How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

- **[Cooperation driven by reciprocity, not conformity](#)** [周二, 12 9月 00:26]

From an evolutionary perspective, cooperating with others can yield benefits that increase chances of survival. But what are the conditions

that motivate us to cooperate? New research suggests that reciprocity -- cooperation under the assumption that we will receive benefits in return -- outweighs our desire to conform with group norms when we're deciding whether to cooperate with someone.

• [**New treatment option discovered for brain injury patients suffering from aggression**](#) [周二, 12 9月 00:26]

A drug originally developed in the 1960s as an antiviral medication is showing promise as a treatment option for people who suffer from increased feelings of aggression following traumatic brain injury, researchers have reported.

• [**Patients to benefit from new 3-D visualizations of the heart**](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'**](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

- [**New way to stabilize next-generation fusion plasmas**](#) [周三, 13 9月 01:48]

Recent experiments conducted on the DIII-D National Fusion Facility suggest that up to 40 percent of high-energy particles are lost during tokamak fusion reactions because of Alfvén waves.

- [**Magnetic cellular 'Legos' for the regenerative medicine of the future**](#) [周三, 13 9月 01:48]

By incorporating magnetic nanoparticles in cells and developing a system using miniaturized magnets, researchers have succeeded in creating cellular magnetic 'Legos.' They were able to aggregate cells using only magnets and without an external supporting matrix, with the cells then forming a tissue that can be deformed at will.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control.

The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Graphene based terahertz absorbers**](#) [周二, 12 9月 22:27]

A terahertz saturable absorber has been created using printable graphene inks with an order of magnitude higher absorption modulation than other devices produced to date.

- [**Study sets new distance record for medical drone transport**](#) [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

- [**Method controls whether freezing droplets bounce off or stick**](#) [周二, 12 9月 03:09]

Self-peeling droplets have been discovered, along with a new way to control adhesion of freezing droplets by adjusting the thermal properties of substrates. These findings could make everything from additive manufacturing to deicing more efficient.

- [**The turbulent healing powers of plasma**](#) [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent

and effective medical therapies.

- [**A novel and practical fab-route for superomniphobic liquid-free surfaces**](#) [周二, 12 9月 00:27]

Scientists have developed a fabrication technology that can inexpensively produce surfaces capable of repelling liquids, including water and oil.

- [**Connecting up the quantum internet**](#) [周二, 12 9月 00:27]

Major leap for practical building blocks of a quantum internet: New research demonstrates how to dramatically improve the storage time of a telecom-compatible quantum memory, a vital component of a global quantum network. The technology operates in the same 1550 nanometer band as today's telecommunications infrastructure. It can also be operated as a quantum light source or used as an optical link for solid-state quantum computing devices such as superconducting qubits and silicon qubits.

- [**Self-assembling nanoparticle arrays can switch between a mirror and a window**](#) [周二, 12 9月 00:27]

By finely tuning the distance between nanoparticles in a single layer, researchers have made a filter that can change between a mirror and a window.

- [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- [**Hollow atoms: The consequences of an underestimated effect**](#) [周二, 12 9月 00:26]

In a 'hollow atom', electrons occupy high-energy states far away from the nucleus, it can get rid of their excess energy on a remarkably short timescale. The reason for this has been unknown. Researchers have now shown that this is due to a previously underestimated effect: the

'interatomic coulomb decay' allows the atom to transfer its energy to several other atoms simultaneously. This also explains why radiation therapy can be so effective.

- [**Patients to benefit from new 3-D visualizations of the heart**](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

- [**Study clarifies how neural nets 'think' when processing language**](#) [周二, 12 9月 00:26]

A new general-purpose technique has been developed for making sense of neural networks that are trained to perform natural-language-processing tasks, in which computers attempt to interpret freeform texts written in ordinary, or 'natural,' language (as opposed to a structured language, such as a database-query language).

- [**First on-chip nanoscale optical quantum memory developed**](#) [周二, 12 9月 00:26]

Engineers have built a chip capable of storing and retrieving individual photons of light, with all of their quantum properties left intact. The chip represents the first nanoscale optical quantum memory device, and could one day be used to create more secure Internet communications.

- [**Using mirrors to improve the quality of light particles**](#) [周一, 11 9月 21:59]

Scientists have succeeded in dramatically improving the quality of individual photons generated by a quantum system. The scientists have successfully put a 10-year-old theoretical prediction into practice. With their paper, they have taken an important step towards future applications in quantum information technology.

- [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

- [**New software can detect when people text and drive**](#) [周六, 09 9月 08:55]

Computer algorithms developed by engineering researchers can accurately determine when drivers are texting or engaged in other distracting activities.

- [**When electrons ride a wave**](#) [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

- [**Scientists unravel new insights into promising semiconductor material**](#) [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

- [**Are we being watched? Tens of other worlds could spot the Earth**](#) [周六, 09 9月 08:55]

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

- [**High-speed quantum memory for photons**](#) [周六, 09 9月 08:54]

Physicists have developed a memory that can store photons. These quantum particles travel at the speed of light and are thus suitable for high-speed data transfer. The researchers were able to store them in an atomic vapor and read them out again later without altering their quantum mechanical properties too much. This memory technology is simple and fast and it could find application in a future quantum Internet.

• [**How to draw electricity from the bloodstream**](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

• [**New guidelines discourage use of brain imaging as a 'lie detector' for chronic pain**](#) [周六, 09 9月 08:54]

A task force consisting of researchers from around the world has released a set of recommendations that advise against the use of brain imaging as a test for chronic pain.

• [**A sweeter way to make green products**](#) [周六, 09 9月 08:16]

A more efficient process has been created for extracting the sugars from wood chips, corn cobs and other organic waste from forests and farms. This biorenewable feedstock could serve as a cheaper, sustainable substitute for the petroleum used in manufacturing tons of consumer goods annually -- goods that consumers want to be greener.

• [**Scientists make methanol using air around us**](#) [周五, 08 9月 02:27]

Scientists have created methanol from methane using oxygen from the air. Methanol is currently produced by breaking down natural gas at high temperatures. But researchers have discovered they can produce methanol from methane through simple catalysis that allows methanol production at low temperatures using oxygen and hydrogen peroxide. The findings have major implications for cleaner, greener industrial processes worldwide.

• [**New way to directly convert methane to methanol using gold-palladium nanoparticles**](#) [周五, 08 9月 02:27]

Scientists have used colloidal gold-palladium (Au-Pd) nanoparticles to directly oxidize methane to methanol with high selectivity in aqueous solution at low temperatures.

• [**Tweet life vs. street life: Exploring the gap between content, feelings**](#) [周五, 08 9月 02:27]

Twitter is an unreliable witness to the world's emotions, suggests a researcher, adding that online social life doesn't always reflect offline social reality.

• [**Quantum detectives in the hunt for the world's first quantum computer**](#) [周五, 08 9月 02:26]

A new paper is the latest confirmation of Majorana fermions -- a strange quasiparticle at the heart of the next generation of quantum machines being pursued by engineers.

• [**Streamlined security: Optimizing sensor placement with mathematics**](#) [周五, 08 9月 01:25]

Increasing reliance on heightened security in public and private settings calls for optimal sensor technology. However, placing security sensors to optimize resource management and system performance while simultaneously protecting people and products is undoubtedly challenging. In a new paper, experts propose a computational level set method to optimally position a sensor-based security system for maximum surveillance of a complex environment.

• [**New acid-free magnet recycling process created**](#) [周五, 08 9月 01:25]

A new rare-earth magnet recycling process dissolves magnets in an acid-free solution and recovers high purity rare earth elements.

• [**Curious properties: Researchers analyze flocking behavior on curved surfaces**](#) [周五, 08 9月 01:25]

A murmuration of starlings. The phrase reads like something from

literature or the title of an arthouse film. In fact, it is meant to describe the phenomenon that results when hundreds, sometimes thousands, of these birds fly in swooping, intricately coordinated patterns through the sky.

- [**Lignin: Much more valuable than just as waste**](#) [周五, 08 9月 00:03]

Lignin, a substance considered as a waste product in biomass and ethanol production, will now reach its proper value as bio-oil in new products.

- [**Aspirin tablets help unravel basic physics**](#) [周五, 08 9月 00:03]

Aspirin in form of small crystallites provides new insight into delicate motions of electrons and atomic nuclei. Set into molecular vibration by strong ultrashort far-infrared (terahertz) pulses, the nuclei oscillate much faster than for weak excitation. They gradually return to their intrinsic oscillation frequency, in parallel to the picosecond decay of electronic motions. An analysis of the terahertz waves radiated from the moving particles by in-depth theory reveals the strongly coupled chara...

- [**Scanning tunneling microscopy measurements identify active sites on catalyst surfaces**](#) [周五, 08 9月 00:02]

Chemistry live: using a scanning tunneling microscope, researchers were able for the very first time to witness in detail the activity of catalysts during an electrochemical reaction. The measurements show how the surface structure of the catalysts influences their activity. The new analysis method can now be used to improve catalysts for the electrochemical industry.

- [**'Rubber material' discovered that could lead to scratch-proof paint for car**](#) [周五, 08 9月 00:02]

A stretchy miracle material has been discovered that could be used to create highly resistant smart devices and scratch-proof paint for cars, report investigators.

- [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard

for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

- [**Pluto features given first official names**](#) [周四, 07 9月 23:24]

The Working Group for Planetary System Nomenclature of the International Astronomical Union has officially approved the naming of 14 features on the surface of Pluto. These are the first geological features on the planet to be named following the close flyby by the New Horizons spacecraft in July 2015.

- [**3-D-printed biomaterials that degrade on demand**](#) [周四, 07 9月 23:24]

The temporary structures, which can be degraded away with a biocompatible chemical trigger, could be useful in fabricating microfluidic devices, creating biomaterials that respond dynamically to stimuli and in patterning artificial tissue.

- [**Smartphone screen technology used to trick harmful bacteria**](#) [周四, 07 9月 22:41]

Conducting plastics found in smartphone screens can be used to trick the metabolism of pathogenic bacteria, report scientists. By adding or removing electrons from the plastic surface, bacteria may be tricked into growing more or less. The method may find widespread use in preventing bacterial infections in hospitals or improve effectiveness in wastewater management.

- [**New dental imaging method uses squid ink to fish for gum disease**](#) [周四, 07 9月 22:24]

Squid ink could one day make getting checked for gum disease at the dentist less tedious and even painless. By combining squid ink with light and ultrasound, a team led by engineers has developed a new dental imaging method to examine a patient's gums that is noninvasive, more comprehensive and more accurate than the state of the art.

- [**Ultraviolet light from superluminous supernova**](#)

[key to revealing explosion mechanism](#) [周四, 07 9月 22:24]

An international team of researchers has discovered a way to use UV light from superluminous supernovae to uncover its explosion mechanism, and used it to identify Gaia16apd as a shock-interacting supernova, reports a new study.

• [Fast magnetic writing of data](#) [周四, 07 9月 22:24]

Magnetic data storage has long been considered too slow for use in the working memories of computers. Researchers have now investigated a technique by which magnetic data writing can be done considerably faster and using less energy.

• [Intermittent electrical brain stimulation improves memory](#) [周四, 07 9月 22:23]

Intermittent electrical stimulation of an area deep inside the brain that degenerates in Alzheimer's appears to improve working memory, scientists report. Conversely, continuous deep brain stimulation, like the type used for Parkinson's and currently under study in humans with Alzheimer's, impairs memory, according to study.

• [A tiny device offers insights to how cancer spreads](#) [周四, 07 9月 21:36]

Researchers developed a new type of microfluidic device that can cultivate cells for longer periods of time, better reflecting how cancer cells to change over time. The device allowed them to capture the leader cells that would be first to break away and cause metastasis.

• [Drivers don't ignore a ringing phone but do ignore the risk](#) [周四, 07 9月 21:36]

Drivers find it difficult to ignore a ringing phone but do ignore the dangers, with a new study revealing almost 50 percent believe locating and answering a ringing phone is not as risky as talking and texting. Research has found locating a ringing phone, checking who's calling, and rejecting or answering the call, is the most frequent mobile phone task undertaken by drivers.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [Bird songs isolate species, new research suggests](#)

[周三, 13 9月 22:45]

Two birds that look the same, but have songs so different they can't recognize each other, should be considered distinct species, suggests new research. Among 72 related populations of Central and South American birds the researchers tested, they found evidence for 21 new species.

- [Science spin prevalent, researchers warn](#)

[周三, 13 9月 05:05]

More than a quarter of biomedical scientific papers may utilize practices that distort the interpretation of results or mislead readers so that results are viewed more favorably, a new study suggests.

- [Health benefits of olives and olive oil](#)

[周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [How hibernating ribosomes wake up](#)

[周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- ['Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests](#)

[周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only

encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'**](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

- [**Forest regeneration experiment of 30 years yields results**](#) [周三, 13 9月 01:48]

A spruce forest regeneration experiment in Interior Alaska that spanned nearly 30 years demonstrates which forest management practices produce the best results. It looked at different combinations of ground treatments to reduce competition from other vegetation and of regeneration methods, such as planting spruce seedlings and broadcast seeding. The results show the environmental and management situations in which different techniques work best and the situations in which they are unnecessary. Re...

- [**In mice, calorie restriction reduces fat but increases fur**](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

- [**'Missing link' explains how viruses trigger immunity**](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

- [**Reversing the negative effects of adolescent marijuana use**](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- [**Earthquake faults may have played key role in shaping the culture of ancient Greece**](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by

almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- [**Biding time could improve conservation outcomes**](#) [周二, 12 9月 21:31]

Strategic delays in conservation efforts could be the key to protecting more species according to researchers. The new study found instead of spending project funds immediately, conservation organizations could use the right amount of delay to improve the benefits achieved from their funding by focusing first on investment, capacity building, or monitoring and research.

- [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

- [**Researchers discover new, abundant enzyme that helps bacteria infect animals**](#) [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

- [**Ancient tree reveals cause of spike in Arctic temperature**](#) [周二, 12 9月 21:30]

A kauri tree trapped in a New Zealand swamp for 30,000 years may have overturned the idea that a slowdown in ocean currents in the North Atlantic may be entirely responsible for Dansgaard-Oeschger events and the characteristic bi-polar see-saw, which sees the Antarctica cool while the Arctic warms during glacial periods. The research reveals a mechanism that generates a 20,000 km long atmospheric bridge, reaching from Antarctica to the Arctic.

- [**Modeling the impact of green eggs and hens**](#) [周二, 12 9月 21:30]

Poultry given vegan organic chicken feed can help to produce eggs with a smaller environmental footprint than those fed non-organic feeds that contain animal by-products, new research shows.

- [**Rapid climate changes across northern hemisphere in the earliest Middle Pleistocene**](#) [周二, 12 9月 21:30]

By studying climate changes that took place thousands of years ago, we can better understand the global climate system and predict Earth's future climate. A multi-organization research team has discovered evidence of rapid climate changes on a millennial-to-centennial scale that occurred 780 to 760 thousand years ago.

- [**Rising CO2 leading to changes in land plant photosynthesis**](#) [周二, 12 9月 05:04]

Researchers have determined that major changes in plant behavior have occurred over the past 40 years, using measurements of subtle changes in the carbon dioxide (CO2) currently found in the atmosphere.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets

the stage for unprecedented explorations of human origins and diet.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

• [**Muscle nuclei: May the force be with you**](#) [周二, 12 9月 00:26]

A group of researchers has revealed the mechanism by which cellular nuclei reach their position within muscle cells. This discovery can have important implications in therapeutic strategies to treat muscular diseases.

• [**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

• [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

• [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

• [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

• [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards

against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

• [**Fathers can influence the sex of their offspring, scientists show**](#) [周二, 12 9月 00:26]

It has traditionally been thought that in mammals only mothers are able to influence the sex of their offspring. But a new study in wild mice has shown that fathers can, in fact, influence sex ratios.

• [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [**Fire ant venom compounds may lead to skin treatments**](#) [周一, 11 9月 21:59]

Solenopsins, the main toxic components of fire ant venom, chemically resemble ceramides, which are lipid-like molecules essential for maintaining for the barrier function of the skin. Solenopsin analogs can reduce skin thickening and inflammation in a mouse model of psoriasis, scientists have shown.

• [**Ancient wetlands offer window into climate change**](#) [周一, 11 9月 21:59]

Environmental researchers have uncovered a wealth of information about a unique part of Australia that offers never-before-seen insights into climate change since the last ice age.

• [**Desert locusts: New risks in the light of climate change**](#) [周一, 11 9月 21:59]

The desert locust is an invasive species that is both well known and feared because of the large-scale agricultural damage it can cause. It is particularly closely monitored, to prevent the risks of outbreaks and invasions. Climate change could modify its distribution area, meaning a new threat to agriculture, according to a study.

- [**Biosensor detects adulteration of horse in beef meat within one hour**](#) [周一, 11 9月 21:59]

Fraud in meat products has become, in recent years, a battle of the food industry and public health. Although there are numerous strategies to detect it, they are not sufficiently selective and sensitive to differentiate close animal species. A collaboration of experts has developed an electrochemical biosensor capable of detecting, in just one hour, processes of adulteration of beef with horse meat.

- [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

- [**A-MUD: A method for automatically detecting mouse song**](#) [周六, 09 9月 08:55]

Mice produce a remarkable repertoire of vocalizations across five octaves, which they emit during mating and other contexts. Analyses of mice song can provide important information about their social behavior and for research into neuropsychiatric disorders. But their songs are in the ultrasonic range and inaudible for humans. Researchers have now developed a freely available method to automatically detect mouse vocalizations instead of manually.

- [**An officer and a gentlewoman from the Viking army in Birka**](#) [周六, 09 9月 08:55]

War was not an activity exclusive to males in the Viking world. A new study shows that women could be found in the higher ranks at the battlefield.

• [**Young birds suffer in the city**](#) [周六, 09 9月 08:54]

City life is tough for young birds. But if they survive their first year, they are less susceptible to the effects of stress, according to new research.

• [**Why it's difficult to predict evolutionary fate of a new trait**](#) [周六, 09 9月 08:54]

Scientists explain the vexing complexities that make it hard to predict whether a new genetic trait will take over a population or die out, a key challenge for many fields including infectious disease.

• [**NASA flights map summer melt of Greenland ice sheet**](#) [周六, 09 9月 08:54]

Operation IceBridge is flying in Greenland to measure how much ice has melted over the course of the summer from the ice sheet. The flights, which began on Aug. 25 and will go on until Sept. 21, repeat paths flown this spring and aim to monitor seasonal changes in the elevation of the ice sheet.

• [**Meeting a microbe in the morning or in the evening: Is it all the same?**](#) [周六, 09 9月 08:54]

Does the time of day matter when our body is infected by a parasite? According to new research, it matters a great deal.

• [**Animal welfare: Potential new indicator of chronic stress in horses**](#) [周六, 09 9月 08:54]

Cortisol is generally considered to be a stress hormone because its levels rise during episodes of acute stress. Yet its relationship to chronic stress is less clear. Researchers have linked lower cortisol levels to states of chronically poor welfare in adult horses observed under their usual living conditions.

• [**Lazy ants make themselves useful in unexpected ways**](#) [周六, 09 9月 08:53]

They may look useless, but they're not: so-called lazy ants serve as new recruits ready to replace the top productive workers when the need

arises. New research shows that these ants are far from useless.

• [**A sweeter way to make green products**](#) [周六, 09 9月 08:16]

A more efficient process has been created for extracting the sugars from wood chips, corn cobs and other organic waste from forests and farms. This biorenewable feedstock could serve as a cheaper, sustainable substitute for the petroleum used in manufacturing tons of consumer goods annually -- goods that consumers want to be greener.

• [**Extreme weather has limited effect on attitudes toward climate policies**](#) [周五, 08 9月 02:46]

People who recently experienced severe weather events such as floods, storms and drought are more likely to support policies to adapt to the effects of climate change, according to a new study.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

- [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

- [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

- [**Extreme weather has limited effect on attitudes toward climate policies**](#) [周五, 08 9月 02:46]

People who recently experienced severe weather events such as floods, storms and drought are more likely to support policies to adapt to the effects of climate change, according to a new study.

- [**Ship exhaust makes oceanic thunderstorms more intense**](#) [周五, 08 9月 02:27]

Thunderstorms directly above two of the world's busiest shipping lanes are significantly more powerful than storms in areas of the ocean where ships don't travel, according to new research.

- [**Courts' critical, underappreciated role in climate policy**](#) [周五, 08 9月 02:26]

Both climate lawsuits and their reliance on scientific data have increased over the past decade, the most extensive study to date shows.

- [**SNAP benefits aren't enough to afford a healthy diet**](#) [周五, 08 9月 00:56]

A new study finds that the Supplemental Nutrition Assistance Program (SNAP), formerly known as Food Stamps, only covers 43-60 percent of what it costs to consume a diet consistent with federal dietary guidelines for what constitutes a healthy diet. The study highlights the challenges lower-income households face in trying to eat a healthy diet.

- [**Nutrition has benefits for brain network**](#)

[**organization**](#) [周四, 07 9月 23:24]

Nutrition has been linked to cognitive performance, but researchers have not pinpointed what underlies the connection. A new study found that monounsaturated fatty acids -- a class of nutrients found in olive oils, nuts and avocados -- are linked to general intelligence, and that this relationship is driven by the correlation between MUFAs and the organization of the brain's attention network.

• [**Academic argues for changes in the laws governing modern warfare**](#) [周四, 07 9月 22:41]

Modern warfare and terrorist acts often sees the killing of innocent civilians which presents complex challenges for the international legal framework governing the conduct of armed conflicts, explains a new report.

• [**Children exposed to chemicals in 9/11 'dust' show early signs of risk of heart disease**](#) [周四, 07 9月 21:36]

Sixteen years after the collapse of the World Trade Center towers sent a 'cloud' of toxic debris across Lower Manhattan, children living nearby who likely breathed in the ash and fumes are showing early signs of risk for future heart disease.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [The beam of invisibility](#) [周三, 13 9月 22:45]
A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.
- [Earthquake faults may have played key role in shaping the culture of ancient Greece](#) [周二, 12 9月 22:35]
The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.
- [AI -- Engineering: merging, morphing, mobile robots](#) [周二, 12 9月 22:35]
Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.
- [Looking stressed can help keep the peace](#) [周一, 11 9月 21:59]
Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.
- [Explosive birth of stars swells galactic cores](#) [周一, 11 9月 11:25]
Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found

explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

· [**How to draw electricity from the bloodstream**](#) [周六,

09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

· [**Climate change for aliens**](#) [周四, 07 9月 23:24]

For more than 50 years, the Kardashev scale has been the gold standard for classifying hypothetical 'exo-civilizations' by their ability to harness energy. A team of researchers has devised a new system that takes into account the impacts of that energy use.

· [**Australian Magpie 'dunks' its food before eating, researchers find**](#) [周四, 07 9月 22:23]

Scientists have shown that the Australian Magpie may 'dunk' its food in water before eating, a process that appears to be 'copied' by its offspring.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

- [**Biomarkers in the blood prove strong role of food for type 2 diabetes**](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**Rare genetic cause of peritoneal mesothelioma points to targeted therapy**](#) [周五, 15 9月 03:23]

Investigators have uncovered a new genetic cause of mesothelioma: a genetic rearrangement in the ALK gene, observed in three patients with

peritoneal mesothelioma. Unlike previously known causes, this new discovery points to a potential therapeutic approach for those few patients whose tumors harbor the mutation.

- [**Huge genetic diversity among Papuan New Guinean peoples revealed**](#) [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

- [**Insulin therapy initially declined and delayed by an average of two years**](#) [周五, 15 9月 03:23]

Thirty percent of type 2 diabetic patients don't begin insulin when it's initially recommended, with the average start time being two years later.

- [**Synaptic receptor mobility: Discovery of a new mechanism for controlling memory**](#) [周五, 15 9月 03:23]

A new mechanism has been discovered for storing information in synapses and a means of controlling the storage process. The breakthrough moves science closer to unveiling the mystery of the molecular mechanisms of memory and learning processes.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**'Mysterious' ancient creature was definitely an animal, research confirms**](#) [周五, 15 9月 03:22]

It lived well over 550 million years ago, is known only through fossils and has variously been described as looking a bit like a jellyfish, a worm, a fungus and lichen. But was the 'mysterious' Dickinsonia an animal, or was it something else? A new study provides strong proof that Dickinsonia was an animal.

- [**Hydrogen power moves a step closer**](#) [周五, 15 9月 03:22]

Physicists are developing methods of creating renewable fuel from water using quantum technology. Renewable hydrogen can already be produced by photoelectrolysis where solar power is used to split water molecules into oxygen and hydrogen. But fundamental problems remain before this can be adopted commercially due to inefficiency. A new study demonstrates that the novel use of nanostructures could increase the maximum photovoltage generated in a photoelectrochemical cell, increasing the productivi...

- [**Premature infants may get metabolic boost from mom's breast milk**](#) [周四, 14 9月 20:40]

The breast milk of mothers with premature babies has different amounts of microRNA than that of mothers with babies born at term, which may

help premature babies catch up in growth and development, according to researchers.

- **[Chronic pain common in people living with HIV](#)**

[周四, 14 9月 20:40]

All people living with HIV should be screened for chronic pain, which affects 39 to 85 percent of people with the condition, recommend new HIVMA guidelines. Those who have chronic pain should be treated using a multidisciplinary approach focused on non-drug options ranging from yoga to physical therapy, note the guidelines. Opioids should never be a first-line treatment.

- **[Mechanism behind calorie restriction, lengthened lifespan revealed](#)**

[周四, 14 9月 20:40]

Almost a century ago, scientists discovered that cutting calorie intake could dramatically extend lifespan in certain animal species. Despite numerous studies since, however, researchers have been unable to explain precisely why. Now, investigators have broken past that barrier.

- **[Social media helps students learn scientific argumentation better](#)**

[周四, 14 9月 07:31]

Students who took part in a program that taught scientific argumentation learned the concepts better than their peers who did not, a study concludes.

