators assembled the largest known database of fossilized body coverings, or integument, from land-dwelling vertebrates, a group known as tetrapods, collected from lagerstatte. They found that unlike feathers, hairs are extremely rare finds.

"Mammal hair has been around for more than 160 million years yet over that time we have very few records," Eliason said.

The rarity might be explained by feathers and hair containing different types of the protein keratin, which may impact the likelihood of fossilization. However, the study notes that the lack of hair samples could have nothing to do with fossilization, and be explained by the collecting behavior of paleontologists, with a single feather usually being much easier to identify than a single hair.

The database also allowed the researchers to conduct a type of statistical method called gap analysis, which models the probability of finding a fossil in a given

time. The team found that feathers appear to have evolved very close to the earliest known examples in the fossil record, about 165 million years ago. However, hair and hair-like filaments found on pterosaurs probably evolved far earlier in the fossil record than currently known.

"The hunt is on," said Clarke. "These data suggest we might expect to find records up to 100 million years earlier potentially."

The team also applied a statistical approach called a time series analyses to study if climatic factors might explain gaps in the fossil record. They found that soft tissue preservation was most common when ancient sea levels were high.

"There is still a lot we don't know about the chemistry of these deposits and why they are so uneven through time," Clarke said. "But we can say that their uneven distribution across the world -- most [sites] are in North America or Eurasia -- is an artifact of where paleontologists looked. We have a lot more work to do."

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

[Nutrition has benefits for brain network organization](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

[3-D-printed biomaterials that degrade on demand](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

[Intermittent electrical brain stimulation improves memory](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

[How monkey fights grow](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

[Emoji fans take heart: Scientists pinpoint 27 states of emotion](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal

categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

• [**Biologists slow aging, extend lifespan of fruit flies**](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

• [**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows,

cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Eat fat, live longer?**](#) [周三, 06 9月 02:55]

As more people live into their 80s and 90s, researchers have delved into the issues of health and quality of life during aging. A recent mouse study sheds light on those questions by demonstrating that a high fat, or ketogenic, diet not only increases longevity, but improves physical strength.

- [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

• [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

• [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

• [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

• [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

• [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

• [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs'

self-cognition proposed last year.

• [**Zika virus kills brain cancer stem cells**](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

• [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

• [**Mobile women were key to cultural exchange in Stone Age and Bronze Age Europe**](#) [周二, 05 9月 03:10]

At the end of the Stone Age and in the early Bronze Age, families were established in a surprising manner in the Lechtal, south of Augsburg, Germany. The majority of women probably came from Bohemia or Central Germany, while men usually remained in the region of their birth. This so-called patrilocal pattern combined with individual female mobility persisted over a period of 800 years during the transition from the Neolithic to the Early Bronze Age.

• [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

• [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

[Stellar corpse sheds light on origin of cosmic rays](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

· [**Better understanding of 'one of the most complex organs' for better lung treatments**](#) [周五, 08 9月 02:45]

Details of lung cell molecular pathways that promote or inhibit tissue regeneration have been reported by researchers. Their aim is to find new ways to treat lung disorders.

· [**Interrupting Parkinson's disease**](#) [周五, 08 9月 02:30]

Scientists have identified a toxic cascade that leads to neuronal degeneration in patients with Parkinson's disease and figured out how to interrupt it, reports a study. Intervening with an antioxidant early in the disease process may break the degenerative cycle and improve neuron function in Parkinson's, the study showed. Parkinson's is second most common neurodegenerative disorder.

· [**Mediterranean-style diet may eliminate need for reflux medications**](#) [周五, 08 9月 02:30]

A plant-based, Mediterranean-style diet has been shown to provide the same medical benefits for treating laryngopharyngeal reflux as popular reflux medications, according to new research.

· [**Cilia: 'The bouncer' of bacteria**](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

· [**Circadian clock's inner gears**](#) [周五, 08 9月 02:26]

A set of core clock proteins organize themselves into a handful of molecular machines that control the precise workings of the body's

circadian rhythms, new research has found.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**Researchers closer to uncovering a new feature in heart failure**](#) [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find**](#) [周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that

suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

• [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

• [**Producing malaria treatment at large scales**](#) [周五, 08 9月 00:56]

For the first time, production of the anti-malarial drug artemisinin has been achieved at an industrial scale using genetically engineered moss. This offers new hope for stabilizing artemisinin supplies and combatting malaria.

• [**What makes alcoholics drink? Research shows it's more complex than supposed**](#) [周五, 08 9月 00:02]

What makes alcoholics drink? New research has found that in both men and women with alcohol dependence, the major factor predicting the amount of drinking seems to be a question of immediate mood. Surprisingly men with a history of depression were drinking less often than men who were not depressed. This probably means that alcohol treatment needs to be individually tailored.

• [**Cellular tango: Immune and nerve cells work together to fight gut infections**](#) [周四, 07 9月 23:24]

Nerve cells in the gut play a crucial role in the body's ability to marshal an immune response to infection, according to a new study.

• [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that

monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

• [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

• [**Link between positive emotions and health depends on culture**](#) [周四, 07 9月 23:24]

Positive emotions are often seen as critical aspects of healthy living, but new research suggests that the link between emotion and health outcomes may vary by cultural context. The findings show that experiencing positive emotions is linked with better cardiovascular health in the US but not in Japan.

• [**Using antidepressants during pregnancy may affect your child's mental health**](#) [周四, 07 9月 23:24]

The use of antidepressants during pregnancy increases the risk of your child being diagnosed with a psychiatric disorder later in life, a study of almost one million Danish children shows. However, heritability also plays a part, according to the researchers.

• [**Biomarkers as predictive of sepsis as lengthy patient monitoring**](#) [周四, 07 9月 23:23]

One measurement of key biomarkers in blood that characterize sepsis can give physicians as much information as hours of monitoring symptoms, a new study found.

• [**Connection between low oxygen levels, human gene discovered**](#) [周四, 07 9月 23:23]

Researchers have established a link between hypoxia, a condition that

reduces the flow of oxygen to tissues, and HOTAIR, a noncoding RNA or molecule that has been implicated in several types of cancer.

- [**You are what you think you eat**](#) [周四, 07 9月 22:43]

Despite eating the same breakfast, made from the same ingredients, people consumed more calories throughout the day when they believed that one of the breakfasts was less substantial than the other, investigators have found.

- [**Fifty–fifty split best for children of divorce, study suggests**](#) [周四, 07 9月 22:43]

Preschool children in joint physical custody have less psychological symptoms than those who live mostly or only with one parent after a separation. In a new study of 3,656 children, researchers show that 3–5-year-olds living alternately with their parents after a separation show less behavioral problems and psychological symptoms than those living mostly or only with one of the parents.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Genes behind gestation length, preterm delivery identified**](#) [周四, 07 9月 22:39]

The genes that regulate gestational length and the likelihood of preterm delivery, have been identified in a study involving more than 50,000 women. An article describes the scientific breakthrough that can lead to improved health and survival among children.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay

faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Sometimes you shouldn't say sorry**](#) [周四, 07 9月 22:24]

Being socially rejected can be a painful emotional experience -- but being told sorry may not soften the blow, finds a new study. Contrary to popular belief, apologies increase hurt feelings and the need to express forgiveness, but do not increase feelings of forgiveness, for the person being rebuffed.

- [**Trigger for fatty liver in obesity**](#) [周四, 07 9月 22:24]

Morbid obesity affects the liver: almost one-third of all adults suffer from chronic fatty liver disease, which can lead to infections and even trigger cancer. Researchers have now found a signaling pathway in cells that play an important role in the development of fatty liver disease.

- [**Want your question answered quickly? Use gestures as well as words**](#) [周四, 07 9月 22:23]

When someone asks a question during a conversation, their conversation partner answers more quickly if the questioner also moves their hands or head to accompany their words. The study focuses on how gestures influence language processing.

- [**Intermittent electrical brain stimulation**](#)

improves memory [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

Long-term opioid prescription use jumps threefold over 16-year period, study suggests [周四, 07 9月 22:23]

Opioid prescription use increased significantly between 1999 and 2014, new research has found, and that much of that increase stemmed from patients who'd been taking their medication for 90 days or longer.

A tiny device offers insights to how cancer spreads [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

Uncovering the mechanism behind heart failure, mortality in sepsis [周四, 07 9月 21:36]

Of the nearly 1 million people in the US who are affected by sepsis annually, almost one-fifth die. Cardiovascular complications account for approximately 80 percent of those deaths. Now, researchers describe the mechanism underlying the loss of energy from heart dysfunction in sepsis, opening the way for the development of a new therapy that could save thousands of lives annually.

Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

• [**Link established between a molecular driver of melanoma, novel therapeutic agent**](#) [周四, 07 9月 21:36]

Scientists have described a correlation between a key melanoma signaling pathway and a novel class of drugs being tested in the clinic as adjuvant therapy for advanced melanoma, providing useful information for a more effective use of this type of treatment.

• [**How do close relationships lead to longer life?**](#) [周四, 07 9月 21:36]

While recent research has shown that loneliness can play a role in early death, psychologists are also concerned with the mechanisms by which social relationships and close personal ties affect health. New research offers an overview of the science and makes the case for psychological scientists to work together to make close relationships a public health priority.

• [**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Drivers don't ignore a ringing phone but do ignore the risk**](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

• [**Improved stem cell transplantation therapies?**](#) [周四, 07 9月 21:36]

Researchers have demonstrated that hematopoietic stem cell (HSC) transplants can be improved by treatments that temporarily prevent the

stem cells from dying. The approach could allow those in need of such transplants, including leukemia and lymphoma patients, to be treated with fewer donor stem cells while limiting potential adverse side effects.

• [**Cheaper, faster test for E. coli in drinking water**](#)

[周四, 07 9月 21:36]

Researchers have invented a fast, affordable way for developing communities to test their drinking water for potentially deadly E. coli.

• [**Tooth trouble: Many middle-aged adults report dental pain, embarrassment and poor prevention**](#)

[周四, 07 9月 21:36]

The dental health of middle-aged Americans faces a lot of problems right now, and an uncertain future to come, according to new national poll results. One in three Americans between the ages of 50 and 64 say they're embarrassed by the condition of their teeth, and that dental problems have caused pain or other problems in the past two years. Forty percent of those polled don't get regular cleanings or other preventive oral care.

• [**Ebola: Early immune response provides insight into vaccination**](#)

[周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

• [**Chronic bronchitis: New insights could lead to first diagnostic test, better treatments**](#)

[周四, 07 9月 10:12]

Researchers describe how the concentration of mucins -- the proteins that make mucus thick -- is abnormally high in chronic bronchitis and that high mucin concentrations are associated with disease severity in people with chronic bronchitis. This finding could become the first-ever

objective marker of chronic bronchitis and lead to the creation of diagnostic and prognostic tools.

- [**Discovery of genes linked to preterm birth in landmark study**](#) [周四, 07 9月 10:12]

A massive international DNA analysis of pregnant women has identified for the first time six gene regions that influence the length of pregnancy and the timing of birth. The findings may lead to new ways to prevent preterm birth and its consequences -- the leading cause of death among children under age 5 worldwide.

- [**Human genetics studies reveal new targets to reduce heart disease**](#) [周四, 07 9月 05:06]

Again and again, it's the rare among humans that help the rest of us. The exploration of human genetics is revealing new targets to combat heart disease among atypical variants. Mutations in genes that play a role in heart health are the inspiration for a cluster of new heart drugs.

- [**Honeybees could play a role in developing new antibiotics**](#) [周四, 07 9月 05:06]

An antimicrobial compound made by honeybees could become the basis for new antibiotics, according to new research.

- [**Statins reduce deaths from coronary heart disease by 28 per cent in men, according to longest ever study**](#) [周四, 07 9月 05:04]

A new study focused on men with high levels of 'bad' cholesterol and no other risk factors or signs of heart disease.

- [**A bioactive molecule may protect against congestive heart failure after heart attacks**](#) [周四, 07 9月 05:01]

Researchers show that giving mice a form of the fatty acid-derived bioactive molecule called lipoxin improved heart function after a heart attack, as the lipoxin prompted early activation of the resolving phase of the immune response without altering the acute phase.

. [**Patient satisfaction with pain management linked to nurse staffing**](#) [周四, 07 9月 05:01]

Hospital patients' satisfaction with pain management is linked to nurse staffing, according to an article authored by nurse researchers from the Connell School of Nursing at Boston College and published in the journal Pain Management Nursing.

. [**New model for hard-to-study form of blindness paves way for future research**](#) [周四, 07 9月 05:01]

Researchers have created the first patient-derived laboratory model of macular degeneration, the leading cause of vision loss in older adults. With the new model, the team has identified possible drug targets for the disease, which they hope will help lead to an effective treatment.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**New acid-free magnet recycling process created**](#)

[周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#)

[周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

- [**Lignin: Much more valuable than just as waste**](#)

[周五, 08 9月 00:03]

Lignin, a substance considered as a waste product in biomass and ethanol production, will now reach its proper value as bio-oil in new products.

- [**Aspirin tablets help unravel basic physics**](#)

[周五, 08 9月 00:03]

Aspirin in form of small crystallites provides new insight into delicate motions of electrons and atomic nuclei. Set into molecular vibration by strong ultrashort far-infrared (terahertz) pulses, the nuclei oscillate much faster than for weak excitation. They gradually return to their intrinsic oscillation frequency, in parallel to the picosecond decay of electronic motions. An analysis of the terahertz waves radiated from the moving particles by in-depth theory reveals the strongly coupled chara...

- [**Scanning tunneling microscopy measurements**](#)

[identify active sites on catalyst surfaces](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

• ['Rubber material' discovered that could lead to scratch-proof paint for car](#) [周五, 08 9月 00:02]

A stretchy miracle material has been discovered that could be used to create highly resistant smart devices and scratch-proof paint for cars, report investigators.

• [Climate change for aliens](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

• [Pluto features given first official names](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

• [3-D-printed biomaterials that degrade on demand](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

• [Smartphone screen technology used to trick harmful bacteria](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Ultraviolet light from superluminous supernova key to revealing explosion mechanism**](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

- [**Fast magnetic writing of data**](#) [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

- [**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

- [**A tiny device offers insights to how cancer**](#)

[spreads](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

. [Drivers don't ignore a ringing phone but do ignore the risk](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

. [Water-based lithium-ion batteries that don't explode now created](#) [周四, 07 9月 05:01]

For the first time a lithium-ion battery has been developed that uses a water-salt solution as its electrolyte and reaches the 4.0 volt mark desired for household electronics, such as laptop computers, without the fire and explosive risks associated with some commercially available non-aqueous lithium-ion batteries.

. [Study quantifies potential for water reuse in permian basin oil production](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

. [Researchers challenge status quo of battery commercialization](#) [周四, 07 9月 05:01]

Researchers are looking to the pharmaceutical industry to propose an updated model of US battery commercialization.

• [**New device accurately identifies cancer in seconds**](#) [周四, 07 9月 02:49]

A team of scientists and engineers has invented a powerful tool that rapidly and accurately identifies cancerous tissue during surgery, delivering results in about 10 seconds. The MasSpec Pen is an innovative handheld instrument that gives surgeons precise diagnostic information about what tissue to cut or preserve, helping improve treatment and reduce the chances of cancer recurrence.

• [**Particle physicists on a quest for 'new physics'**](#) [周四, 07 9月 02:29]

The Large Hadron Collider (LHC) at CERN, the European Organization for Nuclear Research, produces hundreds of millions of proton collisions per second. But researchers working on the Large Hadron Collider beauty (LHCb) experiment can only record 2,000 of those collisions, using one of the detectors installed on the accelerator. So in the end, this technological marvel leaves the physicists wanting more. They are convinced that the vast volume of uncaptured data holds the answers to several unreso...

• [**Earth as hybrid planet: New classification places Anthropocene era in astrobiological context**](#) [周四, 07 9月 01:55]

A new classification scheme has been devised for the evolutionary stages of worlds based on 'non-equilibrium thermodynamics' -- a planet's energy flow being out of sync, as the presence of life could cause.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Supercharging silicon batteries**](#) [周三, 06 9月 22:36]

Scientists have designed a novel silicon-based anode to provide lithium batteries with increased power and better stability.

• [**Quantum tech has its sights set on human biochemistry**](#) [周三, 06 9月 22:36]

Scientists have developed a new tool for imaging life at the nanoscale that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.

• [**Green light for ultra-fine display colors**](#) [周三, 06 9月 22:36]

Chemical engineers have succeeded in generating ultra-pure green light for the first time. The new light-emitting diode will pave the way for visibly improved color quality in a new generation of ultra-high definition displays for TVs and smartphones.

• [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

• [**New tool for characterizing quantum simulators**](#) [周三, 06 9月 22:35]

Physicists are developing quantum simulators, to help solve problems that are beyond the reach of conventional computers. However, they first need new tools to ensure that the simulators work properly. Researchers have now implemented a new technique in the laboratory that can be used to efficiently characterize the complex states of quantum simulators. The technique could become a new standard tool for characterizing quantum simulators.

• [**Keychain detector could catch food allergens before it's too late**](#) [周三, 06 9月 22:35]

For kids and adults with food allergies, a restaurant outing can be a fraught experience. Even when care is taken, freshly prepared or packaged meals can accidentally become cross-contaminated with an

offending food and trigger a reaction. Now researchers report the development of a new portable allergen-detection system -- including a keychain analyzer -- that could help prevent trips to the emergency room.

• [**Flip-flop qubits: Radical new quantum computing design invented**](#) [周三, 06 9月 22:35]

Engineers have invented a radical new architecture for quantum computing, based on novel 'flip-flop qubits,' that promises to make the large-scale manufacture of quantum chips dramatically cheaper -- and easier -- than thought possible. The new chip design allows for a silicon quantum processor that can be scaled up without the precise placement of atoms required in other approaches.

• [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

• [**Superhuman 'night' vision during the total eclipse?**](#) [周三, 06 9月 04:40]

It was dark as night during the recent total solar eclipse, yet people and objects were easier to see than on a typical moonless night. Scientists have discovered a possible biological explanation -- the presence (or absence) of a protein in the retina known as a GABA receptor.

• [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

- [**More durable, less expensive fuel cells**](#) [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative to internal combustion engines because they produce power through electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

- [**Nanoparticles limit damage in spinal cord injury**](#) [周三, 06 9月 01:44]

After a spinal cord injury, significant secondary nerve damage is caused by inflammation and internal scarring that inhibits the ability of the nervous system to repair itself. A biodegradable nanoparticle injected after a spinal cord trauma prevented the inflammation and internal scarring that inhibits the repair process, reports a new study.

- [**Unique study tests fundamental laws of physics**](#) [周三, 06 9月 00:54]

A study that will ‘test our understanding of how the Universe works, particularly outside the relatively narrow confines of our planet’ is being undertaken by an international team of researchers.

- [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

- [**Solubility study could impact energy, biology, environment**](#) [周三, 06 9月 00:32]

Chemical engineers have used the most realistic computer model yet devised to simulate the precise atomic and molecular interactions that come into play when water mixes with alkanes, a family of hydrocarbons that includes methane, propane and other refined products.

- [**Surgeons create 'vacuum' procedure to remove infected pacemaker**](#) [周三, 06 9月 00:32]

Electrophysiologists get creative in removing infected pacemaker wires of a patient unable to have open heart surgery. He would have died if they didn't use a 'vacuum' typically used to remove foreign objects.

- [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [**Glowing cancer tool illuminates benign, but dangerous, brain tumors during pituitary surgery**](#) [周三, 06 9月 00:32]

An experimental imaging tool that uses a targeted fluorescent dye successfully lit up the benign brain tumors of patients during removal surgery, allowing surgeons to identify tumor tissue, a new study shows.

- ['Extreme' telescopes find the second-fastest-spinning pulsar](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

- [When strangers can control our lights](#) [周二, 05 9月 21:38]

Smart home products such as lamps controlled via mobile devices are becoming ever more popular in private households. We would, however, feel vulnerable in our own four walls if strangers suddenly started switching the lights in our homes on and off. Researchers have discovered security problems of this nature in smart lights manufactured by GE, IKEA, Philips and Osram.

- [Was the primordial soup a hearty pre-protein stew?](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

- [New fluorescent dyes could advance biological imaging](#) [周二, 05 9月 00:04]

Scientists have developed a new method for fine-tuning the structure of rhodamine dyes, and can now create a colorful palette of fluorescent molecules.

- [Equation reveals the characteristics of quantum chaos](#) [周一, 04 9月 21:37]

Researchers have now succeeded in formulating a mathematical result that provides an exact answer to the question of how chaos actually behaves. The researchers have analyzed chaotic states at the atomic level.

- [Like a revolving door: How shuttling proteins](#)

[operate nuclear pores](#) [周一, 04 9月 21:36]

Nuclear pore complexes are tiny channels where the exchange of substances between the cell nucleus and the cytoplasm takes place. Scientists report on startling new research that might overturn established models of nuclear transport regulation. Their study reveals how shuttling proteins known as importins control the function of nuclear pores – as opposed to the view that nuclear pores control the shuttling of importins.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Why are fossilized hairs so rare?**](#) [周五, 08 9月 02:27]

When it comes to preserving body parts, fossilized hair is rare--five times rarer than feathers--despite being an important tool for understanding ancient species. This finding has researchers trying to determine if the lack of hair in the fossil record has to do with physical traits that might make it more difficult for hair to fossilize, or an issue with scientists' collection techniques that could lead to them missing important finds.

- [**Cilia: 'The bouncer' of bacteria**](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

- [**Eighteenth century nautical charts reveal coral loss**](#) [周五, 08 9月 02:27]

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

- [**Courts' critical, underappreciated role in**](#)

[climate policy](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

• [Discovery of chromosome motor supports DNA loop extrusion](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

• [New acid-free magnet recycling process created](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

• [Curious properties: Researchers analyze flocking behavior on curved surfaces](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

• [Direct evidence of sea level 'fingerprints' discovered](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

• [Smartphone screen technology used to trick harmful bacteria](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or

removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Hidden Inca treasure: Remarkable new tree genus discovered in the Andes**](#) [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

- [**Algorithm reconstructs processes from individual images**](#) [周四, 07 9月 22:24]

Researchers have developed a new method for reconstructing continuous biological processes, such as disease progression, using image data.

- [**Australian Magpie 'dunks' its food before**](#)

[eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

• [Increasing effective decision-making for coastal marine ecosystems](#) [周四, 07 9月 22:23]

Marine restoration, rather than protection, might be the most cost-effective solution for coastal marine ecosystems suffering from human activities, a new study has found. The study examined how to best benefit coastal marine ecosystems on limited conservation budgets, to help managers better understand the trade-offs.

• [Breaking through the wall in bacterial membrane vesicle research](#) [周四, 07 9月 21:36]

Researchers used advanced imaging techniques to investigate the formation of membrane vesicles in a Gram-positive bacterium, a process that is poorly understood, particularly in bacteria with thick cell walls. The consortium showed that membrane vesicle formation was triggered by an enzyme called endolysin that damages the cell wall to create holes that allow the release of membrane vesicles. This mechanism could be exploited for the mass production of bacterial vesicles.

• [How monkey fights grow](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

• [Ebola: Early immune response provides insight into vaccination](#) [周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

- [**Honeybees could play a role in developing new antibiotics**](#) [周四, 07 9月 05:06]

An antimicrobial compound made by honeybees could become the basis for new antibiotics, according to new research.

- [**Study quantifies potential for water reuse in permian basin oil production**](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

- [**Bacterial in-fighting provides new treatment for hospital infections**](#) [周四, 07 9月 02:49]

A bacteria that is a leading cause of death worldwide from hospital acquired infections following antibiotic treatment looks set to be brought down through its own sibling rivalry.

- [**Pollen stays on bee bodies right where flowers need it for pollination**](#) [周四, 07 9月 02:49]

After grooming, bees still have pollen on body parts that match the position of flower pollen-sacs and stigmas, according to a new study.

- [**Giant bacterium contains genomes for an entire population**](#) [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its “normal” counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as *Achromatium* can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria

aficiona...

• [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Tick tock: Biologists show wildlife loss and climate change can synergistically increase tick abundance and the risk of tick-borne disease**](#) [周三, 06 9月 23:46]

Around the world, ticks are one of the most important vectors of zoonotic diseases -- animal diseases communicable to humans -- and they're everywhere. New research suggests that the abundance of ticks that carry certain fevers are likely to rise in the future, thanks to a combination of wildlife loss and climate change.

• [**Substance in coffee delays onset of diabetes in laboratory mice**](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

• [**Cloud formation suppressed by biogenic organic**](#)

[emissions](#) [周三, 06 9月 22:36]

Evidence has been found that near-ground biogenic emissions of organics suppress cloud formation in cool-temperate forests in autumn, providing clues to how global warming will affect cloud formation and the overall climate.

• [Colon of patients with IBS reacts differently to bacteria](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

• [Unraveling a major cause of sea ice retreat in the Arctic Ocean](#) [周三, 06 9月 22:36]

Quantitative analysis has evidenced the acceleration system of melting ice: dark water surfaces absorb more heat than white ice surfaces, thus melting ice and making more water surfaces in the Arctic Ocean.

• [Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens](#) [周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

• [Protein that extends life of yeast cells](#) [周三, 06 9月 22:35]

To understand and control aging is the aspiration of many scientists. Researchers have now discovered that the protein Gcn4 decreases protein synthesis and extends the life of yeast cells. Understanding how individual genes affect lifespan opens new ways to control the aging process and the occurrence of aging-related diseases.

• [Bacteria responsible for legionellosis modulates the host cell metabolism to its advantage](#) [周三, 06 9月 22:35]

The bacterial pathogen *Legionella pneumophila* has developed a specific strategy to target the host cell mitochondria, the organelles in charge of cellular bioenergetics, scientists have shown. New work provides precious information on how a pathogen manipulates the cellular metabolism to replicate intracellularly, and proposes a new concept of protection of host cells from *Legionella*-induced mitochondrial changes in order to fight infection.

[Research dog helps scientists save endangered carnivores](#) [周三, 06 9月 22:35]

Scat-sniffing research dogs are helping scientists map out a plan to save reclusive jaguars, pumas, bush dogs and other endangered carnivores in the increasingly fragmented forests of northeastern Argentina, according to a new study.

[Will mallards hybridize their cousins out of existence?](#) [周三, 06 9月 22:35]

Mallards -- the familiar ducks of city parks -- are one of a group of closely related species, many of which are far less common. Interbreeding can threaten the genetic distinctiveness of those other species and cause concern for their conservation. A new study investigates hybridization between mallards and mottled ducks, a species adapted for life in coastal marshes, and finds that while hybridization rates are currently low, human activity could cause them to rise in the future.

[Biologists slow aging, extend lifespan of fruit flies](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

[Clever cockatoos bend hooks into straight wire to fish for food](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

- [**Invasive plants change ecosystems from the bottom up**](#) [周三, 06 9月 02:56]

Even when two different Phragmite lineages are grown side-by-side in the same ecosystem, the bacterial communities in the soil differ dramatically. This is a discovery that will aid in understanding how plant invasions get started and the conditions necessary for their success.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to

their higher content of heme iron in these meats, new research shows.

• [Could switchgrass help China's air quality?](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

• [Oregon's marijuana legalization prompted big drop in sales in Washington's border counties](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

• [Birds choose mates with ornamental traits](#) [周三, 06 9月 00:57]

A recurring theme in nature documentaries is that of choosy females selecting brightly colored males. A new study shows that, in monogamous mating systems, male birds may select their lifelong mates in much the same way.

• [First detailed decoding of complex finger millet genome](#) [周三, 06 9月 00:56]

Finger millet has two important properties: The grain is rich in important minerals and resistant towards drought and heat. Thanks to a novel combination of state-of-the-art technologies, researchers were able to decode the large and extremely complex genome of finger millet in high quality for the first time. This represents a fundamental basis for improving food security in countries like India and parts of Africa.

• [Cell marking opens up a window into the body](#) [周三, 06 9月 00:35]

Researchers have developed new methods to track cells in mice which could help to reduce animal experiments.

• [Building a morphogen gradient by simple diffusion in a growing plant leaf](#) [周三, 06 9月 00:33]

The research team has shown that a transcriptional co-activator ANGUSTIFOLIA3 (AN3) forms a signaling gradient along the leaf proximal-to-distal axis to determine cell-proliferation domain.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the

organization of the brain's attention network.

- [**Academic argues for changes in the laws governing modern warfare**](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

- [**Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease**](#) [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

- [**Study quantifies potential for water reuse in Permian basin oil production**](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals

subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

· [**Oregon's marijuana legalization prompted big drop in sales in Washington's border counties**](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

· [**PSA screening significantly reduces the risk for death from prostate cancer**](#) [周二, 05 9月 06:17]

After differences in implementation and settings were accounted for, two important prostate cancer screening trials provide compatible evidence that screening reduces prostate cancer mortality.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Climate change for aliens](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [Australian Magpie 'dunks' its food before eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- ['Vampires' may have been real people with this blood disorder](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [Giant bacterium contains genomes for an entire population](#) [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its "normal" counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as *Achromatium* can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**Circadian clock's inner gears**](#) [周五, 08 9月 02:26]

A set of core clock proteins organize themselves into a handful of molecular machines that control the precise workings of the body's circadian rhythms, new research has found.

- [**Discovery of chromosome motor supports DNA**](#)

[loop extrusion](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

[Researchers closer to uncovering a new feature in heart failure](#) [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

[Human skin cells transformed directly into motor neurons](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

[Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find](#) [周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

[**New acid-free magnet recycling process created**](#)

[周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

[together to fight gut infections](#) [周四, 07 9月 23:24]

Nerve cells in the gut play a crucial role in the body's ability to marshal an immune response to infection, according to a new study.

• [Climate change for aliens](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

• [Pluto features given first official names](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

• [Nutrition has benefits for brain network organization](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

• [3-D-printed biomaterials that degrade on demand](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

• [Link between positive emotions and health depends on culture](#) [周四, 07 9月 23:24]

Positive emotions are often seen as critical aspects of healthy living, but

new research suggests that the link between emotion and health outcomes may vary by cultural context. The findings show that experiencing positive emotions is linked with better cardiovascular health in the US but not in Japan.

- [**Using antidepressants during pregnancy may affect your child's mental health**](#) [周四, 07 9月 23:24]

The use of antidepressants during pregnancy increases the risk of your child being diagnosed with a psychiatric disorder later in life, a study of almost one million Danish children shows. However, heritability also plays a part, according to the researchers.

- [**Biomarkers as predictive of sepsis as lengthy patient monitoring**](#) [周四, 07 9月 23:23]

One measurement of key biomarkers in blood that characterize sepsis can give physicians as much information as hours of monitoring symptoms, a new study found.

- [**You are what you think you eat**](#) [周四, 07 9月 22:43]

Despite eating the same breakfast, made from the same ingredients, people consumed more calories throughout the day when they believed that one of the breakfasts was less substantial than the other, investigators have found.

- [**Fifty–fifty split best for children of divorce, study suggests**](#) [周四, 07 9月 22:43]

Preschool children in joint physical custody have less psychological symptoms than those who live mostly or only with one parent after a separation. In a new study of 3,656 children, researchers show that 3–5-year-olds living alternately with their parents after a separation show less behavioral problems and psychological symptoms than those living mostly or only with one of the parents.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the

metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Academic argues for changes in the laws governing modern warfare**](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

- [**Genes behind gestation length, preterm delivery identified**](#) [周四, 07 9月 22:39]

The genes that regulate gestational length and the likelihood of preterm delivery, have been identified in a study involving more than 50,000 women. An article describes the scientific breakthrough that can lead to improved health and survival among children.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more

comprehensive and more accurate than the state of the art.

- [**Hidden Inca treasure: Remarkable new tree genus discovered in the Andes**](#) [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

- [**Ultraviolet light from superluminous supernova key to revealing explosion mechanism**](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

- [**Sometimes you shouldn't say sorry**](#) [周四, 07 9月 22:24]

Being socially rejected can be a painful emotional experience -- but being told sorry may not soften the blow, finds a new study. Contrary to popular belief, apologies increase hurt feelings and the need to express forgiveness, but do not increase feelings of forgiveness, for the person being rebuffed.

- [**Fast magnetic writing of data**](#) [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

When electrons ride a wave: Optimum conditions for laser plasma acceleration -- ScienceDaily

Conventional electron accelerators have become an indispensable tool in modern research. The extremely bright radiation generated by synchrotrons, or free electron lasers, provides us with unique insights into matter at the atomic level. But even the smallest versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative: with a much smaller footprint and much higher peak currents it could be the basis for the next generation of compact light sources. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for possible applications. Physicists at the Helmholtz-Zentrum Dresden-Rossendorf (HZDR) have now developed a method to increase both beam stability and quality.

The basic principle of laser acceleration seems quite simple: A bundled, ultra-strong laser beam hits a trace

of gas, which instantly creates plasma -- an ionized state of matter or, in other words, a whirling mix of charged particles. The power of the light pulse pushes electrons away from their parent ions, creating a sort of bubble-like structure with a strong electric field in the plasma. This field, which the laser pulse drags behind itself like a stern wave, traps the electrons, accelerating them to nearly the speed of light. "These speedy particles allow us to generate x-rays," Dr. Arie Irman from the HZDR Institute of Radiation Physics explains the purpose of the procedure. "For instance, when we make these electron bundles collide with another laser beam, the impact generates bright, ultra-short x-ray flashes -- an immensely valuable research tool for examining extreme states of matter."

Right Time + Right Place = Perfect Acceleration

The strength of the secondary radiation greatly depends on the particles' electrical current. The current, in turn, is mostly determined by the number of electrons fed into the process. Laser-powered acceleration therefore holds great potential, because it reaches significantly higher peak currents in comparison with the conventional method. However, as physicist Jurjen Pieter Couperus points out, the so-called beam loading

effect kicks in: "These higher currents create an electric self-field strong enough to superimpose and disturb the laser-driven wave, distorting thereby the beam. The bundle is stretched out and not accelerated properly. The electrons therefore have different energies and quality levels." But in order to use them as a tool for other experiments, each beam must have the same parameters. "The electrons have to be in the right place at the right time," summarizes Couperus, who is a Ph.D. candidate in Irman's team.

Together with other colleagues at the HZDR, the two researchers were the first to demonstrate how the beam loading effect can be exploited for improved beam quality. They add a bit of nitrogen to the helium at which the laser beam is usually directed. "We can control the number of electrons we feed into the process by changing the concentration of the nitrogen," Irman explains. "In our experiments, we found out that conditions are ideal at a charge of about 300 picocoulomb. Any deviation from it -- if we add more or fewer electrons to the wave -- results in a broader spread of energy, which impairs beam quality."

As the physicists' calculations have shown, experiments under ideal conditions yield peak currents

of about 50 kiloamperes. "To put this in context, only about 0.6 kiloamperes flow through the standard overhead line for a German high-speed train," Jurjen Pieter Couperus explains. He is confident that they can beat their own record: "Using our findings and a laser pulse in the petawatt range, which our high-intensity laser DRACO can achieve, we should be able to generate a high-quality electron beam with peak currents of 150 kiloamperes. That would exceed modern large-scale research accelerators by about two orders of magnitude." An achievement which the researchers from Dresden believe would pave the way for the next generation of compact radiation sources.

Scientists unravel new insights into promising semiconductor material -- ScienceDaily

Researchers from the National University of Singapore (NUS) have established new findings on the properties of two-dimensional molybdenum disulfide (MoS_2), a widely studied semiconductor of the future.

In two separate studies led by Professor Andrew Wee and Assistant Professor Andriwo Rusydi from the Department of Physics at the NUS Faculty of Science, the researchers uncovered the role of oxygen in MoS_2 , and a novel technique to create multiple tunable, inverted optical band gaps in the material. These novel insights deepen the understanding of the intrinsic properties of MoS_2 which could potentially transform its applications in the semiconductor industry.

The studies were published in scientific journals *Physical Review Letters* and *Nature Communications* respectively.

MoS₂ -- An alternative to graphene

MoS₂ is a semiconductor-like material that exhibits desirable electronic and optical properties for the development and enhancement of transistors, photodetectors and solar cells.

Prof Wee explained, "MoS₂ holds great industrial importance. With an atomically thin two-dimensional structure and the presence of a 1.8eV energy band gap, MoS₂ is a semiconductor that can offer broader applications than graphene which lacks a band gap."

Presence of oxygen alters the electronic and optical properties of MoS₂

In the first study published in *Physical Review Letters* on 16 August 2017, NUS researchers conducted an in-depth analysis which revealed that the energy storage capacity or dielectric function of MoS₂ can be altered using oxygen.

The team observed that MoS₂ displayed a higher dielectric function when exposed to oxygen. This new knowledge shed light on how adsorption and

desorption of oxygen by MoS₂ can be employed to modify its electronic and optical properties to suit different applications. The study also highlights the need for adequate consideration of extrinsic factors that may affect the properties of the material in future research.

The first author of this paper is Dr Pranjali Kumar Gogoi from the Department of Physics at NUS Faculty of Science.

MoS₂ can possess two tunable optical band gaps

In the second study published in *Nature Communications* on 7 September 2017, the team of NUS researchers discovered that as opposed to conventional semiconductors which typically have only one optical band gap, electron doping of MoS₂ on gold can create two unusual optical band gaps in the material. In addition, the two optical bandgaps in MoS₂ are tunable via a simple, straight forward annealing process.

The research team also identified that the tunable optical band gaps are induced by strong-charge lattice coupling as a result of the electron doping.

The first author of this second paper is Dr Xinmao Yin from the Department of Physics at NUS Faculty of Science.

The research findings from the two studies lend insights to other materials that possess similar structure with MoS₂.

"MoS₂ falls under a group of material known as the two-dimensional transitional metal dichalcogenides (2D-TMDs) which are of great research interest because of their potential industrial applications. The new knowledge from our studies will assist us in unlocking the possibilities of 2D-TMD-based applications such as the fabrication of 2D-TMD-based field effect transistors," said Asst Prof Rusydi.

Leveraging the findings of these studies, the researchers will apply similar studies to other 2D-TMDs and to explore different possibilities of generating new, valuable properties in 2D-TMDs that do not exist in nature.

An officer and a gentlewoman from the Viking army in Birka -- ScienceDaily

War was not an activity exclusive to males in the Viking world. A new study conducted by researchers at Stockholm and Uppsala Universities shows that women could be found in the higher ranks at the battlefield.

Charlotte Hedenstierna-Jonson, who led the study, explains: "What we have studied was not a Valkyrie from the sagas but a real life military leader, that happens to be a woman."

The study was conducted on one of the most iconic graves from the Viking Age. It holds the remains of a warrior surrounded by weapons, including a sword, armour-piercing arrows, and two horses. There were also a full set of gaming pieces and a gaming board. "The gaming set indicates that she was an officer," says Charlotte, "someone who worked with tactics and strategy and could lead troops in battle." The warrior was buried in the Viking town of Birka during the mid-10th century. Isotope analyses confirm an itinerant life

style, well in tune with the martial society that dominated 8th to 10th century northern Europe.

Anna Kjellström, who also participated in the study, has taken an interest in the burial previously. "The morphology of some skeletal traits strongly suggests that she was a woman, but this has been the type specimen for a Viking warrior for over a century why we needed to confirm the sex in any way we could."

And this is why the archaeologists turned to genetics, to retrieve a molecular sex identification based on X and Y chromosomes. Such analyses can be quite useful according to Maja Krezwinska: "Using ancient DNA for sex identification is useful when working with children for example, but can also help to resolve controversial cases such as this one." Maja was thus able to confirm the morphological sex identification with the presence of X chromosomes but the lack of a Y chromosome.

Jan Storå, who holds the senior position on this study, reflects over the history of the material: "This burial was excavated in the 1880ies and has served as a model of a professional Viking warrior ever since. Especially, the grave-goods cemented an interpretation

for over a century." It was just assumed she was a man through all these years. "The utilization of new techniques, methods, but also renewed critical perspectives, again, shows the research potential and scientific value of our museum collections."

The study is a part of the ongoing ATLAS project, which is a joint effort by Stockholm University and Uppsala University, supported by Riksbankens Jubileumsfond (The Swedish Foundation for Humanities and Social Sciences) and Vetenskapsrådet (The Swedish Research Council), to investigate the genetic history of Scandinavia.

Immune cells help fat deal with environmental challenges -- ScienceDaily

Immunosuppressive regulatory T-cells play an important role in the functioning of adipose tissue. This is the discovery of scientists from the Helmholtz Diabetes Center (HDC) at Helmholtz Zentrum München and the Technical University of Munich (TUM). Their findings are published in the journal *Cell Metabolism*.

The number of obese people as well as those suffering from type 2 diabetes is increasing worldwide. Both disorders are associated with metabolic changes including amplified inflammatory responses in adipose tissue. "Previous studies have indicated that immunosuppressive regulatory T-cells -- or Tregs for short -- play an important role in these processes," explains the leader of the study Dr. Carolin Daniel, group leader at the Institute for Diabetes Research (IDF) of the Helmholtz Zentrum München and a scientist in the German Center for Diabetes Research

(DZD). "We now wanted to examine how these immune cells might support adipose function in more detail."

In an experimental model, Daniel, together with co-first authors Dr. Stefanie Kälin and Maike Becker and colleagues, determined that the number of Tregs in adipose tissue increases in response to different environmental stimuli. These stimuli included a short-term cold treatment, stimulation of the sympathetic nervous system (β -adrenoreceptors) or short-term high-caloric exposure. "All these stimuli supported those immunosuppressive cells directly in the adipose tissue," says Becker.

Fat burning activated

The magnitude of the increase in Tregs differed depending on the type of adipose tissue: it was particularly pronounced in brown fat, somewhat weaker in subcutaneous fat and weakest in visceral fat. To investigate the specific function of Tregs, the researchers determined how gene expression changes in adipose tissue. Especially in brown fat, genes were activated that promote heat production (thermogenesis) as well as those that are used for the breakdown

(lipolysis) and burning (oxidation) of fatty acids. Subsequent experiments revealed that the signalling molecules Stat6 und Pten play a vital role in this process.

"A better understanding of the immunological mechanisms involved in the target tissue will be critical for the development of personalized interventions in order to improve adipose tissue function during obesity and diabetes," says the leader of the study Carolin Daniel. "Our experiments show for the first time that Tregs can support fat depots in dealing with environmental challenges."

"Our findings highlight the complex interactions between our body and the environment. We have known for a while that hormones play a key role here - - but now have to accept that immune cells may be just as important for a balanced metabolism," comments Prof. Dr. Matthias Tschöp. He is the scientific director of the HDC at Helmholtz Zentrum München and holds the chair for metabolic diseases at the TUM. "These insights therefore help us tremendously with designing more efficient ways to therapeutically optimize when and how to store calories."

Prof. Dr. Matthias Mann from the Max Planck Institute of Biochemistry in Martinsried as well as the group of PD Dr. Benno Weigmann from Universitätsklinikum Erlangen also made significant contributions to the study.

All Top News

Top science stories featured on ScienceDaily's home page.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

[Nutrition has benefits for brain network organization](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

[3-D-printed biomaterials that degrade on demand](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

[Intermittent electrical brain stimulation improves memory](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

[How monkey fights grow](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

[Emoji fans take heart: Scientists pinpoint 27 states of emotion](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal

categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

• [**Biologists slow aging, extend lifespan of fruit flies**](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

• [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

• [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

• [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

• [**Eat fat, live longer?**](#) [周三, 06 9月 02:55]

As more people live into their 80s and 90s, researchers have delved into the issues of health and quality of life during aging. A recent mouse study sheds light on those questions by demonstrating that a high fat, or ketogenic, diet not only increases longevity, but improves physical strength.

• [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

• [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

• [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space

constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

- [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

- [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

- [**CRISPR technology used to change flower color**](#) [周三, 06 9月 00:32]

In a world-first, scientists have used the revolutionary CRISPR, or CRISPR/Cas9, genome-editing tool to change flower color in an ornamental plant.

- [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

- [**Zika virus kills brain cancer stem cells**](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing

fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

• [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

• [**Mobile women were key to cultural exchange in Stone Age and Bronze Age Europe**](#) [周二, 05 9月 03:10]

At the end of the Stone Age and in the early Bronze Age, families were established in a surprising manner in the Lechtal, south of Augsburg, Germany. The majority of women probably came from Bohemia or Central Germany, while men usually remained in the region of their birth. This so-called patrilocal pattern combined with individual female mobility persisted over a period of 800 years during the transition from the Neolithic to the Early Bronze Age.

• [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

• [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

[Stellar corpse sheds light on origin of cosmic](#)

[rays](#) [周一, 04 9月 21:34]

New research revealed that the entire zoo of electromagnetic radiation streaming from the Crab nebula -- one of the most iconic objects in the sky -- has its origin in one population of electrons and must be produced in a different way than scientists have traditionally thought. The results have implications for our understanding of how cosmic rays attain their incredible energies.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Folic acid may mitigate autism risk from pesticides**](#) [周六, 09 9月 08:55]

Researchers have shown that mothers who take recommended amounts of folic acid around conception might reduce their children's pesticide-related autism risk.

- [**Immune cells help fat deal with environmental challenges**](#) [周六, 09 9月 08:55]

Immunosuppressive regulatory T-cells play an important role in the functioning of adipose tissue.

- [**Better understanding of 'one of the most complex organs' for better lung treatments**](#) [周五, 08 9月 02:45]

Details of lung cell molecular pathways that promote or inhibit tissue regeneration have been reported by researchers. Their aim is to find new ways to treat lung disorders.

- [**Interrupting Parkinson's disease**](#) [周五, 08 9月 02:30]

Scientists have identified a toxic cascade that leads to neuronal degeneration in patients with Parkinson's disease and figured out how to interrupt it, reports a study. Intervening with an antioxidant early in the disease process may break the degenerative cycle and improve neuron function in Parkinson's, the study showed. Parkinson's is second most common neurodegenerative disorder.

- [**Mediterranean-style diet may eliminate need for**](#)

[reflux medications](#) [周五, 08 9月 02:30]

A plant-based, Mediterranean-style diet has been shown to provide the same medical benefits for treating laryngopharyngeal reflux as popular reflux medications, according to new research.

• [Cilia: 'The bouncer' of bacteria](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

• [Circadian clock's inner gears](#) [周五, 08 9月 02:26]

A set of core clock proteins organize themselves into a handful of molecular machines that control the precise workings of the body's circadian rhythms, new research has found.

• [Discovery of chromosome motor supports DNA loop extrusion](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

• [Researchers closer to uncovering a new feature in heart failure](#) [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

• [Human skin cells transformed directly into motor neurons](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

[Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find](#)

[周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

[SNAP benefits aren't enough to afford a healthy diet](#)

[周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

[Producing malaria treatment at large scales](#)

[周五, 08 9月 00:56]

For the first time, production of the anti-malarial drug artemisinin has been achieved at an industrial scale using genetically engineered moss. This offers new hope for stabilizing artemisinin supplies and combatting malaria.

[What makes alcoholics drink? Research shows it's more complex than supposed](#)

[周五, 08 9月 00:02]

What makes alcoholics drink? New research has found that in both men and women with alcohol dependence, the major factor predicting the amount of drinking seems to be a question of immediate mood. Surprisingly men with a history of depression were drinking less often

than men who were not depressed. This probably means that alcohol treatment needs to be individually tailored.

- [**Cellular tango: Immune and nerve cells work together to fight gut infections**](#) [周四, 07 9月 23:24]

Nerve cells in the gut play a crucial role in the body's ability to marshal an immune response to infection, according to a new study.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Link between positive emotions and health depends on culture**](#) [周四, 07 9月 23:24]

Positive emotions are often seen as critical aspects of healthy living, but new research suggests that the link between emotion and health outcomes may vary by cultural context. The findings show that experiencing positive emotions is linked with better cardiovascular health in the US but not in Japan.

- [**Using antidepressants during pregnancy may affect your child's mental health**](#) [周四, 07 9月 23:24]

The use of antidepressants during pregnancy increases the risk of your child being diagnosed with a psychiatric disorder later in life, a study of

almost one million Danish children shows. However, heritability also plays a part, according to the researchers.

- [**Biomarkers as predictive of sepsis as lengthy patient monitoring**](#) [周四, 07 9月 23:23]

One measurement of key biomarkers in blood that characterize sepsis can give physicians as much information as hours of monitoring symptoms, a new study found.

- [**Connection between low oxygen levels, human gene discovered**](#) [周四, 07 9月 23:23]

Researchers have established a link between hypoxia, a condition that reduces the flow of oxygen to tissues, and HOTAIR, a noncoding RNA or molecule that has been implicated in several types of cancer.

- [**You are what you think you eat**](#) [周四, 07 9月 22:43]

Despite eating the same breakfast, made from the same ingredients, people consumed more calories throughout the day when they believed that one of the breakfasts was less substantial than the other, investigators have found.

- [**Fifty–fifty split best for children of divorce, study suggests**](#) [周四, 07 9月 22:43]

Preschool children in joint physical custody have less psychological symptoms than those who live mostly or only with one parent after a separation. In a new study of 3,656 children, researchers show that 3–5-year-olds living alternately with their parents after a separation show less behavioral problems and psychological symptoms than those living mostly or only with one of the parents.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in

preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Genes behind gestation length, preterm delivery identified**](#) [周四, 07 9月 22:39]

The genes that regulate gestational length and the likelihood of preterm delivery, have been identified in a study involving more than 50,000 women. An article describes the scientific breakthrough that can lead to improved health and survival among children.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Sometimes you shouldn't say sorry**](#) [周四, 07 9月 22:24]

Being socially rejected can be a painful emotional experience -- but being told sorry may not soften the blow, finds a new study. Contrary to popular belief, apologies increase hurt feelings and the need to express forgiveness, but do not increase feelings of forgiveness, for the person being rebuffed.

- [**Trigger for fatty liver in obesity**](#) [周四, 07 9月 22:24]

Morbid obesity affects the liver: almost one-third of all adults suffer

from chronic fatty liver disease, which can lead to infections and even trigger cancer. Researchers have now found a signaling pathway in cells that play an important role in the development of fatty liver disease.

• [**Want your question answered quickly? Use gestures as well as words**](#) [周四, 07 9月 22:23]

When someone asks a question during a conversation, their conversation partner answers more quickly if the questioner also moves their hands or head to accompany their words. The study focuses on how gestures influence language processing.

• [**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• [**Long-term opioid prescription use jumps threefold over 16-year period, study suggests**](#) [周四, 07 9月 22:23]

Opioid prescription use increased significantly between 1999 and 2014, new research has found, and that much of that increase stemmed from patients who'd been taking their medication for 90 days or longer.

• [**A tiny device offers insights to how cancer spreads**](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

• [**Uncovering the mechanism behind heart failure, mortality in sepsis**](#) [周四, 07 9月 21:36]

Of the nearly 1 million people in the US who are affected by sepsis annually, almost one-fifth die. Cardiovascular complications account for

approximately 80 percent of those deaths. Now, researchers describe the mechanism underlying the loss of energy from heart dysfunction in sepsis, opening the way for the development of a new therapy that could save thousands of lives annually.

• [**Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease**](#) [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

• [**Link established between a molecular driver of melanoma, novel therapeutic agent**](#) [周四, 07 9月 21:36]

Scientists have described a correlation between a key melanoma signaling pathway and a novel class of drugs being tested in the clinic as adjuvant therapy for advanced melanoma, providing useful information for a more effective use of this type of treatment.

• [**How do close relationships lead to longer life?**](#) [周四, 07 9月 21:36]

While recent research has shown that loneliness can play a role in early death, psychologists are also concerned with the mechanisms by which social relationships and close personal ties affect health. New research offers an overview of the science and makes the case for psychological scientists to work together to make close relationships a public health priority.

• [**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Drivers don't ignore a ringing phone but do**](#)

ignore the risk [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

Improved stem cell transplantation therapies? [周四, 07 9月 21:36]

Researchers have demonstrated that hematopoietic stem cell (HSC) transplants can be improved by treatments that temporarily prevent the stem cells from dying. The approach could allow those in need of such transplants, including leukemia and lymphoma patients, to be treated with fewer donor stem cells while limiting potential adverse side effects.

Cheaper, faster test for E. coli in drinking water [周四, 07 9月 21:36]

Researchers have invented a fast, affordable way for developing communities to test their drinking water for potentially deadly E. coli.

Tooth trouble: Many middle-aged adults report dental pain, embarrassment and poor prevention [周四, 07 9月 21:36]

The dental health of middle-aged Americans faces a lot of problems right now, and an uncertain future to come, according to new national poll results. One in three Americans between the ages of 50 and 64 say they're embarrassed by the condition of their teeth, and that dental problems have caused pain or other problems in the past two years. Forty percent of those polled don't get regular cleanings or other preventive oral care.

Ebola: Early immune response provides insight into vaccination [周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a

challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

- [**Chronic bronchitis: New insights could lead to first diagnostic test, better treatments**](#) [周四, 07 9月 10:12]

Researchers describe how the concentration of mucins -- the proteins that make mucus thick -- is abnormally high in chronic bronchitis and that high mucin concentrations are associated with disease severity in people with chronic bronchitis. This finding could become the first-ever objective marker of chronic bronchitis and lead to the creation of diagnostic and prognostic tools.

- [**Discovery of genes linked to preterm birth in landmark study**](#) [周四, 07 9月 10:12]

A massive international DNA analysis of pregnant women has identified for the first time six gene regions that influence the length of pregnancy and the timing of birth. The findings may lead to new ways to prevent preterm birth and its consequences -- the leading cause of death among children under age 5 worldwide.

- [**Human genetics studies reveal new targets to reduce heart disease**](#) [周四, 07 9月 05:06]

Again and again, it's the rare among humans that help the rest of us. The exploration of human genetics is revealing new targets to combat heart disease among atypical variants. Mutations in genes that play a role in heart health are the inspiration for a cluster of new heart drugs.

- [**Honeybees could play a role in developing new antibiotics**](#) [周四, 07 9月 05:06]

An antimicrobial compound made by honeybees could become the basis for new antibiotics, according to new research.

- [**Statins reduce deaths from coronary heart disease by 28 per cent in men, according to**](#)

longest ever study [周四, 07 9月 05:04]

A new study focused on men with high levels of ‘bad’ cholesterol and no other risk factors or signs of heart disease.

A bioactive molecule may protect against congestive heart failure after heart attacks [周四, 07 9月 05:01]

Researchers show that giving mice a form of the fatty acid-derived bioactive molecule called lipoxin improved heart function after a heart attack, as the lipoxin prompted early activation of the resolving phase of the immune response without altering the acute phase.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**When electrons ride a wave**](#) [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

- [**Scientists unravel new insights into promising semiconductor material**](#) [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

- [**Are we being watched? Tens of other worlds could spot the Earth**](#) [周六, 09 9月 08:55]

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Curious properties: Researchers analyze**](#)

[flocking behavior on curved surfaces](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

• [Lignin: Much more valuable than just as waste](#) [周五, 08 9月 00:03]

Lignin, a substance considered as a waste product in biomass and ethanol production, will now reach its proper value as bio-oil in new products.

• [Aspirin tablets help unravel basic physics](#) [周五, 08 9月 00:03]

Aspirin in form of small crystallites provides new insight into delicate motions of electrons and atomic nuclei. Set into molecular vibration by strong ultrashort far-infrared (terahertz) pulses, the nuclei oscillate much faster than for weak excitation. They gradually return to their intrinsic oscillation frequency, in parallel to the picosecond decay of electronic motions. An analysis of the terahertz waves radiated from the moving particles by in-depth theory reveals the strongly coupled chara...

• [Scanning tunneling microscopy measurements identify active sites on catalyst surfaces](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

• ['Rubber material' discovered that could lead to scratch-proof paint for car](#) [周五, 08 9月 00:02]

A stretchy miracle material has been discovered that could be used to create highly resistant smart devices and scratch-proof paint for cars, report investigators.

- [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

• **[Ultraviolet light from superluminous supernova key to revealing explosion mechanism](#)** [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

• **[Fast magnetic writing of data](#)** [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

• **[Intermittent electrical brain stimulation improves memory](#)** [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• **[A tiny device offers insights to how cancer spreads](#)** [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

• **[Drivers don't ignore a ringing phone but do ignore the risk](#)** [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone

task undertaken by drivers.

• [**Water-based lithium-ion batteries that don't explode now created**](#) [周四, 07 9月 05:01]

For the first time a lithium-ion battery has been developed that uses a water-salt solution as its electrolyte and reaches the 4.0 volt mark desired for household electronics, such as laptop computers, without the fire and explosive risks associated with some commercially available non-aqueous lithium-ion batteries.

• [**Study quantifies potential for water reuse in permian basin oil production**](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

• [**Researchers challenge status quo of battery commercialization**](#) [周四, 07 9月 05:01]

Researchers are looking to the pharmaceutical industry to propose an updated model of US battery commercialization.

• [**New device accurately identifies cancer in seconds**](#) [周四, 07 9月 02:49]

A team of scientists and engineers has invented a powerful tool that rapidly and accurately identifies cancerous tissue during surgery, delivering results in about 10 seconds. The MasSpec Pen is an innovative handheld instrument that gives surgeons precise diagnostic information about what tissue to cut or preserve, helping improve treatment and reduce the chances of cancer recurrence.

• [**Particle physicists on a quest for 'new physics'**](#) [周四, 07 9月 02:29]

The Large Hadron Collider (LHC) at CERN, the European Organization

for Nuclear Research, produces hundreds of millions of proton collisions per second. But researchers working on the Large Hadron Collider beauty (LHCb) experiment can only record 2,000 of those collisions, using one of the detectors installed on the accelerator. So in the end, this technological marvel leaves the physicists wanting more. They are convinced that the vast volume of uncaptured data holds the answers to several unreso...

- [**Earth as hybrid planet: New classification places Anthropocene era in astrobiological context**](#) [周四, 07 9月 01:55]

A new classification scheme has been devised for the evolutionary stages of worlds based on 'non-equilibrium thermodynamics' -- a planet's energy flow being out of sync, as the presence of life could cause.

- [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

- [**Supercharging silicon batteries**](#) [周三, 06 9月 22:36]

Scientists have designed a novel silicon-based anode to provide lithium batteries with increased power and better stability.

- [**Quantum tech has its sights set on human biochemistry**](#) [周三, 06 9月 22:36]

Scientists have developed a new tool for imaging life at the nanoscale that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.

- [**Green light for ultra-fine display colors**](#) [周三, 06 9月 22:36]

Chemical engineers have succeeded in generating ultra-pure green light for the first time. The new light-emitting diode will pave the way for visibly improved color quality in a new generation of ultra-high

definition displays for TVs and smartphones.

- [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

- [**New tool for characterizing quantum simulators**](#) [周三, 06 9月 22:35]

Physicists are developing quantum simulators, to help solve problems that are beyond the reach of conventional computers. However, they first need new tools to ensure that the simulators work properly. Researchers have now implemented a new technique in the laboratory that can be used to efficiently characterize the complex states of quantum simulators. The technique could become a new standard tool for characterizing quantum simulators.

- [**Keychain detector could catch food allergens before it's too late**](#) [周三, 06 9月 22:35]

For kids and adults with food allergies, a restaurant outing can be a fraught experience. Even when care is taken, freshly prepared or packaged meals can accidentally become cross-contaminated with an offending food and trigger a reaction. Now researchers report the development of a new portable allergen-detection system -- including a keychain analyzer -- that could help prevent trips to the emergency room.

- [**Flip-flop qubits: Radical new quantum computing design invented**](#) [周三, 06 9月 22:35]

Engineers have invented a radical new architecture for quantum computing, based on novel 'flip-flop qubits,' that promises to make the large-scale manufacture of quantum chips dramatically cheaper -- and easier -- than thought possible. The new chip design allows for a silicon quantum processor that can be scaled up without the precise placement of atoms required in other approaches.

• [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

• [**Superhuman 'night' vision during the total eclipse?**](#) [周三, 06 9月 04:40]

It was dark as night during the recent total solar eclipse, yet people and objects were easier to see than on a typical moonless night. Scientists have discovered a possible biological explanation -- the presence (or absence) of a protein in the retina known as a GABA receptor.

• [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

• [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

• [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

• [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

• [**More durable, less expensive fuel cells**](#) [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative to internal combustion engines because they produce power through electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

• [**Nanoparticles limit damage in spinal cord injury**](#) [周三, 06 9月 01:44]

After a spinal cord injury, significant secondary nerve damage is caused by inflammation and internal scarring that inhibits the ability of the nervous system to repair itself. A biodegradable nanoparticle injected after a spinal cord trauma prevented the inflammation and internal scarring that inhibits the repair process, reports a new study.

• [**Unique study tests fundamental laws of physics**](#) [周三, 06 9月 00:54]

A study that will 'test our understanding of how the Universe works, particularly outside the relatively narrow confines of our planet' is being undertaken by an international team of researchers.

• [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

• [**Solubility study could impact energy, biology, environment**](#) [周三, 06 9月 00:32]

Chemical engineers have used the most realistic computer model yet devised to simulate the precise atomic and molecular interactions that come into play when water mixes with alkanes, a family of hydrocarbons that includes methane, propane and other refined products.

- [**Surgeons create 'vacuum' procedure to remove infected pacemaker**](#) [周三, 06 9月 00:32]

Electrophysiologists get creative in removing infected pacemaker wires of a patient unable to have open heart surgery. He would have died if they didn't use a 'vacuum' typically used to remove foreign objects.

- [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

- [**Glowing cancer tool illuminates benign, but dangerous, brain tumors during pituitary surgery**](#) [周三, 06 9月 00:32]

An experimental imaging tool that uses a targeted fluorescent dye successfully lit up the benign brain tumors of patients during removal surgery, allowing surgeons to identify tumor tissue, a new study shows.

- [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

- [**Sweet success: Nanocapsule perfectly binds sucrose in water**](#) [周二, 05 9月 22:44]

Researchers have developed an artificial receptor that can bind sucrose in water with exquisite precision. The achievement represents a leap forward for the development of biosensors, and provides new insights

into our perception of sweetness.

• [**When strangers can control our lights**](#) [周二, 05 9月 21:38]

Smart home products such as lamps controlled via mobile devices are becoming ever more popular in private households. We would, however, feel vulnerable in our own four walls if strangers suddenly started switching the lights in our homes on and off. Researchers have discovered security problems of this nature in smart lights manufactured by GE, IKEA, Philips and Osram.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**An officer and a gentlewoman from the Viking army in Birka**](#) [周六, 09 9月 08:55]

War was not an activity exclusive to males in the Viking world. A new study shows that women could be found in the higher ranks at the battlefield.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Why are fossilized hairs so rare?**](#) [周五, 08 9月 02:27]

When it comes to preserving body parts, fossilized hair is rare--five times rarer than feathers--despite being an important tool for understanding ancient species. This finding has researchers trying to determine if the lack of hair in the fossil record has to do with physical traits that might make it more difficult for hair to fossilize, or an issue with scientists' collection techniques that could lead to them missing important finds.

- [**Cilia: 'The bouncer' of bacteria**](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

- [**Eighteenth century nautical charts reveal coral loss**](#) [周五, 08 9月 02:27]

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental

water and ice sheet mass -- has been reported by researchers.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Hidden Inca treasure: Remarkable new tree genus discovered in the Andes**](#) [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

- [**Algorithm reconstructs processes from**](#)

[individual images](#) [周四, 07 9月 22:24]

Researchers have developed a new method for reconstructing continuous biological processes, such as disease progression, using image data.

• [Australian Magpie 'dunks' its food before eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

• [Breaking through the wall in bacterial membrane vesicle research](#) [周四, 07 9月 21:36]

Researchers used advanced imaging techniques to investigate the formation of membrane vesicles in a Gram-positive bacterium, a process that is poorly understood, particularly in bacteria with thick cell walls. The consortium showed that membrane vesicle formation was triggered by an enzyme called endolysin that damages the cell wall to create holes that allow the release of membrane vesicles. This mechanism could be exploited for the mass production of bacterial vesicles.

• [How monkey fights grow](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

• [Ebola: Early immune response provides insight into vaccination](#) [周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

• [Honeybees could play a role in developing new](#)

antibiotics [周四, 07 9月 05:06]

An antimicrobial compound made by honeybees could become the basis for new antibiotics, according to new research.

• **Study quantifies potential for water reuse in permian basin oil production** [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

• **Bacterial in-fighting provides new treatment for hospital infections** [周四, 07 9月 02:49]

A bacteria that is a leading cause of death worldwide from hospital acquired infections following antibiotic treatment looks set to be brought down through its own sibling rivalry.

• **Pollen stays on bee bodies right where flowers need it for pollination** [周四, 07 9月 02:49]

After grooming, bees still have pollen on body parts that match the position of flower pollen-sacs and stigmas, according to a new study.

• **Giant bacterium contains genomes for an entire population** [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its “normal” counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as *Achromatium* can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria aficionados...