- **[New supernova analysis reframes dark energy debate](#)**

[周四, 14 9月 07:31]

The accelerating expansion of the Universe may not be real, but could just be an apparent effect, according to new research. The new study finds the fit of Type Ia supernovae to a model universe with no dark energy to be very slightly better than the fit to the standard dark energy model.

- **[How well electron transport works in furfural biogas](#)**

[周四, 14 9月 07:31]

Furfural is a promising candidate in the quest for alternative biofuels.

- [**Evolution of 'true frogs' defies long-held expectations of science**](#) [周四, 14 9月 07:31]

New research shows, in contrast to expectations, 'the rapid global range expansion of true frogs was not associated with increased net-diversification.'

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**In-utero treatment reverses cleft palate in mice**](#) [周四, 14 9月 07:30]

Researchers clarified a molecular pathway responsible for the formation of cleft palate and identified a new treatment to reverse this defect in mouse pups in utero.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**First global map of water in moon's soil**](#) [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as resource in future lunar exploration.

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**New gravity map suggests Mars has a porous**](#)

[crust](#) [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

. ['The dark side' of quantum computers](#) [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

. [Squirrels use 'chunking' to organize their favorite nuts](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

. [Climate change challenges the survival of fish across the world](#) [周四, 14 9月 07:29]

Researchers have published the first analysis looking at how vulnerable the world's freshwater and marine fishes are to climate change. Their study used physiological data to predict how nearly 3,000 fish species living in oceans and rivers will respond to warming water temperatures in different regions.

. [Self-folding electronics could enable advanced robotics](#) [周三, 13 9月 22:45]

As demand grows for more versatile, advanced robotics and other technologies, the need for components that can enable these applications also increases. Producing such components en masse has been a major challenge. But now, researchers report that they have developed a way to help meet this need by printing electronics that can fold themselves into a desired shape.

. [Bird songs isolate species, new research suggests](#)

[周三, 13 9月 22:45]

Two birds that look the same, but have songs so different they can't

recognize each other, should be considered distinct species, suggests new research. Among 72 related populations of Central and South American birds the researchers tested, they found evidence for 21 new species.

- [Popular bottle-breaking trick is giving insight to brain injuries](#) [周三, 13 9月 22:45]

As many YouTube videos show, striking the top of a liquid-filled bottle can shatter the bottom. Researchers are hoping to use new knowledge of that party trick to help fill a gap in something much more serious: brain research.

- [The beam of invisibility](#) [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

- [New hope for 'bubble baby disease'](#) [周三, 13 9月 22:45]

If untreated, severe combined immune deficiency (SCID) syndrome -- or 'bubble baby disease' -- is often fatal within the first year of a infant's life. A checklist of SCID markers could make diagnosis faster, allowing more babies to receive treatment within a critical timeframe, say researchers.

- [Multifunctional nano-sized drug carriers based on reactive polypept\(o\)ides](#) [周三, 13 9月 22:44]

Researchers have been able to demonstrate that reactive polypept(o)ides constitute ideal building blocks to control morphology and function of carrier systems in a simple but precise manner.

- [Teens' ability to consider the intentions of others linked to structural changes in the brain](#) [周三, 13 9月 20:44]

When it comes to the concept of fairness, teenagers' ability to consider the intentions of others appears to be linked to structural changes underway in the brain, according to a study. The study is the first to

provide evidence linking structural changes with behavioral changes within this context. Understanding the intentions of others is fundamental to human cooperation and how we exist as social beings.

- [**Paper-based tuberculosis test could boost diagnoses in developing countries**](#) [周三, 13 9月 20:44]

Diagnosing tuberculosis early can allow patients to receive the medicine they need and also help prevent the disease from spreading. But in resource-limited areas, equipment requirements and long wait times for results are obstacles to diagnosis and treatment. To tackle this problem, scientists report the development of a fast, paper-based tuberculosis test that can be read with a smartphone.

- [**Systems analysis points to links between Toxoplasma infection and common brain diseases**](#) [周三, 13 9月 20:44]

Nearly one out of every three humans on earth has a lifelong infection with the brain-dwelling parasite *Toxoplasma gondii*. In a new report, researchers from multiple institutions describe efforts to learn how infection with the parasite *Toxoplasma gondii* may alter, and in some cases amplify, several brain disorders, including epilepsy, Alzheimer's and Parkinson's diseases as well as some cancers.

- [**As 'flesh-eating' Leishmania come closer, a vaccine against them does, too**](#) [周三, 13 9月 20:44]

Boils the size of sand dollars, facial damage reminiscent of acid wounds, death by maiming of the liver and spleen. *Leishmania* parasites inflict suffering around the world that is the stuff of parables. They are the second-deadliest parasites after malaria, and global warming is slowly pushing them north toward the United States. Can a new experimental vaccine someday stop them? The vaccine has worked in humanized mice, as detailed in a new study.

- [**New research on probiotics in the prevention and treatment of colon cancer**](#) [周三, 13 9月 20:44]

In an innovative approach to colorectal cancer (CRC) prevention and treatment, scientists are studying ways to replace missing metabolites in patients prone to gut inflammation and CRC. A new study describes how administration of histamine-producing gut microbes to mice lacking the enzyme histidine decarboxylase (HDC) reduced inflammation and tumor formation. These results suggest that alteration of the gut microbiome with probiotics may become a new preventative or therapeutic strategy for patie...

• [**A hair-trigger for cells fighting infection**](#) [周三, 13 9月 20:44]

In response to infection the immune system produces unique antibodies to target each illness. To make these new antibodies, cells in the immune system must intentionally damage their own genes, meaning they run the risk of becoming cancer cells. New research reveals how a proteins called Tia1 acts as a hair-trigger for DNA repair, allowing the immune system to walk the line between health and harm.

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

In step toward controlling chemistry, physicists create a new molecule, atom by atom: Study paves the way for creating on, off buttons for chemical reactions -- ScienceDaily

UCLA physicists have pioneered a method for creating a unique new molecule that could eventually have applications in medicine, food science and other fields. Their research, which also shows how chemical reactions can be studied on a microscopic scale using tools of physics, is reported in the journal *Science*.

For the past 200 years, scientists have developed rules to describe chemical reactions that they've observed, including reactions in food, vitamins, medications and living organisms. One of the most ubiquitous is the "octet rule," which states that each atom in a molecule that is produced by a chemical reaction will have eight outer orbiting electrons. (Scientists have found exceptions to the rule, but those exceptions are rare.)

But the molecule created by UCLA professor Eric

Hudson and colleagues violates that rule. Barium-oxygen-calcium, or BaOCa^+ , is the first molecule ever observed by scientists that is composed of an oxygen atom bonded to two different metal atoms.

Normally, one metal atom (either barium or calcium) can react with an oxygen atom to produce a stable molecule. However, when the UCLA scientists added a second metal atom to the mix, a new molecule, BaOCa^+ , which no longer satisfied the octet rule, had been formed.

Other molecules that violate the octet rule have been observed before, but the UCLA study is among the first to observe such a molecule using tools from physics -- namely lasers, ion traps and ultra-cold atom traps.

Hudson's laboratory used laser light to cool tiny amounts of the reactant atoms and molecules to an extremely low temperature -- one one-thousandth of a degree above absolute zero -- and then levitate them in a space smaller than the width of a human hair, inside of a vacuum chamber. Under these highly controlled conditions, the scientists could observe properties of the atoms and molecules that are otherwise hidden from view, and the "physics tools" they used enabled

them to hold a sample of atoms and observe chemical reactions one molecule at a time.

The ultra-cold temperatures used in the experiment can also be used to simulate the reaction as it would occur in outer space. That could help scientists understand how certain complex molecules, including some that could be precursors to life, came to exist in space, Hudson said.

The researchers found that when they brought together calcium and barium methoxide inside of their system under normal conditions, they would not react because the atoms could not find a way to rearrange themselves to form a stable molecule. However, when the scientists used a laser to change the distribution of the electrons in the calcium atom, the reaction quickly proceeded, producing a new molecule, CaOBa^+ .

The approach is part of a new physics-inspired subfield of chemistry that uses the tools of ultra-cold physics, such as lasers and electromagnetism, to observe and control how and when single-particle reactions occur.

UCLA graduate student Prateek Puri, the project's lead researcher, said the experiment demonstrates not only

how these techniques can be used to create exotic molecules, but also how they can be used to engineer important reactions. The discovery could ultimately be used to create new methods for preserving food (by preventing unwanted chemical reactions between food and the environment) or developing safer medications (by eliminating the chemical reactions that cause negative side effects).

"Experiments like these pave the way for developing new methods for controlling chemistry," Puri said. "We're essentially creating 'on buttons' for reactions."

Hudson said he hopes the work will encourage other scientists to further narrow the gap between physics and chemistry, and to demonstrate that increasingly complex molecules can be studied and controlled. He added that one key to the success of the new study was the involvement of experts from various fields: experimental physicists, theoretical physicists and a physical chemist.

A key player in the research is already making a name for itself in Hollywood. A device called the integrated ion-trap-time-of-flight mass spectrometer, which was invented by Hudson's lab and which was used to

discover the reaction -- was featured on a recent episode of the sitcom "The Big Bang Theory."

"The device enables us to detect and identify the products of reactions on the single-particle level, and for us, it has really been a bridge between chemistry and physics," said Michael Mills, a UCLA graduate student who worked on the project. "We were delighted to see it picked up by the show."

Biomarkers in the blood prove strong role of food for type 2 diabetes -- ScienceDaily

A pioneering method, developed at Chalmers University of Technology, has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

Researchers from Chalmers University of Technology and Sahlgrenska Academy, University of Gothenburg, have found that several diet and nutrient biomarkers -- molecules that can be measured in blood that are related to diet -- are linked with both risk to have type 2 diabetes and future risk of developing diabetes.

The study, published in the leading nutrition research journal *American Journal of Clinical Nutrition*, was carried out on 600 women from Gothenburg where diagnosis of diabetes was made at the start of the study,

at their age 64, and again after 5 ½ years.

The results underline that diet is an important factor when it comes to risk for developing type 2 diabetes, with fish, whole grains, vegetable oils and good vitamin E status found to be protective against type 2 diabetes, while red meat and saturated fat increased the risk for developing the disease.

"What is really important is that we were able to reach these conclusions without having any additional information on diet from the subjects," said lead author Doctor Otto Savolainen, who works at the Division of Food and Nutrition Science and the Chalmers Mass Spectrometry Infrastructure at Chalmers University of Technology.

The blood samples were analysed at Chalmers, where a unique metabolic fingerprint, including many different diet biomarkers, could be linked to each woman at the specific time the sample was taken. Using this method it was possible for the first time to objectively determine the impact of key dietary components on future type 2 diabetes risk, as well as to find differences in dietary patterns between women with and without type 2 diabetes.

"Collecting information about diet can be complicated and time consuming, and is always biased by what people remember and think they should report. Dietary biomarkers don't have this problem, and highlight that dietary recommendations to avoid red meat and saturated fat and increase intake of plant-based oils and whole grains do seem to hold true, at least in this group of women," says Associate Professor Alastair Ross, responsible senior researcher at Chalmers, at the Division of Food and Nutrition Science.

"The new method has allowed us to measure several markers of diet and nutrient status at the same time in a large number of people, which we believe is the first time this has been done," he says.

Although the role of diet is often discussed as a preventative measure for developing type 2 diabetes, this new research provides strong support for dietary guidelines, and underlines the importance of changing diet to improve health.

"New methods such as ours will help to improve how we measure diet and understand in more detail how dietary patterns relate to disease," says Alastair Ross.

Rare genetic cause of peritoneal mesothelioma points to targeted therapy: Genetic rearrangement in the ALK gene found in young women with mesothelioma may be targetable with FDA-approved drugs -- ScienceDaily

Mesothelioma is a rare and aggressive tumor that, in many cases, results from exposure to asbestos. But over the last several decades, other causes of the disease have emerged, including treatment with high-intensity therapeutic radiation and, more recently, an inherited genetic mutation. Now, through an unexpected observation and a meticulous study of patients seen at Brigham and Women's Hospital, BWH investigators have added a fourth cause to the list: a genetic rearrangement in the ALK gene, observed in three patients with peritoneal mesothelioma. Unlike previously known causes, this new discovery points to a potential therapeutic approach for those few patients whose tumors harbor the mutation.

The team's findings are published in *JAMA Oncology*.

"Mesothelioma is highly lethal and has no cure. Often, it is not diagnosed until at a late stage, when many tumors have already formed," said principal investigator Lucian Chirieac, MD, a thoracic oncology pathologist in the Department of Pathology at BWH and associate professor at Harvard Medical School.

"Although this mutation only exists in a small percentage of cases, this discovery points to a potential therapeutic avenue for these patients."

There are about 3,000 new cases of mesothelioma each year in the U.S., and only about 300 of those are peritoneal mesothelioma, which forms in the lining of the abdomen. Most cases of mesothelioma result decades after exposure to asbestos or radiation therapy. But in rare cases, young patients who have never been exposed to either risk factor are diagnosed with the disease. One such case led Chirieac and his colleagues to their unexpected finding.

"This was a serendipitous discovery. We had a young patient with peritoneal mesothelioma that was difficult to diagnose. We extended our molecular diagnostics to test for a genetic rearrangement that had been reported

in lymphoma and lung cancer, but never in mesothelioma. When it came back positive, we were intrigued," said first author Yin (Rex) Hung, MD, PhD, the Corson Thoracic Pathology Fellow in the Department of Pathology at BWH and HMS.

Hung and Chirieac collaborated with other physicians and scientists at BWH and Massachusetts General Hospital to confirm their observation. They carefully examined samples from 88 consecutive patients with peritoneal mesothelioma who had been seen at BWH between 2005 and 2015. They identified ALK-positive mesotheliomas by immunohistochemistry; confirmed with fluorescence in situ hybridization; and performed targeted next-generation sequencing of tumor DNA and RNA to get a full picture of the exact genetic rearrangement underpinning the disease.

Three patient samples were positive for ALK -- these patients with peritoneal mesothelioma were women with no history of asbestos or radiation therapy exposure. They also looked in samples collected from patients with pleural mesothelioma -- the more common form of the diseases -- but none of those samples were positive for ALK.

The ALK gene is important during embryonic development of the nervous system but should be inactive later in life. Previous studies of genetic alterations in lymphoma and lung cancer have found that certain genetic mutations -- specifically when part of a gene breaks off and gets fused to another -- can inappropriately switch on ALK, driving cancer cells to grow and divide. Targeting ALK with therapeutic drugs can turn that switch back off, blocking cancer progression -- at least temporarily -- without harming healthy cells. The FDA has approved several ALK inhibitors for treating non-small cell lung cancer. While the costs of targeted therapy may remain high, the cost of diagnostic testing for such genetic rearrangements is low.

Chirieac and colleagues hope to extend their study of ALK-positive mesotheliomas in a global patient population. In his own practice, Chirieac is routinely examining for the presence of ALK rearrangements for patients with mesothelioma and educating his residents about this new finding. "When I teach my residents about the causes of mesothelioma, I talk to them about asbestos, radiation therapy and an inherited mutation," said Chirieac. "We believe this paper adds a fourth cause to that list -- one that is potentially clinically

actionable."

Huge genetic diversity among Papuan New Guinean peoples revealed: Genetic diversity found to mirror linguistic and cultural diversity among Papuan New Guinean people -- ScienceDaily

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists at the Wellcome Trust Sanger Institute and their colleagues at the University of Oxford and the Papua New Guinea Institute of Medical Research reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

Reported in *Science*, the study also gives insights into how the development of agriculture and cultural events such as the Bronze or Iron Age could affect the genetic

structure of human societies.

Papua New Guinea is a country in the southwestern Pacific with some of the earliest archaeological evidence of human existence outside Africa. Largely free from Western influence and with fascinating cultural diversity, it has been of enormous interest to anthropologists and other scientists seeking to understand human cultures and evolution.

With approximately 850 domestic languages, which account for over 10 per cent of the world's total, Papua New Guinea is the most linguistically diverse country in the world. To discover if the linguistic and cultural diversity was echoed in the genetic structure of the population, researchers studied the genomes of 381 Papuan New Guinean people from 85 different language groups within the country.

The researchers looked at more than a million genetic positions in the genome of each individual, and compared them to investigate genetic similarities and differences. They found that groups of people speaking different languages were surprisingly genetically distinct from each other.

Anders Bergström, the first author on the paper from the Wellcome Trust Sanger Institute, said: "This is the first large-scale study of genetic diversity and population history in Papua New Guinea. Our study revealed that the genetic differences between groups of people there are generally very strong, often much stronger even than between major populations within all of Europe or all of East Asia."

Professor Stephen J. Oppenheimer, second author of the paper from the Wellcome Trust Centre for Human Genetics, University of Oxford, said: "We found a striking difference between the groups of people who live in the mountainous highlands and those in the lowlands, with genetic separation dating back 10,000-20,000 years between the two. This makes sense culturally, as the highland groups historically have kept to themselves, but such a strong genetic barrier between otherwise geographically close groups is still very unusual and fascinating."

Human evolution in Europe and Asia has been greatly influenced by the development of agriculture around 10,000 years ago. When small bands of hunter-gatherers settled into villages and started farming, they expanded and over time gave rise to more genetically

homogenous (similar) societies. However, despite the independent development of agriculture in Papua New Guinea at about the same time, the same process of homogenization did not occur here. This may indicate that other historical processes in Europe and Asia, such as the later Bronze and Iron Ages, were the key events that shaped the current genetic structure of those populations.

Dr Chris Tyler-Smith, corresponding author on the paper from the Wellcome Trust Sanger Institute, said: "Using genetics, we were able to see that people on the island of New Guinea evolved independently from rest of the world for much of the last 50,000 years. This study allows us to glimpse a different version of human evolution from that in Europe and Asia, one in which there was agriculture but no later Bronze Age or Iron Age. Papua New Guinea might show the genetic, cultural and linguistic diversity that many settled human societies would have had before these technological transformations."

- [**In-utero treatment reverses cleft palate in mice**](#) [周四, 14 9月 07:30]

Researchers clarified a molecular pathway responsible for the formation of cleft palate and identified a new treatment to reverse this defect in mouse pups in utero.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**First global map of water in moon's soil**](#) [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as resource in future lunar exploration.

- [**New gravity map suggests Mars has a porous crust**](#) [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**Climate change challenges the survival of fish across the world**](#) [周四, 14 9月 07:29]

Researchers have published the first analysis looking at how vulnerable the world's freshwater and marine fishes are to climate change. Their study used physiological data to predict how nearly 3,000 fish species living in oceans and rivers will respond to warming water temperatures in different regions.

- [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Your stools reveal whether you can lose weight**](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

- [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that

survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

- [**Urban climate change**](#) [周二, 12 9月 03:09]

Southern cities such as Houston and Tampa -- which faced the wrath of hurricanes Harvey and Irma, respectively -- may not be the only urban environments vulnerable to extreme weather. Northern cities also face the potential for flooding as global temperatures continue to warm.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

- **[Brain Composer: 'Thinking' melodies onto a musical score](#)** [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- **[Cold region 'tipping point' now inevitable](#)** [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

- **[The evolutionary origin of the gut](#)** [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

- **[USA threatened by more frequent flooding](#)** [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

- **[Half-a-billion-year-old fossils shed light animal evolution on Earth](#)** [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

- **[Biodiversity just as powerful as climate change for healthy ecosystems](#)** [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards

against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

• [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

• [**Scientist finds secret to thriving**](#) [周六, 09 9月 08:55]

What it takes to thrive, rather than merely survive, could be as simple as feeling good about life and yourself and being good at something, according to new research.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Biomarkers in the blood prove strong role of food for type 2 diabetes**](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**Rare genetic cause of peritoneal mesothelioma points to targeted therapy**](#) [周五, 15 9月 03:23]

Investigators have uncovered a new genetic cause of mesothelioma: a genetic rearrangement in the ALK gene, observed in three patients with peritoneal mesothelioma. Unlike previously known causes, this new discovery points to a potential therapeutic approach for those few patients whose tumors harbor the mutation.

- [**Huge genetic diversity among Papuan New Guinean peoples revealed**](#) [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands

region have been completely independent even until the present day.

- [**Insulin therapy initially declined and delayed by an average of two years**](#) [周五, 15 9月 03:23]

Thirty percent of type 2 diabetic patients don't begin insulin when it's initially recommended, with the average start time being two years later.

- [**Synaptic receptor mobility: Discovery of a new mechanism for controlling memory**](#) [周五, 15 9月 03:23]

A new mechanism has been discovered for storing information in synapses and a means of controlling the storage process. The breakthrough moves science closer to unveiling the mystery of the molecular mechanisms of memory and learning processes.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Premature infants may get metabolic boost from mom's breast milk**](#) [周四, 14 9月 20:40]

The breast milk of mothers with premature babies has different amounts of microRNA than that of mothers with babies born at term, which may help premature babies catch up in growth and development, according to researchers.

- [**Chronic pain common in people living with HIV**](#) [周四, 14 9月 20:40]

All people living with HIV should be screened for chronic pain, which affects 39 to 85 percent of people with the condition, recommend new HIVMA guidelines. Those who have chronic pain should be treated using a multidisciplinary approach focused on non-drug options ranging from yoga to physical therapy, note the guidelines. Opioids should never be a first-line treatment.

- [**Mechanism behind calorie restriction, lengthened lifespan revealed**](#) [周四, 14 9月 20:40]

Almost a century ago, scientists discovered that cutting calorie intake could dramatically extend lifespan in certain animal species. Despite numerous studies since, however, researchers have been unable to explain precisely why. Now, investigators have broken past that barrier.

- [**Social media helps students learn scientific argumentation better**](#) [周四, 14 9月 07:31]

Students who took part in a program that taught scientific argumentation learned the concepts better than their peers who did not, a study concludes.

- [**In-utero treatment reverses cleft palate in mice**](#) [周四, 14 9月 07:30]

Researchers clarified a molecular pathway responsible for the formation of cleft palate and identified a new treatment to reverse this defect in mouse pups in utero.

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**Popular bottle-breaking trick is giving insight to brain injuries**](#) [周三, 13 9月 22:45]

As many YouTube videos show, striking the top of a liquid-filled bottle can shatter the bottom. Researchers are hoping to use new knowledge of that party trick to help fill a gap in something much more serious: brain research.

- [**New hope for 'bubble baby disease'**](#) [周三, 13 9月 22:45]

If untreated, severe combined immune deficiency (SCID) syndrome -- or 'bubble baby disease' -- is often fatal within the first year of a infant's life. A checklist of SCID markers could make diagnosis faster, allowing more babies to receive treatment within a critical timeframe, say researchers.

- [**Multifunctional nano-sized drug carriers based**](#)

[on reactive polypept\(o\)ides](#) [周三, 13 9月 22:44]

Researchers have been able to demonstrate that reactive polypept(o)ides constitute ideal building blocks to control morphology and function of carrier systems in a simple but precise manner.

[Teens' ability to consider the intentions of others linked to structural changes in the brain](#) [周三, 13 9月 20:44]

When it comes to the concept of fairness, teenagers' ability to consider the intentions of others appears to be linked to structural changes underway in the brain, according to a study. The study is the first to provide evidence linking structural changes with behavioral changes within this context. Understanding the intentions of others is fundamental to human cooperation and how we exist as social beings.

[Paper-based tuberculosis test could boost diagnoses in developing countries](#) [周三, 13 9月 20:44]

Diagnosing tuberculosis early can allow patients to receive the medicine they need and also help prevent the disease from spreading. But in resource-limited areas, equipment requirements and long wait times for results are obstacles to diagnosis and treatment. To tackle this problem, scientists report the development of a fast, paper-based tuberculosis test that can be read with a smartphone.

[Systems analysis points to links between Toxoplasma infection and common brain diseases](#) [周三, 13 9月 20:44]

Nearly one out of every three humans on earth has a lifelong infection with the brain-dwelling parasite *Toxoplasma gondii*. In a new report, researchers from multiple institutions describe efforts to learn how infection with the parasite *Toxoplasma gondii* may alter, and in some cases amplify, several brain disorders, including epilepsy, Alzheimer's and Parkinson's diseases as well as some cancers.

[As 'flesh-eating' Leishmania come closer, a vaccine against them does, too](#) [周三, 13 9月 20:44]

Boils the size of sand dollars, facial damage reminiscent of acid wounds, death by maiming of the liver and spleen. Leishmania parasites inflict suffering around the world that is the stuff of parables. They are the second-deadliest parasites after malaria, and global warming is slowly pushing them north toward the United States. Can a new experimental vaccine someday stop them? The vaccine has worked in humanized mice, as detailed in a new study.

- [**New research on probiotics in the prevention and treatment of colon cancer**](#) [周三, 13 9月 20:44]

In an innovative approach to colorectal cancer (CRC) prevention and treatment, scientists are studying ways to replace missing metabolites in patients prone to gut inflammation and CRC. A new study describes how administration of histamine-producing gut microbes to mice lacking the enzyme histidine decarboxylase (HDC) reduced inflammation and tumor formation. These results suggest that alteration of the gut microbiome with probiotics may become a new preventative or therapeutic strategy for patie...

- [**A hair-trigger for cells fighting infection**](#) [周三, 13 9月 20:44]

In response to infection the immune system produces unique antibodies to target each illness. To make these new antibodies, cells in the immune system must intentionally damage their own genes, meaning they run the risk of becoming cancer cells. New research reveals how a proteins called Tia1 acts as a hair-trigger for DNA repair, allowing the immune system to walk the line between health and harm.

- [**Science spin prevalent, researchers warn**](#) [周三, 13 9月 05:05]

More than a quarter of biomedical scientific papers may utilize practices that distort the interpretation of results or mislead readers so that results are viewed more favorably, a new study suggests.

- [**Cold comfort: Fat-rich diets and adaptation among indigenous Siberian populations**](#) [周三, 13 9月 05:05]

Recently, scientists have been exploring the genetic signatures of adaptation in several indigenous cold-adapted human populations. Now, a new study has identified new signals of adaptation across multiple

genes and exploring a rich demographic history. By performing extensive analyses on DNA sequencing data for two North-Central Siberian populations, the Nganasan (nomadic hunters) and Yakut (herders), they have been able to infer the most comprehensive demographic and adaptive history.