• [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Tick tock: Biologists show wildlife loss and climate change can synergistically increase tick abundance and the risk of tick-borne disease**](#) [周三, 06 9月 23:46]

Around the world, ticks are one of the most important vectors of zoonotic diseases -- animal diseases communicable to humans -- and they're everywhere. New research suggests that the abundance of ticks that carry certain fevers are likely to rise in the future, thanks to a combination of wildlife loss and climate change.

• [**Substance in coffee delays onset of diabetes in laboratory mice**](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

• [**Cloud formation suppressed by biogenic organic emissions**](#) [周三, 06 9月 22:36]

Evidence has been found that near-ground biogenic emissions of organics suppress cloud formation in cool-temperate forests in autumn, providing clues to how global warming will affect cloud formation and the overall climate.

• [**Colon of patients with IBS reacts differently to bacteria**](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

• [**Unraveling a major cause of sea ice retreat in the Arctic Ocean**](#) [周三, 06 9月 22:36]

Quantitative analysis has evidenced the acceleration system of melting ice: dark water surfaces absorb more heat than white ice surfaces, thus melting ice and making more water surfaces in the Arctic Ocean.

• [**Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens**](#) [周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

• [**Protein that extends life of yeast cells**](#) [周三, 06 9月 22:35]

To understand and control aging is the aspiration of many scientists. Researchers have now discovered that the protein Gcn4 decreases protein synthesis and extends the life of yeast cells. Understanding how individual genes affect lifespan opens new ways to control the aging process and the occurrence of aging-related diseases.

• [**Bacteria responsible for legionellosis modulates the host cell metabolism to its advantage**](#) [周三, 06 9月 22:35]

The bacterial pathogen *Legionella pneumophila* has developed a specific

strategy to target the host cell mitochondria, the organelles in charge of cellular bioenergetics, scientists have shown. New work provides precious information on how a pathogen manipulates the cellular metabolism to replicate intracellularly, and proposes a new concept of protection of host cells from Legionella-induced mitochondrial changes in order to fight infection.

Research dog helps scientists save endangered carnivores [周三, 06 9月 22:35]

Scat-sniffing research dogs are helping scientists map out a plan to save reclusive jaguars, pumas, bush dogs and other endangered carnivores in the increasingly fragmented forests of northeastern Argentina, according to a new study.

Will mallards hybridize their cousins out of existence? [周三, 06 9月 22:35]

Mallards -- the familiar ducks of city parks -- are one of a group of closely related species, many of which are far less common. Interbreeding can threaten the genetic distinctiveness of those other species and cause concern for their conservation. A new study investigates hybridization between mallards and mottled ducks, a species adapted for life in coastal marshes, and finds that while hybridization rates are currently low, human activity could cause them to rise in the future.

Biologists slow aging, extend lifespan of fruit flies [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

Clever cockatoos bend hooks into straight wire to fish for food [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow

Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

• [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

• [**Invasive plants change ecosystems from the bottom up**](#) [周三, 06 9月 02:56]

Even when two different Phragmite lineages are grown side-by-side in the same ecosystem, the bacterial communities in the soil differ dramatically. This is a discovery that will aid in understanding how plant invasions get started and the conditions necessary for their success.

• [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

• [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

• [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

· [Could switchgrass help China's air quality?](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

· [Oregon's marijuana legalization prompted big drop in sales in Washington's border counties](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

· [Birds choose mates with ornamental traits](#) [周三, 06 9月 00:57]

A recurring theme in nature documentaries is that of choosy females selecting brightly colored males. A new study shows that, in monogamous mating systems, male birds may select their lifelong mates in much the same way.

· [First detailed decoding of complex finger millet genome](#) [周三, 06 9月 00:56]

Finger millet has two important properties: The grain is rich in important minerals and resistant towards drought and heat. Thanks to a novel combination of state-of-the-art technologies, researchers were able to decode the large and extremely complex genome of finger millet in high quality for the first time. This represents a fundamental basis for improving food security in countries like India and parts of Africa.

· [Cell marking opens up a window into the body](#) [周三, 06 9月 00:35]

Researchers have developed new methods to track cells in mice which could help to reduce animal experiments.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the

organization of the brain's attention network.

- [**Academic argues for changes in the laws governing modern warfare**](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

- [**Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease**](#) [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

- [**Study quantifies potential for water reuse in Permian basin oil production**](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals

subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

· [**Oregon's marijuana legalization prompted big drop in sales in Washington's border counties**](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

· [**PSA screening significantly reduces the risk for death from prostate cancer**](#) [周二, 05 9月 06:17]

After differences in implementation and settings were accounted for, two important prostate cancer screening trials provide compatible evidence that screening reduces prostate cancer mortality.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Climate change for aliens](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [Australian Magpie 'dunks' its food before eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- ['Vampires' may have been real people with this blood disorder](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [Giant bacterium contains genomes for an entire population](#) [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its "normal" counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as *Achromatium* can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria

aficiona...

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Folic acid may mitigate autism risk from pesticides**](#) [周六, 09 9月 08:55]

Researchers have shown that mothers who take recommended amounts of folic acid around conception might reduce their children's pesticide-related autism risk.

- [**When electrons ride a wave**](#) [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

- [**Scientists unravel new insights into promising semiconductor material**](#) [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

- [**An officer and a gentlewoman from the Viking**](#)

[army in Birka](#) [周六, 09 9月 08:55]

War was not an activity exclusive to males in the Viking world. A new study shows that women could be found in the higher ranks at the battlefield.

• [Immune cells help fat deal with environmental challenges](#) [周六, 09 9月 08:55]

Immunosuppressive regulatory T-cells play an important role in the functioning of adipose tissue.

• [Are we being watched? Tens of other worlds could spot the Earth](#) [周六, 09 9月 08:55]

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

• [High-speed quantum memory for photons](#) [周六, 09 9月 08:54]

Physicists have developed a memory that can store photons. These quantum particles travel at the speed of light and are thus suitable for high-speed data transfer. The researchers were able to store them in an atomic vapor and read them out again later without altering their quantum mechanical properties too much. This memory technology is simple and fast and it could find application in a future quantum Internet.

• [How to draw electricity from the bloodstream](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

• [Better understanding of 'one of the most complex organs' for better lung treatments](#) [周五, 08 9月 02:45]

Details of lung cell molecular pathways that promote or inhibit tissue regeneration have been reported by researchers. Their aim is to find new ways to treat lung disorders.

- [**Interrupting Parkinson's disease**](#) [周五, 08 9月 02:30]

Scientists have identified a toxic cascade that leads to neuronal degeneration in patients with Parkinson's disease and figured out how to interrupt it, reports a study. Intervening with an antioxidant early in the disease process may break the degenerative cycle and improve neuron function in Parkinson's, the study showed. Parkinson's is second most common neurodegenerative disorder.

- [**Mediterranean-style diet may eliminate need for reflux medications**](#) [周五, 08 9月 02:30]

A plant-based, Mediterranean-style diet has been shown to provide the same medical benefits for treating laryngopharyngeal reflux as popular reflux medications, according to new research.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Why are fossilized hairs so rare?**](#) [周五, 08 9月 02:27]

When it comes to preserving body parts, fossilized hair is rare--five times rarer than feathers--despite being an important tool for understanding ancient species. This finding has researchers trying to determine if the lack of hair in the fossil record has to do with physical traits that might make it more difficult for hair to fossilize, or an issue with scientists' collection techniques that could lead to them missing important finds.

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

• **Circadian clock's inner gears** [周五, 08 9月 02:26]

A set of core clock proteins organize themselves into a handful of molecular machines that control the precise workings of the body's circadian rhythms, new research has found.

• **Discovery of chromosome motor supports DNA loop extrusion** [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

• **Researchers closer to uncovering a new feature in heart failure** [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find**](#) [周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

• [Ultraviolet light from superluminous supernova key to revealing explosion mechanism](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

Folic acid may mitigate autism risk from pesticides -- ScienceDaily

Researchers at UC Davis and other institutions have shown that mothers who take recommended amounts of folic acid around conception might reduce their children's pesticide-related autism risk.

In the study, children whose mothers took 800 or more micrograms of folic acid (the amount in most prenatal vitamins) had a significantly lower risk of developing autism spectrum disorder (ASD) -- even when their mothers were exposed to household or agricultural pesticides associated with increased risk. The study appears today in the journal *Environmental Health Perspectives*.

"We found that if the mom was taking folic acid during the window around conception, the risk associated with pesticides seemed to be attenuated," said Rebecca J. Schmidt, assistant professor in the Department of Public Health Sciences and first author on the paper. "Mothers should try to avoid pesticides. But if they live near agriculture, where pesticides can blow in, this

might be a way to counter those effects."

In the paper, which used data from the Childhood Autism Risks from Genetics and the Environment (CHARGE) study, researchers looked at 296 children between 2 and 5 who had been diagnosed with ASD and 220 who had developed typically. Mothers were interviewed about their household pesticide exposure during pregnancy, as well as their folic acid and B vitamin intake. The team also linked data from California Pesticide Use reports, which provide important details about agricultural spraying, with the mothers' addresses.

Mothers who took less than 800 micrograms and encountered household pesticides had a much higher estimated risk of having a child who developed an ASD than moms who took 800 micrograms of folic acid or more and were not exposed to pesticides. The associated risk increased for women exposed repeatedly. Women with low folic acid intake who were exposed to agricultural pesticides during a window from three months before conception to three months afterward also were at higher estimated risk.

"Folic acid intake below the median and exposure to

pesticides was associated with higher risk of autism than either low intake or exposure alone," said Schmidt, a UC Davis MIND Institute faculty member. "The mothers who had the highest risk were the ones who were exposed to pesticides regularly."

While folic acid did reduce the associated risk of a child developing autism, it did not entirely eliminate it.

"It would be better for women to avoid chronic pesticide exposure if they can while pregnant," Schmidt said.

The authors caution that this is a case-control study that relied heavily on participants' memories. In addition, they have yet to establish a causal link. However, these results certainly warrant larger studies to validate them. The team is also eager to investigate the mechanisms that contribute to folic acid's possible protective effects.

"Folate plays a critical role in DNA methylation (a process by which genes are turned off or on), as well as in DNA repair and synthesis," said Schmidt. "These are all really important during periods of rapid growth when there are lots of cells dividing, as in a developing

fetus. Adding folic acid might be helping out in a number of these genomic functions."

Scientists unravel new insights into promising semiconductor material -- ScienceDaily

Researchers from the National University of Singapore (NUS) have established new findings on the properties of two-dimensional molybdenum disulfide (MoS_2), a widely studied semiconductor of the future.

In two separate studies led by Professor Andrew Wee and Assistant Professor Andriwo Rusydi from the Department of Physics at the NUS Faculty of Science, the researchers uncovered the role of oxygen in MoS_2 , and a novel technique to create multiple tunable, inverted optical band gaps in the material. These novel insights deepen the understanding of the intrinsic properties of MoS_2 which could potentially transform its applications in the semiconductor industry.

The studies were published in scientific journals *Physical Review Letters* and *Nature Communications* respectively.

MoS₂ -- An alternative to graphene

MoS₂ is a semiconductor-like material that exhibits desirable electronic and optical properties for the development and enhancement of transistors, photodetectors and solar cells.

Prof Wee explained, "MoS₂ holds great industrial importance. With an atomically thin two-dimensional structure and the presence of a 1.8eV energy band gap, MoS₂ is a semiconductor that can offer broader applications than graphene which lacks a band gap."

Presence of oxygen alters the electronic and optical properties of MoS₂

In the first study published in *Physical Review Letters* on 16 August 2017, NUS researchers conducted an in-depth analysis which revealed that the energy storage capacity or dielectric function of MoS₂ can be altered using oxygen.

The team observed that MoS₂ displayed a higher dielectric function when exposed to oxygen. This new knowledge shed light on how adsorption and

desorption of oxygen by MoS₂ can be employed to modify its electronic and optical properties to suit different applications. The study also highlights the need for adequate consideration of extrinsic factors that may affect the properties of the material in future research.

The first author of this paper is Dr Pranjali Kumar Gogoi from the Department of Physics at NUS Faculty of Science.

MoS₂ can possess two tunable optical band gaps

In the second study published in *Nature Communications* on 7 September 2017, the team of NUS researchers discovered that as opposed to conventional semiconductors which typically have only one optical band gap, electron doping of MoS₂ on gold can create two unusual optical band gaps in the material. In addition, the two optical bandgaps in MoS₂ are tunable via a simple, straight forward annealing process.

The research team also identified that the tunable optical band gaps are induced by strong-charge lattice coupling as a result of the electron doping.

The first author of this second paper is Dr Xinmao Yin from the Department of Physics at NUS Faculty of Science.

The research findings from the two studies lend insights to other materials that possess similar structure with MoS₂.

"MoS₂ falls under a group of material known as the two-dimensional transitional metal dichalcogenides (2D-TMDs) which are of great research interest because of their potential industrial applications. The new knowledge from our studies will assist us in unlocking the possibilities of 2D-TMD-based applications such as the fabrication of 2D-TMD-based field effect transistors," said Asst Prof Rusydi.

Leveraging the findings of these studies, the researchers will apply similar studies to other 2D-TMDs and to explore different possibilities of generating new, valuable properties in 2D-TMDs that do not exist in nature.

An officer and a gentlewoman from the Viking army in Birka -- ScienceDaily

War was not an activity exclusive to males in the Viking world. A new study conducted by researchers at Stockholm and Uppsala Universities shows that women could be found in the higher ranks at the battlefield.

Charlotte Hedenstierna-Jonson, who led the study, explains: "What we have studied was not a Valkyrie from the sagas but a real life military leader, that happens to be a woman."

The study was conducted on one of the most iconic graves from the Viking Age. It holds the remains of a warrior surrounded by weapons, including a sword, armour-piercing arrows, and two horses. There were also a full set of gaming pieces and a gaming board. "The gaming set indicates that she was an officer," says Charlotte, "someone who worked with tactics and strategy and could lead troops in battle." The warrior was buried in the Viking town of Birka during the mid-10th century. Isotope analyses confirm an itinerant life

style, well in tune with the martial society that dominated 8th to 10th century northern Europe.

Anna Kjellström, who also participated in the study, has taken an interest in the burial previously. "The morphology of some skeletal traits strongly suggests that she was a woman, but this has been the type specimen for a Viking warrior for over a century why we needed to confirm the sex in any way we could."

And this is why the archaeologists turned to genetics, to retrieve a molecular sex identification based on X and Y chromosomes. Such analyses can be quite useful according to Maja Krezwinska: "Using ancient DNA for sex identification is useful when working with children for example, but can also help to resolve controversial cases such as this one." Maja was thus able to confirm the morphological sex identification with the presence of X chromosomes but the lack of a Y chromosome.

Jan Storå, who holds the senior position on this study, reflects over the history of the material: "This burial was excavated in the 1880ies and has served as a model of a professional Viking warrior ever since. Especially, the grave-goods cemented an interpretation

for over a century." It was just assumed she was a man through all these years. "The utilization of new techniques, methods, but also renewed critical perspectives, again, shows the research potential and scientific value of our museum collections."

The study is a part of the ongoing ATLAS project, which is a joint effort by Stockholm University and Uppsala University, supported by Riksbankens Jubileumsfond (The Swedish Foundation for Humanities and Social Sciences) and Vetenskapsrådet (The Swedish Research Council), to investigate the genetic history of Scandinavia.

Immune cells help fat deal with environmental challenges -- ScienceDaily

Immunosuppressive regulatory T-cells play an important role in the functioning of adipose tissue. This is the discovery of scientists from the Helmholtz Diabetes Center (HDC) at Helmholtz Zentrum München and the Technical University of Munich (TUM). Their findings are published in the journal *Cell Metabolism*.

The number of obese people as well as those suffering from type 2 diabetes is increasing worldwide. Both disorders are associated with metabolic changes including amplified inflammatory responses in adipose tissue. "Previous studies have indicated that immunosuppressive regulatory T-cells -- or Tregs for short -- play an important role in these processes," explains the leader of the study Dr. Carolin Daniel, group leader at the Institute for Diabetes Research (IDF) of the Helmholtz Zentrum München and a scientist in the German Center for Diabetes Research

(DZD). "We now wanted to examine how these immune cells might support adipose function in more detail."

In an experimental model, Daniel, together with co-first authors Dr. Stefanie Kälin and Maike Becker and colleagues, determined that the number of Tregs in adipose tissue increases in response to different environmental stimuli. These stimuli included a short-term cold treatment, stimulation of the sympathetic nervous system (β -adrenoreceptors) or short-term high-caloric exposure. "All these stimuli supported those immunosuppressive cells directly in the adipose tissue," says Becker.

Fat burning activated

The magnitude of the increase in Tregs differed depending on the type of adipose tissue: it was particularly pronounced in brown fat, somewhat weaker in subcutaneous fat and weakest in visceral fat. To investigate the specific function of Tregs, the researchers determined how gene expression changes in adipose tissue. Especially in brown fat, genes were activated that promote heat production (thermogenesis) as well as those that are used for the breakdown

(lipolysis) and burning (oxidation) of fatty acids. Subsequent experiments revealed that the signalling molecules Stat6 und Pten play a vital role in this process.

"A better understanding of the immunological mechanisms involved in the target tissue will be critical for the development of personalized interventions in order to improve adipose tissue function during obesity and diabetes," says the leader of the study Carolin Daniel. "Our experiments show for the first time that Tregs can support fat depots in dealing with environmental challenges."

"Our findings highlight the complex interactions between our body and the environment. We have known for a while that hormones play a key role here - - but now have to accept that immune cells may be just as important for a balanced metabolism," comments Prof. Dr. Matthias Tschöp. He is the scientific director of the HDC at Helmholtz Zentrum München and holds the chair for metabolic diseases at the TUM. "These insights therefore help us tremendously with designing more efficient ways to therapeutically optimize when and how to store calories."

Prof. Dr. Matthias Mann from the Max Planck Institute of Biochemistry in Martinsried as well as the group of PD Dr. Benno Weigmann from Universitätsklinikum Erlangen also made significant contributions to the study.

All Top News

Top science stories featured on ScienceDaily's home page.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

[**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

[**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

[**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

[**How monkey fights grow**](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

[**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal

categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

• [**Biologists slow aging, extend lifespan of fruit flies**](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

• [**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows,

cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Eat fat, live longer?**](#) [周三, 06 9月 02:55]

As more people live into their 80s and 90s, researchers have delved into the issues of health and quality of life during aging. A recent mouse study sheds light on those questions by demonstrating that a high fat, or ketogenic, diet not only increases longevity, but improves physical strength.

- [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

• [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

• [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

• [**Contagious yawning more closely associated with perceptual sensitivity than empathy**](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

• [**Discovery of boron on Mars adds to evidence for habitability**](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

• [**'Extreme' telescopes find the second-fastest-spinning pulsar**](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

• [**CRISPR technology used to change flower color**](#)

[周三, 06 9月 00:32]

In a world-first, scientists have used the revolutionary CRISPR, or CRISPR/Cas9, genome-editing tool to change flower color in an ornamental plant.

- [**The sniff test of self-recognition confirmed: Dogs have self-awareness**](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

- [**Zika virus kills brain cancer stem cells**](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

- [**Was the primordial soup a hearty pre-protein stew?**](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

- [**Face value: Brain's ability to recognize faces is shaped through repeated exposure, study suggests**](#) [周二, 05 9月 00:04]

Scientists have long deemed the ability to recognize faces innate for people and other primates -- something our brains just know how to do immediately from birth. However, the findings of a new study cast doubt on this longstanding view.

- [**More 'losers' than 'winners' predicted for Southern Ocean seafloor animals**](#) [周二, 05 9月 00:04]

A new study of the marine invertebrates living in the seas around Antarctica reveals there will be more 'losers' than 'winners' over the next century as the Antarctic seafloor warms.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Folic acid may mitigate autism risk from pesticides**](#) [周六, 09 9月 08:55]

Researchers have shown that mothers who take recommended amounts of folic acid around conception might reduce their children's pesticide-related autism risk.

- [**Immune cells help fat deal with environmental challenges**](#) [周六, 09 9月 08:55]

Immunosuppressive regulatory T-cells play an important role in the functioning of adipose tissue.

- [**How to draw electricity from the bloodstream**](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

- [**Better understanding of 'one of the most complex organs' for better lung treatments**](#) [周五, 08 9月 02:45]

Details of lung cell molecular pathways that promote or inhibit tissue regeneration have been reported by researchers. Their aim is to find new ways to treat lung disorders.

- [**Mediterranean-style diet may eliminate need for reflux medications**](#) [周五, 08 9月 02:30]

A plant-based, Mediterranean-style diet has been shown to provide the same medical benefits for treating laryngopharyngeal reflux as popular reflux medications, according to new research.

- [**Cilia: 'The bouncer' of bacteria**](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

- [**Circadian clock's inner gears**](#) [周五, 08 9月 02:26]

A set of core clock proteins organize themselves into a handful of molecular machines that control the precise workings of the body's circadian rhythms, new research has found.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**Researchers closer to uncovering a new feature in heart failure**](#) [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

- [**Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find**](#) [周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that

suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Producing malaria treatment at large scales**](#) [周五, 08 9月 00:56]

For the first time, production of the anti-malarial drug artemisinin has been achieved at an industrial scale using genetically engineered moss. This offers new hope for stabilizing artemisinin supplies and combatting malaria.

- [**What makes alcoholics drink? Research shows it's more complex than supposed**](#) [周五, 08 9月 00:02]

What makes alcoholics drink? New research has found that in both men and women with alcohol dependence, the major factor predicting the amount of drinking seems to be a question of immediate mood. Surprisingly men with a history of depression were drinking less often than men who were not depressed. This probably means that alcohol treatment needs to be individually tailored.

- [**Cellular tango: Immune and nerve cells work together to fight gut infections**](#) [周四, 07 9月 23:24]

Nerve cells in the gut play a crucial role in the body's ability to marshal an immune response to infection, according to a new study.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that

monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Link between positive emotions and health depends on culture**](#) [周四, 07 9月 23:24]

Positive emotions are often seen as critical aspects of healthy living, but new research suggests that the link between emotion and health outcomes may vary by cultural context. The findings show that experiencing positive emotions is linked with better cardiovascular health in the US but not in Japan.

- [**Using antidepressants during pregnancy may affect your child's mental health**](#) [周四, 07 9月 23:24]

The use of antidepressants during pregnancy increases the risk of your child being diagnosed with a psychiatric disorder later in life, a study of almost one million Danish children shows. However, heritability also plays a part, according to the researchers.

- [**Biomarkers as predictive of sepsis as lengthy patient monitoring**](#) [周四, 07 9月 23:23]

One measurement of key biomarkers in blood that characterize sepsis can give physicians as much information as hours of monitoring symptoms, a new study found.

- [**Connection between low oxygen levels, human gene discovered**](#) [周四, 07 9月 23:23]

Researchers have established a link between hypoxia, a condition that

reduces the flow of oxygen to tissues, and HOTAIR, a noncoding RNA or molecule that has been implicated in several types of cancer.

- [**You are what you think you eat**](#) [周四, 07 9月 22:43]

Despite eating the same breakfast, made from the same ingredients, people consumed more calories throughout the day when they believed that one of the breakfasts was less substantial than the other, investigators have found.

- [**Fifty–fifty split best for children of divorce, study suggests**](#) [周四, 07 9月 22:43]

Preschool children in joint physical custody have less psychological symptoms than those who live mostly or only with one parent after a separation. In a new study of 3,656 children, researchers show that 3–5-year-olds living alternately with their parents after a separation show less behavioral problems and psychological symptoms than those living mostly or only with one of the parents.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Genes behind gestation length, preterm delivery identified**](#) [周四, 07 9月 22:39]

The genes that regulate gestational length and the likelihood of preterm delivery, have been identified in a study involving more than 50,000 women. An article describes the scientific breakthrough that can lead to improved health and survival among children.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay

faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Sometimes you shouldn't say sorry**](#) [周四, 07 9月 22:24]

Being socially rejected can be a painful emotional experience -- but being told sorry may not soften the blow, finds a new study. Contrary to popular belief, apologies increase hurt feelings and the need to express forgiveness, but do not increase feelings of forgiveness, for the person being rebuffed.

- [**Trigger for fatty liver in obesity**](#) [周四, 07 9月 22:24]

Morbid obesity affects the liver: almost one-third of all adults suffer from chronic fatty liver disease, which can lead to infections and even trigger cancer. Researchers have now found a signaling pathway in cells that play an important role in the development of fatty liver disease.

- [**Want your question answered quickly? Use gestures as well as words**](#) [周四, 07 9月 22:23]

When someone asks a question during a conversation, their conversation partner answers more quickly if the questioner also moves their hands or head to accompany their words. The study focuses on how gestures influence language processing.

- [**Intermittent electrical brain stimulation**](#)

improves memory [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

Long-term opioid prescription use jumps threefold over 16-year period, study suggests [周四, 07 9月 22:23]

Opioid prescription use increased significantly between 1999 and 2014, new research has found, and that much of that increase stemmed from patients who'd been taking their medication for 90 days or longer.

A tiny device offers insights to how cancer spreads [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

Uncovering the mechanism behind heart failure, mortality in sepsis [周四, 07 9月 21:36]

Of the nearly 1 million people in the US who are affected by sepsis annually, almost one-fifth die. Cardiovascular complications account for approximately 80 percent of those deaths. Now, researchers describe the mechanism underlying the loss of energy from heart dysfunction in sepsis, opening the way for the development of a new therapy that could save thousands of lives annually.

Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

- [**Link established between a molecular driver of melanoma, novel therapeutic agent**](#) [周四, 07 9月 21:36]

Scientists have described a correlation between a key melanoma signaling pathway and a novel class of drugs being tested in the clinic as adjuvant therapy for advanced melanoma, providing useful information for a more effective use of this type of treatment.

- [**How do close relationships lead to longer life?**](#) [周四, 07 9月 21:36]

While recent research has shown that loneliness can play a role in early death, psychologists are also concerned with the mechanisms by which social relationships and close personal ties affect health. New research offers an overview of the science and makes the case for psychological scientists to work together to make close relationships a public health priority.

- [**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

- [**Drivers don't ignore a ringing phone but do ignore the risk**](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

- [**Improved stem cell transplantation therapies?**](#) [周四, 07 9月 21:36]

Researchers have demonstrated that hematopoietic stem cell (HSC) transplants can be improved by treatments that temporarily prevent the

stem cells from dying. The approach could allow those in need of such transplants, including leukemia and lymphoma patients, to be treated with fewer donor stem cells while limiting potential adverse side effects.

- **[Cheaper, faster test for E. coli in drinking water](#)**

[周四, 07 9月 21:36]

Researchers have invented a fast, affordable way for developing communities to test their drinking water for potentially deadly E. coli.

- **[Tooth trouble: Many middle-aged adults report dental pain, embarrassment and poor prevention](#)**

[周四, 07 9月 21:36]

The dental health of middle-aged Americans faces a lot of problems right now, and an uncertain future to come, according to new national poll results. One in three Americans between the ages of 50 and 64 say they're embarrassed by the condition of their teeth, and that dental problems have caused pain or other problems in the past two years. Forty percent of those polled don't get regular cleanings or other preventive oral care.

- **[Ebola: Early immune response provides insight into vaccination](#)**

[周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

- **[Chronic bronchitis: New insights could lead to first diagnostic test, better treatments](#)**

[周四, 07 9月 10:12]

Researchers describe how the concentration of mucins -- the proteins that make mucus thick -- is abnormally high in chronic bronchitis and that high mucin concentrations are associated with disease severity in people with chronic bronchitis. This finding could become the first-ever

objective marker of chronic bronchitis and lead to the creation of diagnostic and prognostic tools.

- [**Discovery of genes linked to preterm birth in landmark study**](#) [周四, 07 9月 10:12]

A massive international DNA analysis of pregnant women has identified for the first time six gene regions that influence the length of pregnancy and the timing of birth. The findings may lead to new ways to prevent preterm birth and its consequences -- the leading cause of death among children under age 5 worldwide.

- [**Human genetics studies reveal new targets to reduce heart disease**](#) [周四, 07 9月 05:06]

Again and again, it's the rare among humans that help the rest of us. The exploration of human genetics is revealing new targets to combat heart disease among atypical variants. Mutations in genes that play a role in heart health are the inspiration for a cluster of new heart drugs.

- [**Honeybees could play a role in developing new antibiotics**](#) [周四, 07 9月 05:06]

An antimicrobial compound made by honeybees could become the basis for new antibiotics, according to new research.

- [**Statins reduce deaths from coronary heart disease by 28 per cent in men, according to longest ever study**](#) [周四, 07 9月 05:04]

A new study focused on men with high levels of 'bad' cholesterol and no other risk factors or signs of heart disease.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

• [**When electrons ride a wave**](#) [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

• [**Scientists unravel new insights into promising semiconductor material**](#) [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

• [**Are we being watched? Tens of other worlds could spot the Earth**](#) [周六, 09 9月 08:55]

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

• [**High-speed quantum memory for photons**](#) [周六, 09 9月 08:54]

Physicists have developed a memory that can store photons. These quantum particles travel at the speed of light and are thus suitable for high-speed data transfer. The researchers were able to store them in an atomic vapor and read them out again later without altering their

quantum mechanical properties too much. This memory technology is simple and fast and it could find application in a future quantum Internet.

- [**How to draw electricity from the bloodstream**](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

- [**Lignin: Much more valuable than just as waste**](#) [周五, 08 9月 00:03]

Lignin, a substance considered as a waste product in biomass and ethanol production, will now reach its proper value as bio-oil in new products.

- [**Scanning tunneling microscopy measurements identify active sites on catalyst surfaces**](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

- [**'Rubber material' discovered that could lead to scratch-proof paint for car**](#) [周五, 08 9月 00:02]

A stretchy miracle material has been discovered that could be used to create highly resistant smart devices and scratch-proof paint for cars, report investigators.

- [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**New dental imaging method uses squid ink to**](#)

[fish for gum disease](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

[Ultraviolet light from superluminous supernova key to revealing explosion mechanism](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

[Fast magnetic writing of data](#) [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

[Intermittent electrical brain stimulation improves memory](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

[A tiny device offers insights to how cancer spreads](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

[Drivers don't ignore a ringing phone but do](#)

[ignore the risk](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

• **[Water-based lithium-ion batteries that don't explode now created](#)** [周四, 07 9月 05:01]

For the first time a lithium-ion battery has been developed that uses a water-salt solution as its electrolyte and reaches the 4.0 volt mark desired for household electronics, such as laptop computers, without the fire and explosive risks associated with some commercially available non-aqueous lithium-ion batteries.

• **[Study quantifies potential for water reuse in permian basin oil production](#)** [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

• **[Researchers challenge status quo of battery commercialization](#)** [周四, 07 9月 05:01]

Researchers are looking to the pharmaceutical industry to propose an updated model of US battery commercialization.

• **[New device accurately identifies cancer in seconds](#)** [周四, 07 9月 02:49]

A team of scientists and engineers has invented a powerful tool that rapidly and accurately identifies cancerous tissue during surgery,

delivering results in about 10 seconds. The MasSpec Pen is an innovative handheld instrument that gives surgeons precise diagnostic information about what tissue to cut or preserve, helping improve treatment and reduce the chances of cancer recurrence.

• [Particle physicists on a quest for 'new physics'](#) [周四, 07 9月 02:29]

The Large Hadron Collider (LHC) at CERN, the European Organization for Nuclear Research, produces hundreds of millions of proton collisions per second. But researchers working on the Large Hadron Collider beauty (LHCb) experiment can only record 2,000 of those collisions, using one of the detectors installed on the accelerator. So in the end, this technological marvel leaves the physicists wanting more. They are convinced that the vast volume of uncaptured data holds the answers to several unreso...

• [Earth as hybrid planet: New classification places Anthropocene era in astrobiological context](#) [周四, 07 9月 01:55]

A new classification scheme has been devised for the evolutionary stages of worlds based on 'non-equilibrium thermodynamics' -- a planet's energy flow being out of sync, as the presence of life could cause.

• [Researchers report new way to make dissolving electronics](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [Supercharging silicon batteries](#) [周三, 06 9月 22:36]

Scientists have designed a novel silicon-based anode to provide lithium batteries with increased power and better stability.

• [Quantum tech has its sights set on human biochemistry](#) [周三, 06 9月 22:36]

Scientists have developed a new tool for imaging life at the nanoscale

that will provide new insights into the role of transition metal ions such as copper in neurodegenerative diseases.

- [**Green light for ultra-fine display colors**](#) [周三, 06 9月 22:36]

Chemical engineers have succeeded in generating ultra-pure green light for the first time. The new light-emitting diode will pave the way for visibly improved color quality in a new generation of ultra-high definition displays for TVs and smartphones.

- [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

- [**New tool for characterizing quantum simulators**](#)

[周三, 06 9月 22:35]

Physicists are developing quantum simulators, to help solve problems that are beyond the reach of conventional computers. However, they first need new tools to ensure that the simulators work properly. Researchers have now implemented a new technique in the laboratory that can be used to efficiently characterize the complex states of quantum simulators. The technique could become a new standard tool for characterizing quantum simulators.

- [**Keychain detector could catch food allergens before it's too late**](#) [周三, 06 9月 22:35]

For kids and adults with food allergies, a restaurant outing can be a fraught experience. Even when care is taken, freshly prepared or packaged meals can accidentally become cross-contaminated with an offending food and trigger a reaction. Now researchers report the development of a new portable allergen-detection system -- including a keychain analyzer -- that could help prevent trips to the emergency room.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

- [**Superhuman 'night' vision during the total eclipse?**](#) [周三, 06 9月 04:40]

It was dark as night during the recent total solar eclipse, yet people and objects were easier to see than on a typical moonless night. Scientists have discovered a possible biological explanation -- the presence (or absence) of a protein in the retina known as a GABA receptor.

- [**Mobile phone use while pregnant not linked to child neurodevelopment problems, study suggests**](#) [周三, 06 9月 02:55]

Mobile phone use during pregnancy is unlikely to have any adverse effects on child neurodevelopment, according to new research. These findings provide further evidence that exposure to radio frequency electromagnetic fields associated with maternal use of mobile phones during pregnancy is not linked to neurodevelopment in children.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

- [**More durable, less expensive fuel cells**](#) [周三, 06 9月 01:44]

A new technology has been created that could make fuel cells cheaper and more durable. Hydrogen-powered fuel cells are a green alternative

to internal combustion engines because they produce power through electrochemical reactions, leaving no pollution behind. Platinum is the most common catalyst in the type of fuel cells used in vehicles, but it's expensive. The UD team used a novel method to come up with a less expensive catalyst.

• [Nanoparticles limit damage in spinal cord injury](#)

[周三, 06 9月 01:44]

After a spinal cord injury, significant secondary nerve damage is caused by inflammation and internal scarring that inhibits the ability of the nervous system to repair itself. A biodegradable nanoparticle injected after a spinal cord trauma prevented the inflammation and internal scarring that inhibits the repair process, reports a new study.

• [Unique study tests fundamental laws of physics](#) [周

三, 06 9月 00:54]

A study that will 'test our understanding of how the Universe works, particularly outside the relatively narrow confines of our planet' is being undertaken by an international team of researchers.

• [Solubility study could impact energy, biology, environment](#) [周三, 06 9月 00:32]

Chemical engineers have used the most realistic computer model yet devised to simulate the precise atomic and molecular interactions that come into play when water mixes with alkanes, a family of hydrocarbons that includes methane, propane and other refined products.

• [Surgeons create 'vacuum' procedure to remove infected pacemaker](#) [周三, 06 9月 00:32]

Electrophysiologists get creative in removing infected pacemaker wires of a patient unable to have open heart surgery. He would have died if they didn't use a 'vacuum' typically used to remove foreign objects.

• [Discovery of boron on Mars adds to evidence for habitability](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

[**. Glowing cancer tool illuminates benign, but dangerous, brain tumors during pituitary surgery**](#) [周三, 06 9月 00:32]

An experimental imaging tool that uses a targeted fluorescent dye successfully lit up the benign brain tumors of patients during removal surgery, allowing surgeons to identify tumor tissue, a new study shows.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**An officer and a gentlewoman from the Viking army in Birka**](#) [周六, 09 9月 08:55]

War was not an activity exclusive to males in the Viking world. A new study shows that women could be found in the higher ranks at the battlefield.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Why are fossilized hairs so rare?**](#) [周五, 08 9月 02:27]

When it comes to preserving body parts, fossilized hair is rare--five times rarer than feathers--despite being an important tool for understanding ancient species. This finding has researchers trying to determine if the lack of hair in the fossil record has to do with physical traits that might make it more difficult for hair to fossilize, or an issue with scientists' collection techniques that could lead to them missing important finds.

- [**Cilia: 'The bouncer' of bacteria**](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

- [**Eighteenth century nautical charts reveal coral loss**](#) [周五, 08 9月 02:27]

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in

preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Hidden Inca treasure: Remarkable new tree genus discovered in the Andes**](#) [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

- [**Algorithm reconstructs processes from individual images**](#) [周四, 07 9月 22:24]

Researchers have developed a new method for reconstructing continuous biological processes, such as disease progression, using image data.

- [**Australian Magpie 'dunks' its food before eating, researchers find**](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in

water before eating, a process that appears to be 'copied' by its offspring.

- [**Increasing effective decision-making for coastal marine ecosystems**](#) [周四, 07 9月 22:23]

Marine restoration, rather than protection, might be the most cost-effective solution for coastal marine ecosystems suffering from human activities, a new study has found. The study examined how to best benefit coastal marine ecosystems on limited conservation budgets, to help managers better understand the trade-offs.

- [**Breaking through the wall in bacterial membrane vesicle research**](#) [周四, 07 9月 21:36]

Researchers used advanced imaging techniques to investigate the formation of membrane vesicles in a Gram-positive bacterium, a process that is poorly understood, particularly in bacteria with thick cell walls. The consortium showed that membrane vesicle formation was triggered by an enzyme called endolysin that damages the cell wall to create holes that allow the release of membrane vesicles. This mechanism could be exploited for the mass production of bacterial vesicles.

- [**How monkey fights grow**](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

- [**Ebola: Early immune response provides insight into vaccination**](#) [周四, 07 9月 21:36]

The latest outbreaks of emerging pathogens, such as Ebola or Zika, emphasize the importance of the rapid development of vaccines. However, being able to predict the efficacy of new vaccines remains a challenge in vaccine development. Scientists have now successfully assessed early on the longer-term immune response in humans after being vaccinated with the newly developed Ebola vaccine rVSV-ZEBOV.

- [**Honeybees could play a role in developing new**](#)

antibiotics [周四, 07 9月 05:06]

An antimicrobial compound made by honeybees could become the basis for new antibiotics, according to new research.

• **Study quantifies potential for water reuse in permian basin oil production** [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

• **Bacterial in-fighting provides new treatment for hospital infections** [周四, 07 9月 02:49]

A bacteria that is a leading cause of death worldwide from hospital acquired infections following antibiotic treatment looks set to be brought down through its own sibling rivalry.

• **Pollen stays on bee bodies right where flowers need it for pollination** [周四, 07 9月 02:49]

After grooming, bees still have pollen on body parts that match the position of flower pollen-sacs and stigmas, according to a new study.

• **Giant bacterium contains genomes for an entire population** [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its “normal” counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as Achromatium can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria aficiona...

• [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Tick tock: Biologists show wildlife loss and climate change can synergistically increase tick abundance and the risk of tick-borne disease**](#) [周三, 06 9月 23:46]

Around the world, ticks are one of the most important vectors of zoonotic diseases -- animal diseases communicable to humans -- and they're everywhere. New research suggests that the abundance of ticks that carry certain fevers are likely to rise in the future, thanks to a combination of wildlife loss and climate change.

• [**Substance in coffee delays onset of diabetes in laboratory mice**](#) [周三, 06 9月 22:37]

Substances in coffee have been identified that could help quash the risk of developing type 2 diabetes. But few of these have been tested in animals. Now, scientists report that one of these previously untested compounds appears to improve cell function and insulin sensitivity in laboratory mice. The finding could spur the development of new drugs to treat or even prevent the disease.

• [**Colon of patients with IBS reacts differently to bacteria**](#) [周三, 06 9月 22:36]

The intestinal barrier of patients with the gastrointestinal disease IBS allows bacteria to pass more freely than in healthy people, according to a study. The study is the first to investigate IBS using living bacteria.

- [**Unraveling a major cause of sea ice retreat in the Arctic Ocean**](#) [周三, 06 9月 22:36]

Quantitative analysis has evidenced the acceleration system of melting ice: dark water surfaces absorb more heat than white ice surfaces, thus melting ice and making more water surfaces in the Arctic Ocean.

- [**Gut microbiota of larvae has an impact on mosquito's ability to transmit human pathogens**](#) [周三, 06 9月 22:36]

Researchers have demonstrated that differential bacterial exposure during the development of mosquito larvae (*Aedes aegypti*) can have carry-over effects on adult traits related to an insect's ability to be a successful vector of arboviruses. This study represents an important step toward a more comprehensive understanding of how the environment shapes the risk of vector-borne disease.

- [**Protein that extends life of yeast cells**](#) [周三, 06 9月 22:35]

To understand and control aging is the aspiration of many scientists. Researchers have now discovered that the protein Gcn4 decreases protein synthesis and extends the life of yeast cells. Understanding how individual genes affect lifespan opens new ways to control the aging process and the occurrence of aging-related diseases.

- [**Bacteria responsible for legionellosis modulates the host cell metabolism to its advantage**](#) [周三, 06 9月 22:35]

The bacterial pathogen *Legionella pneumophila* has developed a specific strategy to target the host cell mitochondria, the organelles in charge of cellular bioenergetics, scientists have shown. New work provides precious information on how a pathogen manipulates the cellular metabolism to replicate intracellularly, and proposes a new concept of protection of host cells from *Legionella*-induced mitochondrial changes in order to fight infection.

[**Research dog helps scientists save endangered carnivores**](#) [周三, 06 9月 22:35]

Scat-sniffing research dogs are helping scientists map out a plan to save reclusive jaguars, pumas, bush dogs and other endangered carnivores in the increasingly fragmented forests of northeastern Argentina, according to a new study.

[**Will mallards hybridize their cousins out of existence?**](#) [周三, 06 9月 22:35]

Mallards -- the familiar ducks of city parks -- are one of a group of closely related species, many of which are far less common. Interbreeding can threaten the genetic distinctiveness of those other species and cause concern for their conservation. A new study investigates hybridization between mallards and mottled ducks, a species adapted for life in coastal marshes, and finds that while hybridization rates are currently low, human activity could cause them to rise in the future.

[**Biologists slow aging, extend lifespan of fruit flies**](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

[**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

- [**Invasive plants change ecosystems from the bottom up**](#) [周三, 06 9月 02:56]

Even when two different Phragmite lineages are grown side-by-side in the same ecosystem, the bacterial communities in the soil differ dramatically. This is a discovery that will aid in understanding how plant invasions get started and the conditions necessary for their success.

- [**Research shows how DNA molecules cross nanopores**](#) [周三, 06 9月 02:55]

Research sheds new light on the understanding of the measurement of polymer properties in diverse chemical industries such as plastics manufacturing and food processing, and the design of biosensors.

- [**Aeroices: Newly discovered ultralow-density ice**](#) [周三, 06 9月 02:55]

Relatively little is known about the effects of extreme negative pressure on water molecules. Exploring a significant region of negative pressure through molecular dynamic simulations, researchers have now theoretically discovered a new family of ice phases. Called aeroices, these ices have the lowest density of all known ice crystals.

- [**Eating meat linked to higher risk of diabetes**](#) [周三, 06 9月 01:45]

Higher intake of red meat and poultry is associated with significantly increased risk of developing diabetes, which is partially attributed to their higher content of heme iron in these meats, new research shows.

- [**Could switchgrass help China's air quality?**](#) [周三, 06 9月 01:45]

Researchers have proposed an idea that could improve China's air quality, but they're not atmospheric scientists. They're agronomists.

- [**Oregon's marijuana legalization prompted big**](#)

[**drop in sales in Washington's border counties**](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

• [**Birds choose mates with ornamental traits**](#) [周三, 06 9月 00:57]

A recurring theme in nature documentaries is that of choosy females selecting brightly colored males. A new study shows that, in monogamous mating systems, male birds may select their lifelong mates in much the same way.

• [**First detailed decoding of complex finger millet genome**](#) [周三, 06 9月 00:56]

Finger millet has two important properties: The grain is rich in important minerals and resistant towards drought and heat. Thanks to a novel combination of state-of-the-art technologies, researchers were able to decode the large and extremely complex genome of finger millet in high quality for the first time. This represents a fundamental basis for improving food security in countries like India and parts of Africa.

• [**Cell marking opens up a window into the body**](#) [周三, 06 9月 00:35]

Researchers have developed new methods to track cells in mice which could help to reduce animal experiments.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the

organization of the brain's attention network.

- [**Academic argues for changes in the laws governing modern warfare**](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

- [**Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease**](#) [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

- [**Study quantifies potential for water reuse in permian basin oil production**](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals

subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

· [**Oregon's marijuana legalization prompted big drop in sales in Washington's border counties**](#) [周三, 06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

· [**PSA screening significantly reduces the risk for death from prostate cancer**](#) [周二, 05 9月 06:17]

After differences in implementation and settings were accounted for, two important prostate cancer screening trials provide compatible evidence that screening reduces prostate cancer mortality.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [How to draw electricity from the bloodstream](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

- [Climate change for aliens](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [Australian Magpie 'dunks' its food before eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- ['Vampires' may have been real people with this blood disorder](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [Giant bacterium contains genomes for an entire population](#) [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its “normal” counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as Achromatium can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria aficionada...

• [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

• [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**Method controls whether freezing droplets bounce off or stick**](#) [周二, 12 9月 03:09]

Self-peeling droplets have been discovered, along with a new way to control adhesion of freezing droplets by adjusting the thermal properties of substrates. These findings could make everything from additive manufacturing to deicing more efficient.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and

deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

- [**A new genetic marker for schizophrenia**](#) [周二, 12 9月 00:27]

Scientists find a rare genetic variant that shows strong association with schizophrenia.

- [**The turbulent healing powers of plasma**](#) [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent and effective medical therapies.

- [**A novel and practical fab-route for superomniphobic liquid-free surfaces**](#) [周二, 12 9月 00:27]

Scientists have developed a fabrication technology that can inexpensively produce surfaces capable of repelling liquids, including water and oil.

- [**Connecting up the quantum internet**](#) [周二, 12 9月 00:27]

Major leap for practical building blocks of a quantum internet: New research demonstrates how to dramatically improve the storage time of a telecom-compatible quantum memory, a vital component of a global quantum network. The technology operates in the same 1550 nanometer band as today's telecommunications infrastructure. It can also be

operated as a quantum light source or used as an optical link for solid-state quantum computing devices such as superconducting qubits and silicon qubits.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

- [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- [**Muscle nuclei: May the force be with you**](#) [周二, 12 9月 00:26]

A group of researchers has revealed the mechanism by which cellular nuclei reach their position within muscle cells. This discovery can have important implications in therapeutic strategies to treat muscular diseases.

- [**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

• [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

• [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

• [**Cooperation driven by reciprocity, not conformity**](#) [周二, 12 9月 00:26]

From an evolutionary perspective, cooperating with others can yield benefits that increase chances of survival. But what are the conditions that motivate us to cooperate? New research suggests that reciprocity -- cooperation under the assumption that we will receive benefits in return -- outweighs our desire to conform with group norms when we're deciding whether to cooperate with someone.

• [**New treatment option discovered for brain injury patients suffering from aggression**](#) [周二, 12 9月 00:26]

A drug originally developed in the 1960s as an antiviral medication is showing promise as a treatment option for people who suffer from increased feelings of aggression following traumatic brain injury, researchers have reported.

• [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved

on Earth.

- [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

- [**Patients to benefit from new 3-D visualizations of the heart**](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

- [**Biophysics study makes exciting advancements for the future of DNA sequencing**](#) [周二, 12 9月 00:26]

New technology that optimizes DNA sequencing using nanophysics and electric currents has been developed by scientists. Their work offers a method for loading DNA into sequencing wells with orders of magnitude higher efficiencies.

- [**Scientists list 50 terms you may be confusing**](#) [周二, 12 9月 00:26]

A list of commonly used psychological terms that are often assumed to be similar, if not identical, but which refer to very different concepts has been revealed by new research.

- [**Study clarifies how neural nets 'think' when processing language**](#) [周二, 12 9月 00:26]

A new general-purpose technique has been developed for making sense of neural networks that are trained to perform natural-language-

processing tasks, in which computers attempt to interpret freeform texts written in ordinary, or 'natural,' language (as opposed to a structured language, such as a database-query language).

- [**Scientists construct first predictive model of inflammatory bowel disease**](#) [周二, 12 9月 00:26]

An in-depth, multi-omics approach to characterizing the immune component of inflammatory bowel disease (IBD) has been revealed by researchers. These results provide new insights into the biologic networks involved in IBD with potential to identify new targets and eventually novel interventions for the treatment of patients living with IBD.

- [**Fathers can influence the sex of their offspring, scientists show**](#) [周二, 12 9月 00:26]

It has traditionally been thought that in mammals only mothers are able to influence the sex of their offspring. But a new study in wild mice has shown that fathers can, in fact, influence sex ratios.

- [**First on-chip nanoscale optical quantum memory developed**](#) [周二, 12 9月 00:26]

Engineers have built a chip capable of storing and retrieving individual photons of light, with all of their quantum properties left intact. The chip represents the first nanoscale optical quantum memory device, and could one day be used to create more secure Internet communications.

- [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [**Fire ant venom compounds may lead to skin treatments**](#) [周一, 11 9月 21:59]

Solenopsins, the main toxic components of fire ant venom, chemically resemble ceramides, which are lipid-like molecules essential for maintaining for the barrier function of the skin. Solenopsin analogs can reduce skin thickening and inflammation in a mouse model of psoriasis,

scientists have shown.

- [**Ancient wetlands offer window into climate change**](#) [周一, 11 9月 21:59]

Environmental researchers have uncovered a wealth of information about a unique part of Australia that offers never-before-seen insights into climate change since the last ice age.

- [**Desert locusts: New risks in the light of climate change**](#) [周一, 11 9月 21:59]

The desert locust is an invasive species that is both well known and feared because of the large-scale agricultural damage it can cause. It is particularly closely monitored, to prevent the risks of outbreaks and invasions. Climate change could modify its distribution area, meaning a new threat to agriculture, according to a study.

- [**Biosensor detects adulteration of horse in beef meat within one hour**](#) [周一, 11 9月 21:59]

Fraud in meat products has become, in recent years, a battle of the food industry and public health. Although there are numerous strategies to detect it, they are not sufficiently selective and sensitive to differentiate close animal species. A collaboration of experts has developed an electrochemical biosensor capable of detecting, in just one hour, processes of adulteration of beef with horse meat.

- [**Using mirrors to improve the quality of light particles**](#) [周一, 11 9月 21:59]

Scientists have succeeded in dramatically improving the quality of individual photons generated by a quantum system. The scientists have successfully put a 10-year-old theoretical prediction into practice. With their paper, they have taken an important step towards future applications in quantum information technology.

- [**Respiratory tract infections in young children linked to asthma and worse lung function**](#) [周一, 11 9月 11:25]

Respiratory tract infections in young children are linked to an increased

risk of asthma and worse lung function in later life, according to new research.

• [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

• [**E-cig refills contain irritants, and people who smoke and use e-cigs suffer more symptoms**](#) [周一, 11 9月 11:25]

Two new studies highlight the risks associated with using e-cigarettes, especially for those who also smoke conventional cigarettes.

• [**Children with asthma are being prescribed unnecessary antibiotics**](#) [周一, 11 9月 11:25]

Children with asthma are more likely to be prescribed antibiotics even though there is no evidence that they need them any more than children without asthma.

• [**Study challenges perception that empathy erodes during medical school**](#) [周日, 10 9月 07:40]

A new study by social neuroscientists challenges the common perception that empathy declines during medical training.

• [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

- **[Folic acid may mitigate autism risk from pesticides](#)** [周六, 09 9月 08:55]

Researchers have shown that mothers who take recommended amounts of folic acid around conception might reduce their children's pesticide-related autism risk.

- **[Number of Europeans exposed to secondhand smoke at work rising to more than one in four](#)** [周六, 09 9月 08:55]

More than one in four of people who work indoors are being exposed to secondhand smoke at work, according to new research.

- **[When electrons ride a wave](#)** [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

- **[Scientist finds secret to thriving](#)** [周六, 09 9月 08:55]

What it takes to thrive, rather than merely survive, could be as simple as feeling good about life and yourself and being good at something, according to new research.

- **[Eye changes may signal frontotemporal lobe degeneration](#)** [周六, 09 9月 08:55]

Frontotemporal degeneration (FTD) is a progressive neurodegenerative condition that is present in tens of thousands of Americans, but is often difficult to diagnose accurately. Now a study has found evidence that a simple eye exam and retinal imaging test may help improve that accuracy.

- **[Scientists unravel new insights into promising semiconductor material](#)** [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

- [**A-MUD: A method for automatically detecting mouse song**](#) [周六, 09 9月 08:55]

Mice produce a remarkable repertoire of vocalizations across five octaves, which they emit during mating and other contexts. Analyses of mice song can provide important information about their social behavior and for research into neuropsychiatric disorders. But their songs are in the ultrasonic range and inaudible for humans. Researchers have now developed a freely available method to automatically detect mouse vocalizations instead of manually.

- [**An officer and a gentlewoman from the Viking army in Birka**](#) [周六, 09 9月 08:55]

War was not an activity exclusive to males in the Viking world. A new study shows that women could be found in the higher ranks at the battlefield.

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

- [**High-speed quantum memory for photons**](#) [周六, 09 9月 08:54]

Physicists have developed a memory that can store photons. These quantum particles travel at the speed of light and are thus suitable for high-speed data transfer. The researchers were able to store them in an

atomic vapor and read them out again later without altering their quantum mechanical properties too much. This memory technology is simple and fast and it could find application in a future quantum Internet.

• [How to draw electricity from the bloodstream](#) [周六,

09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

Study of circular DNA comes full circle with use of old technique -- ScienceDaily

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint.

With the aid of a process called density gradient centrifugation, a research team, which included scientists from The University of Texas at Dallas and Stanford University School of Medicine, recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

What Is Circular DNA?

The DNA molecules that make up the genes and chromosomes in our cells are rope-like strands, free at both ends and shaped like a twisted ladder, or helix. That DNA, called chromosomal DNA, is found in each

cell's nucleus and contains genetic instructions needed to carry out biological functions.

But another population of DNA, called extrachromosomal circular DNA, is shaped like a circle, with no loose ends, and exists independently of linear DNA. While researchers are beginning to better understand how circular DNA functions in humans, much is still unknown. The study, published online recently in the journal *G3: Genes, Genomes and Genetics*, found that different cell varieties harbor different sets of circular DNAs.

"The interesting thing is that different types of cells seem to have different repertoires of these circles, even within the same person," said lead study author Dr. Massa Shoura, a Beckman Foundation postdoctoral research fellow at Stanford who earned two PhDs from UT Dallas. "They're not all created equal -- the circles in your skin cells might be different from those in my skin."

'Circulome' Could Predict Disease

In both the worm and the human cells, the researchers observed circles that were copies of coding regions on

chromosomal DNA, regions that contain genes for making specific proteins. While the investigators have some clues as to how such circular DNA is created, the exact processes are not well understood.

"We think they have different functions, and different mechanisms that generate them, but much more study is needed," said Shoura BS'08, MA'10, PhD'13, PhD'14. "One of the things we're trying to find out is whether there are specific repertoires of circular DNA - - a term we coined as the 'circulome' -- that are specific to various pathologies, like cancer."

For example, Shoura and her colleagues are investigating whether there are marked differences between the circulome in healthy tissue and colon cancer tissue from the same person. If so, circular DNA offers a potential diagnostic biomarker for cancer.

"In order to establish circular DNA as a biomarker for disease, we first have to have a method for reliably and cleanly separating circular DNA out of a sample, purifying it, so that we know what we are studying is just the circles, without other genetic materials mixed in," she said. "That's where my UT Dallas training

comes in."

What's Old is New Again

Before she joined the Stanford lab of Nobel laureate Dr. Andrew Fire in 2015, Shoura was a graduate student working at UT Dallas in the lab of Dr. Stephen Levene, Cecil H. and Ida Green Professor in Systems Biology Science. For the study published in *G3*, which Fire and Levene also co-authored, the team incorporated Levene and Shoura's expertise with an old-school lab technique called density gradient centrifugation. Developed 50 years ago -- and now, according to Levene, rarely used -- the method separates DNA based on density.

Levene and Shoura both said that the technique runs circles around more modern analysis methods.

"I've been using this DNA isolation technique since I was a graduate student, and I still think it's the best method for recovering a clean sample of circular DNA," said Levene, a bioengineering professor who also is affiliated with the departments of biological sciences and physics at UT Dallas.

In the process, DNA is mixed with a dense salt solution containing cesium chloride in a small test tube, along with a dye that binds to both linear DNA and circular DNA. The dye binds differently to each DNA type, resulting in the linear DNA being less dense than the circular DNA. When the sample is spun in an ultracentrifuge at high speeds, around 120,000 rpm, the higher density circular DNA concentrates in a band near the bottom of the tube.

The researchers also subjected their samples to additional, more modern purification methods to further ensure a clean sample of circular DNA. "This study clearly shows that circular DNA is part of the genome; it plays a role in normal DNA processing," Shoura said. "The more we study it, we're learning that the human genome is more dynamic than we thought."

The work was funded primarily by the National Institutes of Health and the National Science Foundation.

UTD Prepared Scientist for Career

Dr. Massa Shoura credits UT Dallas for providing the tools and experience to further her research career. She

earned bachelor's and master's degrees in biological sciences from the School of Natural Sciences and Mathematics, and completed doctorates in molecular and cell biology, and in bioengineering, both under Levene's guidance.

"If I was a graduate student now somewhere besides UT Dallas, I might not know what cesium chloride gradients are, and I wouldn't have used them to benefit my research," Shoura said. "There are still not many labs that use this technique, and the ones that do haven't optimized it to work with extremely small samples, as Dr. Levene has done.

"What I accomplished in the Levene lab was a lot of interdisciplinary work in chemistry, math, physics and computer simulation, all applied to DNA," Shoura said. "I'm not an expert in these fields, but by being a little familiar with each one, I am better able to identify a tool or a collaborator that could help on a new problem."

Method controls whether freezing droplets bounce off or stick: Study reveals a new way to enhance or reduce the adhesion of freezing droplets -- ScienceDaily

When freezing droplets impact a surface, they generally either stick to it or bounce away. Controlling this response is crucial to many applications, including 3-D printing, the spraying of some surface coatings, and the prevention of ice formation on structures such as airplane wings, wind turbines, or power lines.

Now, MIT researchers have found a surprising new twist to the mechanics involved when droplets come in contact with surfaces. While most research has focused on the hydrophobic properties of such surfaces, it turns out that their thermal properties are also crucially important -- and provide an unexpected opportunity to "tune" those surfaces to meet the exact needs of a given application. The new results are presented today in the journal *Nature Physics*, in a report by MIT associate

professor of mechanical engineering Kripa Varanasi, former postdoc Jolet de Ruiter, and postdoc Dan Soto.

"We found something very interesting," Varanasi explains. His team was studying the properties of a liquid -- in this case, drops of molten metal -- freezing onto a surface. "We had two substrates that had similar wetting properties [the tendency to either spread out or bead up on a surface] but different thermal properties." According to conventional thinking, the way droplets acted on the two surfaces should have been similar, but instead it turned out to be dramatically different.

On silicon, which conducts heat very well, as most metals do, "the molten metal just fell off," Varanasi says. But on glass, which is a good thermal insulator, "the drops of metal stuck and were hard to remove."

The finding showed that "we can control the adhesion of a droplet freezing on a surface by controlling the thermal properties" of that surface, he says. "It's a whole new approach" to determining how liquids interact with surfaces, he adds. "It provides new tools for us to control the outcome of such liquid-solid interactions."

To explain the difference in thermal conductivity of different materials, Varanasi gives the example of two flooring surfaces, one made of stone, another of wood. Even if both are at exactly the same temperature, if you step with bare feet on the wood, it will feel warmer than the stone. That's because the stone has higher thermal effusivity (the rate at which a material can exchange heat) than wood, so it draws heat away from your feet more rapidly, causing it to feel colder.

The experiments in the study were carried out with molten metal, which is important in some industrial processes such as the thermal spray coatings that are applied to turbine blades and other machine parts. For these processes, the quality and uniformity of the coatings can depend on how well each tiny droplet adheres to the surface during deposition. The results likely apply to all kinds of liquids as well, including water, Varanasi says.

When coating surfaces, "the way droplets impact and form splats dictates the integrity of the coating itself. If it's not perfect, it can have a tremendous impact on the performance of the part, such as a turbine blade," Varanasi says. "Our findings will provide a whole new understanding of when things stick and when they

don't."

The new insights could be useful both when it is desirable to have droplets stick to surfaces, such as in some kinds of 3-D printers, to help make sure each printed layer adheres thoroughly to the previous layer, and when it's important to prevent droplets from sticking, such as on airplane wings in icy weather. The research could also be helpful for cleaning and waste management of additive manufacturing and thermal spray processes.

Soto says the discovery came about when the team was studying the local freezing mechanism at the interface between the liquid and the substrate, using a thermal high-speed camera that revealed rapid effects during the cooling process that would have been impossible to see at longer timescales. The images showed a progressive development of fringes around the droplets' outer edges. "We then realized that the droplet was unexpectedly curling up and detaching from the surface as it froze," he says. They described this phenomenon as "self-peeling" of the droplets.

"The main ingredients for this phenomenon," de Ruiter says, "are the interplay between short timescale fluid

dynamics, which set the adhesion, and longer timescale thermal effects, which lead to global deformation." The team developed a design map that captures different possible outcomes (sticking, self-peeling, or bouncing) in terms of key thermal properties: drop and substrate effusivities, and temperatures.

Since the degree to which droplets stick or don't depends on a material's thermal properties, it's possible to tailor those properties based on the application, Soto says. "We can imagine scenarios where thermal properties can be adjusted in real time through electric or magnetic fields, allowing the stickiness of the surface to impacting droplets to be adjustable."

The sticking outcome can also be controlled simply by changing the relative temperatures of the droplets and the surface, the team found. In many cases, these changes are counterintuitive: For example, while one might expect that the only way to prevent sticking of freezing droplets is by warming a substrate, the team found a new regime, where cooling the surface can also lead to the same outcome.

Why your ancestors would have aced the long jump: First primates were built for leaping, fossil ankle suggests -- ScienceDaily

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats.

These first primates spent most of their time in the trees rather than on the ground, but just how nimble they were as they moved around in the treetops has been a topic of dispute.

For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches to stalk insects or find flowers and fruits.

But a fossil study published in the October 2017 issue of the *Journal of Human Evolution* suggests the first primates were masters at leaping through the trees.

Paleontologists working in a quarry in southeastern France uncovered the quarter-inch-long bone, the lower part of the ankle joint.

The fossil matched up best with a chipmunk-sized creature called *Donrussellia provincialis*.

Previously only known from jaws and teeth, *Donrussellia* is thought to be one of the earliest members of the primate family tree, on the branch leading to lemurs, lorises and bush babies.

Duke University assistant professor Doug Boyer and colleagues studied scans of *Donrussellia*'s ankle and compared it to other animals, using computer algorithms to analyze the 3-D digital shape of each tiny bone.

They were surprised to find that *Donrussellia*'s ankle was not like those of other primates, but was more similar to those of treeshrews and other nonprimate species.

The team's analyses also suggest the animal didn't just clamber or scurry along small branches. Instead, it may have been able to bound between trunks and branches,

using its grasping feet to stick the landing.

The researchers say that -- contrary to what many scientists thought -- the first primates may have evolved their acrobatic leaping skills first, while anatomical changes that allowed them to cling to slender branch tips and creep from tree to tree came later.

"Being able to jump from one tree to another might have been important, especially if there were ground predators around waiting to snag them," Boyer said.

Earthquake triggers 'slow motion' quakes in New Zealand -- ScienceDaily

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study led by The University of Texas at Austin, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

Some of the slow slip events occurred as far away as 300 miles from the earthquake's epicenter. The study of new linkages between the two types of seismic activity, published in *Nature Geoscience* on Sept. 11, may help promote better understanding of earthquake hazard posed by subduction zones, a type of fault responsible for some of the world's most powerful earthquakes.

"This is probably the clearest example worldwide of long-distance, large-scale slow slip triggering," said lead author Laura Wallace, a research scientist at the University of Texas Institute for Geophysics (UTIG). She also holds a joint position at GNS Science, a New

Zealand research organization that studies natural hazards and resources.