- [**Health benefits of olives and olive oil**](#) [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [**Lay interventions for depression and drinking**](#) [周三, 13 9月 03:48]

Brief psychological interventions delivered by lay counselors in primary care were effective and cost-effective for patients with depression and harmful drinking in India, according to two new studies.

- [**Predicting atypical development in infants at high risk for autism?**](#) [周三, 13 9月 03:48]

New research identifies a potential biomarker that predicts atypical development in 1- to 2-month-old infants at high versus low familial risk for developing autism spectrum disorders (ASD).

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- [**'Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests**](#) [周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [**In mice, calorie restriction reduces fat but**](#)

increases fur [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

• **'Missing link' explains how viruses trigger immunity** [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

• **Reversing the negative effects of adolescent marijuana use** [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

• **AI -- Engineering: merging, morphing, mobile robots** [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

• **Father's environmental exposure affects sperm epigenetics, study shows** [周二, 12 9月 22:28]

Authors of a new report believe that theirs is among the first human studies to investigate the influence of phthalate exposure on sperm epigenetics, embryo development and whether DNA methylation in sperm cells may be a path by which a father's environmental exposure influences these endpoints. DNA methylation, one mechanism of epigenetics, is a chemical tag on DNA that does not change the gene sequence but is involved in controlling gene expression.

- [**Researchers identify potential biomarkers of age-related macular degeneration**](#) [周二, 12 9月 22:28]

Patients with any stage of age-related macular degeneration (AMD) carry signs of the disease in their blood that may be found through special laboratory tests, according to a new study.

- [**Cancer drug stimulates tripolar mode of mitosis**](#) [周二, 12 9月 22:28]

Taxanes inhibit cell division and make cancer cells sensitive to radiation therapy. A current study has investigated the underlying mechanisms of this action - and which biomarkers may be useful for predicting the success of therapy.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- [**Exposure to head impacts in youth football practice drills**](#) [周二, 12 9月 21:31]

Researchers have examined differences in the number, location, and magnitude of head impacts sustained by young athletes during various youth football practice drills. Such information could lead to recommendations for football practices, including modification of some high-intensity drills in order to reduce players' exposure to head impacts and, consequently, lessen the risks of injury.

- [**Air quality in 'green' housing affected by toxic**](#)

[chemicals in building materials](#) [周二, 12 9月 21:31]

Indoor air pollution can be a problem in many homes, even in eco-friendly buildings. Thanks to a new innovative study, researchers have a better idea of where these pollutants come from -- which ones come from chemicals leaching out of building materials and which ones from the personal items people bring into their homes. The findings could inform the development of new green building standards and lead to healthier housing, especially for low-income communities.

• [How should we handle boys who can't read?](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

• [Sexually aroused male flies unable to sleep after close encounters with females](#) [周二, 12 9月 21:31]

The urge to mate appears to override the need to sleep in flies, according to new research that hints at the importance of sleep for animals.

• [Running group helps half its graduates quit smoking](#) [周二, 12 9月 21:31]

Half the people who completed a 10-week community running program aimed at helping them quit smoking were successful in their attempt. Many others reduced their smoking, and saw their mental health improve.

• [Your stools reveal whether you can lose weight](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

• [Explaining bursts of activity in brains of preterm babies](#) [周二, 12 9月 21:31]

The source of spontaneous, high-amplitude bursts of activity seen in the brains of preterm babies, which are vital for healthy development, has been identified by a team of researchers.

- [**Eye movements reveal temporal expectation deficits in ADHD**](#) [周二, 12 9月 21:31]

A technique that measures tiny movements of the eyes may help scientists better understand and perhaps eventually improve assessment of ADHD, according to research.

- [**Study sets new distance record for medical drone transport**](#) [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

- [**Researchers discover new, abundant enzyme that helps bacteria infect animals**](#) [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

- [**Long sitting periods may be just as harmful as daily total**](#) [周二, 12 9月 06:00]

A new study finds that sitting around for 12 or more hours per day, particularly if accumulated during 60- to 90-minute periods, increased the risk of early death -- even in those who exercised.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Hydrogen power moves a step closer**](#) [周五, 15 9月 03:22]

Physicists are developing methods of creating renewable fuel from water using quantum technology. Renewable hydrogen can already be produced by photoelectrolysis where solar power is used to split water

molecules into oxygen and hydrogen. But fundamental problems remain before this can be adopted commercially due to inefficiency. A new study demonstrates that the novel use of nanostructures could increase the maximum photovoltage generated in a photoelectrochemical cell, increasing the productivi...

- [**Social media helps students learn scientific argumentation better**](#) [周四, 14 9月 07:31]

Students who took part in a program that taught scientific argumentation learned the concepts better than their peers who did not, a study concludes.

- [**New supernova analysis reframes dark energy debate**](#) [周四, 14 9月 07:31]

The accelerating expansion of the Universe may not be real, but could just be an apparent effect, according to new research. The new study finds the fit of Type Ia supernovae to a model universe with no dark energy to be very slightly better than the fit to the standard dark energy model.

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**First global map of water in moon's soil**](#) [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as

resource in future lunar exploration.

- [**New gravity map suggests Mars has a porous crust**](#) [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

- [**'The dark side' of quantum computers**](#) [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

- [**Self-folding electronics could enable advanced robotics**](#) [周三, 13 9月 22:45]

As demand grows for more versatile, advanced robotics and other technologies, the need for components that can enable these applications also increases. Producing such components en masse has been a major challenge. But now, researchers report that they have developed a way to help meet this need by printing electronics that can fold themselves into a desired shape.

- [**The beam of invisibility**](#) [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

- [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

- [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark**](#)

[matter'](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

• **[New way to stabilize next-generation fusion plasmas](#)** [周三, 13 9月 01:48]

Recent experiments conducted on the DIII-D National Fusion Facility suggest that up to 40 percent of high-energy particles are lost during tokamak fusion reactions because of Alfvén waves.

• **[Magnetic cellular 'Legos' for the regenerative medicine of the future](#)** [周三, 13 9月 01:48]

By incorporating magnetic nanoparticles in cells and developing a system using miniaturized magnets, researchers have succeeded in creating cellular magnetic 'Legos.' They were able to aggregate cells using only magnets and without an external supporting matrix, with the cells then forming a tissue that can be deformed at will.

• **[AI -- Engineering: merging, morphing, mobile robots](#)** [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

• **[Graphene based terahertz absorbers](#)** [周二, 12 9月 22:27]

A terahertz saturable absorber has been created using printable graphene inks with an order of magnitude higher absorption modulation than other devices produced to date.

• **[Study sets new distance record for medical drone transport](#)** [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of

Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

- [**Method controls whether freezing droplets bounce off or stick**](#) [周二, 12 9月 03:09]

Self-peeling droplets have been discovered, along with a new way to control adhesion of freezing droplets by adjusting the thermal properties of substrates. These findings could make everything from additive manufacturing to deicing more efficient.

- [**Airline industry could fly thousands of miles on biofuel from a new promising feedstock**](#) [周二, 12 9月 00:59]

A Boeing 747 burns one gallon of jet fuel each second. A recent analysis estimates that this aircraft could fly for 10 hours on bio-jet fuel produced on 54 acres of specially engineered sugarcane.

- [**Sunscreen protects skin without seeping in**](#) [周二, 12 9月 00:27]

A non-penetrating sunscreen invented by its researchers has been licensed to a major aloe verde supplier. The sunscreen will appeal to consumers concerned about chemicals exposure.

- [**Core solutions reach optimally extreme light pulses**](#) [周二, 12 9月 00:27]

A new hollow-core photonic crystal fiber system demonstrates high energy, single-cycle IR pulses at an extraordinary repetition rate, suitable for hard X-ray production and real-time investigations of atomic dynamics.

- [**The turbulent healing powers of plasma**](#) [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent and effective medical therapies.

- [**A novel and practical fab-route for superomniphobic liquid-free surfaces**](#) [周二, 12 9月 00:27]

Scientists have developed a fabrication technology that can inexpensively produce surfaces capable of repelling liquids, including water and oil.

- [**Connecting up the quantum internet**](#) [周二, 12 9月 00:27]

Major leap for practical building blocks of a quantum internet: New research demonstrates how to dramatically improve the storage time of a telecom-compatible quantum memory, a vital component of a global quantum network. The technology operates in the same 1550 nanometer band as today's telecommunications infrastructure. It can also be operated as a quantum light source or used as an optical link for solid-state quantum computing devices such as superconducting qubits and silicon qubits.

- [**Self-assembling nanoparticle arrays can switch between a mirror and a window**](#) [周二, 12 9月 00:27]

By finely tuning the distance between nanoparticles in a single layer, researchers have made a filter that can change between a mirror and a window.

- [**Hints from hemoglobin lead to better carbon monoxide storage**](#) [周二, 12 9月 00:26]

Highly porous metal-organic frameworks have proved ideal for storing many chemicals, from carbon dioxide and hydrogen to water. A new tweak to MOFs has now produced a highly selective material for

adsorbing carbon monoxide, which is used in many industrial processes, including as a component of syngas. Using only one-third the energy of a common process for capturing and reusing CO, it holds promise for more efficient recycling of CO in the steel industry.

• [Brain Composer: 'Thinking' melodies onto a musical score](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

• [Astronomers spun up by galaxy-shape finding](#) [周二, 12 9月 00:26]

For the first time astronomers have measured how a galaxy's spin affects its shape -- something scientists have tried to do for 90 years -- using a sample of 845 galaxies. Because a galaxy's shape is the result of past events such as merging with other galaxies, knowing its shape also tells us about the galaxy's history. The team made its findings with SAMI (the Sydney-AAO Multi-object Integral field unit), a game-changing instrument.

• [Hollow atoms: The consequences of an underestimated effect](#) [周二, 12 9月 00:26]

In a 'hollow atom', electrons occupy high-energy states far away from the nucleus, it can get rid of their excess energy on a remarkably short timescale. The reason for this has been unknown. Researchers have now shown that this is due to a previously underestimated effect: the 'interatomic coulomb decay' allows the atom to transfer its energy to several other atoms simultaneously. This also explains why radiation therapy can be so effective.

• [Patients to benefit from new 3-D visualizations of the heart](#) [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations,

explains a new report.

- [**Study clarifies how neural nets 'think' when processing language**](#) [周二, 12 9月 00:26]

A new general-purpose technique has been developed for making sense of neural networks that are trained to perform natural-language-processing tasks, in which computers attempt to interpret freeform texts written in ordinary, or 'natural,' language (as opposed to a structured language, such as a database-query language).

- [**First on-chip nanoscale optical quantum memory developed**](#) [周二, 12 9月 00:26]

Engineers have built a chip capable of storing and retrieving individual photons of light, with all of their quantum properties left intact. The chip represents the first nanoscale optical quantum memory device, and could one day be used to create more secure Internet communications.

- [**Using mirrors to improve the quality of light particles**](#) [周一, 11 9月 21:59]

Scientists have succeeded in dramatically improving the quality of individual photons generated by a quantum system. The scientists have successfully put a 10-year-old theoretical prediction into practice. With their paper, they have taken an important step towards future applications in quantum information technology.

- [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

- [**First imaging of free nanoparticles in laboratory experiment using a high-intensity laser source**](#) [周日, 10 9月 06:38]

In a joint research project, scientists have managed for the first time to

image free nanoparticles in a laboratory experiment using a high-intensity laser source. Previously, the structural analysis of these extremely small objects via single-shot diffraction was only possible at large-scale research facilities using so-called XUV and x-ray free electron lasers.

- [**How safe are critical infrastructures from hacker attacks?**](#) [周日, 10 9月 06:37]

Critical infrastructures such as wind power stations are partially controlled via mobile phone networks. Using state-of-the-art tests, researchers are investigating how well protected that form of communication is from external attacks. The team is aiming to make critical infrastructures in Europe able to withstand hacker attacks.

- [**New software can detect when people text and drive**](#) [周六, 09 9月 08:55]

Computer algorithms developed by engineering researchers can accurately determine when drivers are texting or engaged in other distracting activities.

- [**When electrons ride a wave**](#) [周六, 09 9月 08:55]

Conventional electron accelerators are an indispensable tool in modern research. But even smaller versions of these super microscopes are the size of a soccer field. Laser plasma acceleration could offer an alternative with a smaller footprint and higher peak currents. So far, the challenge with laser accelerators has been to create a reliable and stable electron beam, which is the prerequisite for applications. Physicists have developed a method to increase beam stability and quality.

- [**Scientists unravel new insights into promising semiconductor material**](#) [周六, 09 9月 08:55]

Researchers have established new findings on the properties of two-dimensional molybdenum disulfide, a widely studied semiconductor of the future.

- [**Are we being watched? Tens of other worlds**](#)

[could spot the Earth](#) [周六, 09 9月 08:55]

Scientists have turned exoplanet-hunting on its head, in a study that instead looks at how an alien observer might be able to detect Earth using our own methods. They find that at least nine exoplanets are ideally placed to observe transits of Earth.

• [High-speed quantum memory for photons](#) [周六, 09 9月 08:54]

Physicists have developed a memory that can store photons. These quantum particles travel at the speed of light and are thus suitable for high-speed data transfer. The researchers were able to store them in an atomic vapor and read them out again later without altering their quantum mechanical properties too much. This memory technology is simple and fast and it could find application in a future quantum Internet.

• [How to draw electricity from the bloodstream](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

• [New guidelines discourage use of brain imaging as a 'lie detector' for chronic pain](#) [周六, 09 9月 08:54]

A task force consisting of researchers from around the world has released a set of recommendations that advise against the use of brain imaging as a test for chronic pain.

• [A sweeter way to make green products](#) [周六, 09 9月 08:16]

A more efficient process has been created for extracting the sugars from wood chips, corn cobs and other organic waste from forests and farms. This biorenewable feedstock could serve as a cheaper, sustainable substitute for the petroleum used in manufacturing tons of consumer goods annually -- goods that consumers want to be greener.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**'Mysterious' ancient creature was definitely an animal, research confirms**](#) [周五, 15 9月 03:22]

It lived well over 550 million years ago, is known only through fossils and has variously been described as looking a bit like a jellyfish, a worm, a fungus and lichen. But was the 'mysterious' Dickinsonia an animal, or was it something else? A new study provides strong proof that Dickinsonia was an animal.

- [**Hydrogen power moves a step closer**](#) [周五, 15 9月 03:22]

Physicists are developing methods of creating renewable fuel from water using quantum technology. Renewable hydrogen can already be

produced by photoelectrolysis where solar power is used to split water molecules into oxygen and hydrogen. But fundamental problems remain before this can be adopted commercially due to inefficiency. A new study demonstrates that the novel use of nanostructures could increase the maximum photovoltage generated in a photoelectrochemical cell, increasing the productivi...

- [**How well electron transport works in furfural biogas**](#) [周四, 14 9月 07:31]

Furfural is a promising candidate in the quest for alternative biofuels.

- [**Evolution of 'true frogs' defies long-held expectations of science**](#) [周四, 14 9月 07:31]

New research shows, in contrast to expectations, 'the rapid global range expansion of true frogs was not associated with increased net-diversification.'

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**Climate change challenges the survival of fish across the world**](#) [周四, 14 9月 07:29]

Researchers have published the first analysis looking at how vulnerable the world's freshwater and marine fishes are to climate change. Their study used physiological data to predict how nearly 3,000 fish species living in oceans and rivers will respond to warming water temperatures in different regions.

- [**Bird songs isolate species, new research suggests**](#)

[周三, 13 9月 22:45]

Two birds that look the same, but have songs so different they can't recognize each other, should be considered distinct species, suggests new research. Among 72 related populations of Central and South American birds the researchers tested, they found evidence for 21 new species.

- [**Science spin prevalent, researchers warn**](#) [周三, 13 9月 05:05]

More than a quarter of biomedical scientific papers may utilize practices that distort the interpretation of results or mislead readers so that results are viewed more favorably, a new study suggests.

- [**Health benefits of olives and olive oil**](#) [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- [**'Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests**](#) [周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [**Queens control worker reproduction without castration in stingless bee species**](#) [周三, 13 9月 01:48]

Study contradicts the view that worker bees are forcibly castrated by the queen among the 600-odd species of stingless bees widely distributed in tropical and subtropical regions of the world.

• [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'**](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

• [**Forest regeneration experiment of 30 years yields results**](#) [周三, 13 9月 01:48]

A spruce forest regeneration experiment in Interior Alaska that spanned nearly 30 years demonstrates which forest management practices produce the best results. It looked at different combinations of ground treatments to reduce competition from other vegetation and of regeneration methods, such as planting spruce seedlings and broadcast seeding. The results show the environmental and management situations in which different techniques work best and the situations in which they are unnecessary. Re...

• [**In mice, calorie restriction reduces fat but increases fur**](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

• [**'Missing link' explains how viruses trigger immunity**](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to

reduce the virus' spread.

- [**Reversing the negative effects of adolescent marijuana use**](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- [**Earthquake faults may have played key role in shaping the culture of ancient Greece**](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Explosion in number of known life forms**](#) [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

• [**Biding time could improve conservation outcomes**](#) [周二, 12 9月 21:31]

Strategic delays in conservation efforts could be the key to protecting more species according to researchers. The new study found instead of spending project funds immediately, conservation organizations could use the right amount of delay to improve the benefits achieved from their funding by focusing first on investment, capacity building, or monitoring and research.

• [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

• [**Researchers discover new, abundant enzyme that helps bacteria infect animals**](#) [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

• [**Ancient tree reveals cause of spike in Arctic temperature**](#) [周二, 12 9月 21:30]

A kauri tree trapped in a New Zealand swamp for 30,000 years may have overturned the idea that a slowdown in ocean currents in the North Atlantic may be entirely responsible for Dansgaard-Oeschger events and the characteristic bi-polar see-saw, which sees the Antarctica cool while the Arctic warms during glacial periods. The research reveals a mechanism that generates a 20,000 km long atmospheric bridge, reaching from Antarctica to the Arctic.

• [**Modeling the impact of green eggs and hens**](#) [周二, 12 9月 21:30]

Poultry given vegan organic chicken feed can help to produce eggs with a smaller environmental footprint than those fed non-organic feeds that

contain animal by-products, new research shows.

- [**Rapid climate changes across northern hemisphere in the earliest Middle Pleistocene**](#) [周二, 12 9月 21:30]

By studying climate changes that took place thousands of years ago, we can better understand the global climate system and predict Earth's future climate. A multi-organization research team has discovered evidence of rapid climate changes on a millennial-to-centennial scale that occurred 780 to 760 thousand years ago.

- [**Rising CO2 leading to changes in land plant photosynthesis**](#) [周二, 12 9月 05:04]

Researchers have determined that major changes in plant behavior have occurred over the past 40 years, using measurements of subtle changes in the carbon dioxide (CO2) currently found in the atmosphere.

- [**Study of circular DNA comes full circle with use of old technique**](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

- [**Air pollution cuts 3 years off lifespans in Northern China**](#) [周二, 12 9月 03:09]

A Chinese policy is unintentionally causing people in northern China to live 3.1 years less than people in the south due to air pollution concentrations that are 46 percent higher. These findings imply that every additional 10 micrograms per cubic meter of particulate matter pollution (PM10) reduces life expectancy by 0.6 years.

- [**'Internal clock' found within live human cells**](#) [周二, 12 9月 03:09]

An internal clock has been discovered within live human cells, a finding

that creates new opportunities for understanding the building blocks of life and the onset of disease.

- [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

- [**Clouds like honeycomb**](#) [周二, 12 9月 03:09]

An innovative network approach to explain polygonal patterns in clouds could help scientists find more accurate descriptions of clouds in computer models of weather and climate change.

- [**Urban climate change**](#) [周二, 12 9月 03:09]

Southern cities such as Houston and Tampa -- which faced the wrath of hurricanes Harvey and Irma, respectively -- may not be the only urban environments vulnerable to extreme weather. Northern cities also face the potential for flooding as global temperatures continue to warm.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake

immediately triggering a series of large slow slip events.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

- [**Muscle nuclei: May the force be with you**](#) [周二, 12 9月 00:26]

A group of researchers has revealed the mechanism by which cellular nuclei reach their position within muscle cells. This discovery can have important implications in therapeutic strategies to treat muscular diseases.

- [**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

- [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

• [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

• [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

• [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

• [**Fathers can influence the sex of their offspring, scientists show**](#) [周二, 12 9月 00:26]

It has traditionally been thought that in mammals only mothers are able to influence the sex of their offspring. But a new study in wild mice has shown that fathers can, in fact, influence sex ratios.

• [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [**Fire ant venom compounds may lead to skin treatments**](#) [周一, 11 9月 21:59]

Solenopsins, the main toxic components of fire ant venom, chemically resemble ceramides, which are lipid-like molecules essential for maintaining for the barrier function of the skin. Solenopsin analogs can reduce skin thickening and inflammation in a mouse model of psoriasis, scientists have shown.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

- [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

- [**Air pollution cuts 3 years off lifespans in Northern China**](#) [周二, 12 9月 03:09]

A Chinese policy is unintentionally causing people in northern China to live 3.1 years less than people in the south due to air pollution concentrations that are 46 percent higher. These findings imply that every additional 10 micrograms per cubic meter of particulate matter pollution (PM10) reduces life expectancy by 0.6 years.

• [**Urban climate change**](#) [周二, 12 9月 03:09]

Southern cities such as Houston and Tampa -- which faced the wrath of hurricanes Harvey and Irma, respectively -- may not be the only urban environments vulnerable to extreme weather. Northern cities also face the potential for flooding as global temperatures continue to warm.

• [**Earthquake triggers 'slow motion' quakes in New Zealand**](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

• [**Do we need to reform international drug treaties as more countries legalize cannabis?**](#) [周六, 09 9月 08:55]

The future of international drug control treaties is in doubt because of recent treaty-violating decisions to legalize cannabis use in Canada, the United States and Uruguay. A professor, whose 2014 review of 20 years of cannabis research made world headlines, thinks so. If decriminalization is the way of the future, he advocates a cautious approach to policy reform that would involve trialing and evaluating the effects of incrementally more liberal drug policies.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Sorting molecules with DNA robots](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [The return of the comet-like exoplanet](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- ['Handedness' in scale-eating fish: Nature and nurture](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [Could interstellar ice provide the answer to birth of DNA?](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be

converted into the building blocks of DNA, researchers have shown.

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**'The dark side' of quantum computers**](#) [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**The beam of invisibility**](#) [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now

pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

- [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

- [**Earthquake faults may have played key role in shaping the culture of ancient Greece**](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

- [**How to draw electricity from the bloodstream**](#) [周六, 09 9月 08:54]

Men build dams and huge turbines to turn the energy of waterfalls and tides into electricity. To produce hydropower on a much smaller scale, scientists have now developed a lightweight power generator based on

carbon nanotube fibers suitable to convert even the energy of flowing blood in blood vessels into electricity.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.

- [**Delayed weaning reduces behavioural problems in cats**](#) [周六, 16 9月 04:52]

Early weaning increases aggression and stereotypic behavior in cats. Based on the study, the recommended weaning age of 12 weeks should be raised by at least two weeks. Delaying weaning is an easy and cost-efficient way of improving the quality of life of cats.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited electrons in solids in real-time.

- [**Black Sea water temperatures may buck global trend**](#) [周六, 16 9月 04:29]

Scientists have successfully simulated the Black Sea's long term currents, salt water content and temperature for the first time.

- [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- [**The body's own fat-metabolism protects against the harmful effects of sugar**](#) [周六, 16 9月 02:41]

Researchers have discovered that the fat-metabolism in the cells takes place simultaneously with a detoxification of the harmful substances from the blood sugar, which can avert the damage that can in turn lead to age-related diseases such as diabetes, Alzheimer's and cancer. This indicates that we have a detoxification system which we were not previously aware of.

- [**Scientists question study about plastic-eating caterpillars**](#) [周六, 16 9月 02:41]

Do the larvae of the wax moth really solve the world's plastic problem? Sensational report of biochemical degradation of polyethylene by caterpillars not confirmed.

- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.

- [**Why we did not evolve to live forever: Unveiling**](#)

[the mystery of why we age](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

• [Immune system linked to alcohol drinking behavior](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

• [Time to dial back on diabetes treatment in older patients? Study finds 11 percent are overtreated](#)

[周六, 16 9月 02:41]

Almost 11 percent of Medicare participants with diabetes had very low blood sugar levels that suggested they were being over-treated, a new study finds. But only 14 percent of these patients had a reduction in blood sugar medication refills in the next six months.

• [Couples weather bickering with a little help from their friends](#) [周六, 16 9月 02:41]

New research finds that having good friends and family members to turn to alleviates the stress of everyday conflict between marital partners. Social networks may help provide protection against health problems brought about by ordinary tension between spouses.

• [Arctic sea ice once again shows considerable melting](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

• [Star formation influenced by local environmental conditions](#) [周五, 15 9月 22:36]

Three scientists have carried out extensive computer simulations related to star formation. They conclude that the present idealized models are

lacking when it comes to describing details in the star formation process.

- [**Discovery can pave the way for more effective cholesterol medicine**](#) [周五, 15 9月 22:35]

Research sheds new light on how the body converts the bad kind of cholesterol. The discovery could lead to new and potentially more effective medicine.

- [**Celebrity fossil reveals all for science**](#) [周五, 15 9月 22:35]

With the help of an artist, a geology professor has figuratively speaking breathed life into one of science's most well-known fossil species; *Agnostus pisiformis*. The trilobite-like arthropod lived in huge numbers in Scandinavia a half-billion years ago. Today, this extinct species provides important clues for science in several ways.

- [**Humans no longer have ancient defense mechanism against viruses**](#) [周五, 15 9月 21:53]

Insects and plants have an important ancient defense mechanism that helps them to fight viruses. This is encoded in their DNA. Scientists have long assumed that vertebrates -- including humans -- also had this same mechanism. But researchers have found that vertebrates lost this particular asset in the course of their evolution.