Co-authors include other GNS scientists, as well as scientists from Georgia Tech and the University of Missouri. UTIG is a research unit of the UT Jackson School of Geosciences.

In November 2016, the second largest quake ever recorded in New Zealand -- the 7.8 magnitude Kaikōura quake -- hit the country's South Island. A GPS network operated by GeoNet, a partnership between GNS Science and the New Zealand Earthquake Commission, detected slow slip events hundreds of miles away beneath the North Island. The events occurred along the shallow part of the Hikurangi subduction zone that runs along and across New Zealand.

A subduction zone is an area where a tectonic plate dives or "subducts" beneath an adjacent tectonic plate. This type of fault is responsible for causing some of the world's most powerful earthquakes, which occur when areas of built-up stress between the plates rupture.

Slow slip events are similar to earthquakes, as they

involve more rapid than normal movement between two pieces of Earth's crust along a fault. However, unlike earthquakes (where the movement occurs in seconds), movement in these slow slip events or "silent earthquakes" can take weeks to months to occur.

The GPS network detected the slow slip events occurring on the Hikurangi subduction zone plate boundary in the weeks and months following the Kaikōura earthquake. The slow slip occurred at less than 9 miles deep below the surface (or seabed) and spanned an area of more than 6,000 square miles offshore from the Hawke's Bay and Gisborne regions, comparable with the area occupied by the state of New Jersey. There was also a deeper slow slip event triggered on the subduction zone at 15-24 miles beneath the Kapiti Coast region, just west of New Zealand's capital city Wellington. This deeper slow slip event near Wellington is still ongoing today.

"The slow slip event following the Kaikōura earthquake is the largest and most widespread episode of slow slip observed in New Zealand since these observations started in 2002," Wallace said.

The triggering effect was probably accentuated by an

offshore "sedimentary wedge" -- a mass of sedimentary rock piled up at the edge of the subduction zone boundary offshore from the North Island's east coast. This layer of more compliant rock is particularly susceptible to trapping seismic energy, which promotes slip between the plates at the base of the sedimentary wedge where the slow slip events occur.

"Our study also suggests that the northward traveling rupture during the Kaikōura quake directed strong pulses of seismic energy towards the North Island, which also influenced the long-distance triggering of the slow slip events beneath the North Island," said Yoshihiro Kaneko, a seismologist at GNS Science.

Slow slip events in the past have been associated with triggering earthquakes, including the magnitude 9.0 Tohoku earthquake that struck Japan in 2011. The researchers have also found that the slow slip events triggered by the Kaikōura quake were the catalyst for other quakes offshore from the North Island's east coast, including a magnitude 6.0 just offshore from the town of Porangahau on Nov. 22, 2016.

Although scientists are still in the early stages of trying to understand the relationships between slow slip

events and earthquakes, Wallace said that the study results highlight additional linkages between these processes.

A new genetic marker for schizophrenia -- ScienceDaily

Schizophrenia is a complicated disease that often appears in early adulthood. Although scientists have not traced the genetic causes, more than 80% of schizophrenia cases are considered to have a hereditary cause. In a new report published in *Translational Psychiatry*, Japanese researchers report that a rare genetic variant, RTN4R, may have a fundamental role in the disease.

"Schizophrenia is a disease caused by disturbances in neural circuits. Myelin-related genes are associated with the disease," explains Osaka University Professor Toshihide Yamashita, one of the authors of the studies.

Myelin acts as a conductor of signals for the neural circuits. Yamashita hypothesized that myelin-related genes could contribute to the pathology of schizophrenia.

RTN4R is a subunit of RTN4, which regulates crucial functions for neural circuits, namely, axon regeneration

and structural plasticity.

Moreover, "RTN4 is a promising candidate gene for schizophrenia because it is located at chromosome 22q11.2, a hotspot for schizophrenia," he said.

Rare variants describe mutations that have low frequency but a large effect. Yamashita and his colleagues searched for rare variants of RTN4. Screening the DNA of 370 schizophrenia patients, he found a single missense mutation, R292H, that changed the amino acid of this protein from arginine to histidine in two patients.

R292H is located in the domain of RTN4R that binds to ligands, so a change in even a single amino acid could have profound effects on RTN4 function. To test this possibility, the scientists expressed the mutation in chick retinal cells, which only weakly express the gene, finding a significant change in myelin-dependent axonal behavior. Computer simulations showed that the mutation reduced the interaction between RTN4 and its partner protein, LINGO1, by increasing the distance between the two.

Yamashita is convinced that rare variants could act as

risk factors for schizophrenia.

"There is growing evidence that rare variants contribute to neurodevelopment diseases. The R292H mutation was not found in any existing databases. Our findings strengthen the evidence that rare variants could contribute to schizophrenia," he said.

• **[Cold region 'tipping point' now inevitable](#)** [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

• **[The evolutionary origin of the gut](#)** [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

• **[USA threatened by more frequent flooding](#)** [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

• **[Half-a-billion-year-old fossils shed light animal evolution on Earth](#)** [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

• **[Biodiversity just as powerful as climate change for healthy ecosystems](#)** [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these

experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

• [Looking stressed can help keep the peace](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [Explosive birth of stars swells galactic cores](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

• [Scientist finds secret to thriving](#) [周六, 09 9月 08:55]

What it takes to thrive, rather than merely survive, could be as simple as feeling good about life and yourself and being good at something, according to new research.

• [Scientists make methanol using air around us](#) [周五, 08 9月 02:27]

Scientists have created methanol from methane using oxygen from the air. Methanol is currently produced by breaking down natural gas at high temperatures. But researchers have discovered they can produce methanol from methane through simple catalysis that allows methanol production at low temperatures using oxygen and hydrogen peroxide. The findings have major implications for cleaner, greener industrial processes worldwide.

• [Individuality drives collective behavior of schooling fish](#) [周五, 08 9月 02:27]

New research sheds light on how 'animal personalities' -- inter-individual differences in animal behavior -- can drive the collective behavior and functioning of animal groups such as schools of fish, including their cohesion, leadership, movement dynamics, and group

performance.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Listening to happy music may enhance divergent creativity**](#) [周五, 08 9月 02:27]

Listening to happy music may help generate more, innovative solutions compared to listening to silence, according to a study.

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**Nutrition has benefits for brain network**](#)

[organization](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

• [3-D-printed biomaterials that degrade on demand](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

• [Intermittent electrical brain stimulation improves memory](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• [How monkey fights grow](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

• [Emoji fans take heart: Scientists pinpoint 27 states of emotion](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

• [**Whole grains decrease colorectal cancer risk, processed meats increase the risk**](#) [周四, 07 9月 21:36]

Major new report finds strong evidence of links between lifestyle and colorectal cancer risk. Physical activity and whole grains lowers risk of this cancer; too much alcohol and red meat, processed meats and obesity increase the risk. An estimated 47 percent of US colorectal cancers could be prevented each year with lifestyle changes.

• [**Monkey sees ... monkey knows?**](#) [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

• [**One powerful cell makes or breaks your habits**](#) [周四, 07 9月 01:55]

Neuroscientists have pinpointed a single type of neuron deep within the brain that serves as a 'master controller' of habits. The team found that habit formation boosts the activity of this influential cell, and that shutting it down is enough to break unhelpful habits in sugar-seeking mice. The findings may point towards new treatments for addiction or compulsive behavior in humans.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

• [**Does the organic material of comets predate our solar system?**](#) [周三, 06 9月 23:46]

The Rosetta space probe discovered a large amount of organic material in the nucleus of comet 'Chury.' Researchers now advance the theory

that this matter has its origin in interstellar space and predates the birth of the solar system.

- [**Accretion-powered pulsar reveals unique timing glitch**](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

- [**Biologists slow aging, extend lifespan of fruit flies**](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

- [**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

- [**Newly-discovered semiconductor dynamics may help improve energy efficiency**](#) [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability

to carry a charge as they become more densely 'doped.'

- [**Humans still evolving, large-scale study of genetic data shows**](#) [周三, 06 9月 02:55]

In a study analyzing the genomes of 210,000 people in the United States and Britain, researchers have found that the genetic variants linked to Alzheimer's disease and heavy smoking are less frequent in people with longer lifespans, suggesting that natural selection is weeding out these unfavorable variants in both populations.

- [**Eat fat, live longer?**](#) [周三, 06 9月 02:55]

As more people live into their 80s and 90s, researchers have delved into the issues of health and quality of life during aging. A recent mouse study sheds light on those questions by demonstrating that a high fat, or ketogenic, diet not only increases longevity, but improves physical strength.

- [**Swings in dad's testosterone affects the family -- for better or worse -- after baby arrives**](#) [周三, 06 9月 02:55]

Testosterone levels are a key factor in a family's health and happiness after a newborn arrives. Researchers have found that a drop can signal postpartum depression in dad, and a spike may be a sign of aggression.

- [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

- [**Crab nebula in the limelight: Unified model for the entire radiation spectrum**](#) [周三, 06 9月 00:48]

The origin of cosmic rays, high-energy particles from outer space constantly impacting on Earth, is among the most challenging open questions in astrophysics. Now research sheds new light on the origin of those energetic particles.

- [**Contagious yawning more closely associated**](#)

[with perceptual sensitivity than empathy](#) [周三, 06 9月 00:33]

Contrary to common belief that the yawning contagion is associated with empathy, it is in fact, more likely that perceptual sensitivity is to blame, research suggests.

• [Discovery of boron on Mars adds to evidence for habitability](#) [周三, 06 9月 00:32]

The discovery of boron on Mars gives scientists more clues about whether life could have ever existed on the planet, according to a new paper.

• ['Extreme' telescopes find the second-fastest-spinning pulsar](#) [周三, 06 9月 00:32]

By following up on mysterious high-energy sources mapped by NASA's Fermi Gamma-ray Space Telescope, a Netherlands-based radio telescope has discovered a new pulsar, the second fastest-spinning known.

• [CRISPR technology used to change flower color](#) [周三, 06 9月 00:32]

In a world-first, scientists have used the revolutionary CRISPR, or CRISPR/Cas9, genome-editing tool to change flower color in an ornamental plant.

• [The sniff test of self-recognition confirmed: Dogs have self-awareness](#) [周二, 05 9月 23:13]

A new research study used a sniff-test to evaluate the ability of dogs to recognize themselves. The experiment confirms the hypothesis of dogs' self-cognition proposed last year.

• [Zika virus kills brain cancer stem cells](#) [周二, 05 9月 21:36]

While Zika virus causes devastating damage to the brains of developing fetuses, it one day may be an effective treatment for glioblastoma, a deadly form of brain cancer. New research shows that the virus kills brain cancer stem cells, the kind of cancer cells most resistant to standard treatments.

[Was the primordial soup a hearty pre-protein stew?](#) [周二, 05 9月 21:36]

How proteins evolved billions of years ago, when Earth was devoid of life, has stumped many a scientist. A little do-si-do between amino acids and their chemical lookalikes may have done the trick. Evolutionary chemists tried it and got results by the boatload.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**A new genetic marker for schizophrenia**](#) [周二, 12 9月 00:27]

Scientists find a rare genetic variant that shows strong association with schizophrenia.

- [**The turbulent healing powers of plasma**](#) [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction

and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent and effective medical therapies.

- [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

- [**Cooperation driven by reciprocity, not conformity**](#) [周二, 12 9月 00:26]

From an evolutionary perspective, cooperating with others can yield benefits that increase chances of survival. But what are the conditions that motivate us to cooperate? New research suggests that reciprocity -- cooperation under the assumption that we will receive benefits in return -- outweighs our desire to conform with group norms when we're deciding whether to cooperate with someone.

- [**New treatment option discovered for brain injury patients suffering from aggression**](#) [周二, 12 9月 00:26]

A drug originally developed in the 1960s as an antiviral medication is showing promise as a treatment option for people who suffer from increased feelings of aggression following traumatic brain injury, researchers have reported.

- [**Patients to benefit from new 3-D visualizations**](#)

[of the heart](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

• [Biophysics study makes exciting advancements for the future of DNA sequencing](#) [周二, 12 9月 00:26]

New technology that optimizes DNA sequencing using nanophysics and electric currents has been developed by scientists. Their work offers a method for loading DNA into sequencing wells with orders of magnitude higher efficiencies.

• [Scientists list 50 terms you may be confusing](#) [周二, 12 9月 00:26]

A list of commonly used psychological terms that are often assumed to be similar, if not identical, but which refer to very different concepts has been revealed by new research.

• [Fathers can influence the sex of their offspring, scientists show](#) [周二, 12 9月 00:26]

It has traditionally been thought that in mammals only mothers are able to influence the sex of their offspring. But a new study in wild mice has shown that fathers can, in fact, influence sex ratios.

• [Looking stressed can help keep the peace](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [Fire ant venom compounds may lead to skin treatments](#) [周一, 11 9月 21:59]

Solenopsins, the main toxic components of fire ant venom, chemically resemble ceramides, which are lipid-like molecules essential for maintaining for the barrier function of the skin. Solenopsin analogs can reduce skin thickening and inflammation in a mouse model of psoriasis, scientists have shown.

• [**Respiratory tract infections in young children linked to asthma and worse lung function**](#) [周一, 11 9月 11:25]

Respiratory tract infections in young children are linked to an increased risk of asthma and worse lung function in later life, according to new research.

• [**E-cig refills contain irritants, and people who smoke and use e-cigs suffer more symptoms**](#) [周一, 11 9月 11:25]

Two new studies highlight the risks associated with using e-cigarettes, especially for those who also smoke conventional cigarettes.

• [**Children with asthma are being prescribed unnecessary antibiotics**](#) [周一, 11 9月 11:25]

Children with asthma are more likely to be prescribed antibiotics even though there is no evidence that they need them any more than children without asthma.

• [**Study challenges perception that empathy erodes during medical school**](#) [周日, 10 9月 07:40]

A new study by social neuroscientists challenges the common perception that empathy declines during medical training.

• [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

• [**Folic acid may mitigate autism risk from pesticides**](#) [周六, 09 9月 08:55]

Researchers have shown that mothers who take recommended amounts of folic acid around conception might reduce their children's pesticide-related autism risk.

- [**Number of Europeans exposed to secondhand smoke at work rising to more than one in four**](#) [周六, 09 9月 08:55]

More than one in four of people who work indoors are being exposed to secondhand smoke at work, according to new research.

- [**Scientist finds secret to thriving**](#) [周六, 09 9月 08:55]

What it takes to thrive, rather than merely survive, could be as simple as feeling good about life and yourself and being good at something, according to new research.

- [**Eye changes may signal frontotemporal lobe degeneration**](#) [周六, 09 9月 08:55]

Frontotemporal degeneration (FTD) is a progressive neurodegenerative condition that is present in tens of thousands of Americans, but is often difficult to diagnose accurately. Now a study has found evidence that a simple eye exam and retinal imaging test may help improve that accuracy.

- [**Immune cells help fat deal with environmental challenges**](#) [周六, 09 9月 08:55]

Immunosuppressive regulatory T-cells play an important role in the functioning of adipose tissue.

- [**How to draw electricity from the bloodstream**](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

- [**New guidelines discourage use of brain imaging as a 'lie detector' for chronic pain**](#) [周六, 09 9月 08:54]

A task force consisting of researchers from around the world has released a set of recommendations that advise against the use of brain imaging as a test for chronic pain.

- [**Blocking sweet taste receptors can help body fight off sinus infections**](#) [周六, 09 9月 08:54]

Sweet taste receptor, known as T1R, can be activated by certain amino acids secreted by bacteria. Researchers took cells from rhinosinusitis patients and isolated the various communities of bacteria that were present. They found cultures of Staphylococcus bacteria produced two D-amino acids called D-Phe and D-Leu, both of which activate T1R sweet receptors and block the release of antimicrobial peptides.

- [**Why it's difficult to predict evolutionary fate of a new trait**](#) [周六, 09 9月 08:54]

Scientists explain the vexing complexities that make it hard to predict whether a new genetic trait will take over a population or die out, a key challenge for many fields including infectious disease.

- [**Polio-like disease in children**](#) [周六, 09 9月 08:54]

In Germany in the summer and autumn of 2016, several cases of illness in children were observed that were accompanied by acute flaccid paralysis. A new article describes this disease on the basis of two case reports.

- [**Later circadian timing of food intake is associated with increased body mass index**](#) [周六, 09 9月 08:54]

Investigators examine the relationships between body fat and body mass index, and the timing of food consumption, to time of day and to the body's circadian or body clock.

- [**Extreme weather has limited effect on attitudes toward climate policies**](#) [周五, 08 9月 02:46]

People who recently experienced severe weather events such as floods, storms and drought are more likely to support policies to adapt to the effects of climate change, according to a new study.

- [**Are you barking up the wrong tree by sleeping with your dog?**](#) [周五, 08 9月 02:45]

Let sleeping dogs lie ... in the bedroom. That's according to a new study that's sure to set many tails wagging.

- [**Better understanding of 'one of the most complex organs' for better lung treatments**](#) [周五, 08 9月 02:45]

Details of lung cell molecular pathways that promote or inhibit tissue regeneration have been reported by researchers. Their aim is to find new ways to treat lung disorders.

- [**Interrupting Parkinson's disease**](#) [周五, 08 9月 02:30]

Scientists have identified a toxic cascade that leads to neuronal degeneration in patients with Parkinson's disease and figured out how to interrupt it, reports a study. Intervening with an antioxidant early in the disease process may break the degenerative cycle and improve neuron function in Parkinson's, the study showed. Parkinson's is second most common neurodegenerative disorder.

- [**Mediterranean-style diet may eliminate need for reflux medications**](#) [周五, 08 9月 02:30]

A plant-based, Mediterranean-style diet has been shown to provide the same medical benefits for treating laryngopharyngeal reflux as popular reflux medications, according to new research.

- [**Hip fracture often deadly, study shows**](#) [周五, 08 9月 02:30]

There is excess mortality risk from hip fracture while accounting for pre-injury comorbid conditions, shows a large population-based matched cohort study. The study found that hip fracture sufferers experienced significantly worse survival at 12-months post-fracture. Individuals with hip fracture were more than 3.5 times more likely to die within 12 months compared to their non-injured counterpart, and excess mortality was higher in men than in women.

- [**Cilia: 'The bouncer' of bacteria**](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for

bacteria filtering and enhancing chemical communication.

- [**Sharpest image of Alzheimer's fibrils shows previously unknown details**](#) [周五, 08 9月 02:27]

A team of researchers has determined the structure of an amyloid fibril with previously unachieved resolution. The fibrils of the body's own amyloid beta protein are the main constituent of Alzheimer's disease related and characteristic pathological protein deposits in the brain. The atomic-level structure displays previously unknown structural details which can answer many questions on the growth of harmful deposits and also explain the effect of genetic risk factors.

- [**Tweet life vs. street life: Exploring the gap between content, feelings**](#) [周五, 08 9月 02:27]

Twitter is an unreliable witness to the world's emotions, suggests a researcher, adding that online social life doesn't always reflect offline social reality.

- [**Listening to happy music may enhance divergent creativity**](#) [周五, 08 9月 02:27]

Listening to happy music may help generate more, innovative solutions compared to listening to silence, according to a study.

- [**Human papillomavirus 16 infections may pose variable cancer risk**](#) [周五, 08 9月 02:26]

Human papillomavirus 16 accounts for about half of all cervical cancers, but researchers have found that not all infections are equal. An analysis of the HPV16 genome from 5,570 human cell and tissue samples revealed that the virus actually consists of thousands of unique genomes, such that infected women living in the same region often have different HPV16 sequences and variable risks to cancer.

- [**Seven steps to keep your brain healthy from childhood to old age**](#) [周五, 08 9月 02:26]

A set of simple steps that promote heart health, called Life's Simple 7, can also foster ideal brain health, an expert panel says. Improving your

health status with Life's Simple 7 may reduce the risk of dementia caused by strokes, vascular dementia and Alzheimer's disease.

- [**Circadian clock's inner gears**](#) [周五, 08 9月 02:26]

A set of core clock proteins organize themselves into a handful of molecular machines that control the precise workings of the body's circadian rhythms, new research has found.

- [**New mindset in the search for stroke therapies**](#) [周五, 08 9月 02:26]

Researchers have identified a promising new avenue to explore in the search for stroke treatments, after translating findings from Alzheimer's disease.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**Researchers closer to uncovering a new feature in heart failure**](#) [周五, 08 9月 01:29]

Each cell in the average human body contains 23 pairs of chromosomes, with four telomeres on each pair. Telomeres cover the end of the chromosome, protecting it from deterioration or fusion with adjacent chromosomes. While there is a length range for classifying a healthy telomere, researchers found, for the first time ever, that people with heart failure have shorter telomeres within the cells that make up the heart muscle (known as cardiomyocytes).

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into

motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

[Shortened telomeres linked to dysfunction in Duchenne muscular dystrophy, researchers find](#)

[周五, 08 9月 01:25]

A discovery about muscular dystrophy disorders has been made that suggests new possibilities for treatment. Researchers found that stem cells in the muscles of muscular dystrophy patients may, at an early age, lose their ability to regenerate new muscle, due to shortened telomeres.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Method controls whether freezing droplets bounce off or stick**](#) [周二, 12 9月 03:09]

Self-peeling droplets have been discovered, along with a new way to control adhesion of freezing droplets by adjusting the thermal properties of substrates. These findings could make everything from additive manufacturing to deicing more efficient.

- [**The turbulent healing powers of plasma**](#) [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent and effective medical therapies.

- [**A novel and practical fab-route for superomniphobic liquid-free surfaces**](#) [周二, 12 9月 00:27]

Scientists have developed a fabrication technology that can inexpensively produce surfaces capable of repelling liquids, including water and oil.

- [**Connecting up the quantum internet**](#) [周二, 12 9月 00:27]

Major leap for practical building blocks of a quantum internet: New research demonstrates how to dramatically improve the storage time of a telecom-compatible quantum memory, a vital component of a global quantum network. The technology operates in the same 1550 nanometer

band as today's telecommunications infrastructure. It can also be operated as a quantum light source or used as an optical link for solid-state quantum computing devices such as superconducting qubits and silicon qubits.

- [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- [**Patients to benefit from new 3-D visualizations of the heart**](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

- [**Study clarifies how neural nets 'think' when processing language**](#) [周二, 12 9月 00:26]

A new general-purpose technique has been developed for making sense of neural networks that are trained to perform natural-language-processing tasks, in which computers attempt to interpret freeform texts written in ordinary, or 'natural,' language (as opposed to a structured language, such as a database-query language).

- [**First on-chip nanoscale optical quantum memory developed**](#) [周二, 12 9月 00:26]

Engineers have built a chip capable of storing and retrieving individual photons of light, with all of their quantum properties left intact. The chip represents the first nanoscale optical quantum memory device, and could one day be used to create more secure Internet communications.

- [**Using mirrors to improve the quality of light particles**](#) [周一, 11 9月 21:59]

Scientists have succeeded in dramatically improving the quality of individual photons generated by a quantum system. The scientists have successfully put a 10-year-old theoretical prediction into practice. With their paper, they have taken an important step towards future applications in quantum information technology.

• [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

• [**When electrons ride a wave**](#) [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

• [**Scientists unravel new insights into promising semiconductor material**](#) [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

• [**Are we being watched? Tens of other worlds could spot the Earth**](#) [周六, 09 9月 08:55]

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

• [**High-speed quantum memory for photons**](#) [周六, 09 9月]

08:54]

Physicists have developed a memory that can store photons. These quantum particles travel at the speed of light and are thus suitable for high-speed data transfer. The researchers were able to store them in an atomic vapor and read them out again later without altering their quantum mechanical properties too much. This memory technology is simple and fast and it could find application in a future quantum Internet.

• [How to draw electricity from the bloodstream](#) [周六,

09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

• [New guidelines discourage use of brain imaging as a 'lie detector' for chronic pain](#) [周六, 09 9月 08:54]

A task force consisting of researchers from around the world has released a set of recommendations that advise against the use of brain imaging as a test for chronic pain.

• [A sweeter way to make green products](#) [周六, 09 9月 08:16]

A more efficient process has been created for extracting the sugars from wood chips, corn cobs and other organic waste from forests and farms. This biorenewable feedstock could serve as a cheaper, sustainable substitute for the petroleum used in manufacturing tons of consumer goods annually -- goods that consumers want to be greener.

• [Scientists make methanol using air around us](#) [周五,

08 9月 02:27]

Scientists have created methanol from methane using oxygen from the air. Methanol is currently produced by breaking down natural gas at high temperatures. But researchers have discovered they can produce methanol from methane through simple catalysis that allows methanol production at low temperatures using oxygen and hydrogen peroxide. The findings have major implications for cleaner, greener industrial processes worldwide.

- [**Tweet life vs. street life: Exploring the gap between content, feelings**](#) [周五, 08 9月 02:27]

Twitter is an unreliable witness to the world's emotions, suggests a researcher, adding that online social life doesn't always reflect offline social reality.

- [**Quantum detectives in the hunt for the world's first quantum computer**](#) [周五, 08 9月 02:26]

A new paper is the latest confirmation of Majorana fermions -- a strange quasiparticle at the heart of the next generation of quantum machines being pursued by engineers.

- [**Streamlined security: Optimizing sensor placement with mathematics**](#) [周五, 08 9月 01:25]

Increasing reliance on heightened security in public and private settings calls for optimal sensor technology. However, placing security sensors to optimize resource management and system performance while simultaneously protecting people and products is undoubtedly challenging. In a new paper, experts propose a computational level set method to optimally position a sensor-based security system for maximum surveillance of a complex environment.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

- [**Lignin: Much more valuable than just as waste**](#) [周五, 08 9月 00:03]

Lignin, a substance considered as a waste product in biomass and ethanol production, will now reach its proper value as bio-oil in new products.

- [**Aspirin tablets help unravel basic physics**](#) [周五, 08 9月 00:03]

Aspirin in form of small crystallites provides new insight into delicate motions of electrons and atomic nuclei. Set into molecular vibration by strong ultrashort far-infrared (terahertz) pulses, the nuclei oscillate much faster than for weak excitation. They gradually return to their intrinsic oscillation frequency, in parallel to the picosecond decay of electronic motions. An analysis of the terahertz waves radiated from the moving particles by in-depth theory reveals the strongly coupled chara...

- [**Scanning tunneling microscopy measurements identify active sites on catalyst surfaces**](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

- [**'Rubber material' discovered that could lead to scratch-proof paint for car**](#) [周五, 08 9月 00:02]

A stretchy miracle material has been discovered that could be used to create highly resistant smart devices and scratch-proof paint for cars, report investigators.

- [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of

14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Ultraviolet light from superluminous supernova key to revealing explosion mechanism**](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

- [**Fast magnetic writing of data**](#) [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

- [**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

- [**A tiny device offers insights to how cancer spreads**](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

- [**Drivers don't ignore a ringing phone but do ignore the risk**](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

- [**Water-based lithium-ion batteries that don't explode now created**](#) [周四, 07 9月 05:01]

For the first time a lithium-ion battery has been developed that uses a water-salt solution as its electrolyte and reaches the 4.0 volt mark desired for household electronics, such as laptop computers, without the fire and explosive risks associated with some commercially available non-aqueous lithium-ion batteries.

- [**Study quantifies potential for water reuse in permian basin oil production**](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

- [**Researchers challenge status quo of battery commercialization**](#) [周四, 07 9月 05:01]

Researchers are looking to the pharmaceutical industry to propose an updated model of US battery commercialization.

- [**New device accurately identifies cancer in seconds**](#) [周四, 07 9月 02:49]

A team of scientists and engineers has invented a powerful tool that rapidly and accurately identifies cancerous tissue during surgery, delivering results in about 10 seconds. The MasSpec Pen is an innovative handheld instrument that gives surgeons precise diagnostic information about what tissue to cut or preserve, helping improve treatment and reduce the chances of cancer recurrence.

- [**Particle physicists on a quest for 'new physics'**](#) [周四, 07 9月 02:29]

The Large Hadron Collider (LHC) at CERN, the European Organization for Nuclear Research, produces hundreds of millions of proton collisions per second. But researchers working on the Large Hadron Collider beauty (LHCb) experiment can only record 2,000 of those collisions, using one of the detectors installed on the accelerator. So in the end, this technological marvel leaves the physicists wanting more. They are convinced that the vast volume of uncaptured data holds the answers to several unreso...

- [**Realistic projections of economic growth and**](#)

[**carbon emissions**](#) [周四, 07 9月 01:56]

Between 2008 and 2015, the United States was able to reduce carbon emissions while enjoying limited economic growth. But in a recent commentary, John Deutch, who has worked with the energy departments of several presidential administrations, urges cautious optimism. He explains the country experienced a short-term decoupling of emissions and economic growth that models suggest won't sustain in the future or be enough to prevent climate change.

• [**Water-based lithium-ion batteries without explosive risks now a reality**](#) [周四, 07 9月 01:56]

Researchers have developed for the first time a lithium-ion battery that uses a water-salt solution as its electrolyte and reaches the 4.0 volt mark desired for household electronics, such as laptop computers, without the fire and explosive risks associated with some commercially available non-aqueous lithium-ion batteries.

• [**Defects in next-generation solar cells can be healed with light**](#) [周四, 07 9月 01:56]

Researchers have shown that defects in the molecular structure of perovskites -- a material which could revolutionize the solar cell industry -- can be 'healed' by exposing it to light and just the right amount of humidity.

• [**Earth as hybrid planet: New classification places Anthropocene era in astrobiological context**](#) [周四, 07 9月 01:55]

A new classification scheme has been devised for the evolutionary stages of worlds based on 'non-equilibrium thermodynamics' -- a planet's energy flow being out of sync, as the presence of life could cause.

• [**Researchers report new way to make dissolving electronics**](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable

personal electronics and biomedical devices that dissolve within the body.

- [**Light-based method improves practicality and quality of remote wind measurements**](#) [周三, 06 9月 23:46]

Researchers have developed a new remote sensing instrument based on light detection and ranging that could offer a simple and robust way to accurately measure wind speed, which could help scientists better understand how hurricanes form and provide information to pinpoint landfall earlier.

- [**Does the organic material of comets predate our solar system?**](#) [周三, 06 9月 23:46]

The Rosetta space probe discovered a large amount of organic material in the nucleus of comet 'Chury.' Researchers now advance the theory that this matter has its origin in interstellar space and predates the birth of the solar system.

- [**Voting vulnerability**](#) [周三, 06 9月 22:38]

Online attackers may be able to purchase -- for as little as a few thousand dollars -- enough personal information to potentially alter voter registration information in as many as 36 states and the District of Columbia. Dubbed 'voter identity theft,' the vulnerability could be exploited by attackers to disenfranchise many voters where voter registration information can be changed online.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

- [**Muscle nuclei: May the force be with you**](#) [周二, 12 9月 00:26]

A group of researchers has revealed the mechanism by which cellular nuclei reach their position within muscle cells. This discovery can have important implications in therapeutic strategies to treat muscular diseases.

- [**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

- [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

- [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

- [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

- [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

- [**Fathers can influence the sex of their offspring, scientists show**](#) [周二, 12 9月 00:26]

It has traditionally been thought that in mammals only mothers are able to influence the sex of their offspring. But a new study in wild mice has shown that fathers can, in fact, influence sex ratios.

- [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [**Fire ant venom compounds may lead to skin treatments**](#) [周一, 11 9月 21:59]

Solenopsins, the main toxic components of fire ant venom, chemically resemble ceramides, which are lipid-like molecules essential for

maintaining for the barrier function of the skin. Solenopsin analogs can reduce skin thickening and inflammation in a mouse model of psoriasis, scientists have shown.

- [**Ancient wetlands offer window into climate change**](#) [周一, 11 9月 21:59]

Environmental researchers have uncovered a wealth of information about a unique part of Australia that offers never-before-seen insights into climate change since the last ice age.

- [**Desert locusts: New risks in the light of climate change**](#) [周一, 11 9月 21:59]

The desert locust is an invasive species that is both well known and feared because of the large-scale agricultural damage it can cause. It is particularly closely monitored, to prevent the risks of outbreaks and invasions. Climate change could modify its distribution area, meaning a new threat to agriculture, according to a study.

- [**Biosensor detects adulteration of horse in beef meat within one hour**](#) [周一, 11 9月 21:59]

Fraud in meat products has become, in recent years, a battle of the food industry and public health. Although there are numerous strategies to detect it, they are not sufficiently selective and sensitive to differentiate close animal species. A collaboration of experts has developed an electrochemical biosensor capable of detecting, in just one hour, processes of adulteration of beef with horse meat.