- [**Golf carts causing serious injuries to children**](#) [周五, 15 9月 21:52]

As golf carts become increasingly popular in communities beyond the fairway, new research shows, a significant number of children are being seriously injured while using them.

- [**Riding a slide while on a parent's lap increases the risk of injury**](#) [周五, 15 9月 21:52]

Going down a slide on a parent's lap can lead to a broken leg for small children. An estimated 352,698 children less than 6 years of age were injured on slides in the United States from 2002 through 2015, and many of those injuries were leg fractures.

- [**People with schizophrenia left out of longevity**](#)

[**revolution**](#) [周五, 15 9月 21:52]

A team of researchers has analyzed all eight published longitudinal studies of mortality in schizophrenia that met their strict research criteria and found that the mean standardized mortality ratio -- a measure of the mortality rate in schizophrenia -- has increased 37 percent from pre-1970s studies to post-1970s studies.

• [**Carbohydrates may be the key to a better malaria vaccine**](#) [周五, 15 9月 21:52]

An international research team has shown for the first time that carbohydrates on the surface of malaria parasites play a critical role in malaria's ability to infect mosquito and human hosts. The discovery also suggests steps that may improve the only malaria vaccine approved to protect people against Plasmodium falciparum malaria -- the most deadly form of the disease.

• [**Life-saving post-ER suicide prevention strategies are cost effective**](#) [周五, 15 9月 21:52]

Three interventions designed for follow up of patients who are identified with suicide risk in hospital emergency departments save lives and are cost effective relative to usual care. A study has modeled the use of the approaches in emergency departments and found that all three interventions compare favorably with a standard benchmark of cost-effectiveness used in evaluating healthcare costs.

• [**Skin patch dissolves 'love handles' in mice**](#) [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

• [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

- [**New climate risk classification created to account for potential 'existential' threats**](#) [周五, 15 9月 09:06]

A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.

- [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

- [**Biomarkers in the blood prove strong role of food for type 2 diabetes**](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

- [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock

and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**Engineered therapy for blood clotting disorder shows early promise**](#) [周五, 15 9月 03:24]

An investigational treatment that mimics a key clotting enzyme is effective, safe, and may one day eliminate the need for blood products for people with the rare, life-threatening blood disease hereditary thrombotic thrombocytopenic purpura (TTP), according to a study.

- [**Rare genetic cause of peritoneal mesothelioma points to targeted therapy**](#) [周五, 15 9月 03:23]

Investigators have uncovered a new genetic cause of mesothelioma: a genetic rearrangement in the ALK gene, observed in three patients with peritoneal mesothelioma. Unlike previously known causes, this new discovery points to a potential therapeutic approach for those few patients whose tumors harbor the mutation.

- [**One vaccine injection could carry many doses**](#) [周五, 15 9月 03:23]

A new 3-D fabrication method has been developed that can create a new type of drug-carrying particle that could allow several doses of a drug or vaccine to be delivered over an extended time period with just one injection.

- [**Huge genetic diversity among Papuan New Guinean peoples revealed**](#) [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have

remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

- [**Synaptic receptor mobility: Discovery of a new mechanism for controlling memory**](#) [周五, 15 9月 03:23]

A new mechanism has been discovered for storing information in synapses and a means of controlling the storage process. The breakthrough moves science closer to unveiling the mystery of the molecular mechanisms of memory and learning processes.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

Tough stuff: Spider silk enhanced with graphene-based materials -- ScienceDaily

Natural spider silk has excellent mechanical properties. Researchers from the Graphene Flagship have found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

Researchers from the Graphene Flagship have demonstrated that graphene-based materials can be used to boost the properties of spider's silk. The silk -- produced naturally by the spiders, incorporating graphene and carbon nanotubes (rolled up graphene sheets) introduced in their environment -- had enhanced mechanical properties of up to three times the strength and ten times the toughness of the unmodified silks. The work is published in *2D Materials* and was a collaboration between the University of Trento, Italy and the Cambridge Graphene Centre at the University of Cambridge, UK, within the Graphene Flagship's Polymer Composites

Work Package.

Artificially modified biological materials are an expanding area of research. Natural materials can have properties that cannot be achieved with lab-produced materials, and taking inspiration from nature is an effective research tool

To enhance the spider's silk, the researchers prepared solutions of graphene and carbon nanotubes (CNTs) which were sprayed within the enclosure the spiders were kept in. After allowing the spiders to ingest the graphene and CNT dispersions from their environment, silk was collected from the spiders and tested for graphene/CNT content and mechanical properties.

The silks showed enhanced mechanical properties compared to reference silks collected from the same spiders, with significant increases in the strength, toughness and elasticity of the biocomposite silk threads. The strongest silk threads had a fracture strength of up to 5.4 GPa, over 3 times as strong as the unmodified silks, as well as a tenfold increase of toughness modulus up to 2.1 GPa.

This study opens up new potentials for tailoring the

properties of biological materials to enhance their properties for use in novel applications. For example, these artificially modified silks could find use in high-performance or biodegradable textiles such as parachutes or medical dressings.

"Humans have used silkworm silks widely for thousands of years, but recently research has focussed on spider silk, as it has promising mechanical properties. It is among the best spun polymer fibres in terms of tensile strength, ultimate strain, and especially toughness, even when compared to synthetic fibres such as Kevlar," said Nicola Pugno, of the University of Trento.

"We already know that there are biominerals present in the protein matrices and hard tissues of insects, which gives them high strength and hardness in their jaws, mandibles and teeth, for example. So our study looked at whether spider silk's properties could be 'enhanced' by artificially incorporating various different nanomaterials into the silk's biological protein structures," said Pugno.

"This is the highest fibre toughness reported to date, and a strength comparable to that of the strongest

carbon fibres or limpet teeth," said Pugno. "These are still early days, but our results are a proof of concept that paves the way to exploiting the naturally efficient spider spinning process to produce reinforced bionic silk fibres, thus further improving one of the most promising strong materials."

Andrea Ferrari, director of the Cambridge Graphene Centre, Science and Technology Officer of the Graphene Flagship, and Chair of the Flagship's management panel, added "The interaction between graphene and related materials and bio-materials is key to broaden their possible applications. This is one of many examples showing potential in this area. This work can help us to design novel composites with enhanced properties, taking inspiration from nature"

Magnetic fields to alleviate anxiety -- ScienceDaily

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically. This has been shown by researchers from the Würzburg University Hospital in a new study.

Nearly one in seven Germans suffer from an anxiety disorder. Some panic upon boarding an aircraft, others find it impossible to enter a room with a spider on the wall and again others prefer the staircase over the elevator -- even to get to the tenth floor -- because riding in elevators elevates their heart rate.

What sounds like funny anecdotes is often debilitating for the sufferers. Sometimes their anxiety can affect them to a point that they are unable to follow a normal daily routine. But help is available: "Cognitive behavioural therapy is an excellent treatment option," says Professor Martin J. Herrmann, a psychologist at the Center of Mental Health of the Würzburg University Hospital. This form of therapy deliberately

exposes anxiety patients to the situations they feel threatened by -- under the individual psychological supervision of an expert.

Brain stimulation improves response

However, current studies have shown that this type of intervention does not benefit all persons in equal measure. This is why Herrmann and researchers from the Department of Clinical Psychology of the University of Würzburg have been looking for ways to improve the patients' response to cognitive behavioural therapy -- by using the so-called transcranial magnetic stimulation. In fact, a positive effect was found on the study participants treated with this method.

"We knew from previous studies that a specific region in the frontal lobe of the human brain is important for unlearning anxiety," Martin J. Herrmann explains the work of the Würzburg scientists. He goes on to say that initial studies have shown that magnetically stimulating this brain region can improve the effectiveness of unlearning anxiety responses in the laboratory. In its recently published study, the team investigated whether this also works for treating a fear of heights.

To this end, 39 participants with a pronounced fear of heights were taken to dizzying heights during two sessions -- however not in real life but using virtual reality. It does not matter that the environment is not real: "The people feel actual fear also in a virtual reality -- although they know that they are not really in a dangerous situation," Herrmann explains.

The scientists stimulated the frontal lobe of some of the anxiety patients for about 20 minutes before entering the virtual world; the other group was only administered a pseudo stimulation. The result: "The findings demonstrate that all participants benefit considerably from the therapy in virtual reality and the positive effects of the intervention are still clearly visible even after three months," Herrmann explains. And what is more: By stimulating the frontal lobe, the therapy response is accelerated.

Next the researchers want to study whether this method is also suitable to treat other forms of anxiety by conducting a further virtual reality therapy study for arachnophobic patients.

The study was performed within the scope of Collaborative Research Center / Transregio 58 "Fear,

Anxiety and Anxiety Disorders."

Delayed weaning reduces behavioural problems in cats -- ScienceDaily

Early weaning increases aggression and stereotypic behaviour in cats, shows a new study from Professor Hannes Lohi's research group. Based on the study conducted at the University of Helsinki, the recommended weaning age of 12 weeks should be raised by at least two weeks. Delaying weaning is an easy and cost-efficient way of improving the quality of life of cats.

The cat is the most popular companion animal, and people are increasingly interested in its wellbeing. One of the topics under international debate is the weaning age, i.e., the age at which kittens are separated from their mother and siblings and brought to a new home. In Finland, the recommended minimum age of weaning is 12 weeks, but in many other countries, such as the United States, weaning of kittens as young as 8 weeks is common.

It has previously been thought that the critical period of socialisation in cats ends by 8 weeks of age, after

which social experiences have little impact on behaviour.

"We found that positive changes in the cat's behaviour can occur after the currently recommended age of weaning, 12 weeks. I'm a cat lover myself, and this study supports my own previous experiences on the importance of the weaning age on the wellbeing of cats. I think raising the recommended age of weaning would be the animal welfare act of the year," says doctoral student Milla Ahola.

While the detrimental effects of early weaning have been studied in some other animal species, no studies on the topic have been conducted on cats, despite suspicions of its connection to feline behavioural problems.

"We found an easy way to improve cat welfare: we propose that the recommended age of weaning be increased by two weeks. The number of cats in the world is immense, and behavioural problems are very common. This could have a significant positive impact on the wellbeing of both cats and their owners on a global scale," says Professor Hannes Lohi.

The study used the results from the health and behaviour survey Professor Lohi's group had previously conducted on nearly 6,000 cats, currently the most extensive cat behaviour database in the world. According to the survey, many behavioural problems are more common than expected. More than 80% of cats were reported as exhibiting mild behavioural problems, while serious behavioural problems were reported for 25% of all cats. Feline behavioural problems can include shyness, stereotypic wool sucking, excessive grooming and aggression.

"The age of weaning has an impact on the cat's later behaviour. Cats weaned under the age of 8 weeks displayed more aggression and stereotypic behaviour. Cats weaned in adulthood had fewer such problems than other cats. Cats weaned at 14 weeks of age had fewer behavioural problems than cats weaned earlier," explains Ahola.

Studies on other animal species have produced similar results. For example, among rodents, monkeys and minks, early separation from the mother leads to a higher prevalence of stereotypic behaviour and aggression. A similar phenomenon has been found in humans.

"These behavioural changes are also linked. We found that increased aggression correlated with increased stereotypic behaviour. The impacts of early weaning seem to manifest specifically as aggression and stereotypic behaviour, which suggests changes in the neurotransmitters of the basal ganglia," states Professor Lohi.

Professor Hannes Lohi's research group works in the University of Helsinki's Faculty of Veterinary Medicine and Faculty of Medicine as well as at the Folkhälsan Research Centre. Professor Lohi's research has received support from Kissaliitto, the Jane and Aatos Erkkö Foundation, and the ERANET-NEURON network under the European Commission.

Ultrafast snapshots of relaxing electrons in solids -- ScienceDaily

A team of scientists at the Max Planck Institute of Quantum Optics, Garching, Germany has been able to capture the dynamics of core-excited electrons in solids in real-time.

Using ultrafast flashes of laser and x-ray radiation, scientists at the Max Planck Institute of Quantum Optics (Garching, Germany) took snapshots of the briefest electron motion inside a solid material to date. The electron motion lasted only 750 billionths of the billionth of a second before it faded, setting a new record of human capability to capture ultrafast processes inside solids!

When x-rays shine onto solid materials or large molecules, an electron is pushed away from its original place near the nucleus of the atom, leaving a hole behind. For a long time, scientists have suspected that the liberated electron and the positively charged hole form a new kind of quasiparticle -- known as 'core-excited electron-hole pair'. But so far, there has not yet been a real proof

of its existence. Scientists have a wide range of tools to track excitons in semiconductors in real-time. Those are generated by ordinary light, and can be employed in various applications in optoelectronics and microelectronics. On the contrary, core-excitons are extremely short-lived, and up to now, no technique was available to track their motion and deduce their properties.

A team of scientists led by Dr. Eleftherios Goulielmakis, head of the research group "Attoselectronics" at the Max Planck Institute of Quantum Optics, have been able to capture the dynamics of core-excitons in solids in real-time. Using flashes of x-ray radiation lasting only few hundreds attoseconds (1 attosecond = 0.0000000000000000001 seconds) followed by optical light flashes of similar duration (a tool developed by the group last year) the scientists obtain an ultrafast camera which allowed them to take snapshots of the short-lived excitons in silicon dioxide for the first time.

"Core-excitons live for a very short time because their interactions with other particles in the solid quickly stops their motion," said Antoine Moulet, leading author in this work. "In quantum mechanics we say that

the exciton loses its coherence," he adds.

A key tool to track the dynamics of core-excitons has been the development of attosecond light flashes in the optical range. The work was published by the Attoselectronics group last year.

"In our experiment we use x-ray flashes to light up core-excitons in solids, whereas the optical attosecond pulses provide the possibility to resolve this motion in real-time," says Julien Bertrand, a former researcher in the group of Goulielmakis, at present assistant professor at Laval University, Canada. "The combination of both allowed us to take snapshots of the motion of core-excitons which lived for approximately 750 attoseconds."

But the study was not limited to capturing these fleeting motions inside solids. "We were able to acquire quantitative information about the properties of core-excitons such as their miniature dimension which were merely bigger than that of a single atom, or how easily they are polarized by visible light," says Goulielmakis. "Our technique advances excitonics, i.e. the measurement, the control and the application of excitons in the x-ray regime. But at the same time, it is

a general tool for studying ultrafast x-ray initiated processes in solids on their natural time scales. Such a capability has never before been possible in x-ray science."

The team now envisages applications of their technique for studying ultrafast processes at interfaces of solids, and new routes to realize ultrafast switches for x-ray radiation based on optical light fields. "With x-ray free electron lasers rapidly proliferating around the world, the capability of controlling x-rays with visible light becomes increasingly important," says Goulielmakis.

Black Sea water temperatures may buck global trend -- ScienceDaily

Using a model developed at the JRC, scientists have successfully simulated the Black Sea's long term currents, salt water content and temperature for the first time.

Average surface temperatures of the Black Sea may not have risen, according to the surprising results of a new study from the JRC.

The study used a model to simulate possible temperature changes and predict long term trends in the Black Sea's hydrodynamics.

While the surface showed no long term warming trend, the same simulations also indicated that average temperatures at 50 metres below the surface may be rising.

The Black Sea has unique natural conditions like a positive net freshwater balance and very specific local currents. Observational data on temperature change is

varied and scarce. As such it is not clear what the impacts of climate change have been on Black Sea water temperatures.

The Sea has undergone significant ecological degradation since the 1970s, due largely to pollution, overfishing and natural climatic variations. Mapping trends in its ecosystem and simulating future scenarios is vital to understand how the Sea's properties may develop in the future as a result of climate change and policy decisions.

Main findings

The simulations in this study, covering five decades, show no significant long-term trend in the Black Sea's average surface water temperature. This lack of a trend is an entirely new result based on a long term simulation that had not previously been successfully conducted.

The simulation was run for the full period from 1960 -- 2015 and the results were checked against known data, both from satellite information available over the last twenty years and less complete data from earlier decades.

Prior to the completion of this study, scientists had relied on sparse surface temperature data from ship cruises to understand the Sea's properties in the earlier decades.

However, the few data points that do exist for this period have not been enough to prove a decisive trend. In fact, in the decade between 1966 and 1975 there is practically no observational data available at all.

The results of the simulation, while filling in the gaps, also came as a surprise to scientists who were expecting to see at least some warming trend between 1960 and 2015. The results also come in direct contrast to previous simulations of the nearby Mediterranean Sea, which is getting warmer.

Scientists were also surprised to find a significant decreasing trend in surface salt content of 0.02 % per year, again in direct contrast to the increasing surface salinity found in the Mediterranean. The simulations found no individual correlation between salinity and wind speed/direction, or indeed with an increase in fresh water input from the many rivers running into the Black Sea.

This suggests that combinations of weather conditions are responsible for the trend.

Furthermore, the study identifies three distinct periods in which there was a significant shift in the salt water and temperature properties of the Black Sea -- 1960-1970, 1970-1995 and 1995-2015. This may be related to changes in the Sea's currents, as the periods were also characterised by significant changes from a weak and disintegrated current circulation in the first period, to a strong main 'Rim Current' circulation in the second and third periods.

Over the full simulation period, the strengthening of this circulation can be seen, accompanied by intensified formation of small, localised eddies running against the current.

The bigger picture

The Earth is getting warmer, but this isn't happening uniformly across the planet and some regions are heating faster than others. So whilst the Black Sea might not be strongly affected, this is likely compensated by other regions which are warming at a faster rate than the globe as a whole.

For example, the sea-surface waters near Texas when Hurricane Harvey roared toward Houston were among the Earth's warmest.

While it might sound like good news that there has been no long-term increase in the surface water temperatures of the Black Sea, this does not mean that it is unaffected by global warming. These effects may be hidden or mitigated by the fact that air temperature in the region is warming.

Indeed, the study also looked at average temperature trends at specific depths and found a positive trend at 50 metres below the surface, which suggests a warming of the deeper waters prior to the surface layer.

Background

Several unique natural conditions of the Black Sea are well known: the so-called 'Rim Current' of strong water circulation around the perimeter of the Sea; the Cold Intermediate Layer (CIL) of waters below surface level; and the high level of anoxic water, which makes up over 90% of the basin's deep water volume.

However, current knowledge about the spatial and

temporal dynamics of the Black Sea's salt content and temperature characteristics is far more limited, due to a lack of data and sparse distribution of existing measurements.

With this knowledge gap in mind, researchers at the JRC sought to develop a model able to reproduce the Black Sea's temperature and salt-water content over the long term.

During the study, carried out as part of the EU's Scenario simulations of the changing Black Sea ecosystem (SIMSEA) project, continuous simulations covering the period 1960-2015 were performed.

The researchers used a high-resolution General Estuarine Transport Model (GETM) with specific equations designed to accurately reproduce the main physical features of the Black Sea without relying on scarce observational and climatological data.

The study is the first successful Black Sea model based on GETM and has been published in the Journal of Geophysical Research. The successful validation and long-term application of the model used will be incorporated into future forecasts and simulations.

All Top News

Top science stories featured on ScienceDaily's home page.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

- [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

• [**Skin patch dissolves 'love handles' in mice**](#) [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

• [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

• [**Biomarkers in the blood prove strong role of food for type 2 diabetes**](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

• [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

• [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

• [**Huge genetic diversity among Papuan New Guinean peoples revealed**](#) [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Hubble observes pitch black planet**](#) [周五, 15 9月 03:22]

Astronomers have discovered that the well-studied exoplanet WASP-12b reflects almost no light, making it appear essentially pitch black. This discovery sheds new light on the atmospheric composition of the planet and also refutes previous hypotheses about WASP-12b's

atmosphere. The results are also in stark contrast to observations of another similarly sized exoplanet.

- [**New supernova analysis reframes dark energy debate**](#) [周四, 14 9月 07:31]

The accelerating expansion of the Universe may not be real, but could just be an apparent effect, according to new research. The new study finds the fit of Type Ia supernovae to a model universe with no dark energy to be very slightly better than the fit to the standard dark energy model.

- [**Evolution of 'true frogs' defies long-held expectations of science**](#) [周四, 14 9月 07:31]

New research shows, in contrast to expectations, 'the rapid global range expansion of true frogs was not associated with increased net-diversification.'

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**In-utero treatment reverses cleft palate in mice**](#) [周四, 14 9月 07:30]

Researchers clarified a molecular pathway responsible for the formation of cleft palate and identified a new treatment to reverse this defect in mouse pups in utero.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**First global map of water in moon's soil**](#) [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as resource in future lunar exploration.

- [**New gravity map suggests Mars has a porous crust**](#) [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**Climate change challenges the survival of fish across the world**](#) [周四, 14 9月 07:29]

Researchers have published the first analysis looking at how vulnerable the world's freshwater and marine fishes are to climate change. Their study used physiological data to predict how nearly 3,000 fish species living in oceans and rivers will respond to warming water temperatures in different regions.

- [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Coffee and bees: New model of climate change effects**](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- [**Your stools reveal whether you can lose weight**](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

- [**Nanoparticles from tattoos travel inside the body, scientists find**](#) [周二, 12 9月 21:31]

The elements that make up the ink in tattoos travel inside the body in micro and nanoparticle forms and reach the lymph nodes according to a new study. It is the first time that there is analytical evidence of the transport of various organic, inorganic pigments and toxic element impurities as well as in depth characterization of the pigments ex vivo in tattooed tissues.

- [**Octopuses aren't loners, new evidence suggests**](#) [周二, 12 9月 05:04]

Octopuses are usually solitary creatures, but a new site in the waters off the east coast of Australia is the home of up to 15 gloomy octopuses (*Octopus tetricus*) that have been observed communicating -- either directly as in den evictions or indirectly through posturing, chasing or color changes, according to new research findings.

- [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

- [**Urban climate change**](#) [周二, 12 9月 03:09]

Southern cities such as Houston and Tampa -- which faced the wrath of hurricanes Harvey and Irma, respectively -- may not be the only urban environments vulnerable to extreme weather. Northern cities also face the potential for flooding as global temperatures continue to warm.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect worldwide climate**](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

- [**Brain Composer: 'Thinking' melodies onto a musical score**](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be

composed by the power of thought has now been developed by scientists.

- [**Cold region 'tipping point' now inevitable**](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

- [**The evolutionary origin of the gut**](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

- [**USA threatened by more frequent flooding**](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

- [**Half-a-billion-year-old fossils shed light animal evolution on Earth**](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved on Earth.

- [**Biodiversity just as powerful as climate change for healthy ecosystems**](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental

predictions, in some cases topping even effects of climate.

• [**Looking stressed can help keep the peace**](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [**Explosive birth of stars swells galactic cores**](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.
- [**The body's own fat-metabolism protects against the harmful effects of sugar**](#) [周六, 16 9月 02:41]

Researchers have discovered that the fat-metabolism in the cells takes place simultaneously with a detoxification of the harmful substances from the blood sugar, which can avert the damage that can in turn lead to age-related diseases such as diabetes, Alzheimer's and cancer. This indicates that we have a detoxification system which we were not previously aware of.
- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.
- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Immune system linked to alcohol drinking behavior**](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- [**Time to dial back on diabetes treatment in older patients? Study finds 11 percent are overtreated**](#) [周六, 16 9月 02:41]

Almost 11 percent of Medicare participants with diabetes had very low blood sugar levels that suggested they were being over-treated, a new study finds. But only 14 percent of these patients had a reduction in blood sugar medication refills in the next six months.

- [**Couples weather bickering with a little help from their friends**](#) [周六, 16 9月 02:41]

New research finds that having good friends and family members to turn to alleviates the stress of everyday conflict between marital partners. Social networks may help provide protection against health problems brought about by ordinary tension between spouses.

- [**Discovery can pave the way for more effective cholesterol medicine**](#) [周五, 15 9月 22:35]

Research sheds new light on how the body converts the bad kind of cholesterol. The discovery could lead to new and potentially more effective medicine.

- [**Golf carts causing serious injuries to children**](#) [周五, 15 9月 21:52]

As golf carts become increasingly popular in communities beyond the fairway, new research shows, a significant number of children are being seriously injured while using them.

- [**Riding a slide while on a parent's lap increases the risk of injury**](#) [周五, 15 9月 21:52]

Going down a slide on a parent's lap can lead to a broken leg for small children. An estimated 352,698 children less than 6 years of age were injured on slides in the United States from 2002 through 2015, and many

of those injuries were leg fractures.

- **[People with schizophrenia left out of longevity revolution](#)** [周五, 15 9月 21:52]

A team of researchers has analyzed all eight published longitudinal studies of mortality in schizophrenia that met their strict research criteria and found that the mean standardized mortality ratio -- a measure of the mortality rate in schizophrenia -- has increased 37 percent from pre-1970s studies to post-1970s studies.

- **[Carbohydrates may be the key to a better malaria vaccine](#)** [周五, 15 9月 21:52]

An international research team has shown for the first time that carbohydrates on the surface of malaria parasites play a critical role in malaria's ability to infect mosquito and human hosts. The discovery also suggests steps that may improve the only malaria vaccine approved to protect people against Plasmodium falciparum malaria -- the most deadly form of the disease.

- **[Life-saving post-ER suicide prevention strategies are cost effective](#)** [周五, 15 9月 21:52]

Three interventions designed for follow up of patients who are identified with suicide risk in hospital emergency departments save lives and are cost effective relative to usual care. A study has modeled the use of the approaches in emergency departments and found that all three interventions compare favorably with a standard benchmark of cost-effectiveness used in evaluating healthcare costs.

- **[Skin patch dissolves 'love handles' in mice](#)** [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

- **[A subtler sexism now frames TV coverage of](#)**

women in sports [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

• **Biomarkers in the blood prove strong role of food for type 2 diabetes** [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

• **Sorting molecules with DNA robots** [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

• **Engineered therapy for blood clotting disorder shows early promise** [周五, 15 9月 03:24]

An investigational treatment that mimics a key clotting enzyme is effective, safe, and may one day eliminate the need for blood products for people with the rare, life-threatening blood disease hereditary thrombotic thrombocytopenic purpura (TTP), according to a study.