- [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

- [**A-MUD: A method for automatically detecting mouse song**](#) [周六, 09 9月 08:55]

Mice produce a remarkable repertoire of vocalizations across five octaves, which they emit during mating and other contexts. Analyses of mice song can provide important information about their social behavior and for research into neuropsychiatric disorders. But their songs are in the ultrasonic range and inaudible for humans. Researchers have now developed a freely available method to automatically detect mouse vocalizations instead of manually.

- [**An officer and a gentlewoman from the Viking army in Birka**](#) [周六, 09 9月 08:55]

War was not an activity exclusive to males in the Viking world. A new study shows that women could be found in the higher ranks at the battlefield.

- [**Young birds suffer in the city**](#) [周六, 09 9月 08:54]

City life is tough for young birds. But if they survive their first year, they are less susceptible to the effects of stress, according to new research.

- [**Why it's difficult to predict evolutionary fate of a new trait**](#) [周六, 09 9月 08:54]

Scientists explain the vexing complexities that make it hard to predict whether a new genetic trait will take over a population or die out, a key challenge for many fields including infectious disease.

- [**Meeting a microbe in the morning or in the evening: Is it all the same?**](#) [周六, 09 9月 08:54]

Does the time of day matter when our body is infected by a parasite? According to new research, it matters a great deal.

- [**Animal welfare: Potential new indicator of chronic stress in horses**](#) [周六, 09 9月 08:54]

Cortisol is generally considered to be a stress hormone because its levels rise during episodes of acute stress. Yet its relationship to chronic stress

is less clear. Researchers have linked lower cortisol levels to states of chronically poor welfare in adult horses observed under their usual living conditions.

- [**Lazy ants make themselves useful in unexpected ways**](#) [周六, 09 9月 08:53]

They may look useless, but they're not: so-called lazy ants serve as new recruits ready to replace the top productive workers when the need arises. New research shows that these ants are far from useless.

- [**A sweeter way to make green products**](#) [周六, 09 9月 08:16]

A more efficient process has been created for extracting the sugars from wood chips, corn cobs and other organic waste from forests and farms. This biorenewable feedstock could serve as a cheaper, sustainable substitute for the petroleum used in manufacturing tons of consumer goods annually -- goods that consumers want to be greener.

- [**Extreme weather has limited effect on attitudes toward climate policies**](#) [周五, 08 9月 02:46]

People who recently experienced severe weather events such as floods, storms and drought are more likely to support policies to adapt to the effects of climate change, according to a new study.

- [**Are you barking up the wrong tree by sleeping with your dog?**](#) [周五, 08 9月 02:45]

Let sleeping dogs lie ... in the bedroom. That's according to a new study that's sure to set many tails wagging.

- [**Individuality drives collective behavior of schooling fish**](#) [周五, 08 9月 02:27]

New research sheds light on how 'animal personalities' -- inter-individual differences in animal behavior -- can drive the collective behavior and functioning of animal groups such as schools of fish, including their cohesion, leadership, movement dynamics, and group performance.

- [**Ship exhaust makes oceanic thunderstorms**](#)

[more intense](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

• [Why are fossilized hairs so rare?](#) [周五, 08 9月 02:27]

When it comes to preserving body parts, fossilized hair is rare--five times rarer than feathers--despite being an important tool for understanding ancient species. This finding has researchers trying to determine if the lack of hair in the fossil record has to do with physical traits that might make it more difficult for hair to fossilize, or an issue with scientists' collection techniques that could lead to them missing important finds.

• [Cilia: 'The bouncer' of bacteria](#) [周五, 08 9月 02:27]

A new paper elucidates the active role of cilia in regulating flow for bacteria filtering and enhancing chemical communication.

• [How tails help geckos and other vertebrates make great strides](#) [周五, 08 9月 02:27]

A wagging tail is often associated with dogs' emotions, but the side-to-side motion may also help them take longer strides and move faster, according to a study. The research was done on leopard geckos, which are ideal animals for the study of tail function because they naturally lose their tails as a defense mechanism against predators in a process called autotomy.

• [Eighteenth century nautical charts reveal coral loss](#) [周五, 08 9月 02:27]

Centuries-old nautical charts, mapped by long-deceased sailors to avoid shipwrecks, have been used by modern scientists to study loss of coral reefs. A new study compared early British charts to modern coral habitat maps to understand changes to reef environments.

• [The sand trap: Demand outpaces caution, knowledge](#) [周五, 08 9月 02:27]

Sand, spanning miles of beaches, carpeting vast oceans and deserts, is a visual metaphor for limitless resources. Yet seize another metaphor -- sand in an hourglass, marking time running out.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**Discovery of chromosome motor supports DNA loop extrusion**](#) [周五, 08 9月 02:26]

It is one of the mysteries in biology: how does a cell neatly distribute its replicated DNA between two daughter cells? Scientists are split into two camps: the first argues that condensing works like a hook, tying DNA together. The other camp thinks that the ring-shaped protein pulls the DNA inwards to create a loop. Now researchers from give the 'loop-extrusion camp' a boost: condensin does indeed have the putative 'motor power' on board.

- [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the

metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**Mixing and matching yeast DNA**](#) [周四, 07 9月 22:38]

Scientists show molecular factors that determine why some regions in yeast chromosomes are apt for remodeling, while other regions stay faithful during cell replication.

- [**Proteins keep a grip on cells**](#) [周四, 07 9月 22:38]

Scientists have revealed new structural information on the integrin-laminin interaction. These findings provide important insights on cellular interactions that promote cell growth, differentiation, and migration.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Hidden Inca treasure: Remarkable new tree genus discovered in the Andes**](#) [周四, 07 9月 22:24]

Hidden in plain sight -- that's how researchers describe their discovery of a new genus of large forest tree commonly found, yet previously scientifically unknown, in the tropical Andes.

- [**Algorithm reconstructs processes from individual images**](#) [周四, 07 9月 22:24]

Researchers have developed a new method for reconstructing continuous biological processes, such as disease progression, using image data.

- [**Australian Magpie 'dunks' its food before eating, researchers find**](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- [**Increasing effective decision-making for coastal marine ecosystems**](#) [周四, 07 9月 22:23]

Marine restoration, rather than protection, might be the most cost-effective solution for coastal marine ecosystems suffering from human activities, a new study has found. The study examined how to best benefit coastal marine ecosystems on limited conservation budgets, to help managers better understand the trade-offs.

- [**Breaking through the wall in bacterial membrane vesicle research**](#) [周四, 07 9月 21:36]

Researchers used advanced imaging techniques to investigate the formation of membrane vesicles in a Gram-positive bacterium, a process that is poorly understood, particularly in bacteria with thick cell walls. The consortium showed that membrane vesicle formation was triggered by an enzyme called endolysin that damages the cell wall to create holes that allow the release of membrane vesicles. This mechanism could be exploited for the mass production of bacterial vesicles.

- [**How monkey fights grow**](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

- [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

- [**Extreme weather has limited effect on attitudes toward climate policies**](#) [周五, 08 9月 02:46]

People who recently experienced severe weather events such as floods, storms and drought are more likely to support policies to adapt to the effects of climate change, according to a new study.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

- [**Academic argues for changes in the laws governing modern warfare**](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

- [**Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease**](#) [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a

'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

- [**Study quantifies potential for water reuse in permian basin oil production**](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

- [**Improved vaccine that protects against nine types of HPV is highly effective**](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**Realistic projections of economic growth and carbon emissions**](#) [周四, 07 9月 01:56]

Between 2008 and 2015, the United States was able to reduce carbon emissions while enjoying limited economic growth. But in a recent commentary, John Deutch, who has worked with the energy departments of several presidential administrations, urges cautious optimism. He explains the country experienced a short-term decoupling of emissions and economic growth that models suggest won't sustain in the future or be enough to prevent climate change.

- [**Predatory journals a global problem**](#) [周四, 07 9月 01:56]

Contrary to popular belief, a majority of papers in suspected biomedical predatory journals (57 percent) are from high or upper middle income countries, with many coming from prestigious institutions, a massive

investigation shows. Predatory journals provide scientists with a quick and inexpensive way to publish their findings, but do not provide quality controls and are not included in scientific databases.

• [**How retractions significantly hurt scientists**](#) [周三, 06 9月

23:46]

Life scientists who have published papers that are retracted by journals subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

• [**Voting vulnerability**](#) [周三, 06 9月 22:38]

Online attackers may be able to purchase -- for as little as a few thousand dollars -- enough personal information to potentially alter voter registration information in as many as 36 states and the District of Columbia. Dubbed 'voter identity theft,' the vulnerability could be exploited by attackers to disenfranchise many voters where voter registration information can be changed online.

• [**Oregon's marijuana legalization prompted big drop in sales in Washington's border counties**](#) [周三,

06 9月 01:44]

Three days after recreational marijuana sales became legal in Oregon, sales across the border in Washington, where retail availability already existed, dropped by 41 percent, say economists. Their study also suggests that illegal cross-border movement, or diversion, of legally produced marijuana sold at retail outlets across state borders is a real concern but not occurring at alarming levels.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Looking stressed can help keep the peace](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [Explosive birth of stars swells galactic cores](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

- [How to draw electricity from the bloodstream](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

- [Climate change for aliens](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [Australian Magpie 'dunks' its food before eating, researchers find](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- [**'Vampires' may have been real people with this blood disorder**](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [**Giant bacterium contains genomes for an entire population**](#) [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its “normal” counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as Achromatium can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria aficionada...

- [**High-flying ducks cross Himalayas**](#) [周三, 06 9月 08:30]

A high-flying duck species reaches altitudes of up to 6,800 meters (22,000 feet) to cross the Himalayas, new research shows.

- [**Clever cockatoos bend hooks into straight wire to fish for food**](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

- [**Something to sneeze about: Democratic voting in African wild dog packs**](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

• [**Cooling system works without electricity**](#) [周三, 06 9月 02:55]

Scientists cooled water without electricity by sending excess heat where it won't be noticed -- space. The specialized optical surfaces they developed are a major step toward applying this technology to air conditioning and refrigeration.

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Cold comfort: Fat-rich diets and adaptation among indigenous Siberian populations**](#) [周三, 13 9月 05:05]

Recently, scientists have been exploring the genetic signatures of adaptation in several indigenous cold-adapted human populations. Now, a new study has identified new signals of adaptation across multiple genes and exploring a rich demographic history. By performing extensive analyses on DNA sequencing data for two North-Central Siberian populations, the Nganasan (nomadic hunters) and Yakut (herders), they have been able to infer the most comprehensive demographic and adaptive history.

- [**Health benefits of olives and olive oil**](#) [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [**Lay interventions for depression and drinking**](#) [周三, 13 9月 03:48]

Brief psychological interventions delivered by lay counselors in primary care were effective and cost-effective for patients with depression and harmful drinking in India, according to two new studies.

- [**Predicting atypical development in infants at high risk for autism?**](#) [周三, 13 9月 03:48]

New research identifies a potential biomarker that predicts atypical development in 1- to 2-month-old infants at high versus low familial risk for developing autism spectrum disorders (ASD).

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- [**'Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests**](#) [周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'**](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

- [**Forest regeneration experiment of 30 years yields results**](#) [周三, 13 9月 01:48]

A spruce forest regeneration experiment in Interior Alaska that spanned nearly 30 years demonstrates which forest management practices produce the best results. It looked at different combinations of ground treatments to reduce competition from other vegetation and of regeneration methods, such as planting spruce seedlings and broadcast seeding. The results show the environmental and management situations

in which different techniques work best and the situations in which they are unnecessary. Re...

- [**In mice, calorie restriction reduces fat but increases fur**](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

- [**'Missing link' explains how viruses trigger immunity**](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

- [**Reversing the negative effects of adolescent marijuana use**](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- [**New way to stabilize next-generation fusion plasmas**](#) [周三, 13 9月 01:48]

Recent experiments conducted on the DIII-D National Fusion Facility suggest that up to 40 percent of high-energy particles are lost during tokamak fusion reactions because of Alfvén waves.

- **[Magnetic cellular 'Legos' for the regenerative medicine of the future](#)** [周三, 13 9月 01:48]

By incorporating magnetic nanoparticles in cells and developing a system using miniaturized magnets, researchers have succeeded in creating cellular magnetic 'Legos.' They were able to aggregate cells using only magnets and without an external supporting matrix, with the cells then forming a tissue that can be deformed at will.

- **[Historic legacies affect climate change survival in Caribbean](#)** [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- **[Earthquake faults may have played key role in shaping the culture of ancient Greece](#)** [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- **[AI -- Engineering: merging, morphing, mobile robots](#)** [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- **[Father's environmental exposure affects sperm epigenetics, study shows](#)** [周二, 12 9月 22:28]

Authors of a new report believe that theirs is among the first human studies to investigate the influence of phthalate exposure on sperm epigenetics, embryo development and whether DNA methylation in sperm cells may be a path by which a father's environmental exposure influences these endpoints. DNA methylation, one mechanism of epigenetics, is a chemical tag on DNA that does not change the gene

sequence but is involved in controlling gene expression.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Researchers identify potential biomarkers of age-related macular degeneration**](#) [周二, 12 9月 22:28]

Patients with any stage of age-related macular degeneration (AMD) carry signs of the disease in their blood that may be found through special laboratory tests, according to a new study.

- [**Cancer drug stimulates tripolar mode of mitosis**](#) [周二, 12 9月 22:28]

Taxanes inhibit cell division and make cancer cells sensitive to radiation therapy. A current study has investigated the underlying mechanisms of this action - and which biomarkers may be useful for predicting the success of therapy.

- [**Graphene based terahertz absorbers**](#) [周二, 12 9月 22:27]

A terahertz saturable absorber has been created using printable graphene inks with an order of magnitude higher absorption modulation than other devices produced to date.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- [**Biding time could improve conservation outcomes**](#) [周二, 12 9月 21:31]

Strategic delays in conservation efforts could be the key to protecting more species according to researchers. The new study found instead of

spending project funds immediately, conservation organizations could use the right amount of delay to improve the benefits achieved from their funding by focusing first on investment, capacity building, or monitoring and research.

- [**Exposure to head impacts in youth football practice drills**](#) [周二, 12 9月 21:31]

Researchers have examined differences in the number, location, and magnitude of head impacts sustained by young athletes during various youth football practice drills. Such information could lead to recommendations for football practices, including modification of some high-intensity drills in order to reduce players' exposure to head impacts and, consequently, lessen the risks of injury.

- [**Air quality in 'green' housing affected by toxic chemicals in building materials**](#) [周二, 12 9月 21:31]

Indoor air pollution can be a problem in many homes, even in eco-friendly buildings. Thanks to a new innovative study, researchers have a better idea of where these pollutants come from -- which ones come from chemicals leaching out of building materials and which ones from the personal items people bring into their homes. The findings could inform the development of new green building standards and lead to healthier housing, especially for low-income communities.

- [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

- [**Sexually aroused male flies unable to sleep after close encounters with females**](#) [周二, 12 9月 21:31]

The urge to mate appears to override the need to sleep in flies, according to new research that hints at the importance of sleep for animals.

- [**Running group helps half its graduates quit smoking**](#) [周二, 12 9月 21:31]

Half the people who completed a 10-week community running program aimed at helping them quit smoking were successful in their attempt. Many others reduced their smoking, and saw their mental health improve.

• [**Your stools reveal whether you can lose weight**](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

• [**Explaining bursts of activity in brains of preterm babies**](#) [周二, 12 9月 21:31]

The source of spontaneous, high-amplitude bursts of activity seen in the brains of preterm babies, which are vital for healthy development, has been identified by a team of researchers.

• [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

• [**Eye movements reveal temporal expectation deficits in ADHD**](#) [周二, 12 9月 21:31]

A technique that measures tiny movements of the eyes may help scientists better understand and perhaps eventually improve assessment of ADHD, according to research.

• [**Study sets new distance record for medical drone transport**](#) [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

- [**Researchers discover new, abundant enzyme that helps bacteria infect animals**](#) [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

- [**Ancient tree reveals cause of spike in Arctic temperature**](#) [周二, 12 9月 21:30]

A kauri tree trapped in a New Zealand swamp for 30,000 years may have overturned the idea that a slowdown in ocean currents in the North Atlantic may be entirely responsible for Dansgaard-Oeschger events and the characteristic bi-polar see-saw, which sees the Antarctica cool while the Arctic warms during glacial periods. The research reveals a mechanism that generates a 20,000 km long atmospheric bridge, reaching from Antarctica to the Arctic.

- [**Modeling the impact of green eggs and hens**](#) [周二, 12 9月 21:30]

Poultry given vegan organic chicken feed can help to produce eggs with a smaller environmental footprint than those fed non-organic feeds that contain animal by-products, new research shows.

- [**Rapid climate changes across northern hemisphere in the earliest Middle Pleistocene**](#) [周二, 12 9月 21:30]

By studying climate changes that took place thousands of years ago, we can better understand the global climate system and predict Earth's future climate. A multi-organization research team has discovered evidence of rapid climate changes on a millennial-to-centennial scale that occurred 780 to 760 thousand years ago.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

• **[Long sitting periods may be just as harmful as daily total](#)** [周二, 12 9月 06:00]

A new study finds that sitting around for 12 or more hours per day, particularly if accumulated during 60- to 90-minute periods, increased the risk of early death -- even in those who exercised.

• **[Study of circular DNA comes full circle with use of old technique](#)** [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

• **[When ancient fossil DNA isn't available, ancient glycans may help trace human evolution](#)** [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

• **[Method controls whether freezing droplets bounce off or stick](#)** [周二, 12 9月 03:09]

Self-peeling droplets have been discovered, along with a new way to control adhesion of freezing droplets by adjusting the thermal properties of substrates. These findings could make everything from additive manufacturing to deicing more efficient.

• **[Research identifies causes and possible treatments for deadly diseases affecting children](#)** [周二, 12 9月 03:09]

Research has identified four pathogens that are responsible for the vast majority of diarrheal illnesses, leading the way for potential new

treatments.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Childhood maltreatment may change brain's response to threat**](#) [周二, 12 9月 01:25]

Neural activity associated with defensive responses in humans shifts between two brain regions depending on the proximity of a threat, suggests neuroimaging data from two independent samples of adults in the Netherlands. In one sample, the findings suggest that emotional abuse during childhood may shift the balance of activity between these regions.

- [**DNA looping architecture may lead to opportunities to treat brain tumors**](#) [周二, 12 9月 00:59]

The discovery of a mechanism by which normal brain cells regulate the expression of the NFIA gene, which is important for both normal brain development and brain tumor growth, might one day help improve therapies to treat brain tumors.

- [**Relationship science: How can couples keep moving forward?**](#) [周二, 12 9月 00:27]

Family studies researchers who study the science behind maintaining romantic relationships focus their work on the central organizing unit -- the relationship -- rather than on the individual. In a recent study, they discuss romantic relationship maintenance and the two primary motives behind a couple's attempts at staying together: threat mitigation and relationship enhancement.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

- [**A new genetic marker for schizophrenia**](#) [周二, 12 9月 00:27]

Scientists find a rare genetic variant that shows strong association with schizophrenia.

Health benefits of olives and olive oil: A Virginia Tech research team discovered that the olive-derived compound oleuropein helps the body secrete more insulin, a central signaling molecule in the body that controls metabolism. -- ScienceDaily

The health benefits of olives -- and associated natural products such as olive oil -- have long been recognized and touted by proponents of the Mediterranean diet.

However, little was previously known about what specific compounds and biochemical interactions in the fruit contribute to its medical and nutritional benefits such as weight loss and prevention of type 2 diabetes.

A Virginia Tech research team discovered that the olive-derived compound oleuropein helps the body secrete more insulin, a central signaling molecule in the body that controls metabolism. The same compound also detoxifies another signaling molecule called

amylin that over-produces and forms harmful aggregates in type 2 diabetes. In these two distinct ways, oleuropein helps prevent the onset of disease.

The findings were recently published in the journal *Biochemistry* as a Rapid Report, which is reserved for timely topics of unusual interest, according to the journal.

"Our work provides new mechanistic insights into the long-standing question of why olive products can be anti-diabetic," said Bin Xu, lead author, assistant professor of biochemistry in the College of Agriculture and Life Sciences, and a Fralin Life Science Institute affiliate. "We believe it will not only contribute to the biochemistry of the functions of the olive component oleuropein, but also have an impact on the general public to pay more attention to olive products in light of the current diabetes epidemic."

The discovery could help improve understanding of the scientific basis of health benefits of olive products and develop new, low-cost nutraceutical strategies to fight type 2 diabetes and related obesity.

Next steps include testing the compound in a diabetic

animal model and investigation of additional new functions of this compound, or its components, in metabolism and aging.

Lay interventions for depression and drinking -- ScienceDaily

Brief psychological interventions delivered by lay counsellors in primary care were effective and cost-effective for patients with depression and harmful drinking in India, according to two studies in *PLOS Medicine* by Vikram Patel of Harvard Medical School, USA, and colleagues from the London School of Hygiene & Tropical Medicine, London, UK and Sangath, India. The authors have previously reported the effectiveness of the two interventions, Healthy Activity Programme (HAP) and Counselling for Alcohol Problems (CAP), at 3 months; however, the longer-term benefits of the interventions were previously unknown.

In the first trial, 493 adult primary health care attendees with moderately severe or severe depression were randomly assigned to either the HAP treatment plus enhanced usual care (EUC), or enhanced usual care (EUC) alone. The researchers found that HAP participants maintained the benefits they showed at the

end of treatment through the 12-month period, with significantly lower symptom severity scores (adjusted mean difference in BDI-II: -4.45) and higher rates of remission (PHQ-9 score < 5 : 63% versus 48%) than participants who received EUC alone.

In the second trial, 377 adult male primary health care attendees with harmful drinking were randomly assigned to either the CAP treatment plus EUC, or EUC alone. The researchers found that CAP participants maintained the gains they showed at the end of treatment through the 12-month period, with higher remission rates (AUDIT score < 8 : 54.3% versus 31.9%) and a greater proportion reporting no alcohol consumption in the past 14 days (45.1% versus 26.4%), compared with individuals who received EUC alone.

Both HAP and CAP were likely to be cost-effective, and could even save money if productivity costs were taken into account.

The authors say "We have provided the first evidence that two brief psychological therapies targeting the two leading mental health related causes of the global burden of disease, delivered by the same lay counsellor

in routine primary care, to patients who had never received such therapies before, can lead to sustained improvements in health over one year, and that the investments made in providing this intervention is excellent value for money. Given the enormous economic and social consequences of untreated depression and harmful drinking, the moral imperative is for governments to scale up these treatments globally."

Predicting atypical development in infants at high risk for autism? -- ScienceDaily

New research from the Sackler Institute for Developmental Psychobiology at Columbia University Medical Center (CUMC) identifies a potential biomarker that predicts atypical development in 1- to 2-month-old infants at high versus low familial risk for developing autism spectrum disorders (ASD). The search for neurobiological markers that precede atypical trajectories is important in infants with a high risk for developing autism-related disorders because early recognition allows for early intervention and mitigation of difficulties later in life.

Using data from National Database for Autism Research (NDAR), lead author Kristina Denisova, PhD, Assistant Professor of Psychiatry at CUMC and Fellow at the Sackler Institute, studied 71 high and low risk infants who underwent two functional Magnetic Resonance imaging brain scans either at 1-2 months or at 9-10 months: one during a resting period of sleep

and a second while native language was presented to the infants. After extracting measures of head movements during the scans, the statistical characteristics of these movements were quantified.

The study found that infants at high risk for developing ASD have elevated levels of "noise" and increased randomness in their spontaneous head movements during sleep, a pattern possibly suggestive of problems with sleep. In addition, 1- to 2-month-old high risk infants showed more similar signatures while listening to native language and while sleeping while low risk infants showed distinct signatures during the two conditions.

Further, specific features of head movements during sleep at 1-2 months predicted future flatter (delayed) early learning developmental trajectories in the high-risk babies. The existence of generally atypical learning trajectories in the high risk group was verified in separate data sets from four representative high risk infant-sibling studies comprising a total of 1,445 infants with known ASD outcomes as children. These analyses showed that high risk infants -- even those without ASD diagnoses -- have significantly lower functioning in childhood relative to low risk infants.

The current study reveals a possible way to predict which 1-2 months-old infants will show atypical developmental trajectories as toddlers.

Dr. Denisova said, "The finding that head movement signatures are responsive to high context stimuli (native language speech) in low but not high risk infants is informative because it suggests that infants whose siblings were diagnosed with ASD are less attuned to evolutionarily important stimuli early in life." She added that this response pattern may underlie atypical information processing in individuals with neurodevelopmental disorders.

Dr. Jeremy Veenstra-VanderWeele, MD, an autism researcher who was not involved in this study, noted, "This study is a good example of how existing data can be mined for new insights. Additional work is needed to replicate the current findings and understand the underlying mechanisms, but this work suggests new ways to look at movement or motor function in infants at high risk of ASD."

How hibernating ribosomes wake up -- ScienceDaily

Often described as a cell's protein factory, ribosomes translate messenger RNA and link amino acids together to form new proteins. Ribosomes catalyze proteins that are essential for all life.

In bacteria, ribosomes can take an inactive form called hibernating 100S ribosome. Because protein synthesis accounts for more than half of a cell's energy costs, the inactive ribosome form helps bacteria survive under stressful conditions. During limited nutrient access, antibiotic stress, host colonization, adaptation to the dark and biofilm formation, bacteria aim to conserve energy by shutting down the protein factory.

Scientists have observed that the hibernating form of the ribosome is not a permanent state and that if conditions are favorable, it can "wake up" and return to its active form, called 70S, and begin to initiate new cycles of protein synthesis.

"The 100S form is not held together forever," Yap said.

"However, until now, the disassociation of 100S ribosome has been a complete black box. We haven't known how ribosomes move from one form to the other."

Yap was looking for the protein factor that caused the 100S form to return to the intermediate 30S and 50S forms and subsequently into the active 70S form. Studying *Staphylococcus aureus*, commonly known as staph, Yap found that a GTP hydrolase enzyme called HflX is the wake-up call that will re-activate the ribosome.

"HflX is one way to break up the 100S ribosome structure so that it can return to the active 70S form," Yap said.

HflX GTPases are a family of enzymes that are evolutionarily conserved proteins, meaning they also exist in plants, humans and other bacteria. Yap is intrigued by this finding, because while there has been virtually no study of the protein in human cells, it appears in genetic sequencing mapped to cancer patients and those with neurological symptoms, including tic disorder-like syndromes. Scientists do not yet know what this connection means.

Thanks to a new five-year \$1.59 million grant from the National Institutes of Health, Yap will continue to explore these questions and others that surround hibernating ribosomes' role in cell survival.

All Top News

Top science stories featured on ScienceDaily's home page.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Your stools reveal whether you can lose weight**](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

- [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

- [**Why your ancestors would have aced the long**](#)

[**jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

• [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

• [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

• [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

• [**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

• [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

• [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

• [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

• [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

• [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like

yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

• [Scientist finds secret to thriving](#) [周六, 09 9月 08:55]

What it takes to thrive, rather than merely survive, could be as simple as feeling good about life and yourself and being good at something, according to new research.

• [Scientists make methanol using air around us](#) [周五, 08 9月 02:27]

Scientists have created methanol from methane using oxygen from the air. Methanol is currently produced by breaking down natural gas at high temperatures. But researchers have discovered they can produce methanol from methane through simple catalysis that allows methanol production at low temperatures using oxygen and hydrogen peroxide. The findings have major implications for cleaner, greener industrial processes worldwide.

• [Individuality drives collective behavior of schooling fish](#) [周五, 08 9月 02:27]

New research sheds light on how 'animal personalities' -- inter-individual differences in animal behavior -- can drive the collective behavior and functioning of animal groups such as schools of fish, including their cohesion, leadership, movement dynamics, and group performance.

• [Ship exhaust makes oceanic thunderstorms more intense](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

• [Listening to happy music may enhance divergent creativity](#) [周五, 08 9月 02:27]

Listening to happy music may help generate more, innovative solutions compared to listening to silence, according to a study.

- [**Human skin cells transformed directly into motor neurons**](#) [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

- [**3-D-printed biomaterials that degrade on**](#)

demand [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

• **Intermittent electrical brain stimulation**

improves memory [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• **How monkey fights grow** [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

• **Emoji fans take heart: Scientists pinpoint 27 states of emotion** [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

• **Whole grains decrease colorectal cancer risk, processed meats increase the risk** [周四, 07 9月 21:36]

Major new report finds strong evidence of links between lifestyle and colorectal cancer risk. Physical activity and whole grains lowers risk of this cancer; too much alcohol and red meat, processed meats and obesity increase the risk. An estimated 47 percent of US colorectal cancers could be prevented each year with lifestyle changes.

• **Monkey sees ... monkey knows?** [周四, 07 9月 01:55]

Monkeys had higher confidence in their ability to remember an image when the visual contrast was high. These kinds of metacognitive illusions -- false beliefs about how we learn or remember best -- are shared by humans, leading brain and cognitive scientists to believe that metacognition could have an evolutionary basis.

- [One powerful cell makes or breaks your habits](#) [周四, 07 9月 01:55]

Neuroscientists have pinpointed a single type of neuron deep within the brain that serves as a 'master controller' of habits. The team found that habit formation boosts the activity of this influential cell, and that shutting it down is enough to break unhelpful habits in sugar-seeking mice. The findings may point towards new treatments for addiction or compulsive behavior in humans.

- [Researchers report new way to make dissolving electronics](#) [周四, 07 9月 01:55]

Researchers have reported a new type of electronic device that can be triggered to dissolve through exposure to water molecules in the atmosphere. The work holds promise for eco-friendly disposable personal electronics and biomedical devices that dissolve within the body.

- [Does the organic material of comets predate our solar system?](#) [周三, 06 9月 23:46]

The Rosetta space probe discovered a large amount of organic material in the nucleus of comet 'Chury.' Researchers now advance the theory that this matter has its origin in interstellar space and predates the birth of the solar system.

- [Accretion-powered pulsar reveals unique timing glitch](#) [周三, 06 9月 22:36]

The discovery of the largest timing irregularity yet observed in a pulsar is the first confirmation that pulsars in binary systems exhibit the strange phenomenon known as a 'glitch.'

- [Biologists slow aging, extend lifespan of fruit](#)

[flies](#) [周三, 06 9月 22:34]

In research that potentially could delay the onset of Parkinson's disease, Alzheimer's disease, cancer, stroke, cardiovascular disease, and other diseases of aging, biologists have produced a genetic one-two punch that significantly slowed aging and improved health in the middle-aged fruit flies they studied.

• **[Clever cockatoos bend hooks into straight wire to fish for food](#)** [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

• **[Newly-discovered semiconductor dynamics may help improve energy efficiency](#)** [周三, 06 9月 08:29]

Researchers examining the flow of electricity through semiconductors have uncovered another reason these materials seem to lose their ability to carry a charge as they become more densely 'doped.'

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Cold comfort: Fat-rich diets and adaptation among indigenous Siberian populations**](#) [周三, 13 9月 05:05]

Recently, scientists have been exploring the genetic signatures of adaptation in several indigenous cold-adapted human populations. Now, a new study has identified new signals of adaptation across multiple genes and exploring a rich demographic history. By performing extensive analyses on DNA sequencing data for two North-Central Siberian populations, the Nganasan (nomadic hunters) and Yakut (herders), they have been able to infer the most comprehensive demographic and adaptive history.

- [**Health benefits of olives and olive oil**](#) [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [**Lay interventions for depression and drinking**](#) [周三, 13 9月 03:48]

Brief psychological interventions delivered by lay counselors in primary care were effective and cost-effective for patients with depression and harmful drinking in India, according to two new studies.

- [**Predicting atypical development in infants at high risk for autism?**](#) [周三, 13 9月 03:48]

New research identifies a potential biomarker that predicts atypical development in 1- to 2-month-old infants at high versus low familial risk for developing autism spectrum disorders (ASD).

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- ['Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests](#) [周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [In mice, calorie restriction reduces fat but increases fur](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

- ['Missing link' explains how viruses trigger immunity](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

- [Reversing the negative effects of adolescent marijuana use](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal

cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Father's environmental exposure affects sperm epigenetics, study shows**](#) [周二, 12 9月 22:28]

Authors of a new report believe that theirs is among the first human studies to investigate the influence of phthalate exposure on sperm epigenetics, embryo development and whether DNA methylation in sperm cells may be a path by which a father's environmental exposure influences these endpoints. DNA methylation, one mechanism of epigenetics, is a chemical tag on DNA that does not change the gene sequence but is involved in controlling gene expression.