• **Rare genetic cause of peritoneal mesothelioma points to targeted therapy** [周五, 15 9月 03:23]

Investigators have uncovered a new genetic cause of mesothelioma: a genetic rearrangement in the ALK gene, observed in three patients with peritoneal mesothelioma. Unlike previously known causes, this new discovery points to a potential therapeutic approach for those few patients whose tumors harbor the mutation.

• **One vaccine injection could carry many doses** [周五, 15 9月 03:23]

A new 3-D fabrication method has been developed that can create a new type of drug-carrying particle that could allow several doses of a drug or vaccine to be delivered over an extended time period with just one

injection.

- [**Huge genetic diversity among Papuan New Guinean peoples revealed**](#) [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

- [**Insulin therapy initially declined and delayed by an average of two years**](#) [周五, 15 9月 03:23]

Thirty percent of type 2 diabetic patients don't begin insulin when it's initially recommended, with the average start time being two years later.

- [**Synaptic receptor mobility: Discovery of a new mechanism for controlling memory**](#) [周五, 15 9月 03:23]

A new mechanism has been discovered for storing information in synapses and a means of controlling the storage process. The breakthrough moves science closer to unveiling the mystery of the molecular mechanisms of memory and learning processes.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Premature infants may get metabolic boost from mom's breast milk**](#) [周四, 14 9月 20:40]

The breast milk of mothers with premature babies has different amounts of microRNA than that of mothers with babies born at term, which may help premature babies catch up in growth and development, according to researchers.

- [**Chronic pain common in people living with HIV**](#) [周四, 14 9月 20:40]

All people living with HIV should be screened for chronic pain, which affects 39 to 85 percent of people with the condition, recommend new HIVMA guidelines. Those who have chronic pain should be treated using a multidisciplinary approach focused on non-drug options ranging from yoga to physical therapy, note the guidelines. Opioids should never be a first-line treatment.

- [**Mechanism behind calorie restriction, lengthened lifespan revealed**](#) [周四, 14 9月 20:40]

Almost a century ago, scientists discovered that cutting calorie intake could dramatically extend lifespan in certain animal species. Despite numerous studies since, however, researchers have been unable to explain precisely why. Now, investigators have broken past that barrier.

- [**Social media helps students learn scientific argumentation better**](#) [周四, 14 9月 07:31]

Students who took part in a program that taught scientific argumentation learned the concepts better than their peers who did not, a study concludes.

- [**In-utero treatment reverses cleft palate in mice**](#) [周四, 14 9月 07:30]

Researchers clarified a molecular pathway responsible for the formation of cleft palate and identified a new treatment to reverse this defect in mouse pups in utero.

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**Popular bottle-breaking trick is giving insight to brain injuries**](#) [周三, 13 9月 22:45]

As many YouTube videos show, striking the top of a liquid-filled bottle can shatter the bottom. Researchers are hoping to use new knowledge of that party trick to help fill a gap in something much more serious: brain

research.

- [**New hope for 'bubble baby disease'**](#) [周三, 13 9月 22:45]

If untreated, severe combined immune deficiency (SCID) syndrome -- or 'bubble baby disease' -- is often fatal within the first year of a infant's life. A checklist of SCID markers could make diagnosis faster, allowing more babies to receive treatment within a critical timeframe, say researchers.

- [**Multifunctional nano-sized drug carriers based on reactive polypept\(o\)ides**](#) [周三, 13 9月 22:44]

Researchers have been able to demonstrate that reactive polypept(o)ides constitute ideal building blocks to control morphology and function of carrier systems in a simple but precise manner.

- [**Teens' ability to consider the intentions of others linked to structural changes in the brain**](#) [周三, 13 9月 20:44]

When it comes to the concept of fairness, teenagers' ability to consider the intentions of others appears to be linked to structural changes underway in the brain, according to a study. The study is the first to provide evidence linking structural changes with behavioral changes within this context. Understanding the intentions of others is fundamental to human cooperation and how we exist as social beings.

- [**Paper-based tuberculosis test could boost diagnoses in developing countries**](#) [周三, 13 9月 20:44]

Diagnosing tuberculosis early can allow patients to receive the medicine they need and also help prevent the disease from spreading. But in resource-limited areas, equipment requirements and long wait times for results are obstacles to diagnosis and treatment. To tackle this problem, scientists report the development of a fast, paper-based tuberculosis test that can be read with a smartphone.

- [**Systems analysis points to links between Toxoplasma infection and common brain diseases**](#) [周三, 13 9月 20:44]

Nearly one out of every three humans on earth has a lifelong infection with the brain-dwelling parasite *Toxoplasma gondii*. In a new report, researchers from multiple institutions describe efforts to learn how infection with the parasite *Toxoplasma gondii* may alter, and in some cases amplify, several brain disorders, including epilepsy, Alzheimer's and Parkinson's diseases as well as some cancers.

- [**As 'flesh-eating' Leishmania come closer, a vaccine against them does, too**](#) [周三, 13 9月 20:44]

Boils the size of sand dollars, facial damage reminiscent of acid wounds, death by maiming of the liver and spleen. *Leishmania* parasites inflict suffering around the world that is the stuff of parables. They are the second-deadliest parasites after malaria, and global warming is slowly pushing them north toward the United States. Can a new experimental vaccine someday stop them? The vaccine has worked in humanized mice, as detailed in a new study.

- [**New research on probiotics in the prevention and treatment of colon cancer**](#) [周三, 13 9月 20:44]

In an innovative approach to colorectal cancer (CRC) prevention and treatment, scientists are studying ways to replace missing metabolites in patients prone to gut inflammation and CRC. A new study describes how administration of histamine-producing gut microbes to mice lacking the enzyme histidine decarboxylase (HDC) reduced inflammation and tumor formation. These results suggest that alteration of the gut microbiome with probiotics may become a new preventative or therapeutic strategy for patie...

- [**A hair-trigger for cells fighting infection**](#) [周三, 13 9月 20:44]

In response to infection the immune system produces unique antibodies to target each illness. To make these new antibodies, cells in the immune system must intentionally damage their own genes, meaning they run the risk of becoming cancer cells. New research reveals how a proteins called Tia1 acts as a hair-trigger for DNA repair, allowing the immune system to walk the line between health and harm.

- [**Science spin prevalent, researchers warn**](#) [周三, 13 9月 05:05]

More than a quarter of biomedical scientific papers may utilize practices that distort the interpretation of results or mislead readers so that results are viewed more favorably, a new study suggests.

- [**Cold comfort: Fat-rich diets and adaptation among indigenous Siberian populations**](#) [周三, 13 9月 05:05]

Recently, scientists have been exploring the genetic signatures of adaptation in several indigenous cold-adapted human populations. Now, a new study has identified new signals of adaptation across multiple genes and exploring a rich demographic history. By performing extensive analyses on DNA sequencing data for two North-Central Siberian populations, the Nganasan (nomadic hunters) and Yakut (herders), they have been able to infer the most comprehensive demographic and adaptive history.

- [**Health benefits of olives and olive oil**](#) [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [**Lay interventions for depression and drinking**](#) [周三, 13 9月 03:48]

Brief psychological interventions delivered by lay counselors in primary care were effective and cost-effective for patients with depression and harmful drinking in India, according to two new studies.

- [**Predicting atypical development in infants at high risk for autism?**](#) [周三, 13 9月 03:48]

New research identifies a potential biomarker that predicts atypical development in 1- to 2-month-old infants at high versus low familial risk for developing autism spectrum disorders (ASD).

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- [**'Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests**](#) [周三, 13 9月]

01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

• [In mice, calorie restriction reduces fat but increases fur](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

• ['Missing link' explains how viruses trigger immunity](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

• [Reversing the negative effects of adolescent marijuana use](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

• [AI -- Engineering: merging, morphing, mobile](#)

robots [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

- [**Star formation influenced by local environmental conditions**](#) [周五, 15 9月 22:36]

Three scientists have carried out extensive computer simulations related to star formation. They conclude that the present idealized models are lacking when it comes to describing details in the star formation process.

- [**Golf carts causing serious injuries to children**](#) [周五, 15 9月 21:52]

As golf carts become increasingly popular in communities beyond the fairway, new research shows, a significant number of children are being seriously injured while using them.

- [**Skin patch dissolves 'love handles' in mice**](#) [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while

raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

- [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Hubble observes pitch black planet**](#) [周五, 15 9月 03:22]

Astronomers have discovered that the well-studied exoplanet WASP-12b reflects almost no light, making it appear essentially pitch black.

This discovery sheds new light on the atmospheric composition of the planet and also refutes previous hypotheses about WASP-12b's atmosphere. The results are also in stark contrast to observations of another similarly sized exoplanet.

• [**Hydrogen power moves a step closer**](#) [周五, 15 9月 03:22]

Physicists are developing methods of creating renewable fuel from water using quantum technology. Renewable hydrogen can already be produced by photoelectrolysis where solar power is used to split water molecules into oxygen and hydrogen. But fundamental problems remain before this can be adopted commercially due to inefficiency. A new study demonstrates that the novel use of nanostructures could increase the maximum photovoltage generated in a photoelectrochemical cell, increasing the productivi...

• [**Social media helps students learn scientific argumentation better**](#) [周四, 14 9月 07:31]

Students who took part in a program that taught scientific argumentation learned the concepts better than their peers who did not, a study concludes.

• [**New supernova analysis reframes dark energy debate**](#) [周四, 14 9月 07:31]

The accelerating expansion of the Universe may not be real, but could just be an apparent effect, according to new research. The new study finds the fit of Type Ia supernovae to a model universe with no dark energy to be very slightly better than the fit to the standard dark energy model.

• [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- **['Peel-and-go' printable structures fold themselves](#)** [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- **[First global map of water in moon's soil](#)** [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as resource in future lunar exploration.

- **[New gravity map suggests Mars has a porous crust](#)** [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

- **['The dark side' of quantum computers](#)** [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

- **[Self-folding electronics could enable advanced robotics](#)** [周三, 13 9月 22:45]

As demand grows for more versatile, advanced robotics and other technologies, the need for components that can enable these applications also increases. Producing such components en masse has been a major challenge. But now, researchers report that they have developed a way to help meet this need by printing electronics that can fold themselves into a desired shape.

- **[The beam of invisibility](#)** [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result

opens up completely new possibilities for active camouflage.

- [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

- [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'**](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

- [**New way to stabilize next-generation fusion plasmas**](#) [周三, 13 9月 01:48]

Recent experiments conducted on the DIII-D National Fusion Facility suggest that up to 40 percent of high-energy particles are lost during tokamak fusion reactions because of Alfvén waves.

- [**Magnetic cellular 'Legos' for the regenerative medicine of the future**](#) [周三, 13 9月 01:48]

By incorporating magnetic nanoparticles in cells and developing a system using miniaturized magnets, researchers have succeeded in creating cellular magnetic 'Legos.' They were able to aggregate cells using only magnets and without an external supporting matrix, with the cells then forming a tissue that can be deformed at will.

- [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

- [**Graphene based terahertz absorbers**](#) [周二, 12 9月 22:27]

A terahertz saturable absorber has been created using printable graphene inks with an order of magnitude higher absorption modulation than other devices produced to date.

- [**Study sets new distance record for medical drone transport**](#) [周二, 12 9月 21:31]

Researchers have set a new delivery distance record for medical drones, successfully transporting human blood samples across 161 miles of Arizona desert. Throughout the three-hour flight, they report, the on-board payload system maintained temperature control, ensuring the samples were viable for laboratory analysis after landing.

- [**Astronauts don't develop anemia during spaceflight, NASA study suggests**](#) [周二, 12 9月 21:30]

Space flight anemia -- the reduction of circulating red blood cells during time spent in space -- is an established phenomenon, but it may not be a major concern during long-duration space missions, according to a study.

- [**Apparent macroscopic violation of the second law of thermodynamics in a quantum system is discovered**](#) [周二, 12 9月 03:46]

Researchers have encountered a partial violation of the second law of thermodynamics in a quantum system known as Hofstadter lattice. This partial violation has no place within the framework of classical physics.

- [**Advanced material developed for ultra-stable, high capacity rechargeable batteries**](#) [周二, 12 9月 03:42]

A novel organic material of superior electrical conductivity and energy retention capability for use in battery applications has been developed by scientists. This invention paves the way for the development of ultra-stable, high capacity and environmental friendly rechargeable batteries.

- [**To improve health monitoring, simply trip the**](#)

['nanoswitch'](#) [周二, 12 9月 03:09]

A team of researchers has adapted their DNA nanoswitch technology -- previously demonstrated to aid drug discovery and the measure of biochemical interactions -- into a new platform that they call the nanoswitch-linked immunosorbent assay (NLISA) for fast, sensitive and specific protein detection.

[Method controls whether freezing droplets bounce off or stick](#) [周二, 12 9月 03:09]

Self-peeling droplets have been discovered, along with a new way to control adhesion of freezing droplets by adjusting the thermal properties of substrates. These findings could make everything from additive manufacturing to deicing more efficient.

[Airline industry could fly thousands of miles on biofuel from a new promising feedstock](#) [周二, 12 9月 00:59]

A Boeing 747 burns one gallon of jet fuel each second. A recent analysis estimates that this aircraft could fly for 10 hours on bio-jet fuel produced on 54 acres of specially engineered sugarcane.

[Sunscreen protects skin without seeping in](#) [周二, 12 9月 00:27]

A non-penetrating sunscreen invented by its researchers has been licensed to a major aloe verde supplier. The sunscreen will appeal to consumers concerned about chemicals exposure.

[Core solutions reach optimally extreme light pulses](#) [周二, 12 9月 00:27]

A new hollow-core photonic crystal fiber system demonstrates high energy, single-cycle IR pulses at an extraordinary repetition rate, suitable for hard X-ray production and real-time investigations of atomic dynamics.

[The turbulent healing powers of plasma](#) [周二, 12 9月 00:27]

Non-equilibrium atmospheric pressure plasma can help heal wounds, destroy cancer cells and kill harmful bacteria. The jets of plasma that doctors might use, however, often become turbulent with the direction

and velocity changing dramatically. Now, researchers have found this turbulence likely emerges from heat-induced sound waves generated at the plasma electrodes. This new insight is critical for more consistent and effective medical therapies.

- [**A novel and practical fab-route for superomniphobic liquid-free surfaces**](#) [周二, 12 9月 00:27]

Scientists have developed a fabrication technology that can inexpensively produce surfaces capable of repelling liquids, including water and oil.

- [**Connecting up the quantum internet**](#) [周二, 12 9月 00:27]

Major leap for practical building blocks of a quantum internet: New research demonstrates how to dramatically improve the storage time of a telecom-compatible quantum memory, a vital component of a global quantum network. The technology operates in the same 1550 nanometer band as today's telecommunications infrastructure. It can also be operated as a quantum light source or used as an optical link for solid-state quantum computing devices such as superconducting qubits and silicon qubits.

- [**Self-assembling nanoparticle arrays can switch between a mirror and a window**](#) [周二, 12 9月 00:27]

By finely tuning the distance between nanoparticles in a single layer, researchers have made a filter that can change between a mirror and a window.

- [**Hints from hemoglobin lead to better carbon monoxide storage**](#) [周二, 12 9月 00:26]

Highly porous metal-organic frameworks have proved ideal for storing many chemicals, from carbon dioxide and hydrogen to water. A new tweak to MOFs has now produced a highly selective material for adsorbing carbon monoxide, which is used in many industrial processes, including as a component of syngas. Using only one-third the energy of a common process for capturing and reusing CO, it holds promise for more efficient recycling of CO in the steel industry.

- **[Brain Composer: 'Thinking' melodies onto a musical score](#)** [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

- **[Astronomers spun up by galaxy-shape finding](#)** [周二, 12 9月 00:26]

For the first time astronomers have measured how a galaxy's spin affects its shape -- something scientists have tried to do for 90 years -- using a sample of 845 galaxies. Because a galaxy's shape is the result of past events such as merging with other galaxies, knowing its shape also tells us about the galaxy's history. The team made its findings with SAMI (the Sydney-AAO Multi-object Integral field unit), a game-changing instrument.

- **[Hollow atoms: The consequences of an underestimated effect](#)** [周二, 12 9月 00:26]

In a 'hollow atom', electrons occupy high-energy states far away from the nucleus, it can get rid of their excess energy on a remarkably short timescale. The reason for this has been unknown. Researchers have now shown that this is due to a previously underestimated effect: the 'interatomic coulomb decay' allows the atom to transfer its energy to several other atoms simultaneously. This also explains why radiation therapy can be so effective.

- **[Patients to benefit from new 3-D visualizations of the heart](#)** [周二, 12 9月 00:26]

In the future heart surgeons will have access to a new type of 3-D visualization of the cardiac conduction system. This technique could provide improved safety for patients and improve surgical outcomes in patients suffering from heart disease and cardiac malformations, explains a new report.

- **[Study clarifies how neural nets 'think' when processing language](#)** [周二, 12 9月 00:26]

A new general-purpose technique has been developed for making sense of neural networks that are trained to perform natural-language-processing tasks, in which computers attempt to interpret freeform texts written in ordinary, or 'natural,' language (as opposed to a structured language, such as a database-query language).

• [First on-chip nanoscale optical quantum memory developed](#) [周二, 12 9月 00:26]

Engineers have built a chip capable of storing and retrieving individual photons of light, with all of their quantum properties left intact. The chip represents the first nanoscale optical quantum memory device, and could one day be used to create more secure Internet communications.

• [Using mirrors to improve the quality of light particles](#) [周一, 11 9月 21:59]

Scientists have succeeded in dramatically improving the quality of individual photons generated by a quantum system. The scientists have successfully put a 10-year-old theoretical prediction into practice. With their paper, they have taken an important step towards future applications in quantum information technology.

• [Explosive birth of stars swells galactic cores](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

• [First imaging of free nanoparticles in laboratory experiment using a high-intensity laser source](#) [周日, 10 9月 06:38]

In a joint research project, scientists have managed for the first time to image free nanoparticles in a laboratory experiment using a high-intensity laser source. Previously, the structural analysis of these extremely small objects via single-shot diffraction was only possible at

large-scale research facilities using so-called XUV and x-ray free electron lasers.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Delayed weaning reduces behavioural problems in cats**](#) [周六, 16 9月 04:52]

Early weaning increases aggression and stereotypic behavior in cats. Based on the study, the recommended weaning age of 12 weeks should be raised by at least two weeks. Delaying weaning is an easy and cost-efficient way of improving the quality of life of cats.

- [**Black Sea water temperatures may buck global trend**](#) [周六, 16 9月 04:29]

Scientists have successfully simulated the Black Sea's long term currents, salt water content and temperature for the first time.

- [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- [**Scientists question study about plastic-eating caterpillars**](#) [周六, 16 9月 02:41]

Do the larvae of the wax moth really solve the world's plastic problem? Sensational report of biochemical degradation of polyethylene by caterpillars not confirmed.

- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Arctic sea ice once again shows considerable melting**](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

- [**Celebrity fossil reveals all for science**](#) [周五, 15 9月 22:35]

With the help of an artist, a geology professor has figuratively speaking breathed life into one of science's most well-known fossil species; *Agnostus pisiformis*. The trilobite-like arthropod lived in huge numbers in Scandinavia a half-billion years ago. Today, this extinct species provides important clues for science in several ways.

- [**Humans no longer have ancient defense mechanism against viruses**](#) [周五, 15 9月 21:53]

Insects and plants have an important ancient defense mechanism that helps them to fight viruses. This is encoded in their DNA. Scientists

have long assumed that vertebrates -- including humans -- also had this same mechanism. But researchers have found that vertebrates lost this particular asset in the course of their evolution.

- [**Carbohydrates may be the key to a better malaria vaccine**](#) [周五, 15 9月 21:52]

An international research team has shown for the first time that carbohydrates on the surface of malaria parasites play a critical role in malaria's ability to infect mosquito and human hosts. The discovery also suggests steps that may improve the only malaria vaccine approved to protect people against Plasmodium falciparum malaria -- the most deadly form of the disease.

- [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

- [**New climate risk classification created to account for potential 'existential' threats**](#) [周五, 15 9月 09:06]

A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.

- [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included,

above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**'Mysterious' ancient creature was definitely an animal, research confirms**](#) [周五, 15 9月 03:22]

It lived well over 550 million years ago, is known only through fossils and has variously been described as looking a bit like a jellyfish, a worm, a fungus and lichen. But was the 'mysterious' Dickinsonia an animal, or was it something else? A new study provides strong proof that Dickinsonia was an animal.

- [**How well electron transport works in furfural biogas**](#) [周四, 14 9月 07:31]

Furfural is a promising candidate in the quest for alternative biofuels.

- [**Evolution of 'true frogs' defies long-held expectations of science**](#) [周四, 14 9月 07:31]

New research shows, in contrast to expectations, 'the rapid global range expansion of true frogs was not associated with increased net-diversification.'

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**Climate change challenges the survival of fish across the world**](#) [周四, 14 9月 07:29]

Researchers have published the first analysis looking at how vulnerable the world's freshwater and marine fishes are to climate change. Their study used physiological data to predict how nearly 3,000 fish species living in oceans and rivers will respond to warming water temperatures in different regions.

- [**Bird songs isolate species, new research suggests**](#) [周三, 13 9月 22:45]

Two birds that look the same, but have songs so different they can't recognize each other, should be considered distinct species, suggests new research. Among 72 related populations of Central and South American birds the researchers tested, they found evidence for 21 new species.

- [**Science spin prevalent, researchers warn**](#) [周三, 13 9月 05:05]

More than a quarter of biomedical scientific papers may utilize practices that distort the interpretation of results or mislead readers so that results are viewed more favorably, a new study suggests.

- [**Health benefits of olives and olive oil**](#) [周三, 13 9月 04:10]

A research team discovered that the olive-derived compound oleuropein helps prevent type 2 diabetes.

- [**How hibernating ribosomes wake up**](#) [周三, 13 9月 01:48]

Scientists have uncovered the way a bacterial ribosome moves from an inactive to an active form, and how that 'wake up call' is key to its survival.

- [**'Superbug' bacteria gang up on us, fueled by antibiotic use, nursing home study suggests**](#) [周三, 13 9月 01:48]

What's worse than getting exposed to a kind of bacteria that modern antibiotics can't kill? Getting exposed to more than one -- because they may work together to cause an infection, new research suggests. And trying different antibiotics to control one such 'superbug' may only encourage others. The researchers say it's time to think about such bacteria as members of an antibiotic-resistant ecosystem in healthcare environments -- not as single species that act and respond alone.

- [**Queens control worker reproduction without castration in stingless bee species**](#) [周三, 13 9月 01:48]

Study contradicts the view that worker bees are forcibly castrated by the queen among the 600-odd species of stingless bees widely distributed in tropical and subtropical regions of the world.

- [**Microscope invented at marine biological laboratory illuminates chromosomal 'dark matter'**](#) [周三, 13 9月 01:48]

Biologists, instrument developers, and computational scientists have for the first time measured the density of a relatively inscrutable, highly condensed form of chromosomal material (heterochromatin) that appears in the cells of human beings and other eukaryotes.

- [**Forest regeneration experiment of 30 years yields results**](#) [周三, 13 9月 01:48]

A spruce forest regeneration experiment in Interior Alaska that spanned nearly 30 years demonstrates which forest management practices produce the best results. It looked at different combinations of ground treatments to reduce competition from other vegetation and of

regeneration methods, such as planting spruce seedlings and broadcast seeding. The results show the environmental and management situations in which different techniques work best and the situations in which they are unnecessary. Re...

- [**In mice, calorie restriction reduces fat but increases fur**](#) [周三, 13 9月 01:48]

Calorie restriction may help mice stay slim and live longer, but it also means less fat to keep their bodies warm. Researchers in Brazil have found that mouse skin responds to caloric restriction by stimulating fur growth, increasing blood flow, and altering cell metabolism to increase energy efficiency. The study reveals that animals may use this as an evolutionary adaptation to stay warm -- and alive -- in limited food conditions.

- [**'Missing link' explains how viruses trigger immunity**](#) [周三, 13 9月 01:48]

A new discovery has solved a longstanding mystery of how viruses trigger protective immunity within our body. The research team demonstrated a protein called SIDT2 was crucial for cells to detect viral components in their environment, and initiate an immune response to reduce the virus' spread.

- [**Reversing the negative effects of adolescent marijuana use**](#) [周三, 13 9月 01:48]

Researchers have identified a specific mechanism in the prefrontal cortex for some of the negative mental health risks associated with adolescent marijuana use. By demonstrating that adolescent THC exposure modulates the activity of a neurotransmitter called GABA in the prefrontal cortex region of the brain, they were also able to identify a mechanism to reverse those risks.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of

Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- **[Earthquake faults may have played key role in shaping the culture of ancient Greece](#)** [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- **[Coffee and bees: New model of climate change effects](#)** [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

- **[Explosion in number of known life forms](#)** [周二, 12 9月 21:31]

New research has helped increase the number of known genomes by almost 10 percent. Scientists have obtained 7,280 bacterial and 623 archaeal genomes (genetic materials from microorganisms) from environmental samples, explains a new article.

- **[Biding time could improve conservation outcomes](#)** [周二, 12 9月 21:31]

Strategic delays in conservation efforts could be the key to protecting more species according to researchers. The new study found instead of spending project funds immediately, conservation organizations could use the right amount of delay to improve the benefits achieved from their funding by focusing first on investment, capacity building, or monitoring and research.

- **['Keep it local' approach more effective than government schemes at protecting rainforest](#)** [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

- [**Researchers discover new, abundant enzyme that helps bacteria infect animals**](#) [周二, 12 9月 21:30]

A new class of enzymes has been discovered in hundreds of bacterial species, including some that cause disease in humans and animals. The discovery provides new insights into how bacteria invade their hosts.

- [**Ancient tree reveals cause of spike in Arctic temperature**](#) [周二, 12 9月 21:30]

A kauri tree trapped in a New Zealand swamp for 30,000 years may have overturned the idea that a slowdown in ocean currents in the North Atlantic may be entirely responsible for Dansgaard-Oeschger events and the characteristic bi-polar see-saw, which sees the Antarctica cool while the Arctic warms during glacial periods. The research reveals a mechanism that generates a 20,000 km long atmospheric bridge, reaching from Antarctica to the Arctic.

- [**Modeling the impact of green eggs and hens**](#) [周二, 12 9月 21:30]

Poultry given vegan organic chicken feed can help to produce eggs with a smaller environmental footprint than those fed non-organic feeds that contain animal by-products, new research shows.

- [**Rapid climate changes across northern hemisphere in the earliest Middle Pleistocene**](#) [周二, 12 9月 21:30]

By studying climate changes that took place thousands of years ago, we can better understand the global climate system and predict Earth's future climate. A multi-organization research team has discovered evidence of rapid climate changes on a millennial-to-centennial scale that occurred 780 to 760 thousand years ago.

- [**Rising CO2 leading to changes in land plant photosynthesis**](#) [周二, 12 9月 05:04]

Researchers have determined that major changes in plant behavior have occurred over the past 40 years, using measurements of subtle changes in the carbon dioxide (CO₂) currently found in the atmosphere.

• [Octopuses aren't loners, new evidence suggests](#) [周二, 12 9月 05:04]

Octopuses are usually solitary creatures, but a new site in the waters off the east coast of Australia is the home of up to 15 gloomy octopuses (*Octopus tetricus*) that have been observed communicating -- either directly as in den evictions or indirectly through posturing, chasing or color changes, according to new research findings.

• [Study of circular DNA comes full circle with use of old technique](#) [周二, 12 9月 04:32]

A 50-year-old lab technique is helping researchers better understand circular DNA, a lesser-known and poorly understood cousin of the linear version commonly associated with life's genetic blueprint. With the aid of a process called density gradient centrifugation, a research team recently published a study that for the first time characterizes all of the circular DNA in the worm *C. elegans*, as well as in three human cell types.

• [What happens to Rex and Kitty after a natural disaster?](#) [周二, 12 9月 03:42]

After a natural disaster, images of destruction pour into our newsfeeds. Most of these focus on the destruction of the landscape, or on the human suffering caused. In any disaster where people suffer and die, pets and livestock will suffer and die, too. This has grave consequences for the animals, of course, but also for their owners. The aftermath of Hurricane Katrina was particularly devastating. The Louisiana SPCA estimates that 15,500 animals required rescue, and that 80–85 percent of these a...

• [Air pollution cuts 3 years off lifespans in Northern China](#) [周二, 12 9月 03:09]

A Chinese policy is unintentionally causing people in northern China to live 3.1 years less than people in the south due to air pollution concentrations that are 46 percent higher. These findings imply that every additional 10 micrograms per cubic meter of particulate matter pollution (PM10) reduces life expectancy by 0.6 years.

• [**'Internal clock' found within live human cells**](#) [周二, 12 9月 03:09]

An internal clock has been discovered within live human cells, a finding that creates new opportunities for understanding the building blocks of life and the onset of disease.

• [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]
It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.
- [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]
Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.
- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]
An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.
- [**New climate risk classification created to account for potential 'existential' threats**](#) [周五, 15 9月 09:06]
A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.
- [**One vaccine injection could carry many doses**](#) [周五,

15 9月 03:23]

A new 3-D fabrication method has been developed that can create a new type of drug-carrying particle that could allow several doses of a drug or vaccine to be delivered over an extended time period with just one injection.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

- [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

- [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

- [**Air pollution cuts 3 years off lifespans in Northern China**](#) [周二, 12 9月 03:09]

A Chinese policy is unintentionally causing people in northern China to live 3.1 years less than people in the south due to air pollution concentrations that are 46 percent higher. These findings imply that every additional 10 micrograms per cubic meter of particulate matter pollution (PM10) reduces life expectancy by 0.6 years.

- [**Urban climate change**](#) [周二, 12 9月 03:09]

Southern cities such as Houston and Tampa -- which faced the wrath of hurricanes Harvey and Irma, respectively -- may not be the only urban environments vulnerable to extreme weather. Northern cities also face

the potential for flooding as global temperatures continue to warm.

[. Earthquake triggers 'slow motion' quakes in New Zealand](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Tough stuff: Spider silk enhanced with graphene-based materials](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [Immune system linked to alcohol drinking behavior](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- [Electric eels leap to deliver painful, Taser-like jolt](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [Sorting molecules with DNA robots](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [The return of the comet-like exoplanet](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet

that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- **['Handedness' in scale-eating fish: Nature and nurture](#)** [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- **[Could interstellar ice provide the answer to birth of DNA?](#)** [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- **[Artificial 'skin' gives robotic hand a sense of touch](#)** [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- **['Peel-and-go' printable structures fold themselves](#)** [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**'The dark side' of quantum computers**](#) [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**The beam of invisibility**](#) [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

- [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

- [**Earthquake faults may have played key role in shaping the culture of ancient Greece**](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

- [**AI -- Engineering: merging, morphing, mobile**](#)

[robots](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

• [Looking stressed can help keep the peace](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

• [Explosive birth of stars swells galactic cores](#) [周一, 11 9月 11:25]

Astronomers found that active star formation upswells galaxies, like yeast helps bread rise. Using three powerful telescopes on the ground and in orbit, they observed galaxies from 11 billion years ago and found explosive formation of stars in the cores of galaxies. This suggests that galaxies can change their own shape without interaction with other galaxies.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Damage to monarch butterfly colonies in 2016 storm worse than thought**](#) [周一, 18 9月 08:14]

A much greater number of monarch butterflies perished in a snowstorm in March 2016 in Mexico than previously estimated, according to new research. Analysis of damage from the storm -- and the ensuing salvage logging -- sheds further light on the precarious state of the famed butterflies' overwintering colonies.

- [**High blood pressure reasons differ by gender in teens; young adults**](#) [周一, 18 9月 03:10]

Gender matters when it comes to what's most likely to elevate blood pressure in young to middle-aged adults. The volume of blood pumped from the left ventricle during heartbeats, i.e., stroke volume, is the main determinant of blood pressure levels in women, while blood pressure in men is more likely to be determined by the amount of resistance in the body's blood vessels.

- [**Blood pressure better controlled with 'MAP' for doctors**](#) [周一, 18 9月 03:09]

Primary care practices using the Measure accurately, Act rapidly and Partner with patients (MAP) program drove down hypertension rates among patients. In six months of MAP, hypertension control rose from

65.6 percent to 74.8 percent, among more than 21,000 hypertension patients at US primary care practices.

- [**Teens also at risk for organ damage from high blood pressure**](#) [周一, 18 9月 03:09]

Organ damage from high blood pressure doesn't only occur in adults; it can also happen in teenagers, according to new research.

- [**Sugary secrets of a cancer-related protein**](#) [周一, 18 9月 00:03]

The proteins in human cells are extensively decorated with different types of sugars, a phenomenon called glycosylation. These modifications greatly increase the diversity of protein structure and function, affecting how proteins fold, how they behave, and where they go in cells. New research demonstrates that a rare type of glycosylation profoundly affects the function of a protein important for human development and cancer progression.

- [**NASA's Cassini spacecraft ends its historic exploration of Saturn**](#) [周六, 16 9月 22:30]

A thrilling epoch in the exploration of our solar system has come to a close, as NASA's Cassini spacecraft made a fateful plunge into the atmosphere of Saturn, ending its 13-year tour of the ringed planet. Cassini's plunge brings to a close a series of 22 dives between Saturn and its rings, a feat never before attempted by any spacecraft.

- [**Sensing with a twist: A new kind of optical nanosensor uses torque for signal processing**](#) [周六, 16 9月 20:01]

As electronic devices get smaller, their ability to provide precise, chip-based sensing of dynamic physical properties such as motion become challenging to develop. An international group of researchers have put a literal twist on this challenge, demonstrating a new nanoscale optomechanical resonator that can detect torsional motion at near state-of-the-art sensitivity. Their resonator, into which they couple light, also demonstrates torsional frequency mixing, a novel ability to impact optical e...

- **[Fertility research brings death of dogma, birth of hope](#)** [周六, 16 9月 20:01]

A new study shows unequivocally that stem cells in the ovaries are a critical piece of the mammal fertility puzzle, and may be harnessed to revolutionize fertility treatments and perhaps even delay menopause.

- **[Hormone replacement therapy can slow decline in lung function for middle-aged women](#)** [周六, 16 9月 05:05]

Hormone replacement therapy (HRT) can slow the decline in lung function in middle-aged women, according to new research.

- **[Converting waste toilet paper into electricity](#)** [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

- **[A drone for last-centimeter delivery](#)** [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

- **[Light on exoplanets may be quite different from Earth: Different photosynthesis?](#)** [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxygenic phototrophs are most likely to have evolved underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

- **[Tracing the light inside a LED](#)** [周六, 16 9月 04:54]

The performance of white LED's can be improved, based on better knowledge of the absorption and scattering of light inside the LED. A new method can lead to efficiency improvement and powerful design tools.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.

- [**Delayed weaning reduces behavioural problems in cats**](#) [周六, 16 9月 04:52]

Early weaning increases aggression and stereotypic behavior in cats. Based on the study, the recommended weaning age of 12 weeks should be raised by at least two weeks. Delaying weaning is an easy and cost-efficient way of improving the quality of life of cats.

- [**Differences in aggression among people with dementia**](#) [周六, 16 9月 04:50]

Physical aggression among people with dementia is not unusual. A study showed that one-third of patients with the diagnosis Alzheimer's disease or frontotemporal dementia were physically aggressive towards healthcare staff, other patients, relatives, animals and complete strangers. This manifestation of disease must be both understood and addressed in the right way.

- [**Teens come 'jet lagged' to school: Shifting sleeping patterns at weekends**](#) [周六, 16 9月 04:48]

A lack of sleep is associated with more absence and teens turn up jet lagged to school on Mondays, as shown in new research.

• [**Innate immunity: To operate, insert dimers**](#) [周六, 16 9月 04:46]

The presence of DNA in mammalian cell cytoplasm triggers an immune response by binding to a dimeric enzyme, which inserts between DNA double helices to form the “rungs” of a ladder-like structure, as an LMU team has now shown.

• [**Secrets of Bonsai: Uncovering the mechanism of root regeneration**](#) [周六, 16 9月 04:38]

The molecular mechanism behind root regeneration after root cutting in plants has been discovered. A finding which could lead to the development of new methods for regulating plant growth in agriculture and horticulture.

• [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

• [**Black Sea water temperatures may buck global trend**](#) [周六, 16 9月 04:29]

Scientists have successfully simulated the Black Sea’s long term currents, salt water content and temperature for the first time.

• [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

• [**Memory decline after head injury may be prevented by slowing brain cell growth**](#) [周六, 16 9月 02:42]

Scientists say a new study indicates that the excessive burst of new brain cells after a traumatic head injury that researchers have traditionally

believed helped in recovery could instead lead to epileptic seizures and long-term cognitive decline.

- [**The body's own fat-metabolism protects against the harmful effects of sugar**](#) [周六, 16 9月 02:41]

Researchers have discovered that the fat-metabolism in the cells takes place simultaneously with a detoxification of the harmful substances from the blood sugar, which can avert the damage that can in turn lead to age-related diseases such as diabetes, Alzheimer's and cancer. This indicates that we have a detoxification system which we were not previously aware of.

- [**Scientists question study about plastic-eating caterpillars**](#) [周六, 16 9月 02:41]

Do the larvae of the wax moth really solve the world's plastic problem? Sensational report of biochemical degradation of polyethylene by caterpillars not confirmed.

- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Immune system linked to alcohol drinking behavior**](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- [**Time to dial back on diabetes treatment in older patients? Study finds 11 percent are overtreated**](#)

[周六, 16 9月 02:41]

Almost 11 percent of Medicare participants with diabetes had very low blood sugar levels that suggested they were being over-treated, a new study finds. But only 14 percent of these patients had a reduction in blood sugar medication refills in the next six months.

- [**Quality initiatives can reduce harm to newborns, shorten hospital stay and save millions**](#)

[周六, 16 9月 02:41]

A quality-improvement initiative at a neonatal intensive care unit finds that chest X-rays can be performed just twice weekly, lessening the chances of a breathing tube popping out accidentally, reducing infants' exposure to radiation and saving an estimated \$1.6 million per year.

- [**Couples weather bickering with a little help from their friends**](#)

[周六, 16 9月 02:41]

New research finds that having good friends and family members to turn to alleviates the stress of everyday conflict between marital partners. Social networks may help provide protection against health problems brought about by ordinary tension between spouses.

- [**Decreased glucose metabolism in medial prefrontal areas is associated with nutritional status in patients with prodromal and early Alzheimer's disease**](#)

[周六, 16 9月 02:41]

A new study shows that hypometabolism in the medial prefrontal areas is specifically associated with Alzheimer's disease-related nutritional problems, and decrease in fat mass may have a key role.

- [**Medical students not trained to prescribe medical marijuana**](#)

[周六, 16 9月 02:41]

More than half of the states in the US now allow some type of legal marijuana use, primarily medical marijuana. But, in a survey of medical residents and deans at the nation's medical schools, researchers have

found that the majority of schools are not teaching their students about medical marijuana, and the majority of students don't feel prepared to discuss the subject with patients.

- [**New organelled discovered in parasitic wasp venom**](#) [周六, 16 9月 02:41]

Biologists have identified the composition of 'virus-like particles' (VLPs) found in the venom of a wasp that is a parasite of fruit flies. Invisible to the eye, wasp VLPs suppress the flies' immune responses by killing their blood cells.

- [**Brain halves increase communication to compensate for aging, study finds**](#) [周六, 16 9月 02:41]

Increased communication between distant brain regions helps older adults compensate for the negative aspects of aging, reports a new study.

- [**Arctic sea ice once again shows considerable melting**](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

- [**Star formation influenced by local environmental conditions**](#) [周五, 15 9月 22:36]

Three scientists have carried out extensive computer simulations related to star formation. They conclude that the present idealized models are lacking when it comes to describing details in the star formation process.

- [**Discovery can pave the way for more effective cholesterol medicine**](#) [周五, 15 9月 22:35]

Research sheds new light on how the body converts the bad kind of cholesterol. The discovery could lead to new and potentially more effective medicine.

- [**Chemotherapy pain could be eased by jetlag drug, study suggests**](#) [周五, 15 9月 22:35]

Painful side effects from cancer medicines could be tackled with a drug

that eases the effects of jetlag, research suggests.

- [**Celebrity fossil reveals all for science**](#) [周五, 15 9月 22:35]

With the help of an artist, a geology professor has figuratively speaking breathed life into one of science's most well-known fossil species; *Agnostus pisiformis*. The trilobite-like arthropod lived in huge numbers in Scandinavia a half-billion years ago. Today, this extinct species provides important clues for science in several ways.

- [**New study on the placebo effect and antidepressants in children and adolescents**](#) [周五, 15 9月 21:53]

Although the clinical efficacy of antidepressants in children and adolescents is proven, it is frequently accompanied by side effects. In addition, the influence of the placebo effect on the efficacy of antidepressants is unclear. A meta-analysis of data from over 6,500 patients has now shown that, although antidepressants are more effective than placebos, the difference is minor and varies according to the type of mental disorder.

- [**20 minute test determines attention and memory capacity in patients with schizophrenia**](#) [周五, 15 9月 21:53]

Researchers have designed a test which in only 20 minutes can examine short-term memory capacity, mental agility and organizational capacities in patients with schizophrenia.

- [**Humans no longer have ancient defense mechanism against viruses**](#) [周五, 15 9月 21:53]

Insects and plants have an important ancient defense mechanism that helps them to fight viruses. This is encoded in their DNA. Scientists have long assumed that vertebrates -- including humans -- also had this same mechanism. But researchers have found that vertebrates lost this particular asset in the course of their evolution.

- [**Girl soccer players five times more likely than boys to return to play same day after concussion**](#) [周五, 15 9月 21:52]

A new study found girls were significantly more likely than boys to

return to play the same day following a soccer-related concussion, placing them at risk for more significant injury. More than half of girls in the study resumed playing in a game or practice the same day as their injury, compared to just 17 percent of boys.

- [**Common surgeries may serve as pathway to nonmedical opioid use in adolescents**](#) [周五, 15 9月 21:52]

Results of study, the first known to suggest long-term opioid use after surgery may be a significant problem for teens and young adults, shows youth patients commonly fill post-surgical painkiller prescriptions for months beyond typical recovery times.

- [**Golf carts causing serious injuries to children**](#) [周五, 15 9月 21:52]

As golf carts become increasingly popular in communities beyond the fairway, new research shows, a significant number of children are being seriously injured while using them.

- [**300,000 families living in US-Mexico border towns face exposure to toxic stress**](#) [周五, 15 9月 21:52]

Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.

- [**Need for epinephrine in schools -- and staff trained to administer it**](#) [周五, 15 9月 21:52]

With school nurses often covering multiple buildings, researchers find that nearly one in five students who experience severe allergic reactions are given potentially life-saving epinephrine injections from unlicensed staff or students.

- [**Green schoolyards offer physical and mental health benefits for children**](#) [周五, 15 9月 21:52]

A growing body of evidence suggests access to safe, natural areas improves health across a wide variety of areas, including heart health, mental health, weight management, ADHD, and stress among children.

Damage to monarch butterfly colonies in 2016 storm worse than thought: Severe cold, snow, and high winds -- and salvage logging that followed -- weakened forest that protects declining butterfly -- ScienceDaily

A much greater number of monarch butterflies perished in a snowstorm in March 2016 in Mexico than previously estimated, according to new research. Analysis of damage from the storm -- and the ensuing salvage logging -- sheds further light on the precarious state of the famed butterflies' overwintering colonies.

Approximately 30-38 percent of the monarch butterflies (*Danaus plexippus*) in the Sierra Chincua and Cerro Pelón overwintering colonies died in the storm, says a team led by Lincoln Brower, Ph.D., research professor of biology at Sweet Briar College, far more than the estimated 7 percent mortality rate cited in initial media reports after the storm that struck between March 7 and March 11, 2016. The researchers'

findings are reported in the latest issue of the Entomological Society of America's *American Entomologist*.

The storm was a severe combination of rain, snow, sleet, and hail along with strong winds and sub-freezing temperatures that downed several thousand Oyamel firs within the forests of the Monarch Butterfly Biosphere Reserve, declared a World Heritage Site by the United Nations in 2008. Typically, the dense forest creates a favorable "microclimate" for the monarchs, protecting them from exposure to intense winds, rain, and cold temperatures.

"The prolonged severe storm destroyed the normal microclimatic protection provided by the intact Oyamel forest and led to freezing in all the colonies," Brower says. "This awakened us to the realization that the forest surrounding the butterfly colonies also needs to be protected, as a generalized wind buffer."

Brower and colleagues counted dead butterflies in random plots within the colonies to estimate the total mortality rate from the storm: 31 percent in the Sierra Chincua colony and 38 percent in the Cerro Pelón colony. The true impact may still have been greater,

however, as the researchers' analysis of weather data from stations within and surrounding the Monarch Butterfly Biosphere Reserve, measured against existing research on monarch butterfly mortality in freezing temperatures, "support the conclusion that the March 2016 storm mortality ... was substantially greater than 40 percent," the researchers report.

Following the storm, the Mexican government permitted salvage logging to remove downed trees, due to concerns over potential fire or insect damage. Brower and colleagues argue, however, that the logging process was "profoundly disturbing and detrimental to the environment," decreasing the forest's ability to return to maturity and provide safe haven for the butterflies. A volume of 60,000 cubic meters of timber was approved for removal -- equivalent to several thousand trees -- which follows an incident of illegal logging occurring in the monarch reserve in 2015, reported in *American Entomologist* last year.

Brower was recently named a Fellow of the Entomological Society of America, in recognition of his career devoted to studying and raising awareness of the monarch butterfly and its overwintering colonies. Since the 1996-1997 overwintering season, the

monarchs' colonies have declined in size by 90 percent. After more than 60 years, Brower's work carries on, he says. "We hope to carry out a drone study, photographing the colonies from a standard height above the butterflies and then using photometric analysis to estimate changing colony densities," he says. "We are concerned that the current methodology of reporting only total colony areas is underestimating the decline of monarchs overwintering in Mexico."

High blood pressure reasons differ by gender in teens; young adults -- ScienceDaily

There are marked gender differences in what drives blood pressure in middle-age in adulthood, suggesting the need for gender-specific treatments for high blood pressure, according to research presented today at the American Heart Association (AHA) Council on Hypertension, AHA Council on Kidney in Cardiovascular Disease, American Society of Hypertension Joint Scientific Sessions 2017, in San Francisco.

Background

"Blood pressure is determined mainly by three factors: heart rate; stroke volume, which is the volume of blood pumped by the heart; and the resistance to blood flow through the vessels, called total peripheral resistance. An increase in any one of the three factors can lead to an increase in blood pressure," said study author Catriona Syme, Ph.D., postdoctoral fellow at The

Hospital for Sick Children (SickKids) in Toronto, Ontario, Canada. "The key takeaway from this study is that, for young and middle-aged women, stroke volume was the main determinant of blood pressure, while, in men, vascular resistance was the main determinant of blood pressure."

Syme and colleagues studied 1,347 Canadians from the Saguenay Youth Study, including 911 adolescents and 426 adults ages 36 to 65 years. The researchers used a device that measures beat-by-beat blood pressure and the underlying forces of heart rate, stroke volume and total peripheral resistance. In the approximately hour-long protocol, they measured these variables at rest, and during posture changes and a mental stressor -- all designed to mimic daily life activities, according to Syme.

Researchers found:

- In females, stroke volume explains 55 percent of the variance in systolic blood pressure (the top number in a blood pressure reading), versus only 35 percent in males.
- In males, the major determinant of systolic blood pressure was total peripheral resistance, which

explained 47 percent of the variance, versus only 30 percent in females.

- These gender differences were seen across most of the 52-minute protocol, being most prominent during standing and least evident during mental stress, according to the abstract.

This study is novel in that it looks at the relative contributions of the three parameters determining blood pressure, which have not been evaluated in a large population-based study, and it assesses these factors over time, in a way that mimics daily life activities. The study also looks at high blood pressure culprits in adolescents and young to middle aged adults, who are not frequently studied despite being affected by hypertension, according to Syme.

"For example, there have been many studies looking at sex differences in the usefulness of blood pressure medications. But, most of those studies have been done in people whose average age was 60-70 years -- many of the women being post-menopausal," Syme said.

"We think pre-menopausal women and men of a similar age may have elevated blood pressure for different reasons, and thus may need to be treated for hypertension differently. After menopause, when the

production of female sex hormones decreases, reasons for hypertension may be more similar in men and women."

While current treatment recommendations for hypertension do not differ by gender across all ages, this study suggests potential benefits to prescribing blood pressure-lowering medications with consideration for gender differences in the underlying physiology of elevated blood pressure in young and middle-aged adults.

This study was conducted in Caucasians. Future studies should investigate whether the relative contributions of these parameters differ by race.

Teens also at risk for organ damage from high blood pressure -- ScienceDaily

Organ damage from high blood pressure doesn't only occur in adults; it can also happen in teenagers, according to research presented today at the American Heart Association (AHA) Council on Hypertension, AHA Council on Kidney in Cardiovascular Disease, American Society of Hypertension Joint Scientific Sessions 2017 in San Francisco.

And the damage to the heart and blood vessels can occur in youth at blood pressure levels that are below the clinical definition of hypertension in youth.

High blood pressure in youth is defined differently than it is in adults. In childhood, high blood pressure is based on percentiles, rather than blood pressure level. Researchers looked at whether organ damage in teens develops below the 95th percentile, which is the clinical definition of high blood pressure in youth.

Researchers studied blood pressure and measured organ damage in 180 teenagers (14-17 years old, 64 percent white, 57 percent males). They found evidence of organ damage even among the youth categorized as "normal" with blood pressure less than in the 80th percentile. They also found heart and vessel damage in the mid-risk group, which had blood pressures in the 80th to 90th percentiles and the high-risk group, with blood pressures above the 90th percentile.

"Some adolescents may have organ damage related to blood pressure and are not targeted for therapy," said Elaine M. Urbina, M.D., M.S., study author and director of preventive cardiology at Cincinnati Children's Hospital Medical Center in Ohio. "Imaging of the heart may be useful in youth in the high-normal range of blood pressure to determine how aggressive therapy should be."

Sugary secrets of a cancer-related protein -- ScienceDaily

The proteins in human cells are extensively decorated with different types of sugars, a phenomenon called glycosylation. These modifications greatly increase the diversity of protein structure and function, affecting how proteins fold, how they behave, and where they go in cells. New research that will be published in the *Journal of Biological Chemistry* on Sept. 22 demonstrates that a rare type of glycosylation profoundly affects the function of a protein important for human development and cancer progression.

Protein glycosylation is either called N-linked or O-linked, depending on whether the sugar is attached to nitrogen- or oxygen-containing sites, respectively. O-linked modifications typically involve the sugar N-acetylgalactosamine being attached to the amino acids serine or threonine, called "mucin-type" glycosylation because they are commonly found in proteins in mucus membranes; together with N-linked sugars, these "canonical" modifications modify thousands of

different types of proteins.

For over 20 years, Robert Haltiwanger's research group, now at the University of Georgia, has studied much rarer type of O-linked modifications: attachment of the sugars glucose or fucose to serine or threonine, a modification that affects just a few hundred different types of proteins. One of these proteins is Notch, a signaling receptor that is essential for cell development and differentiation and is dysregulated in cancers such as leukemia, breast cancer, and prostate cancer.

"The fact that we found these sugars on Notch was intriguing because Notch is a very important molecule," Haltiwanger said. "So we've been curious about how these sugars affect [Notch's] stability and activity."