- [**Researchers identify potential biomarkers of age-related macular degeneration**](#) [周二, 12 9月 22:28]

Patients with any stage of age-related macular degeneration (AMD) carry signs of the disease in their blood that may be found through special laboratory tests, according to a new study.

- [**Cancer drug stimulates tripolar mode of mitosis**](#) [周二, 12 9月 22:28]

Taxanes inhibit cell division and make cancer cells sensitive to radiation therapy. A current study has investigated the underlying mechanisms of this action - and which biomarkers may be useful for predicting the success of therapy.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- [**Exposure to head impacts in youth football practice drills**](#) [周二, 12 9月 21:31]

Researchers have examined differences in the number, location, and magnitude of head impacts sustained by young athletes during various youth football practice drills. Such information could lead to recommendations for football practices, including modification of some high-intensity drills in order to reduce players' exposure to head impacts and, consequently, lessen the risks of injury.

- [**Air quality in 'green' housing affected by toxic chemicals in building materials**](#) [周二, 12 9月 21:31]

Indoor air pollution can be a problem in many homes, even in eco-friendly buildings. Thanks to a new innovative study, researchers have a better idea of where these pollutants come from -- which ones come from chemicals leaching out of building materials and which ones from the personal items people bring into their homes. The findings could inform the development of new green building standards and lead to healthier housing, especially for low-income communities.

- [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

- [**Sexually aroused male flies unable to sleep after close encounters with females**](#) [周二, 12 9月 21:31]

The urge to mate appears to override the need to sleep in flies, according to new research that hints at the importance of sleep for animals.

- [**Running group helps half its graduates quit smoking**](#) [周二, 12 9月 21:31]

Half the people who completed a 10-week community running program aimed at helping them quit smoking were successful in their attempt. Many others reduced their smoking, and saw their mental health improve.

• [**Your stools reveal whether you can lose weight**](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

• [**Explaining bursts of activity in brains of preterm babies**](#) [周二, 12 9月 21:31]

The source of spontaneous, high-amplitude bursts of activity seen in the brains of preterm babies, which are vital for healthy development, has been identified by a team of researchers.

• [**Eye movements reveal temporal expectation deficits in ADHD**](#) [周二, 12 9月 21:31]

A technique that measures tiny movements of the eyes may help scientists better understand and perhaps eventually improve assessment of ADHD, according to research.

• [**Study sets new distance record for medical drone transport**](#) [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

• [**Researchers discover new, abundant enzyme that helps bacteria infect animals**](#) [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

- [**Long sitting periods may be just as harmful as daily total**](#) [周二, 12 9月 06:00]

A new study finds that sitting around for 12 or more hours per day, particularly if accumulated during 60- to 90-minute periods, increased the risk of early death -- even in those who exercised.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**Research identifies causes and possible treatments for deadly diseases affecting children**](#) [周二, 12 9月 03:09]

Research has identified four pathogens that are responsible for the vast majority of diarrheal illnesses, leading the way for potential new treatments.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along

small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Childhood maltreatment may change brain's response to threat**](#) [周二, 12 9月 01:25]

Neural activity associated with defensive responses in humans shifts between two brain regions depending on the proximity of a threat, suggests neuroimaging data from two independent samples of adults in the Netherlands. In one sample, the findings suggest that emotional abuse during childhood may shift the balance of activity between these regions.

- [**DNA looping architecture may lead to opportunities to treat brain tumors**](#) [周二, 12 9月 00:59]

The discovery of a mechanism by which normal brain cells regulate the expression of the NFIA gene, which is important for both normal brain development and brain tumor growth, might one day help improve therapies to treat brain tumors.

- [**Relationship science: How can couples keep moving forward?**](#) [周二, 12 9月 00:27]

Family studies researchers who study the science behind maintaining romantic relationships focus their work on the central organizing unit -- the relationship -- rather than on the individual. In a recent study, they discuss romantic relationship maintenance and the two primary motives behind a couple's attempts at staying together: threat mitigation and relationship enhancement.

- [**A new genetic marker for schizophrenia**](#) [周二, 12 9月 00:27]

Scientists find a rare genetic variant that shows strong association with schizophrenia.

- [**Massachusetts off-road-vehicle law significantly reduces injuries, hospitalizations in children**](#) [周二, 12 9月 00:27]

The 2010 Massachusetts law restricting the use of off-road vehicles to those age 14 and older led to significant reductions in both emergency

department (ED) visits and hospital admissions resulting from ORV injuries in the following three years, research concludes.

- **[The turbulent healing powers of plasma](#)** [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent and effective medical therapies.

- **[Brain Composer: 'Thinking' melodies onto a musical score](#)** [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- **[Revolutionary process could signal new era for gene synthesis](#)** [周二, 12 9月 00:26]

A team of scientists has demonstrated a groundbreaking new method of gene synthesis -- a vital research tool with real-world applications in everything from growing transplantable organs to developing treatments for cancer.

- **[The evolutionary origin of the gut](#)** [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

- **[Cooperation driven by reciprocity, not conformity](#)** [周二, 12 9月 00:26]

From an evolutionary perspective, cooperating with others can yield benefits that increase chances of survival. But what are the conditions

that motivate us to cooperate? New research suggests that reciprocity -- cooperation under the assumption that we will receive benefits in return -- outweighs our desire to conform with group norms when we're deciding whether to cooperate with someone.

- [**New treatment option discovered for brain injury patients suffering from aggression**](#) [周二, 12 9月 00:26]

A drug originally developed in the 1960s as an antiviral medication is showing promise as a treatment option for people who suffer from increased feelings of aggression following traumatic brain injury, researchers have reported.

- [**Patients to benefit from new 3-D visualizations of the heart**](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

- [**Biophysics study makes exciting advancements for the future of DNA sequencing**](#) [周二, 12 9月 00:26]

New technology that optimizes DNA sequencing using nanophysics and electric currents has been developed by scientists. Their work offers a method for loading DNA into sequencing wells with orders of magnitude higher efficiencies.

- [**Scientists list 50 terms you may be confusing**](#) [周二, 12 9月 00:26]

A list of commonly used psychological terms that are often assumed to be similar, if not identical, but which refer to very different concepts has been revealed by new research.

- [**Scientists construct first predictive model of inflammatory bowel disease**](#) [周二, 12 9月 00:26]

An in-depth, multi-omics approach to characterizing the immune component of inflammatory bowel disease (IBD) has been revealed by

researchers. These results provide new insights into the biologic networks involved in IBD with potential to identify new targets and eventually novel interventions for the treatment of patients living with IBD.

- [**Fathers can influence the sex of their offspring, scientists show**](#) [周二, 12 9月 00:26]

It has traditionally been thought that in mammals only mothers are able to influence the sex of their offspring. But a new study in wild mice has shown that fathers can, in fact, influence sex ratios.

- [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [**Fire ant venom compounds may lead to skin treatments**](#) [周一, 11 9月 21:59]

Solenopsins, the main toxic components of fire ant venom, chemically resemble ceramides, which are lipid-like molecules essential for maintaining for the barrier function of the skin. Solenopsin analogs can reduce skin thickening and inflammation in a mouse model of psoriasis, scientists have shown.

- [**Respiratory tract infections in young children linked to asthma and worse lung function**](#) [周一, 11 9月 11:25]

Respiratory tract infections in young children are linked to an increased risk of asthma and worse lung function in later life, according to new research.

- [**Abdominal fat a key cancer driver for postmenopausal women**](#) [周一, 11 9月 11:25]

Body fat distribution in the trunk is more important than body weight when it comes to cancer risk in postmenopausal women, according to a new study.

- [**Nurses' regular use of disinfectants is associated**](#)

with developing COPD [周一, 11 9月 11:25]

Regular use of disinfectants is linked to a higher risk of developing chronic obstructive pulmonary disease (COPD), according to new research looking at incidence of the disease in over 55,000 nurses in the USA.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'**](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

- [**New way to stabilize next-generation fusion plasmas**](#) [周三, 13 9月 01:48]

Recent experiments conducted on the DIII-D National Fusion Facility suggest that up to 40 percent of high-energy particles are lost during tokamak fusion reactions because of Alfvén waves.

- [**Magnetic cellular 'Legos' for the regenerative medicine of the future**](#) [周三, 13 9月 01:48]

By incorporating magnetic nanoparticles in cells and developing a system using miniaturized magnets, researchers have succeeded in creating cellular magnetic 'Legos.' They were able to aggregate cells using only magnets and without an external supporting matrix, with the cells then forming a tissue that can be deformed at will.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control.

The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Graphene based terahertz absorbers**](#) [周二, 12 9月 22:27]

A terahertz saturable absorber has been created using printable graphene inks with an order of magnitude higher absorption modulation than other devices produced to date.

- [**Study sets new distance record for medical drone transport**](#) [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

- [**Method controls whether freezing droplets bounce off or stick**](#) [周二, 12 9月 03:09]

Self-peeling droplets have been discovered, along with a new way to control adhesion of freezing droplets by adjusting the thermal properties of substrates. These findings could make everything from additive manufacturing to deicing more efficient.

- [**The turbulent healing powers of plasma**](#) [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent

and effective medical therapies.

- [**A novel and practical fab-route for superomniphobic liquid-free surfaces**](#) [周二, 12 9月 00:27]

Scientists have developed a fabrication technology that can inexpensively produce surfaces capable of repelling liquids, including water and oil.

- [**Connecting up the quantum internet**](#) [周二, 12 9月 00:27]

Major leap for practical building blocks of a quantum internet: New research demonstrates how to dramatically improve the storage time of a telecom-compatible quantum memory, a vital component of a global quantum network. The technology operates in the same 1550 nanometer band as today's telecommunications infrastructure. It can also be operated as a quantum light source or used as an optical link for solid-state quantum computing devices such as superconducting qubits and silicon qubits.

- [**Self-assembling nanoparticle arrays can switch between a mirror and a window**](#) [周二, 12 9月 00:27]

By finely tuning the distance between nanoparticles in a single layer, researchers have made a filter that can change between a mirror and a window.

- [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- [**Hollow atoms: The consequences of an underestimated effect**](#) [周二, 12 9月 00:26]

In a 'hollow atom', electrons occupy high-energy states far away from the nucleus, it can get rid of their excess energy on a remarkably short timescale. The reason for this has been unknown. Researchers have now shown that this is due to a previously underestimated effect: the

'interatomic coulomb decay' allows the atom to transfer its energy to several other atoms simultaneously. This also explains why radiation therapy can be so effective.

- [**Patients to benefit from new 3-D visualizations of the heart**](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

- [**Study clarifies how neural nets 'think' when processing language**](#) [周二, 12 9月 00:26]

A new general-purpose technique has been developed for making sense of neural networks that are trained to perform natural-language-processing tasks, in which computers attempt to interpret freeform texts written in ordinary, or 'natural,' language (as opposed to a structured language, such as a database-query language).

- [**First on-chip nanoscale optical quantum memory developed**](#) [周二, 12 9月 00:26]

Engineers have built a chip capable of storing and retrieving individual photons of light, with all of their quantum properties left intact. The chip represents the first nanoscale optical quantum memory device, and could one day be used to create more secure Internet communications.

- [**Using mirrors to improve the quality of light particles**](#) [周一, 11 9月 21:59]

Scientists have succeeded in dramatically improving the quality of individual photons generated by a quantum system. The scientists have successfully put a 10-year-old theoretical prediction into practice. With their paper, they have taken an important step towards future applications in quantum information technology.

- [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

- [**When electrons ride a wave**](#) [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

- [**Scientists unravel new insights into promising semiconductor material**](#) [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

- [**Are we being watched? Tens of other worlds could spot the Earth**](#) [周六, 09 9月 08:55]

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

- [**High-speed quantum memory for photons**](#) [周六, 09 9月 08:54]

Physicists have developed a memory that can store photons. These quantum particles travel at the speed of light and are thus suitable for high-speed data transfer. The researchers were able to store them in an atomic vapor and read them out again later without altering their quantum mechanical properties too much. This memory technology is simple and fast and it could find application in a future quantum

Internet.

- [**How to draw electricity from the bloodstream**](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

- [**New guidelines discourage use of brain imaging as a 'lie detector' for chronic pain**](#) [周六, 09 9月 08:54]

A task force consisting of researchers from around the world has released a set of recommendations that advise against the use of brain imaging as a test for chronic pain.

- [**A sweeter way to make green products**](#) [周六, 09 9月 08:16]

A more efficient process has been created for extracting the sugars from wood chips, corn cobs and other organic waste from forests and farms. This biorenewable feedstock could serve as a cheaper, sustainable substitute for the petroleum used in manufacturing tons of consumer goods annually -- goods that consumers want to be greener.

- [**Scientists make methanol using air around us**](#) [周五, 08 9月 02:27]

Scientists have created methanol from methane using oxygen from the air. Methanol is currently produced by breaking down natural gas at high temperatures. But researchers have discovered they can produce methanol from methane through simple catalysis that allows methanol production at low temperatures using oxygen and hydrogen peroxide. The findings have major implications for cleaner, greener industrial processes worldwide.

- [**Tweet life vs. street life: Exploring the gap between content, feelings**](#) [周五, 08 9月 02:27]

Twitter is an unreliable witness to the world's emotions, suggests a researcher, adding that online social life doesn't always reflect offline social reality.

- [**Quantum detectives in the hunt for the world's first quantum computer**](#) [周五, 08 9月 02:26]

A new paper is the latest confirmation of Majorana fermions -- a strange quasiparticle at the heart of the next generation of quantum machines being pursued by engineers.

- [**Streamlined security: Optimizing sensor placement with mathematics**](#) [周五, 08 9月 01:25]

Increasing reliance on heightened security in public and private settings calls for optimal sensor technology. However, placing security sensors to optimize resource management and system performance while simultaneously protecting people and products is undoubtedly challenging. In a new paper, experts propose a computational level set method to optimally position a sensor-based security system for maximum surveillance of a complex environment.

- [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

- [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

- [**Lignin: Much more valuable than just as waste**](#) [周五, 08 9月 00:03]

Lignin, a substance considered as a waste product in biomass and ethanol production, will now reach its proper value as bio-oil in new products.

- [**Aspirin tablets help unravel basic physics**](#) [周五, 08 9月 00:03]

Aspirin in form of small crystallites provides new insight into delicate

motions of electrons and atomic nuclei. Set into molecular vibration by strong ultrashort far-infrared (terahertz) pulses, the nuclei oscillate much faster than for weak excitation. They gradually return to their intrinsic oscillation frequency, in parallel to the picosecond decay of electronic motions. An analysis of the terahertz waves radiated from the moving particles by in-depth theory reveals the strongly coupled chara...

- [**Scanning tunneling microscopy measurements identify active sites on catalyst surfaces**](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

- [**'Rubber material' discovered that could lead to scratch-proof paint for car**](#) [周五, 08 9月 00:02]

A stretchy miracle material has been discovered that could be used to create highly resistant smart devices and scratch-proof paint for cars, report investigators.

- [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Ultraviolet light from superluminous supernova key to revealing explosion mechanism**](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

- [**Fast magnetic writing of data**](#) [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

- [**Intermittent electrical brain stimulation**](#)

improves memory [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• **A tiny device offers insights to how cancer spreads** [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

• **Drivers don't ignore a ringing phone but do ignore the risk** [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

• **Water-based lithium-ion batteries that don't explode now created** [周四, 07 9月 05:01]

For the first time a lithium-ion battery has been developed that uses a water-salt solution as its electrolyte and reaches the 4.0 volt mark desired for household electronics, such as laptop computers, without the fire and explosive risks associated with some commercially available non-aqueous lithium-ion batteries.

• **Study quantifies potential for water reuse in permian basin oil production** [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with

some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

[Researchers challenge status quo of battery commercialization](#) [周四, 07 9月 05:01]

Researchers are looking to the pharmaceutical industry to propose an updated model of US battery commercialization.

[New device accurately identifies cancer in seconds](#) [周四, 07 9月 02:49]

A team of scientists and engineers has invented a powerful tool that rapidly and accurately identifies cancerous tissue during surgery, delivering results in about 10 seconds. The MasSpec Pen is an innovative handheld instrument that gives surgeons precise diagnostic information about what tissue to cut or preserve, helping improve treatment and reduce the chances of cancer recurrence.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [Health benefits of olives and olive oil](#) [周三, 13 9月 04:10]
A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.
- [How hibernating ribosomes wake up](#) [周三, 13 9月 01:48]
Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.
- ['Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests](#) [周三, 13 9月 01:48]
What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.
- [Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'](#) [周三, 13 9月 01:48]
Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

- [**Forest regeneration experiment of 30 years yields results**](#) [周三, 13 9月 01:48]

A spruce forest regeneration experiment in Interior Alaska that spanned nearly 30 years demonstrates which forest management practices produce the best results. It looked at different combinations of ground treatments to reduce competition from other vegetation and of regeneration methods, such as planting spruce seedlings and broadcast seeding. The results show the environmental and management situations in which different techniques work best and the situations in which they are unnecessary. Re...

- [**In mice, calorie restriction reduces fat but increases fur**](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

- [**'Missing link' explains how viruses trigger immunity**](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

- [**Reversing the negative effects of adolescent marijuana use**](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in

the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- [**Earthquake faults may have played key role in shaping the culture of ancient Greece**](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- [**Biding time could improve conservation outcomes**](#) [周二, 12 9月 21:31]

Strategic delays in conservation efforts could be the key to protecting more species according to researchers. The new study found instead of spending project funds immediately, conservation organizations could use the right amount of delay to improve the benefits achieved from their funding by focusing first on investment, capacity building, or monitoring and research.

• **['Keep it local' approach more effective than government schemes at protecting rainforest](#)** [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

• **[Researchers discover new, abundant enzyme that helps bacteria infect animals](#)** [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

• **[Ancient tree reveals cause of spike in Arctic temperature](#)** [周二, 12 9月 21:30]

A kauri tree trapped in a New Zealand swamp for 30,000 years may have overturned the idea that a slowdown in ocean currents in the North Atlantic may be entirely responsible for Dansgaard-Oeschger events and the characteristic bi-polar see-saw, which sees the Antarctica cool while the Arctic warms during glacial periods. The research reveals a mechanism that generates a 20,000 km long atmospheric bridge, reaching from Antarctica to the Arctic.

• **[Modeling the impact of green eggs and hens](#)** [周二, 12 9月 21:30]

Poultry given vegan organic chicken feed can help to produce eggs with a smaller environmental footprint than those fed non-organic feeds that contain animal by-products, new research shows.

• **[Rapid climate changes across northern hemisphere in the earliest Middle Pleistocene](#)** [周二, 12 9月 21:30]

By studying climate changes that took place thousands of years ago, we can better understand the global climate system and predict Earth's future climate. A multi-organization research team has discovered evidence of rapid climate changes on a millennial-to-centennial scale

that occurred 780 to 760 thousand years ago.

- [**Rising CO2 leading to changes in land plant photosynthesis**](#) [周二, 12 9月 05:04]

Researchers have determined that major changes in plant behavior have occurred over the past 40 years, using measurements of subtle changes in the carbon dioxide (CO₂) currently found in the atmosphere.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Earthquake triggers 'slow motion' quakes in**](#)

[**New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

[**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

[**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

[**Muscle nuclei: May the force be with you**](#) [周二, 12 9月 00:26]

A group of researchers has revealed the mechanism by which cellular nuclei reach their position within muscle cells. This discovery can have important implications in therapeutic strategies to treat muscular diseases.

[**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

[**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question

concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

• [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

• [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

• [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

• [**Fathers can influence the sex of their offspring, scientists show**](#) [周二, 12 9月 00:26]

It has traditionally been thought that in mammals only mothers are able to influence the sex of their offspring. But a new study in wild mice has shown that fathers can, in fact, influence sex ratios.

• [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [**Fire ant venom compounds may lead to skin treatments**](#) [周一, 11 9月 21:59]

Solenopsins, the main toxic components of fire ant venom, chemically resemble ceramides, which are lipid-like molecules essential for maintaining for the barrier function of the skin. Solenopsin analogs can reduce skin thickening and inflammation in a mouse model of psoriasis, scientists have shown.

- [**Ancient wetlands offer window into climate change**](#) [周一, 11 9月 21:59]

Environmental researchers have uncovered a wealth of information about a unique part of Australia that offers never-before-seen insights into climate change since the last ice age.

- [**Desert locusts: New risks in the light of climate change**](#) [周一, 11 9月 21:59]

The desert locust is an invasive species that is both well known and feared because of the large-scale agricultural damage it can cause. It is particularly closely monitored, to prevent the risks of outbreaks and invasions. Climate change could modify its distribution area, meaning a new threat to agriculture, according to a study.

- [**Biosensor detects adulteration of horse in beef meat within one hour**](#) [周一, 11 9月 21:59]

Fraud in meat products has become, in recent years, a battle of the food industry and public health. Although there are numerous strategies to detect it, they are not sufficiently selective and sensitive to differentiate close animal species. A collaboration of experts has developed an electrochemical biosensor capable of detecting, in just one hour, processes of adulteration of beef with horse meat.

- [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

- [**A-MUD: A method for automatically detecting mouse song**](#) [周六, 09 9月 08:55]

Mice produce a remarkable repertoire of vocalizations across five octaves, which they emit during mating and other contexts. Analyses of mice song can provide important information about their social behavior and for research into neuropsychiatric disorders. But their songs are in the ultrasonic range and inaudible for humans. Researchers have now developed a freely available method to automatically detect mouse vocalizations instead of manually.

- [**An officer and a gentlewoman from the Viking army in Birka**](#) [周六, 09 9月 08:55]

War was not an activity exclusive to males in the Viking world. A new study shows that women could be found in the higher ranks at the battlefield.

- [**Young birds suffer in the city**](#) [周六, 09 9月 08:54]

City life is tough for young birds. But if they survive their first year, they are less susceptible to the effects of stress, according to new research.

- [**Why it's difficult to predict evolutionary fate of a new trait**](#) [周六, 09 9月 08:54]

Scientists explain the vexing complexities that make it hard to predict whether a new genetic trait will take over a population or die out, a key challenge for many fields including infectious disease.

- [**Meeting a microbe in the morning or in the**](#)

evening: Is it all the same? [周六, 09 9月 08:54]

Does the time of day matter when our body is infected by a parasite? According to new research, it matters a great deal.

• **Animal welfare: Potential new indicator of chronic stress in horses** [周六, 09 9月 08:54]

Cortisol is generally considered to be a stress hormone because its levels rise during episodes of acute stress. Yet its relationship to chronic stress is less clear. Researchers have linked lower cortisol levels to states of chronically poor welfare in adult horses observed under their usual living conditions.

• **Lazy ants make themselves useful in unexpected ways** [周六, 09 9月 08:53]

They may look useless, but they're not: so-called lazy ants serve as new recruits ready to replace the top productive workers when the need arises. New research shows that these ants are far from useless.

• **A sweeter way to make green products** [周六, 09 9月 08:16]

A more efficient process has been created for extracting the sugars from wood chips, corn cobs and other organic waste from forests and farms. This biorenewable feedstock could serve as a cheaper, sustainable substitute for the petroleum used in manufacturing tons of consumer goods annually -- goods that consumers want to be greener.

• **Extreme weather has limited effect on attitudes toward climate policies** [周五, 08 9月 02:46]

People who recently experienced severe weather events such as floods, storms and drought are more likely to support policies to adapt to the effects of climate change, according to a new study.

• **Are you barking up the wrong tree by sleeping with your dog?** [周五, 08 9月 02:45]

Let sleeping dogs lie ... in the bedroom. That's according to a new study that's sure to set many tails wagging.

. [Individuality drives collective behavior of schooling fish](#) [周五, 08 9月 02:27]

New research sheds light on how 'animal personalities' -- inter-individual differences in animal behavior -- can drive the collective behavior and functioning of animal groups such as schools of fish, including their cohesion, leadership, movement dynamics, and group performance.

. [Ship exhaust makes oceanic thunderstorms more intense](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

- [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

- [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

- [**Extreme weather has limited effect on attitudes toward climate policies**](#) [周五, 08 9月 02:46]

People who recently experienced severe weather events such as floods, storms and drought are more likely to support policies to adapt to the effects of climate change, according to a new study.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Nutrition has benefits for brain network**](#)

[organization](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

• [Academic argues for changes in the laws governing modern warfare](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

• [Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease](#) [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

• [Study quantifies potential for water reuse in permian basin oil production](#) [周四, 07 9月 05:01]

Hydraulic fracturing has once again made the Permian Basin one of the richest oil fields in the world. But the improved reserves come with some serious water management issues. Drilling for oil uses water upfront, and brings up large volumes of water that need to be managed. The study found that recycling the water produced during operations at other hydraulic fracturing sites could help reduce potential problems associated with the technology.

• [Improved vaccine that protects against nine types of HPV is highly effective](#) [周四, 07 9月 02:32]

Cervical cancer is the second most common cause of cancer-related

death worldwide, with almost 300,000 deaths occurring each year. More than 80 percent of these deaths occur in developing nations. The advent of human papillomavirus (HPV) vaccines has significantly reduced the number of those who develop and die from cervical cancer.

- [**Realistic projections of economic growth and carbon emissions**](#) [周四, 07 9月 01:56]

Between 2008 and 2015, the United States was able to reduce carbon emissions while enjoying limited economic growth. But in a recent commentary, John Deutch, who has worked with the energy departments of several presidential administrations, urges cautious optimism. He explains the country experienced a short-term decoupling of emissions and economic growth that models suggest won't sustain in the future or be enough to prevent climate change.

- [**Predatory journals a global problem**](#) [周四, 07 9月 01:56]

Contrary to popular belief, a majority of papers in suspected biomedical predatory journals (57 percent) are from high or upper middle income countries, with many coming from prestigious institutions, a massive investigation shows. Predatory journals provide scientists with a quick and inexpensive way to publish their findings, but do not provide quality controls and are not included in scientific databases.

- [**How retractions significantly hurt scientists**](#) [周三, 06 9月 23:46]

Life scientists who have published papers that are retracted by journals subsequently suffer a 10 percent drop in citations of their remaining work, compared to similar but unaffected scientists, according to a new study.

- [**Fuel economy standards cheaper, more beneficial than previously believed**](#) [周三, 06 9月 23:46]

The regulations that set fuel-economy and greenhouse-gas emission goals for cars and trucks have lower costs and higher benefits than previous analyses report, a new study shows.

- [**Voting vulnerability**](#) [周三, 06 9月 22:38]

Online attackers may be able to purchase -- for as little as a few

thousand dollars -- enough personal information to potentially alter voter registration information in as many as 36 states and the District of Columbia. Dubbed 'voter identity theft,' the vulnerability could be exploited by attackers to disenfranchise many voters where voter registration information can be changed online.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Earthquake faults may have played key role in shaping the culture of ancient Greece](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- [AI -- Engineering: merging, morphing, mobile robots](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [Looking stressed can help keep the peace](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [Explosive birth of stars swells galactic cores](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

- [How to draw electricity from the bloodstream](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and

tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

- [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Australian Magpie 'dunks' its food before eating, researchers find**](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

- [**'Vampires' may have been real people with this blood disorder**](#) [周四, 07 9月 02:49]

A newly discovered genetic mutation triggers erythropoietic protoporphyria (EPP). This discovery illuminates a novel biological mechanism potentially responsible for stories of 'vampires' and identifies a potential therapeutic target for treating EPP.

- [**Giant bacterium contains genomes for an entire population**](#) [周四, 07 9月 02:26]

Achromatium oxaliferum is the largest (known) freshwater bacterium in the world. It is 30,000 times larger than its “normal” counterparts that live in water and owing to its calcite deposits it is visible to the naked eye. It has long been known – at least among bacteria fans – that some sulfur bacteria such as *Achromatium* can be extremely large and may contain several genome copies. But the fact that a single bacterial cell harbors hundreds of different genomes is new – also to bacteria aficiona...

- [**High-flying ducks cross Himalayas**](#) [周三, 06 9月 08:30]

A high-flying duck species reaches altitudes of up to 6,800 meters (22,000 feet) to cross the Himalayas, new research shows.

. [Clever cockatoos bend hooks into straight wire to fish for food](#) [周三, 06 9月 08:29]

Bending of a hook into wire to fish for the handle of a basket by crow Betty 15 years ago stunned the scientific world. Cognitive biologists studied tool making in an Indonesian cockatoo. Other than crows, cockatoos are not using tools in the wild. The birds manufactured hook tools out of straight wire without ever having seen or used a hook tool before.

. [Something to sneeze about: Democratic voting in African wild dog packs](#) [周三, 06 9月 08:29]

Scientists studying African wild dogs in Botswana have found members of this endangered species use sneezes to vote on when the pack will move off and start hunting.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Bird songs isolate species, new research suggests**](#)

[周三, 13 9月 22:45]

Two birds that look the same, but have songs so different they can't recognize each other, should be considered distinct species, suggests new research. Among 72 related populations of Central and South American birds the researchers tested, they found evidence for 21 new species.

- [**Popular bottle-breaking trick is giving insight to brain injuries**](#)

[周三, 13 9月 22:45]

As many YouTube videos show, striking the top of a liquid-filled bottle can shatter the bottom. Researchers are hoping to use new knowledge of that party trick to help fill a gap in something much more serious: brain research.

- [**The beam of invisibility**](#)

[周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

- [**New hope for 'bubble baby disease'**](#)

[周三, 13 9月 22:45]

If untreated, severe combined immune deficiency (SCID) syndrome --

or 'bubble baby disease' -- is often fatal within the first year of a infant's life. A checklist of SCID markers could make diagnosis faster, allowing more babies to receive treatment within a critical timeframe, say researchers.

- [**Multifunctional nano-sized drug carriers based on reactive polypept\(o\)ides**](#) [周三, 13 9月 22:44]

Researchers have been able to demonstrate that reactive polypept(o)ides constitute ideal building blocks to control morphology and function of carrier systems in a simple but precise manner.

- [**Teens' ability to consider the intentions of others linked to structural changes in the brain**](#) [周三, 13 9月 20:44]

When it comes to the concept of fairness, teenagers' ability to consider the intentions of others appears to be linked to structural changes underway in the brain, according to a study. The study is the first to provide evidence linking structural changes with behavioral changes within this context. Understanding the intentions of others is fundamental to human cooperation and how we exist as social beings.

- [**Paper-based tuberculosis test could boost diagnoses in developing countries**](#) [周三, 13 9月 20:44]

Diagnosing tuberculosis early can allow patients to receive the medicine they need and also help prevent the disease from spreading. But in resource-limited areas, equipment requirements and long wait times for results are obstacles to diagnosis and treatment. To tackle this problem, scientists report the development of a fast, paper-based tuberculosis test that can be read with a smartphone.

- [**Systems analysis points to links between Toxoplasma infection and common brain diseases**](#) [周三, 13 9月 20:44]

Nearly one out of every three humans on earth has a lifelong infection with the brain-dwelling parasite *Toxoplasma gondii*. In a new report, researchers from multiple institutions describe efforts to learn how

infection with the parasite *Toxoplasma gondii* may alter, and in some cases amplify, several brain disorders, including epilepsy, Alzheimer's and Parkinson's diseases as well as some cancers.

• [**As 'flesh-eating' Leishmania come closer, a vaccine against them does, too**](#) [周三, 13 9月 20:44]

Boils the size of sand dollars, facial damage reminiscent of acid wounds, death by maiming of the liver and spleen. *Leishmania* parasites inflict suffering around the world that is the stuff of parables. They are the second-deadliest parasites after malaria, and global warming is slowly pushing them north toward the United States. Can a new experimental vaccine someday stop them? The vaccine has worked in humanized mice, as detailed in a new study.

• [**New research on probiotics in the prevention and treatment of colon cancer**](#) [周三, 13 9月 20:44]

In an innovative approach to colorectal cancer (CRC) prevention and treatment, scientists are studying ways to replace missing metabolites in patients prone to gut inflammation and CRC. A new study describes how administration of histamine-producing gut microbes to mice lacking the enzyme histidine decarboxylase (HDC) reduced inflammation and tumor formation. These results suggest that alteration of the gut microbiome with probiotics may become a new preventative or therapeutic strategy for patie...

• [**Science spin prevalent, researchers warn**](#) [周三, 13 9月 05:05]

More than a quarter of biomedical scientific papers may utilize practices that distort the interpretation of results or mislead readers so that results are viewed more favorably, a new study suggests.