The enzymes responsible for modifying Notch with glucose and fucose are called POFUT1 and POGLUT1. Haltiwanger's team, led by Hideyuki Takeuchi, wanted to know exactly why POFUT1 and POGLUT1 were attaching glucose and fucose to Notch in cells.

If you genetically engineer a fly or mouse without POFUT1 or POGLUT1, Haltiwanger said, "you get a

dead fly or a dead mouse. You completely disrupt the Notch pathway; Notch is not functional if you don't add those sugars. There's been a lot of work over the years on: Why is that? What is [the sugar] doing?"

Haltiwanger's new work shows that the fucose and glucose modifications serve as quality-control markers that allow Notch to be transported to its final destination in the cell membrane. When the researchers knocked out POFUT1 or POGLOT1 in cell cultures using CRISPR/Cas technology, cells displayed much less Notch on the cell surface. When both enzymes were knocked out, Notch was almost completely absent.

Using additional biochemical methods, the researchers found that POFUT1 and POGLOT1 attached glucose and fucose to portions of Notch only after they fold in a specific way.

"It's like a stamp of approval," Haltiwanger said. "This part's folded? Boom, you put a fucose on it. And somehow that tells the cell: Don't mess with this anymore. Leave it alone. If you don't add the sugar, [the Notch proteins] get stuck inside the endoplasmic reticulum, get degraded, and don't get secreted."

Knowing that these sugars are essential for Notch activity makes the enzymes that control them, POFUT1 and POGLUT1, potential targets for cancer treatments. Depending on whether Notch is overactive or insufficiently active in a particular cancer, manipulating the sugars that are added to Notch could help correct the dysregulation. Haltiwanger's team is currently working on finding chemical compounds that would inhibit POFUT1 and POGLUT1, thus stopping Notch from embedding in the cell membrane and carrying out its signaling functions. They're also attempting to unravel the details of how the glucose and fucose modifications work together to fine-tune Notch activity.

"That'll keep us busy," Haltiwanger said.

The work was supported by the National Institutes of Health.

Top science stories featured on ScienceDaily's home page.

- [**NASA's Cassini spacecraft ends its historic exploration of Saturn**](#) [周六, 16 9月 22:30]

A thrilling epoch in the exploration of our solar system has come to a close, as NASA's Cassini spacecraft made a fateful plunge into the atmosphere of Saturn, ending its 13-year tour of the ringed planet. Cassini's plunge brings to a close a series of 22 dives between Saturn and its rings, a feat never before attempted by any spacecraft.

- [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

- [**Light on exoplanets may be quite different from Earth: Different photosynthesis?**](#) [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxgenic phototrophs are most likely to have evolved underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

- [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Arctic sea ice once again shows considerable melting**](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

- [**Skin patch dissolves 'love handles' in mice**](#) [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and

diabetes.

- [**Wolves understand cause and effect better than dogs**](#) [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

- [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

- [**Biomarkers in the blood prove strong role of food for type 2 diabetes**](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

- [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- **[Plant geneticists develop a new application of CRISPR to break yield barriers in crops](#)** [周五, 15 9月 03:23]

Scientists have finally harnessed the untapped power of genome editing to improve agricultural crops. In the tomato plant they have mobilized CRISPR to rapidly generate variants of the plant displaying a continuum of three agriculturally important traits: fruit size, branching architecture and overall plant shape. All are major components in determining yield. The method is designed to work in all food, feed, and fuel crops, including staples rice, maize, sorghum and wheat.

- **[Old fish few and far between under fishing pressure](#)** [周五, 15 9月 03:23]

A new study has found that, for dozens of fish populations around the globe, old fish are greatly depleted -- mainly because of fishing pressure. Old fish are increasingly missing in many populations around the world.

- **[Huge genetic diversity among Papuan New Guinean peoples revealed](#)** [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

- **[The return of the comet-like exoplanet](#)** [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

[**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

[**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

[**How does a cell maintain its identity during replication?**](#) [周五, 15 9月 03:22]

Prior to cell division, chromosomes are seemingly a jumbled mess. During cell division, parent cell chromosomes and their duplicates sort themselves out by condensing, becoming thousands of times more compact than at any other time. Researchers have long assumed that genes become "silent" during cell division, not being transcribed into proteins or regulatory molecules. This has left open the question of how genes get properly re-activated after cell division. Now, researchers have found that gen...

[**Hubble observes pitch black planet**](#) [周五, 15 9月 03:22]

Astronomers have discovered that the well-studied exoplanet WASP-12b reflects almost no light, making it appear essentially pitch black. This discovery sheds new light on the atmospheric composition of the planet and also refutes previous hypotheses about WASP-12b's atmosphere. The results are also in stark contrast to observations of another similarly sized exoplanet.

[**New supernova analysis reframes dark energy**](#)

debate [周四, 14 9月 07:31]

The accelerating expansion of the Universe may not be real, but could just be an apparent effect, according to new research. The new study finds the fit of Type Ia supernovae to a model universe with no dark energy to be very slightly better than the fit to the standard dark energy model.

Evolution of 'true frogs' defies long-held expectations of science [周四, 14 9月 07:31]

New research shows, in contrast to expectations, 'the rapid global range expansion of true frogs was not associated with increased net-diversification.'

Artificial 'skin' gives robotic hand a sense of touch [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

In-utero treatment reverses cleft palate in mice [周四, 14 9月 07:30]

Researchers clarified a molecular pathway responsible for the formation of cleft palate and identified a new treatment to reverse this defect in mouse pups in utero.

'Peel-and-go' printable structures fold themselves [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

First global map of water in moon's soil [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as resource in future lunar exploration.

- [**New gravity map suggests Mars has a porous crust**](#) [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**Measuring a crucial mineral in the mantle**](#) [周四, 14 9月 07:29]

New research resolves 40 years of debate about the strength of olivine, the most abundant mineral in the Earth's mantle. Measuring the strength of olivine is critical to understanding how strong tectonic plates are, which, in turn, matters to how plates break and create subduction zones.

- [**Climate change challenges the survival of fish across the world**](#) [周四, 14 9月 07:29]

Researchers have published the first analysis looking at how vulnerable the world's freshwater and marine fishes are to climate change. Their study used physiological data to predict how nearly 3,000 fish species living in oceans and rivers will respond to warming water temperatures in different regions.

- [**New drug effective against malaria**](#) [周三, 13 9月 06:49]

Researchers have developed a new drug that is effective against non-severe cases of malaria, according to results from an FDA-supervised clinical trial. The results are significant as public health experts have long warned that the parasite responsible for most malaria cases, *Plasmodium falciparum*, is developing resistance to widely used treatments. New medications are needed to build up secondary defenses against drug-resistant strains of the parasite.

- [**A one-of-a-kind star found to change over**](#)

[decades](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

• [AI -- Engineering: merging, morphing, mobile robots](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

• [Coffee and bees: New model of climate change effects](#) [周二, 12 9月 22:28]

Areas in Latin America suitable for growing coffee face predicted declines of 73-88 percent by 2050. But bee species diversity may save the day, even if many species in cool highland regions are lost as the climate warms.

• [Your stools reveal whether you can lose weight](#) [周二, 12 9月 21:31]

Something as simple as a feces sample reveals whether you can lose weight by following dietary recommendations characterized by a high content of fruit, vegetables, fibers and whole grains, report scientists.

• [Nanoparticles from tattoos travel inside the body, scientists find](#) [周二, 12 9月 21:31]

The elements that make up the ink in tattoos travel inside the body in micro and nanoparticle forms and reach the lymph nodes according to a new study. It is the first time that there is analytical evidence of the transport of various organic, inorganic pigments and toxic element impurities as well as in depth characterization of the pigments ex vivo in tattooed tissues.

• [Octopuses aren't loners, new evidence suggests](#) [周二, 12 9月 05:04]

Octopuses are usually solitary creatures, but a new site in the waters off the east coast of Australia is the home of up to 15 gloomy octopuses (*Octopus tetricus*) that have been observed communicating -- either

directly as in den evictions or indirectly through posturing, chasing or color changes, according to new research findings.

- [**When ancient fossil DNA isn't available, ancient glycans may help trace human evolution**](#) [周二, 12 9月 03:09]

Researchers have discovered a new kind of glycan (sugar chain) that survives even in a 4-million-year-old animal fossil from Kenya, under conditions where ancient DNA does not. While ancient hominin fossils are not yet available for glycan analysis, this proof-of-concept study sets the stage for unprecedented explorations of human origins and diet.

- [**Urban climate change**](#) [周二, 12 9月 03:09]

Southern cities such as Houston and Tampa -- which faced the wrath of hurricanes Harvey and Irma, respectively -- may not be the only urban environments vulnerable to extreme weather. Northern cities also face the potential for flooding as global temperatures continue to warm.

- [**Why your ancestors would have aced the long jump**](#) [周二, 12 9月 03:09]

A 52-million-year-old ankle fossil suggests our prehuman ancestors were high-flying acrobats. For years, scientists thought the ancestors of today's humans, monkeys, lemurs and apes were relatively slow and deliberate animals, using their grasping hands and feet to creep along small twigs and branches. But a new study suggests the first primates were masters at leaping through the trees.

- [**Scientists track the brain-skull transition from dinosaurs to birds**](#) [周二, 12 9月 00:27]

The dramatic, dinosaur-to-bird transition that occurred in reptiles millions of years ago was accompanied by profound changes in the skull roof of those animals -- and holds important clues about the way the skull forms in response to changes in the brain -- according to a new study. It is the first time scientists have tracked the link between the brain's development and the roofing bones of the skull.

- [**How openings in Antarctic sea ice affect**](#)

[worldwide climate](#) [周二, 12 9月 00:26]

In a new analysis of climate models, researchers reveal the significant global effects that seemingly anomalous polynyas, or openings in sea ice, can have. Their findings indicate that heat escaping from the ocean through these openings impacts sea and atmospheric temperatures and wind patterns around the globe and even rainfall around the tropics.

• [Brain Composer: 'Thinking' melodies onto a musical score](#) [周二, 12 9月 00:26]

A new brain-computer interface application that allows music to be composed by the power of thought has now been developed by scientists.

• [Cold region 'tipping point' now inevitable](#) [周二, 12 9月 00:26]

The decline of cold regions called periglacial zones is now inevitable due to climate change, researchers say.

• [The evolutionary origin of the gut](#) [周二, 12 9月 00:26]

How did the gut, the skin and musculature evolve? This question concerns scientists for more than a century. Through the investigation of the embryonic development of sea anemones, a very old animal lineage, researchers have now come to conclusions which challenge the 150-year-old hypothesis of the homology (common evolutionary origin) of the germ layers that form all later organs and tissues.

• [USA threatened by more frequent flooding](#) [周二, 12 9月 00:26]

The East Coast of the United States is threatened by more frequent flooding in the future. According to this study, the states of Virginia, North Carolina, and South Carolina are most at risk. Their coastal regions are being immersed by up to three millimeters per year -- among other things, due to human intervention.

• [Half-a-billion-year-old fossils shed light animal evolution on Earth](#) [周二, 12 9月 00:26]

Scientists have discovered traces of life more than half-a-billion years old that could change the way we think about how all animals evolved

on Earth.

[Biodiversity just as powerful as climate change for healthy ecosystems](#) [周二, 12 9月 00:26]

Biodiversity is proving to be one of humanity's best defenses against extreme weather. In past experiments, diversity has fostered healthier, more productive ecosystems, like shoreline vegetation that guards against hurricanes. However, many experts doubted whether these experiments would hold up in the real world. A study offers a decisive answer: biodiversity's power in the wild surpasses experimental predictions, in some cases topping even effects of climate.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**High blood pressure reasons differ by gender in teens; young adults**](#) [周一, 18 9月 03:10]

Gender matters when it comes to what's most likely to elevate blood pressure in young to middle-aged adults. The volume of blood pumped from the left ventricle during heartbeats, i.e., stroke volume, is the main determinant of blood pressure levels in women, while blood pressure in men is more likely to be determined by the amount of resistance in the body's blood vessels.

- [**Blood pressure better controlled with 'MAP' for doctors**](#) [周一, 18 9月 03:09]

Primary care practices using the Measure accurately, Act rapidly and Partner with patients (MAP) program drove down hypertension rates among patients. In six months of MAP, hypertension control rose from 65.6 percent to 74.8 percent, among more than 21,000 hypertension patients at US primary care practices.

- [**Teens also at risk for organ damage from high blood pressure**](#) [周一, 18 9月 03:09]

Organ damage from high blood pressure doesn't only occur in adults; it can also happen in teenagers, according to new research.

- [**Sugary secrets of a cancer-related protein**](#) [周一, 18 9月 00:03]

The proteins in human cells are extensively decorated with different types of sugars, a phenomenon called glycosylation. These modifications greatly increase the diversity of protein structure and

function, affecting how proteins fold, how they behave, and where they go in cells. New research demonstrates that a rare type of glycosylation profoundly affects the function of a protein important for human development and cancer progression.

- [**Fertility research brings death of dogma, birth of hope**](#) [周六, 16 9月 20:01]

A new study shows unequivocally that stem cells in the ovaries are a critical piece of the mammal fertility puzzle, and may be harnessed to revolutionize fertility treatments and perhaps even delay menopause.

- [**Hormone replacement therapy can slow decline in lung function for middle-aged women**](#) [周六, 16 9月 05:05]

Hormone replacement therapy (HRT) can slow the decline in lung function in middle-aged women, according to new research.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.

- [**Differences in aggression among people with dementia**](#) [周六, 16 9月 04:50]

Physical aggression among people with dementia is not unusual. A study showed that one-third of patients with the diagnosis Alzheimer's disease or frontotemporal dementia were physically aggressive towards healthcare staff, other patients, relatives, animals and complete strangers. This manifestation of disease must be both understood and addressed in the right way.

- [**Teens come 'jet lagged' to school: Shifting sleeping patterns at weekends**](#) [周六, 16 9月 04:48]

A lack of sleep is associated with more absence and teens turn up jet lagged to school on Mondays, as shown in new research.

- [**Innate immunity: To operate, insert dimers**](#) [周六, 16 9月 04:46]

The presence of DNA in mammalian cell cytoplasm triggers an immune

response by binding to a dimeric enzyme, which inserts between DNA double helices to form the “rungs” of a ladder-like structure, as an LMU team has now shown.

- [**Memory decline after head injury may be prevented by slowing brain cell growth**](#) [周六, 16 9月 02:42]

Scientists say a new study indicates that the excessive burst of new brain cells after a traumatic head injury that researchers have traditionally believed helped in recovery could instead lead to epileptic seizures and long-term cognitive decline.

- [**The body's own fat-metabolism protects against the harmful effects of sugar**](#) [周六, 16 9月 02:41]

Researchers have discovered that the fat-metabolism in the cells takes place simultaneously with a detoxification of the harmful substances from the blood sugar, which can avert the damage that can in turn lead to age-related diseases such as diabetes, Alzheimer's and cancer. This indicates that we have a detoxification system which we were not previously aware of.

- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Immune system linked to alcohol drinking behavior**](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- **[Time to dial back on diabetes treatment in older patients? Study finds 11 percent are overtreated](#)**

[周六, 16 9月 02:41]

Almost 11 percent of Medicare participants with diabetes had very low blood sugar levels that suggested they were being over-treated, a new study finds. But only 14 percent of these patients had a reduction in blood sugar medication refills in the next six months.

- **[Quality initiatives can reduce harm to newborns, shorten hospital stay and save millions](#)**

[周六, 16 9月 02:41]

A quality-improvement initiative at a neonatal intensive care unit finds that chest X-rays can be performed just twice weekly, lessening the chances of a breathing tube popping out accidentally, reducing infants' exposure to radiation and saving an estimated \$1.6 million per year.

- **[Couples weather bickering with a little help from their friends](#)**

[周六, 16 9月 02:41]

New research finds that having good friends and family members to turn to alleviates the stress of everyday conflict between marital partners. Social networks may help provide protection against health problems brought about by ordinary tension between spouses.

- **[Decreased glucose metabolism in medial prefrontal areas is associated with nutritional status in patients with prodromal and early Alzheimer's disease](#)**

[周六, 16 9月 02:41]

A new study shows that hypometabolism in the medial prefrontal areas is specifically associated with Alzheimer's disease-related nutritional problems, and decrease in fat mass may have a key role.

- **[Medical students not trained to prescribe medical marijuana](#)**

[周六, 16 9月 02:41]

More than half of the states in the US now allow some type of legal

marijuana use, primarily medical marijuana. But, in a survey of medical residents and deans at the nation's medical schools, researchers have found that the majority of schools are not teaching their students about medical marijuana, and the majority of students don't feel prepared to discuss the subject with patients.

- [**Brain halves increase communication to compensate for aging, study finds**](#) [周六, 16 9月 02:41]

Increased communication between distant brain regions helps older adults compensate for the negative aspects of aging, reports a new study.

- [**Discovery can pave the way for more effective cholesterol medicine**](#) [周五, 15 9月 22:35]

Research sheds new light on how the body converts the bad kind of cholesterol. The discovery could lead to new and potentially more effective medicine.

- [**Chemotherapy pain could be eased by jetlag drug, study suggests**](#) [周五, 15 9月 22:35]

Painful side effects from cancer medicines could be tackled with a drug that eases the effects of jetlag, research suggests.

- [**New study on the placebo effect and antidepressants in children and adolescents**](#) [周五, 15 9月 21:53]

Although the clinical efficacy of antidepressants in children and adolescents is proven, it is frequently accompanied by side effects. In addition, the influence of the placebo effect on the efficacy of antidepressants is unclear. A meta-analysis of data from over 6,500 patients has now shown that, although antidepressants are more effective than placebos, the difference is minor and varies according to the type of mental disorder.

- [**20 minute test determines attention and memory capacity in patients with schizophrenia**](#) [周五, 15 9月 21:53]

Researchers have designed a test which in only 20 minutes can examine short-term memory capacity, mental agility and organizational capacities

in patients with schizophrenia.

- **[Girl soccer players five times more likely than boys to return to play same day after concussion](#)**

[周五, 15 9月 21:52]

A new study found girls were significantly more likely than boys to return to play the same day following a soccer-related concussion, placing them at risk for more significant injury. More than half of girls in the study resumed playing in a game or practice the same day as their injury, compared to just 17 percent of boys.

- **[Common surgeries may serve as pathway to nonmedical opioid use in adolescents](#)**

[周五, 15 9月 21:52]

Results of study, the first known to suggest long-term opioid use after surgery may be a significant problem for teens and young adults, shows youth patients commonly fill post-surgical painkiller prescriptions for months beyond typical recovery times.

- **[Golf carts causing serious injuries to children](#)**

[周五, 15 9月 21:52]

As golf carts become increasingly popular in communities beyond the fairway, new research shows, a significant number of children are being seriously injured while using them.

- **[300,000 families living in US-Mexico border towns face exposure to toxic stress](#)**

[周五, 15 9月 21:52]

Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.

- **[Need for epinephrine in schools -- and staff trained to administer it](#)**

[周五, 15 9月 21:52]

With school nurses often covering multiple buildings, researchers find that nearly one in five students who experience severe allergic reactions are given potentially life-saving epinephrine injections from unlicensed staff or students.

- [**Green schoolyards offer physical and mental health benefits for children**](#) [周五, 15 9月 21:52]

A growing body of evidence suggests access to safe, natural areas improves health across a wide variety of areas, including heart health, mental health, weight management, ADHD, and stress among children.

- [**Girl soccer players who give up other sports may feel more stressed, less rested**](#) [周五, 15 9月 21:52]

New research has found sport specialization was associated with significantly worse mood, stress, fatigue, soreness, and sleep quality among female youth soccer players, even after controlling for factors such as age and hours spent training.

- [**Immigrant parents report fewer adverse childhood experiences than US-born parents**](#) [周五, 15 9月 21:52]

A new study found immigrants reported fewer potentially health-harming adverse childhood experiences, such as abuse, violence, or divorce, than native-born Americans. The findings suggest immigrants may experience different forms of stress early in life than do those born in the United States.

- [**Campaign increases likelihood parents will ask about guns before a playdate**](#) [周五, 15 9月 21:52]

The Asking Saves Kids (ASK) campaign is effective in increasing parents' comfort level in asking if there is a gun where their child plays, according to research.

- [**Third and fourth graders who own cell phones are more likely to be cyberbullied**](#) [周五, 15 9月 21:52]

New research suggests elementary school-age children who own cell phones may be particularly vulnerable to cyberbullying.

- [**Riding a slide while on a parent's lap increases the risk of injury**](#) [周五, 15 9月 21:52]

Going down a slide on a parent's lap can lead to a broken leg for small

children. An estimated 352,698 children less than 6 years of age were injured on slides in the United States from 2002 through 2015, and many of those injuries were leg fractures.

- [**Increasing number of children arrive at emergency departments addicted to opioids**](#) [周五, 15 9月 21:52]

Showing the opioid epidemic knows no age limits, new research suggests more than 100 children test positive for opioid addiction or dependency each day in US emergency departments.

- [**Injuries caused by firearms differ in rural or urban settings**](#) [周五, 15 9月 21:52]

Researchers examining pediatric firearm injuries found that the age a child is injured by a gun is closely related to where he or she lives: the city or the country.

- [**People with schizophrenia left out of longevity revolution**](#) [周五, 15 9月 21:52]

A team of researchers has analyzed all eight published longitudinal studies of mortality in schizophrenia that met their strict research criteria and found that the mean standardized mortality ratio -- a measure of the mortality rate in schizophrenia -- has increased 37 percent from pre-1970s studies to post-1970s studies.

- [**Carbohydrates may be the key to a better malaria vaccine**](#) [周五, 15 9月 21:52]

An international research team has shown for the first time that carbohydrates on the surface of malaria parasites play a critical role in malaria's ability to infect mosquito and human hosts. The discovery also suggests steps that may improve the only malaria vaccine approved to protect people against Plasmodium falciparum malaria -- the most deadly form of the disease.

- [**Life-saving post-ER suicide prevention strategies are cost effective**](#) [周五, 15 9月 21:52]

Three interventions designed for follow up of patients who are identified

with suicide risk in hospital emergency departments save lives and are cost effective relative to usual care. A study has modeled the use of the approaches in emergency departments and found that all three interventions compare favorably with a standard benchmark of cost-effectiveness used in evaluating healthcare costs.

• **[Regions with stricter firearm laws experience fewer pediatric gun-related injuries](#)** [周五, 15 9月 21:52]

Regions of the United States with stronger firearm legislation had lower rates of Emergency Department visits for pediatric firearm-related injuries, according to a new study.

• **[Skin patch dissolves 'love handles' in mice](#)** [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

• **[45 percent of parents experience depression, anxiety and stress when newborns leave NICU](#)** [周五, 15 9月 21:52]

Almost half of parents whose children were admitted to a neonatal intensive care unit experienced postpartum depressive symptoms, anxiety and stress when their newborns were discharged from the hospital.

• **[Contaminants in food: Health risks of natural origin are frequently underestimated](#)** [周五, 15 9月 21:51]

Just under 60 percent of the German population view undesirable substances in food as a high or very high health risk. The most well-known of these substances, which are scientifically denoted as contaminants, are mercury compounds and dioxins. In contrast, only around 13 percent of respondents have heard of the natural contaminants pyrrolizidine alkaloids (PAs) in honey or tea - and only roughly one in three of those who have heard of PAs believe these substances pose a

significant health risk.

- [**Sodium \(salt\) intake is associated with a risk of developing type 2 diabetes**](#) [周五, 15 9月 09:06]

Sodium intake may be linked to an increased risk of developing both type 2 diabetes and latent autoimmune diabetes in adults says new research.

- [**Thirdhand smoke exposure effects on liver and brain found to worsen over time**](#) [周五, 15 9月 09:06]

Thirdhand-smoke results when exhaled smoke and smoke emanating from the tip of burning cigarettes gets on surfaces such as clothing, hair, homes, and cars. Using a mouse model, researchers have found that thirdhand-smoke exposure has a significant effect on health, specifically the liver and brain, as early as one month after initiation of exposure -- an effect that worsens with time.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

- [**Is the Alzheimer's gene the ring leader or the sidekick?**](#) [周五, 15 9月 09:06]

Scientific literature in recent years has focused extensively on one genetic risk factor for Alzheimer's disease, the ApoE4 gene variant. A recent study raises flags that scientists should investigate another important player, the TOMM40 gene.

- [**Scientific explanation for why spurned males abandon courtship attempts**](#) [周五, 15 9月 09:06]

Unsuccessful courtship attempts by males create aversive memories that can reduce their level of enthusiasm for subsequent courtship attempts. Scientists have attempted to understand this behavior at the molecular level.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**NASA's Cassini spacecraft ends its historic exploration of Saturn**](#) [周六, 16 9月 22:30]

A thrilling epoch in the exploration of our solar system has come to a close, as NASA's Cassini spacecraft made a fateful plunge into the atmosphere of Saturn, ending its 13-year tour of the ringed planet. Cassini's plunge brings to a close a series of 22 dives between Saturn and its rings, a feat never before attempted by any spacecraft.

- [**Sensing with a twist: A new kind of optical nanosensor uses torque for signal processing**](#) [周六, 16 9月 20:01]

As electronic devices get smaller, their ability to provide precise, chip-based sensing of dynamic physical properties such as motion become challenging to develop. An international group of researchers have put a literal twist on this challenge, demonstrating a new nanoscale optomechanical resonator that can detect torsional motion at near state-of-the-art sensitivity. Their resonator, into which they couple light, also demonstrates torsional frequency mixing, a novel ability to impact optical e...

- [**Converting waste toilet paper into electricity**](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

- [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

- [**Light on exoplanets may be quite different from Earth: Different photosynthesis?**](#) [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxygenic phototrophs are most likely to have evolved underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

- [**Tracing the light inside a LED**](#) [周六, 16 9月 04:54]

The performance of white LED's can be improved, based on better knowledge of the absorption and scattering of light inside the LED. A new method can lead to efficiency improvement and powerful design tools.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

- [**Star formation influenced by local**](#)

[environmental conditions](#) [周五, 15 9月 22:36]

Three scientists have carried out extensive computer simulations related to star formation. They conclude that the present idealized models are lacking when it comes to describing details in the star formation process.