• [**Cold comfort: Fat-rich diets and adaptation among indigenous Siberian populations**](#) [周三, 13 9月 05:05]

Recently, scientists have been exploring the genetic signatures of adaptation in several indigenous cold-adapted human populations. Now, a new study has identified new signals of adaptation across multiple genes and exploring a rich demographic history. By performing

extensive analyses on DNA sequencing data for two North-Central Siberian populations, the Nganasan (nomadic hunters) and Yakut (herders), they have been able to infer the most comprehensive demographic and adaptive history.

- [**Health benefits of olives and olive oil**](#) [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [**Lay interventions for depression and drinking**](#) [周三, 13 9月 03:48]

Brief psychological interventions delivered by lay counselors in primary care were effective and cost-effective for patients with depression and harmful drinking in India, according to two new studies.

- [**Predicting atypical development in infants at high risk for autism?**](#) [周三, 13 9月 03:48]

New research identifies a potential biomarker that predicts atypical development in 1- to 2-month-old infants at high versus low familial risk for developing autism spectrum disorders (ASD).

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- [**'Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests**](#) [周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [**Microscope invented at marine biological**](#)

[laboratory illuminates chromosomal 'dark matter'](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

• [Forest regeneration experiment of 30 years yields results](#) [周三, 13 9月 01:48]

A spruce forest regeneration experiment in Interior Alaska that spanned nearly 30 years demonstrates which forest management practices produce the best results. It looked at different combinations of ground treatments to reduce competition from other vegetation and of regeneration methods, such as planting spruce seedlings and broadcast seeding. The results show the environmental and management situations in which different techniques work best and the situations in which they are unnecessary. Re...

• [In mice, calorie restriction reduces fat but increases fur](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

• ['Missing link' explains how viruses trigger immunity](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

- **[Reversing the negative effects of adolescent marijuana use](#)** [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- **[New way to stabilize next-generation fusion plasmas](#)** [周三, 13 9月 01:48]

Recent experiments conducted on the DIII-D National Fusion Facility suggest that up to 40 percent of high-energy particles are lost during tokamak fusion reactions because of Alfvén waves.

- **[Magnetic cellular 'Legos' for the regenerative medicine of the future](#)** [周三, 13 9月 01:48]

By incorporating magnetic nanoparticles in cells and developing a system using miniaturized magnets, researchers have succeeded in creating cellular magnetic 'Legos.' They were able to aggregate cells using only magnets and without an external supporting matrix, with the cells then forming a tissue that can be deformed at will.

- **[Historic legacies affect climate change survival in Caribbean](#)** [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- **[Earthquake faults may have played key role in shaping the culture of ancient Greece](#)** [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- **[AI -- Engineering: merging, morphing, mobile](#)**

robots [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

• **Father's environmental exposure affects sperm epigenetics, study shows** [周二, 12 9月 22:28]

Authors of a new report believe that theirs is among the first human studies to investigate the influence of phthalate exposure on sperm epigenetics, embryo development and whether DNA methylation in sperm cells may be a path by which a father's environmental exposure influences these endpoints. DNA methylation, one mechanism of epigenetics, is a chemical tag on DNA that does not change the gene sequence but is involved in controlling gene expression.

• **Coffee and bees: New model of climate change effects** [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

• **Researchers identify potential biomarkers of age-related macular degeneration** [周二, 12 9月 22:28]

Patients with any stage of age-related macular degeneration (AMD) carry signs of the disease in their blood that may be found through special laboratory tests, according to a new study.

• **Cancer drug stimulates tripolar mode of mitosis** [周二, 12 9月 22:28]

Taxanes inhibit cell division and make cancer cells sensitive to radiation therapy. A current study has investigated the underlying mechanisms of this action - and which biomarkers may be useful for predicting the success of therapy.

• **Graphene based terahertz absorbers** [周二, 12 9月 22:27]

A terahertz saturable absorber has been created using printable graphene inks with an order of magnitude higher absorption modulation than other devices produced to date.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- [**Biding time could improve conservation outcomes**](#) [周二, 12 9月 21:31]

Strategic delays in conservation efforts could be the key to protecting more species according to researchers. The new study found instead of spending project funds immediately, conservation organizations could use the right amount of delay to improve the benefits achieved from their funding by focusing first on investment, capacity building, or monitoring and research.

- [**Exposure to head impacts in youth football practice drills**](#) [周二, 12 9月 21:31]

Researchers have examined differences in the number, location, and magnitude of head impacts sustained by young athletes during various youth football practice drills. Such information could lead to recommendations for football practices, including modification of some high-intensity drills in order to reduce players' exposure to head impacts and, consequently, lessen the risks of injury.

- [**Air quality in 'green' housing affected by toxic chemicals in building materials**](#) [周二, 12 9月 21:31]

Indoor air pollution can be a problem in many homes, even in eco-friendly buildings. Thanks to a new innovative study, researchers have a better idea of where these pollutants come from -- which ones come from chemicals leaching out of building materials and which ones from the personal items people bring into their homes. The findings could inform the development of new green building standards and lead to

healthier housing, especially for low-income communities.

• [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

• [**Sexually aroused male flies unable to sleep after close encounters with females**](#) [周二, 12 9月 21:31]

The urge to mate appears to override the need to sleep in flies, according to new research that hints at the importance of sleep for animals.

• [**Running group helps half its graduates quit smoking**](#) [周二, 12 9月 21:31]

Half the people who completed a 10-week community running program aimed at helping them quit smoking were successful in their attempt. Many others reduced their smoking, and saw their mental health improve.

• [**Your stools reveal whether you can lose weight**](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

• [**Explaining bursts of activity in brains of preterm babies**](#) [周二, 12 9月 21:31]

The source of spontaneous, high-amplitude bursts of activity seen in the brains of preterm babies, which are vital for healthy development, has been identified by a team of researchers.

• [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

- [**Eye movements reveal temporal expectation deficits in ADHD**](#) [周二, 12 9月 21:31]

A technique that measures tiny movements of the eyes may help scientists better understand and perhaps eventually improve assessment of ADHD, according to research.

- [**Study sets new distance record for medical drone transport**](#) [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

- [**Researchers discover new, abundant enzyme that helps bacteria infect animals**](#) [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

- [**Ancient tree reveals cause of spike in Arctic temperature**](#) [周二, 12 9月 21:30]

A kauri tree trapped in a New Zealand swamp for 30,000 years may have overturned the idea that a slowdown in ocean currents in the North Atlantic may be entirely responsible for Dansgaard-Oeschger events and the characteristic bi-polar see-saw, which sees the Antarctica cool while the Arctic warms during glacial periods. The research reveals a mechanism that generates a 20,000 km long atmospheric bridge, reaching from Antarctica to the Arctic.

- [**Modeling the impact of green eggs and hens**](#) [周二, 12 9月 21:30]

Poultry given vegan organic chicken feed can help to produce eggs with a smaller environmental footprint than those fed non-organic feeds that contain animal by-products, new research shows.

- [**Rapid climate changes across northern**](#)

[hemisphere in the earliest Middle Pleistocene](#) [周二, 12 9月 21:30]

9月 21:30]

By studying climate changes that took place thousands of years ago, we can better understand the global climate system and predict Earth's future climate. A multi-organization research team has discovered evidence of rapid climate changes on a millennial-to-centennial scale that occurred 780 to 760 thousand years ago.

· [Astronauts don't develop anemia during spaceflight, NASA study suggests](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

· [Long sitting periods may be just as harmful as daily total](#) [周二, 12 9月 06:00]

A new study finds that sitting around for 12 or more hours per day, particularly if accumulated during 60- to 90-minute periods, increased the risk of early death -- even in those who exercised.

Bird songs isolate species, new research suggests -- ScienceDaily

Two birds that look the same, but have songs so different they can't recognize each other, should be considered distinct species, suggests new University of British Columbia (UBC) research.

"Songs are important for birds and who they choose to mate with," said Benjamin Freeman, a Banting postdoctoral fellow in the department of zoology at UBC. "Birds evolve different songs and we wanted to find out which populations are so different in song that they should be considered different species."

Among the 72 related populations of Central and South American birds the researchers tested, they found evidence for 21 new species.

Organisms that mate and create an offspring that can go on to reproduce are considered to be part of the same species but there are a number of naturally occurring barriers, like geographic location or behaviour, that can prevent similar organisms from

mingling. In the study, UBC and Cornell University biologists examined how different populations of birds respond to each other's songs.

In the tropical forests of Central and South America where the vegetation is dense, birds rely heavily on song to claim their territory and let other birds know where they are. For this experiment, the researchers conducted playback experiments by hanging wireless speakers in the trees and broadcasting songs from related subspecies and then observing how the birds responded.

If the birds continued on with their natural behaviour and ignored the speaker and sound, it indicated that they distinguished the songs. They did not feel like another bird was encroaching on their territory and trying to mate with their partner. If the bird got angry and started to try and kick the "intruder" out, it indicated they recognized the song.

Historically, scientists have identified new species by finding birds that look different enough or occupy different geographic locations.

"It's interesting that with one study in one year, we

came up with good evidence that there are 21 new species that authorities should recognize," said Freeman. "We know so much about birds but this demonstrates that we still have a lot to learn."

This research is part of a larger pursuit to learn about the evolution of bird songs and why birds develop different songs.

"As a birdwatcher in tropical forests, you have no choice but to get interested in songs," said Freeman.

"As you walk through the forest, you hear 25 birds for every one you see. As a biologist, I wanted to know -- is it important that the birds sing differently and is it a little important or a lot important?"

Freeman and his colleagues will submit these findings to a committee of ornithologists who are responsible for naming and recognizing bird species of South America.

Popular bottle-breaking trick is giving insight to brain injuries: Cavitation makes bottles shatter; the same thing could be happening brain trauma -- ScienceDaily

As many YouTube videos show, striking the top of a liquid-filled bottle can shatter the bottom. Now researchers are hoping to use new knowledge of that party trick to help fill a gap in something much more serious: brain research.

A study by engineering professors from Brigham Young University, Utah State University and the Tokyo University of Agriculture and Technology details exactly what happens when a liquid at rest -- like the water in a bottle -- is suddenly put into motion. Using high-speed photography, the team shows how the swift acceleration causes small bubbles to form in the liquid and then rapidly collapse, releasing a destructive shockwave.

The proper term for the phenomenon is called

cavitation, a process well known to engineers for causing damage in pipes and marine propellers. The new study, published in the *Proceedings of the National Academy of Sciences*, details an alternative formula that more accurately predicts when cavitation will happen.

While the finding has immediate implications for many industrial processes interrupted by cavitation-induced damage, there's also growing evidence linking cavitation to brain trauma.

"The brain is surrounded by fluid, and when you have impact, it's possible you are experiencing cavitation within that fluid," said study co-author Scott Thomson, associate professor of mechanical engineering at BYU.

Fluid dynamics experts know how to predict when cavitation will occur in a fluid already in motion, but their formula doesn't work so well when a resting fluid is rapidly accelerated. The new study fixes that problem by finalizing a new equation that considers a fluid's depth and acceleration.

For the brain, knowing this alternative cavitation formula could be used to better predict brain injuries

caused by high-velocity impact. "And once we're able to predict when that will happen, we can better design safety devices to help prevent serious brain damage," Thomson said.

Those safety devices could be for athletic applications, such as football helmets, or even military applications.

"If a blast wave is above a certain magnitude, there may not be much we can do to prevent brain injury for a soldier," said study author Tadd Truscott, associate professor of mechanical engineering at Utah State University. "But maybe a helmet can be developed to detect when that trauma has happened so a soldier can be removed from the front line and be saved from repeat exposure to blasts."

The beam of invisibility: A new cloaking technology has been developed -- ScienceDaily

How do we make an object invisible? Researchers from TU Wien (Vienna), together with colleagues from Greece and the USA, have now developed a new idea for a cloaking technology. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage. The idea can be applied to different kinds of waves, it should work with sound waves just as well as with light waves. Experiments are already in the planning.

Outwitting the Scattering of Light

"Complex materials such as a sugar cube are opaque, because light waves inside them are scattered multiple times," says Professor Stefan Rotter (TU Wien). "A light wave can enter and exit the object, but will never

pass through the medium on a straight line. Instead, it is scattered into all possible directions."

For years many different attempts have been made to outwit this kind of scattering, creating a "cloak of invisibility." Special materials have been worked out, for example, which are able to guide light waves around an object. Alternatively, also experiments have been performed with objects that can emit light by themselves. When an electronic display sends out exactly the same light as it absorbs in the back, it can appear invisible, at least when looked at in the right angle.

At TU Wien a more fundamental approach has now been chosen. "We did not want to reroute the light waves, nor did we want to restore them with additional displays. Our goal was to guide the original light wave through the object, as if the object was not there at all," says Andre Brandstötter, one of the authors of the study. "This sounds strange, but with certain materials and using our special wave technology, it is indeed possible."

The Laser Material

The team at TU Wien has spent years working on optically active materials, which are used for building lasers. To make the laser shine, energy has to be supplied by means of a pump beam. Otherwise, the laser material behaves just like any other material -- it absorbs part of the incident light.

"The crucial point is to pump energy into the material in a spatially tailored way such that light is amplified in exactly the right places, while allowing for absorption at other parts of the material," says Professor Konstantinos Makris from the University of Crete (previously TU Wien). "To achieve this, a beam with exactly the right pattern has to be projected onto the material from above -- like from a standard video projector, except with much higher resolution."

If this pattern perfectly corresponds to the inner irregularities of the material which usually scatter the light, then the projection from above can effectively switch off the scattering, and another beam of light travelling through the material from one side can pass without any obstruction, scattering or loss.

"Mathematically, it is not immediately obvious that it is at all possible to find such a pattern," says Rotter.

"Every object we want to make transparent has to be irradiated with its own specific pattern -- depending on the microscopic details of the scattering process inside. The method we developed now allows us to calculate the right pattern for any arbitrary scattering medium."

Light or Sound

Computer simulations have shown that the method works. Now the idea should be confirmed in experiments. Stefan Rotter is confident that this will be successful: "We are already discussing with experimentalists how this could be done. As a first step, we may test this technology with sound instead of light waves. Experimentally, they are easier to handle, and from a mathematical point of view, the difference does not matter significantly."

New hope for 'bubble baby disease' -- ScienceDaily

Babies born with Severe Combined Immune Deficiency (SCID) syndrome are defenceless against bacterial and viral infections that would be virtually harmless to most healthy people. If untreated, SCID is often fatal within a baby's first year of life.

Research led by the University of Hong Kong has resulted in a new testing regime that could speed up the diagnosis of SCID, allowing more infants to receive life-saving treatment within a critical timeframe.

For the best chance of survival, infants with SCID should be treated as soon after birth as possible, and preferably within three-and-a-half months. However, poor recognition of SCID by front-line doctors is leading to delays in diagnosis, later treatments and poorer outcomes.

The authors of a recent study, published in open-access journal *Frontiers in Immunology*, have developed a "checklist" of potential SCID markers: a family history

of early infant death, persistent candidiasis (often presenting as persistent thrush), Bacillus Calmette-Guérin (BCG) infections, and low absolute lymphocyte counts. "Flagging" an infant showing any one of these four factors would allow potential SCID patients to be fast-tracked for further tests and treatment.

Many countries -- including much of Asia and the UK -- do not test for SCID in their newborn health-screening programmes, with front-line doctors often left to diagnose the fatal condition. By using this checklist, the authors believe that identification, and hence treatment, of SCID patients will be possible much sooner.

Without a working immune system, newborns with SCID are highly vulnerable, and many will repeatedly visit doctors with serious and recurring infections before being diagnosed.

"The recognition of SCID by doctors is poor in Asia, resulting in delayed diagnoses that jeopardize the chance of treatment success," explains lead author Professor Yu Lung Lau, who focused his research on Asian and North African patients. "We wanted to see if we could identify any clinical features that would help

doctors to diagnose SCID earlier."

The study of 147 patients looked at how long it took for doctors to diagnose SCID, relative to the age the babies were first brought to their doctors, and what symptoms they had.

They found that it took an average of two months for babies to be diagnosed, and that the average age at diagnosis was four months old -- beyond the critical age for treatment (which is usually stem cell transplants or gene therapy) to begin.

As the researchers examined the data, four SCID "markers" emerged. Taken in isolation, none helped reduce the time taken for a diagnosis. However, 94% of the patients studied showed at least one of the four factors.

"Family history of early infant death due to infection was useful to aid earlier diagnosis, but it was not due to doctors realizing the importance of the family history, but rather due to the family taking the child to see the doctors earlier," says Lau. "This demonstrates the failure of our medical training and systems in using family history to aid earlier SCID diagnosis."

Candidiasis emerged as one of the most common infections. Unfortunately, as thrush is relatively common in all infants, its presence actually slowed down the time to diagnosis.

Complications from the BCG vaccination also appeared frequently, and over 88% of the patients in the study had a very low absolute lymphocyte counts (ALC).

"Our main recommendation is to perform lymphocyte subsets for any infant with one or more of the following clinical features: family history, persistent candidiasis, BCG infections and ALC less than $3 \times 10^9/L$," explains Lau. "This would confirm the diagnosis of SCID, if present."

For the time being, newborn screening remains out of reach in much of Asia, so education of front-line doctors and parents is key.

"Our recommendations may help earlier diagnosis of SCID, and need to be communicated to doctors as well as to ordinary citizens, who can then urge the doctors along our recommendation," concludes Lau.

Multifunctional nano-sized drug carriers based on reactive polypept(o)ides: Secondary structure formation enables morphology control -- ScienceDaily

Nano-sized carrier systems find medical application to improve pharmacologic properties of bioactive agents. For many therapeutic approaches, it is important that the carrier system can stably incorporate the cargo during circulation without inducing aggregation, while cargo should ideally only be released after successful cellular uptake. These requirements have thus far only been met by chemistry approaches with nanoparticles that are difficult to characterize. Consequently, clinical translation of these systems has been very difficult to achieve.

In cooperation with researchers from the University of Tokyo and Gutenberg Research Awardee Prof. Kazunori Kataoka, Chemists from Mainz have been able to demonstrate that reactive polypept(o)ides

constitute ideal building blocks to control morphology and function of carrier systems in a simple but precise manner. Polypept(o)ides (polysarcosine-block-polypeptide copolymers) have emerged as interesting hybrid materials for drug carrier systems since they combine protein-resistance and high water-solubility of polysarcosine with the stimuli-responsiveness, intrinsic multifunctionality, and secondary structure formation of polypeptides.

In this cooperative work, the researchers could show for the first time that the formation of β -sheets by the synthetic polypeptide segment can be exploited to deliberately manipulate the morphology of polymeric micelles (Klinker K et al. *Angew. Chem. Int. Ed.* 2017, 56 (32), 9608-9613 & *Angew. Chem.* 2017, 129 (32), 9737-9742), which enables the synthesis of either spherical or worm-like micelles from the same block copolymer. By employing reactive groups in the polypeptide segment of the block copolymer, micelles can be core cross-linked by dithiols, resulting in bio-reversible disulfide bonds. Due a difference in redox potential, disulfides are considered stable extracellularly, while they are rapidly reduced to free dithiols intracellularly, which leads to a disintegration of the carrier system and release of the cargo.

"In this way, a variety of different nanocarriers with different functions becomes readily accessible from one single block copolymer and a very selective post-polymerization step. This modular approach to nanoparticles with different function and morphology bears the advantage to address important questions with good comparability, such as the influence of size and shape on in vivo circulation times, biodistribution, tumor accumulation, cell uptake and therapeutic response since the same starting material is used" comments Matthias Barz.

First in vivo experiments have already demonstrated that these core-stabilized micellar nanocarriers exhibit stable circulation behavior, thus indicating that interactions with serum components or blood vessels are absent. Only by ensuring that no unspecific interactions occur within the complex biological setting, cellular uptake in desired specific cell populations seems feasible. The therapeutic potential of the described nanoparticle platform will be further investigated with regards to immunotherapy of malignant melanoma within the SFB 1066.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Your stools reveal whether you can lose weight**](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

- [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- [**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

- [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

- [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

- [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

- [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

- [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

- [**Scientist finds secret to thriving**](#) [周六, 09 9月 08:55]

What it takes to thrive, rather than merely survive, could be as simple as

feeling good about life and yourself and being good at something, according to new research.

- **[Scientists make methanol using air around us](#)** [周五, 08 9月 02:27]

Scientists have created methanol from methane using oxygen from the air. Methanol is currently produced by breaking down natural gas at high temperatures. But researchers have discovered they can produce methanol from methane through simple catalysis that allows methanol production at low temperatures using oxygen and hydrogen peroxide. The findings have major implications for cleaner, greener industrial processes worldwide.

- **[Individuality drives collective behavior of schooling fish](#)** [周五, 08 9月 02:27]

New research sheds light on how 'animal personalities' -- inter-individual differences in animal behavior -- can drive the collective behavior and functioning of animal groups such as schools of fish, including their cohesion, leadership, movement dynamics, and group performance.

- **[Ship exhaust makes oceanic thunderstorms more intense](#)** [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- **[Listening to happy music may enhance divergent creativity](#)** [周五, 08 9月 02:27]

Listening to happy music may help generate more, innovative solutions compared to listening to silence, according to a study.

- **[Human skin cells transformed directly into motor neurons](#)** [周五, 08 9月 01:28]

Scientists have converted skin cells from healthy adults directly into motor neurons without going through a stem cell state. The technique makes it possible to study motor neurons of the human central nervous

system in the lab. Unlike commonly studied mouse motor neurons, human motor neurons growing in the lab would be a new tool since researchers can't take samples of these neurons from living people but can easily take skin samples.

- [**Direct evidence of sea level 'fingerprints' discovered**](#) [周五, 08 9月 00:02]

The first observation of sea level 'fingerprints' -- tell-tale differences in sea level rise around the world in response to changes in continental water and ice sheet mass -- has been reported by researchers.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**Nutrition has benefits for brain network organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Intermittent electrical brain stimulation improves memory**](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

- [**How monkey fights grow**](#) [周四, 07 9月 21:36]

New research finds evidence for a complicated structure behind primate conflict. It is not individuals who control the length of fights, but the relationships between pairs of individuals.

- [**Emoji fans take heart: Scientists pinpoint 27 states of emotion**](#) [周四, 07 9月 21:36]

The Emoji Movie, in which the protagonist can't help but express a wide variety of emotions instead of the one assigned to him, may have gotten something right. A new study challenges a long-held assumption in psychology that most human emotions fall within the universal categories of happiness, sadness, anger, surprise, fear and disgust.

- [**Whole grains decrease colorectal cancer risk, processed meats increase the risk**](#) [周四, 07 9月 21:36]

Major new report finds strong evidence of links between lifestyle and colorectal cancer risk. Physical activity and whole grains lowers risk of this cancer; too much alcohol and red meat, processed meats and obesity increase the risk. An estimated 47 percent of US colorectal cancers could be prevented each year with lifestyle changes.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Popular bottle-breaking trick is giving insight to brain injuries**](#) [周三, 13 9月 22:45]

As many YouTube videos show, striking the top of a liquid-filled bottle can shatter the bottom. Researchers are hoping to use new knowledge of that party trick to help fill a gap in something much more serious: brain research.

- [**New hope for 'bubble baby disease'**](#) [周三, 13 9月 22:45]

If untreated, severe combined immune deficiency (SCID) syndrome -- or 'bubble baby disease' -- is often fatal within the first year of a infant's life. A checklist of SCID markers could make diagnosis faster, allowing more babies to receive treatment within a critical timeframe, say researchers.

- [**Multifunctional nano-sized drug carriers based on reactive polypept\(o\)ides**](#) [周三, 13 9月 22:44]

Researchers have been able to demonstrate that reactive polypept(o)ides constitute ideal building blocks to control morphology and function of carrier systems in a simple but precise manner.

- [**Teens' ability to consider the intentions of others linked to structural changes in the brain**](#) [周三, 13 9月 20:44]

When it comes to the concept of fairness, teenagers' ability to consider the intentions of others appears to be linked to structural changes underway in the brain, according to a study. The study is the first to provide evidence linking structural changes with behavioral changes within this context. Understanding the intentions of others is

fundamental to human cooperation and how we exist as social beings.

- [**Paper-based tuberculosis test could boost diagnoses in developing countries**](#) [周三, 13 9月 20:44]

Diagnosing tuberculosis early can allow patients to receive the medicine they need and also help prevent the disease from spreading. But in resource-limited areas, equipment requirements and long wait times for results are obstacles to diagnosis and treatment. To tackle this problem, scientists report the development of a fast, paper-based tuberculosis test that can be read with a smartphone.

- [**Systems analysis points to links between Toxoplasma infection and common brain diseases**](#) [周三, 13 9月 20:44]

Nearly one out of every three humans on earth has a lifelong infection with the brain-dwelling parasite *Toxoplasma gondii*. In a new report, researchers from multiple institutions describe efforts to learn how infection with the parasite *Toxoplasma gondii* may alter, and in some cases amplify, several brain disorders, including epilepsy, Alzheimer's and Parkinson's diseases as well as some cancers.

- [**As 'flesh-eating' Leishmania come closer, a vaccine against them does, too**](#) [周三, 13 9月 20:44]

Boils the size of sand dollars, facial damage reminiscent of acid wounds, death by maiming of the liver and spleen. Leishmania parasites inflict suffering around the world that is the stuff of parables. They are the second-deadliest parasites after malaria, and global warming is slowly pushing them north toward the United States. Can a new experimental vaccine someday stop them? The vaccine has worked in humanized mice, as detailed in a new study.

- [**New research on probiotics in the prevention and treatment of colon cancer**](#) [周三, 13 9月 20:44]

In an innovative approach to colorectal cancer (CRC) prevention and treatment, scientists are studying ways to replace missing metabolites in

patients prone to gut inflammation and CRC. A new study describes how administration of histamine-producing gut microbes to mice lacking the enzyme histidine decarboxylase (HDC) reduced inflammation and tumor formation. These results suggest that alteration of the gut microbiome with probiotics may become a new preventative or therapeutic strategy for patie...

• **[Science spin prevalent, researchers warn](#)** [周三, 13 9月 05:05]

More than a quarter of biomedical scientific papers may utilize practices that distort the interpretation of results or mislead readers so that results are viewed more favorably, a new study suggests.

• **[Cold comfort: Fat-rich diets and adaptation among indigenous Siberian populations](#)** [周三, 13 9月 05:05]

Recently, scientists have been exploring the genetic signatures of adaptation in several indigenous cold-adapted human populations. Now, a new study has identified new signals of adaptation across multiple genes and exploring a rich demographic history. By performing extensive analyses on DNA sequencing data for two North-Central Siberian populations, the Nganasan (nomadic hunters) and Yakut (herders), they have been able to infer the most comprehensive demographic and adaptive history.

• **[Health benefits of olives and olive oil](#)** [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

• **[Lay interventions for depression and drinking](#)** [周三, 13 9月 03:48]

Brief psychological interventions delivered by lay counselors in primary care were effective and cost-effective for patients with depression and harmful drinking in India, according to two new studies.

• **[Predicting atypical development in infants at high risk for autism?](#)** [周三, 13 9月 03:48]

New research identifies a potential biomarker that predicts atypical development in 1- to 2-month-old infants at high versus low familial risk for developing autism spectrum disorders (ASD).

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- [**'Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests**](#) [周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [**In mice, calorie restriction reduces fat but increases fur**](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

- [**'Missing link' explains how viruses trigger immunity**](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

- [**Reversing the negative effects of adolescent marijuana use**](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Father's environmental exposure affects sperm epigenetics, study shows**](#) [周二, 12 9月 22:28]

Authors of a new report believe that theirs is among the first human studies to investigate the influence of phthalate exposure on sperm epigenetics, embryo development and whether DNA methylation in sperm cells may be a path by which a father's environmental exposure influences these endpoints. DNA methylation, one mechanism of epigenetics, is a chemical tag on DNA that does not change the gene sequence but is involved in controlling gene expression.

- [**Researchers identify potential biomarkers of age-related macular degeneration**](#) [周二, 12 9月 22:28]

Patients with any stage of age-related macular degeneration (AMD) carry signs of the disease in their blood that may be found through special laboratory tests, according to a new study.

- [**Cancer drug stimulates tripolar mode of mitosis**](#) [周二, 12 9月 22:28]

Taxanes inhibit cell division and make cancer cells sensitive to radiation therapy. A current study has investigated the underlying mechanisms of this action - and which biomarkers may be useful for predicting the success of therapy.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- [**Exposure to head impacts in youth football practice drills**](#) [周二, 12 9月 21:31]

Researchers have examined differences in the number, location, and magnitude of head impacts sustained by young athletes during various youth football practice drills. Such information could lead to recommendations for football practices, including modification of some high-intensity drills in order to reduce players' exposure to head impacts and, consequently, lessen the risks of injury.

- [**Air quality in 'green' housing affected by toxic chemicals in building materials**](#) [周二, 12 9月 21:31]

Indoor air pollution can be a problem in many homes, even in eco-friendly buildings. Thanks to a new innovative study, researchers have a better idea of where these pollutants come from -- which ones come from chemicals leaching out of building materials and which ones from the personal items people bring into their homes. The findings could inform the development of new green building standards and lead to healthier housing, especially for low-income communities.

- [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

- [**Sexually aroused male flies unable to sleep after close encounters with females**](#) [周二, 12 9月 21:31]

The urge to mate appears to override the need to sleep in flies, according to new research that hints at the importance of sleep for animals.

- [**Running group helps half its graduates quit**](#)

smoking [周二, 12 9月 21:31]

Half the people who completed a 10-week community running program aimed at helping them quit smoking were successful in their attempt. Many others reduced their smoking, and saw their mental health improve.

• **Your stools reveal whether you can lose weight** [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

• **Explaining bursts of activity in brains of preterm babies** [周二, 12 9月 21:31]

The source of spontaneous, high-amplitude bursts of activity seen in the brains of preterm babies, which are vital for healthy development, has been identified by a team of researchers.

• **Eye movements reveal temporal expectation deficits in ADHD** [周二, 12 9月 21:31]

A technique that measures tiny movements of the eyes may help scientists better understand and perhaps eventually improve assessment of ADHD, according to research.

• **Study sets new distance record for medical drone transport** [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

• **Researchers discover new, abundant enzyme that helps bacteria infect animals** [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

- [**Long sitting periods may be just as harmful as daily total**](#) [周二, 12 9月 06:00]

A new study finds that sitting around for 12 or more hours per day, particularly if accumulated during 60- to 90-minute periods, increased the risk of early death -- even in those who exercised.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**Research identifies causes and possible treatments for deadly diseases affecting children**](#) [周二, 12 9月 03:09]

Research has identified four pathogens that are responsible for the vast majority of diarrheal illnesses, leading the way for potential new treatments.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along

small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Childhood maltreatment may change brain's response to threat**](#) [周二, 12 9月 01:25]

Neural activity associated with defensive responses in humans shifts between two brain regions depending on the proximity of a threat, suggests neuroimaging data from two independent samples of adults in the Netherlands. In one sample, the findings suggest that emotional abuse during childhood may shift the balance of activity between these regions.

- [**DNA looping architecture may lead to opportunities to treat brain tumors**](#) [周二, 12 9月 00:59]

The discovery of a mechanism by which normal brain cells regulate the expression of the NFIA gene, which is important for both normal brain development and brain tumor growth, might one day help improve therapies to treat brain tumors.

- [**Relationship science: How can couples keep moving forward?**](#) [周二, 12 9月 00:27]

Family studies researchers who study the science behind maintaining romantic relationships focus their work on the central organizing unit -- the relationship -- rather than on the individual. In a recent study, they discuss romantic relationship maintenance and the two primary motives behind a couple's attempts at staying together: threat mitigation and relationship enhancement.

- [**A new genetic marker for schizophrenia**](#) [周二, 12 9月 00:27]

Scientists find a rare genetic variant that shows strong association with schizophrenia.

- [**Massachusetts off-road-vehicle law significantly reduces injuries, hospitalizations in children**](#) [周二, 12 9月 00:27]

The 2010 Massachusetts law restricting the use of off-road vehicles to those age 14 and older led to significant reductions in both emergency

department (ED) visits and hospital admissions resulting from ORV injuries in the following three years, research concludes.

- **[The turbulent healing powers of plasma](#)** [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent and effective medical therapies.

- **[Brain Composer: 'Thinking' melodies onto a musical score](#)** [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- **[Revolutionary process could signal new era for gene synthesis](#)** [周二, 12 9月 00:26]

A team of scientists has demonstrated a groundbreaking new method of gene synthesis -- a vital research tool with real-world applications in everything from growing transplantable organs to developing treatments for cancer.

- **[The evolutionary origin of the gut](#)** [周二, 12 9月 00:26]