• [Golf carts causing serious injuries to children](#) [周五,

15 9月 21:52]

As golf carts become increasingly popular in communities beyond the fairway, new research shows, a significant number of children are being seriously injured while using them.

• [Skin patch dissolves 'love handles' in mice](#) [周五, 15 9月

21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

• [A subtler sexism now frames TV coverage of women in sports](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

• [New insights into nanocrystal growth in liquid](#) [周五,

15 9月 09:06]

Researchers have measured the forces that cause certain crystals to assemble, revealing competing factors that researchers might be able to control. The work has a variety of implications in both discovery and applied science. In addition to providing insights into the formation of minerals and semiconductor nanomaterials, it might also help scientists understand soil as it expands and contracts through wetting and drying cycles.

• [Water conservation can have unintended consequences](#) [周五, 15 9月 03:24]

Conventional wisdom dictates water conservation can only benefit communities affected by drought. But researchers have deduced that

indoor residential conservation can have unintended consequences in places where systems of wastewater reuse have already been implemented, diminishing both the quantity and quality of influent available for treatment.

- [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**Discovery could reduce nuclear waste with improved method to chemically engineer molecules**](#) [周五, 15 9月 03:23]

A new chemical principle has the potential to revolutionize the creation of specially engineered molecules whose uses include the reduction of nuclear waste and the extraction of chemical pollutants from water and soil.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**Quantum machine learning**](#) [周五, 15 9月 03:23]

Scientists have presented a thorough review on quantum machine learning, its current status and future prospects. The reports contrasts machine learning using classical and quantum resources, identifying opportunities that quantum computing brings to this field.

- [**Filtering molecules from the water or air with nanomembranes**](#) [周五, 15 9月 03:23]

Free-standing carbon membranes that are a millionth of a millimeter thin. The nanomembranes can serve as ultrafine filters and as a protective layer.

- [**Self-healing gold particles**](#) [周五, 15 9月 03:23]

Self-healing materials are able to repair autonomously defects, such as scratches, cracks or dents, and resume their original shape. For this purpose, they must be composed of several components whose combined properties result in the desired characteristics. Scientists have now discovered that also tiny particles of pure gold have surprising self-healing capacities.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Google Glass app helps autistic children with social interactions**](#) [周五, 15 9月 03:22]

A new study demonstrates the potential of wearable technology as a social-skills aid for children with autism spectrum disorder.

- [**The bilingual brain calculates differently depending on the language used**](#) [周五, 15 9月 03:22]

How do multilingual people solve arithmetical tasks presented to them in different languages? The question will gain in importance in the future, as an increasingly globalized job market and accelerated migration will mean that ever more people seek work and study outside of the linguistic area of their home countries.

- [**Hubble observes pitch black planet**](#) [周五, 15 9月 03:22]

Astronomers have discovered that the well-studied exoplanet WASP-12b reflects almost no light, making it appear essentially pitch black. This discovery sheds new light on the atmospheric composition of the

planet and also refutes previous hypotheses about WASP-12b's atmosphere. The results are also in stark contrast to observations of another similarly sized exoplanet.

[**Physicists offer explanation for diverse galaxy rotations**](#) [周五, 15 9月 03:22]

Physicists have found a simple and viable explanation for the diversity observed in galactic rotations. They report that diverse galactic-rotation curves, a graph of rotation speeds at different distances from the center, can be naturally explained if dark matter particles are assumed to strongly collide with one another in the inner halo, close to the galaxy's center -- a process called dark matter self-interaction.

[**Hydrogen power moves a step closer**](#) [周五, 15 9月 03:22]

Physicists are developing methods of creating renewable fuel from water using quantum technology. Renewable hydrogen can already be produced by photoelectrolysis where solar power is used to split water molecules into oxygen and hydrogen. But fundamental problems remain before this can be adopted commercially due to inefficiency. A new study demonstrates that the novel use of nanostructures could increase the maximum photovoltage generated in a photoelectrochemical cell, increasing the productivi...

[**Corrosion: Nanoscale glimpse of crevice and pitting corrosion as it happens**](#) [周五, 15 9月 03:22]

What affects almost everything made of metal, from cars to boats to underground pipes and even the fillings in your teeth? Corrosion -- a slow process of decay. At a global cost of trillions of dollars annually, it carries a steep price tag, not to mention, the potential safety, environmental and health hazards it poses.

[**Graphene-wrapped nanocrystals makes inroads toward next-gen fuel cells**](#) [周四, 14 9月 20:41]

A new study provides insight into how an ultrathin coating can enhance the performance of graphene-wrapped nanocrystals for hydrogen storage applications.

- [**Social media helps students learn scientific argumentation better**](#) [周四, 14 9月 07:31]

Students who took part in a program that taught scientific argumentation learned the concepts better than their peers who did not, a study concludes.

- [**New supernova analysis reframes dark energy debate**](#) [周四, 14 9月 07:31]

The accelerating expansion of the Universe may not be real, but could just be an apparent effect, according to new research. The new study finds the fit of Type Ia supernovae to a model universe with no dark energy to be very slightly better than the fit to the standard dark energy model.

- [**Test strips for cancer detection get upgraded with nanoparticle bling**](#) [周四, 14 9月 07:31]

Detecting cancer could be as easy as a home pregnancy test. Current test strip designs are not sensitive enough, but a new design with platinum-coated gold nanoparticles could make cheap and simple test strip detection a reality.

- [**New software turns mobile-phone accessory into breathing monitor**](#) [周四, 14 9月 07:31]

Researchers have developed new software that makes it possible to use low-cost, thermal cameras attached to mobile phones to track how fast a person is breathing. This type of mobile thermal imaging could be used for monitoring breathing problems in elderly people living alone, people suspected of having sleep apnea or babies at risk for sudden infant death syndrome.

- [**New manufacturing process for SiC power devices opens market to more competition**](#) [周四, 14 9月 07:31]

Researchers are rolling out a new manufacturing process and chip design for silicon carbide (SiC) power devices, which can be used to more efficiently regulate power in technologies that use electronics. The

process -- called PRESiCE -- was developed to make it easier for companies to enter the SiC marketplace and develop new products.

- [**New method for identifying carbon compounds derived from fossil fuels**](#) [周四, 14 9月 07:31]

Scientists have developed a laboratory instrument that will greatly reduce the cost of analyzing carbon isotopes. Among other things, this will allow scientists to measure how much of the carbon dioxide in the atmosphere came from burning fossil fuels, and to estimate fossil fuel emissions in an area as small as a city or as large as a continent.

- [**Wax on, melt off: Adding phase change materials, like paraffin, to concrete could make roads that melt snow and ice**](#) [周四, 14 9月 07:31]

Researchers have made a discovery that could create roads that melt off ice and snow during winter storms. Their secret? Adding a little paraffin wax to the road's concrete mix.

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**Imaging how magnetism goes surfing**](#) [周四, 14 9月 07:30]

Using advanced dynamic imaging, researchers have been able to visualize deformation (sound) waves in crystals and measured the effect on nanomagnetic elements. This offers new low power magnetization manipulation for memory or logic applications and the methodology offers a new approach for analyzing dynamic strains in other research fields: nanoparticles, chemical reactions, crystallography, etc.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**Spectroscopic 'science camera' system for smartphones**](#) [周四, 14 9月 07:30]

The latest versions of most smartphones contain at least two and sometimes three built-in cameras. Researchers would like to sell mobile device manufactures on the idea of adding yet another image sensor as a built-in capability for health diagnostic, environmental monitoring, and general-purpose color sensing applications.

- [**Long-range communication barrier for near-zero-power devices shattered**](#) [周四, 14 9月 07:30]

Researchers have demonstrated for the first time that devices that run on almost zero power can transmit data across distances of up to 2.8 kilometers -- breaking a long-held barrier and potentially enabling a vast array of interconnected devices.

- [**First global map of water in moon's soil**](#) [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as resource in future lunar exploration.

- [**Groundwork to better understanding optical properties of glass**](#) [周四, 14 9月 07:30]

Researchers demonstrated a new packing of glass with unique optical properties. What they learned could lead to innovations in technology, such as glass with different mechanical properties, and may elucidate some fundamental aspects of glass formation.

- [**New gravity map suggests Mars has a porous crust**](#) [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

- [**'The dark side' of quantum computers**](#) [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

- [**Getting to the point \(mutations\) in re-engineering biofuel-producing bacterial enzymes**](#)

[周四, 14 9月 07:29]

Helping bacteria become more efficient when breaking down fibrous plant waste into biofuel could result in more affordable biofuels for our gas tanks and sustainable products such as bioplastics. One way to achieve this goal is to re-engineer the bacterial enzyme complexes, called cellulosomes, which serve as catalysts in the degradation process.

- [**Self-folding electronics could enable advanced robotics**](#)

[周三, 13 9月 22:45]

As demand grows for more versatile, advanced robotics and other technologies, the need for components that can enable these applications also increases. Producing such components en masse has been a major challenge. But now, researchers report that they have developed a way to help meet this need by printing electronics that can fold themselves into a desired shape.

- [**Better, cheaper bio-ink may be used to create artificial organs**](#)

[周三, 13 9月 22:45]

A new bio-ink that may support a more efficient and inexpensive fabrication of human tissues and organs has been created. The researchers analyzed the physical and biological properties of three different GelMA hydrogels -- porcine skin, cold-water fish skin and cold-soluble gelatin.

- [**The beam of invisibility**](#)

[周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

[Supported liquid metal catalysts -- a new generation of reaction accelerators](#) [周三, 13 9月 22:44]

Catalysts are agents that initiate chemical reactions, speed them up or increase the yield of the desired product. New and improved catalysts are thus considered the key to creating more sustainable and efficient production processes in the chemical industry. Researchers have now discovered how to bypass the known drawbacks of the technical catalysts that are currently in use by means of a new material concept that makes the creation of significantly more efficient catalysts possible.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Damage to monarch butterfly colonies in 2016 storm worse than thought**](#) [周一, 18 9月 08:14]

A much greater number of monarch butterflies perished in a snowstorm in March 2016 in Mexico than previously estimated, according to new research. Analysis of damage from the storm -- and the ensuing salvage logging -- sheds further light on the precarious state of the famed butterflies' overwintering colonies.

- [**Converting waste toilet paper into electricity**](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

- [**Light on exoplanets may be quite different from Earth: Different photosynthesis?**](#) [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxgenic phototrophs are most likely to have evolved underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

- [**Tough stuff: Spider silk enhanced with**](#)

graphene-based materials [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

• **Delayed weaning reduces behavioural problems in cats** [周六, 16 9月 04:52]

Early weaning increases aggression and stereotypic behavior in cats. Based on the study, the recommended weaning age of 12 weeks should be raised by at least two weeks. Delaying weaning is an easy and cost-efficient way of improving the quality of life of cats.

• **Innate immunity: To operate, insert dimers** [周六, 16 9月 04:46]

The presence of DNA in mammalian cell cytoplasm triggers an immune response by binding to a dimeric enzyme, which inserts between DNA double helices to form the “rungs” of a ladder-like structure, as an LMU team has now shown.

• **Secrets of Bonsai: Uncovering the mechanism of root regeneration** [周六, 16 9月 04:38]

The molecular mechanism behind root regeneration after root cutting in plants has been discovered. A finding which could lead to the development of new methods for regulating plant growth in agriculture and horticulture.

• **Black Sea water temperatures may buck global trend** [周六, 16 9月 04:29]

Scientists have successfully simulated the Black Sea's long term currents, salt water content and temperature for the first time.

• **Ancient amphibian had mouthful of teeth ready to grab you** [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on

the roofs of their mouths that would snare prey, according to paleontologists.

- [**Scientists question study about plastic-eating caterpillars**](#) [周六, 16 9月 02:41]

Do the larvae of the wax moth really solve the world's plastic problem? Sensational report of biochemical degradation of polyethylene by caterpillars not confirmed.

- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Medical students not trained to prescribe medical marijuana**](#) [周六, 16 9月 02:41]

More than half of the states in the US now allow some type of legal marijuana use, primarily medical marijuana. But, in a survey of medical residents and deans at the nation's medical schools, researchers have found that the majority of schools are not teaching their students about medical marijuana, and the majority of students don't feel prepared to discuss the subject with patients.

- [**Arctic sea ice once again shows considerable melting**](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

- [**Celebrity fossil reveals all for science**](#) [周五, 15 9月 22:35]

With the help of an artist, a geology professor has figuratively speaking breathed life into one of science's most well-known fossil species; *Agnostus pisiformis*. The trilobite-like arthropod lived in huge numbers in Scandinavia a half-billion years ago. Today, this extinct species provides important clues for science in several ways.

- [**Humans no longer have ancient defense mechanism against viruses**](#) [周五, 15 9月 21:53]

Insects and plants have an important ancient defense mechanism that helps them to fight viruses. This is encoded in their DNA. Scientists have long assumed that vertebrates -- including humans -- also had this same mechanism. But researchers have found that vertebrates lost this particular asset in the course of their evolution.

- [**300,000 families living in US-Mexico border towns face exposure to toxic stress**](#) [周五, 15 9月 21:52]

Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.

- [**Carbohydrates may be the key to a better malaria vaccine**](#) [周五, 15 9月 21:52]

An international research team has shown for the first time that carbohydrates on the surface of malaria parasites play a critical role in malaria's ability to infect mosquito and human hosts. The discovery also suggests steps that may improve the only malaria vaccine approved to protect people against *Plasmodium falciparum* malaria -- the most deadly form of the disease.

- [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged

New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

- **[Contaminants in food: Health risks of natural origin are frequently underestimated](#)** [周五, 15 9月 21:51]

Just under 60 percent of the German population view undesirable substances in food as a high or very high health risk. The most well-known of these substances, which are scientifically denoted as contaminants, are mercury compounds and dioxins. In contrast, only around 13 percent of respondents have heard of the natural contaminants pyrrolizidine alkaloids (PAs) in honey or tea - and only roughly one in three of those who have heard of PAs believe these substances pose a significant health risk.

- **[Wolves understand cause and effect better than dogs](#)** [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

- **[Scientific explanation for why spurned males abandon courtship attempts](#)** [周五, 15 9月 09:06]

Unsuccessful courtship attempts by males create aversive memories that can reduce their level of enthusiasm for subsequent courtship attempts. Scientists have attempted to understand this behavior at the molecular level.

- **[New climate risk classification created to account for potential 'existential' threats](#)** [周五, 15 9月 09:06]

A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to

characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.

- [**Water conservation can have unintended consequences**](#) [周五, 15 9月 03:24]

Conventional wisdom dictates water conservation can only benefit communities affected by drought. But researchers have deduced that indoor residential conservation can have unintended consequences in places where systems of wastewater reuse have already been implemented, diminishing both the quantity and quality of influent available for treatment.

- [**Mixing artificial sweeteners inhibits bitter taste receptors**](#) [周五, 15 9月 03:24]

Blends of artificial sweeteners such as saccharin and cyclamate produce less of a bitter off-taste than each of the individual components, but the explanation for this puzzling phenomenon has been elusive ever since its discovery more than 60 years ago. A study solves this long-standing mystery, revealing that saccharin inhibits the activity of bitter taste receptors stimulated by cyclamate and, conversely, that cyclamate reduces the off-taste elicited by saccharin.

- [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Plant geneticists develop a new application of CRISPR to break yield barriers in crops**](#) [周五, 15 9月 03:23]

Scientists have finally harnessed the untapped power of genome editing to improve agricultural crops. In the tomato plant they have mobilized

CRISPR to rapidly generate variants of the plant displaying a continuum of three agriculturally important traits: fruit size, branching architecture and overall plant shape. All are major components in determining yield. The method is designed to work in all food, feed, and fuel crops, including staples rice, maize, sorghum and wheat.

- [**Discovery could reduce nuclear waste with improved method to chemically engineer molecules**](#) [周五, 15 9月 03:23]

A new chemical principle has the potential to revolutionize the creation of specially engineered molecules whose uses include the reduction of nuclear waste and the extraction of chemical pollutants from water and soil.

- [**Old fish few and far between under fishing pressure**](#) [周五, 15 9月 03:23]

A new study has found that, for dozens of fish populations around the globe, old fish are greatly depleted -- mainly because of fishing pressure. Old fish are increasingly missing in many populations around the world.

- [**Tiny fighters in sediments determine success of invasive marine plants**](#) [周五, 15 9月 03:23]

Armies of microbes that are invisible to the naked eye battle it out to determine whether exotic marine plants successfully invade new territory and replace native species, new research shows. The genetic study, which compared microbial communities in sediments associated with an invasive alga and a native seagrass, is the first to test the idea that marine microbes play a critical role in the establishment of invasive marine species.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers

demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

• [Could interstellar ice provide the answer to birth of DNA?](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

• [Chimera viruses can help the fight against lymphomas](#) [周五, 15 9月 03:22]

Researchers have created a chimera virus that allows the study of molecules to treat cancers caused by human herpes virus infection in mice models of disease.

• [How does a cell maintain its identity during replication?](#) [周五, 15 9月 03:22]

Prior to cell division, chromosomes are seemingly a jumbled mess. During cell division, parent cell chromosomes and their duplicates sort themselves out by condensing, becoming thousands of times more compact than at any other time. Researchers have long assumed that genes become "silent" during cell division, not being transcribed into proteins or regulatory molecules. This has left open the question of how genes get properly re-activated after cell division. Now, researchers have found that gen...

• [Light at the end of the tunnel: Restored forest now shelters dozens of endangered species](#) [周五, 15 9月 03:22]

A twenty-year effort to protect and manage tiny remnants of a dilapidated forest in Benin, along with its agricultural and fallow vegetation surroundings, resulted in 14 ha of rich secondary forest, which corresponds to the size of nearly 20 sacred groves. This sanctuary now protects the critically endangered red-bellied monkey together with

52 endangered plant species.

- **[Threatened Alabama snail renamed after a case of mistaken identity](#)** [周五, 15 9月 03:22]

Confusion surrounding the identity of the Painted Rocksnail, a species listed as federally threatened, has been cleared up after over 100 years of mistaken identity. Researchers determined that reports of the Painted Rocksnail outside the Coosa River system in Alabama were misidentifications. They found that the species is rarer and more restricted than previously thought.

- **['Mysterious' ancient creature was definitely an animal, research confirms](#)** [周五, 15 9月 03:22]

It lived well over 550 million years ago, is known only through fossils and has variously been described as looking a bit like a jellyfish, a worm, a fungus and lichen. But was the 'mysterious' Dickinsonia an animal, or was it something else? A new study provides strong proof that Dickinsonia was an animal.

- **[Cost of not adapting to climate change would be at least five times higher](#)** [周五, 15 9月 03:22]

A study on damage to coastal considered only real estate loss. If nothing is done, researchers say, losses might be up to ten times higher if the predicament includes the spreading of flood- and global warming - related diseases.

- **[Once-abundant ash tree and antelope species face extinction](#)** [周四, 14 9月 20:40]

North America's most widespread and valuable ash tree species are on the brink of extinction due to an invasive beetle decimating their populations, while the loss of wilderness areas and poaching are contributing to the declining numbers of five African antelope species, according to the latest update of the IUCN Red List of Threatened Species. Today's IUCN Red List update also reveals a dramatic decline of grasshoppers and millipedes endemic to Madagascar, and the extinction of the Christmas Is...

- [**Forest fires are not limited to hot or temperate climates**](#) [周四, 14 9月 20:40]

Evidence of wildfires dating back 20,000 years was recently discovered in the Massif du Queyras, in the heart of the French Alps, 2,240 meters above sea level. This discovery echoes the recent wildfires in the Arctic tundra, where the presence of trees have become increasingly common.

- [**Helping Chinese farmers tackle erosion, increase profits**](#) [周四, 14 9月 07:31]

On the steep farming slopes of China, researchers are finding ways to improve economic and environmental stability. They studied intercropping with corn and either setaria grass or chili peppers.

- [**Fish food for marine farms harbor antibiotic resistance genes**](#) [周四, 14 9月 07:31]

From isolated caves to ancient permafrost, antibiotic-resistant bacteria and genes for resistance have been showing up in unexpected places. As scientists puzzle over how genes for antibiotic resistance arise in various environments and what risks to human health they might pose, one team has identified a surprising way some of these genes are getting into ocean sediments: through food for marine fisheries.

- [**How well electron transport works in furfural biogas**](#) [周四, 14 9月 07:31]

Furfural is a promising candidate in the quest for alternative biofuels.

- [**New method for identifying carbon compounds derived from fossil fuels**](#) [周四, 14 9月 07:31]

Scientists have developed a laboratory instrument that will greatly reduce the cost of analyzing carbon isotopes. Among other things, this will allow scientists to measure how much of the carbon dioxide in the atmosphere came from burning fossil fuels, and to estimate fossil fuel emissions in an area as small as a city or as large as a continent.

- [**Evolution of 'true frogs' defies long-held**](#)

[expectations of science](#) [周四, 14 9月 07:31]

New research shows, in contrast to expectations, 'the rapid global range expansion of true frogs was not associated with increased net-diversification.'

. [Wax on, melt off: Adding phase change materials, like paraffin, to concrete could make roads that melt snow and ice](#) [周四, 14 9月 07:31]

Researchers have made a discovery that could create roads that melt off ice and snow during winter storms. Their secret? Adding a little paraffin wax to the road's concrete mix.

. [Song experiments reveal 21 possible new tropical bird species](#) [周四, 14 9月 07:30]

Birds often choose their mates based on song, making it a key factor in separating species. However, analyzing spectrograms can only tell us so much -- the characteristics that birds hone in on when identifying potential mates may not be the same ones scientists notice in audio recordings. A new study uses field experiments to 'ask the birds themselves' and uncovers as many as 21 previously unrecognized species.

. [Marijuana may produce psychotic-like effects in high-risk individuals](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]
It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.
- [**Teens come 'jet lagged' to school: Shifting sleeping patterns at weekends**](#) [周六, 16 9月 04:48]
A lack of sleep is associated with more absence and teens turn up jet lagged to school on Mondays, as shown in new research.
- [**300,000 families living in US-Mexico border towns face exposure to toxic stress**](#) [周五, 15 9月 21:52]
Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.
- [**Need for epinephrine in schools -- and staff trained to administer it**](#) [周五, 15 9月 21:52]
With school nurses often covering multiple buildings, researchers find that nearly one in five students who experience severe allergic reactions are given potentially life-saving epinephrine injections from unlicensed staff or students.
- [**Green schoolyards offer physical and mental health benefits for children**](#) [周五, 15 9月 21:52]
A growing body of evidence suggests access to safe, natural areas improves health across a wide variety of areas, including heart health,

mental health, weight management, ADHD, and stress among children.

- [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

- [**New climate risk classification created to account for potential 'existential' threats**](#) [周五, 15 9月 09:06]

A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.

- [**One vaccine injection could carry many doses**](#) [周五, 15 9月 03:23]

A new 3-D fabrication method has been developed that can create a new type of drug-carrying particle that could allow several doses of a drug or vaccine to be delivered over an extended time period with just one injection.

- [**Cost of not adapting to climate change would be at least five times higher**](#) [周五, 15 9月 03:22]

A study on damage to coastal considered only real estate loss. If nothing is done, researchers say, losses might be up to ten times higher if the predicament includes the spreading of flood- and global warming - related diseases.

• **[Quicker learning: Brief reactivations of visual memories are enough to complete a full learning curve](#)** [周四, 14 9月 07:30]

A new study finds that brief memory reactivations can replace the repeated extensive practice and training known as 'practice makes perfect' as a learning technique.

• **[Lion conservation requires effective international cooperation](#)** [周三, 13 9月 22:44]

In response to the alarming population declines of one of the most charismatic representatives of the megafauna, the lion, a team of international wildlife lawyers and lion experts joined efforts to assess the current and potential future role of international treaties regarding the carnivore's conservation.

• **[Decade of data shows FEMA flood maps missed 3 in 4 claims](#)** [周三, 13 9月 05:05]

An analysis of flood claims in three Houston suburbs from 1999-2009 found that the Federal Emergency Management Agency's 100-year flood plain maps failed to capture 75 percent of flood damages from five serious floods, none of which reached the threshold rainfall of a 100-year event.

• **[Kids praised for being smart are more likely to cheat](#)** [周三, 13 9月 03:48]

Kids who are praised for being smart, or who are told they have a reputation for being smart, are more likely to be dishonest and cheat, a pair of studies has found.

• **[Historic legacies affect climate change survival in Caribbean](#)** [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on understanding and addressing these historic inequalities.

• [**How should we handle boys who can't read?**](#) [周二, 12 9月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

• [**'Keep it local' approach more effective than government schemes at protecting rainforest**](#) [周二, 12 9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

• [**What happens to Rex and Kitty after a natural disaster?**](#) [周二, 12 9月 03:42]

After a natural disaster, images of destruction pour into our newsfeeds. Most of these focus on the destruction of the landscape, or on the human suffering caused. In any disaster where people suffer and die, pets and livestock will suffer and die, too. This has grave consequences for the animals, of course, but also for their owners. The aftermath of Hurricane Katrina was particularly devastating. The Louisiana SPCA estimates that 15,500 animals required rescue, and that 80–85 percent of these a...

• [**Air pollution cuts 3 years off lifespans in Northern China**](#) [周二, 12 9月 03:09]

A Chinese policy is unintentionally causing people in northern China to live 3.1 years less than people in the south due to air pollution concentrations that are 46 percent higher. These findings imply that every additional 10 micrograms per cubic meter of particulate matter pollution (PM10) reduces life expectancy by 0.6 years.

• [**Urban climate change**](#) [周二, 12 9月 03:09]

Southern cities such as Houston and Tampa -- which faced the wrath of hurricanes Harvey and Irma, respectively -- may not be the only urban environments vulnerable to extreme weather. Northern cities also face the potential for flooding as global temperatures continue to warm.

[. Earthquake triggers 'slow motion' quakes in New Zealand](#) [周二, 12 9月 00:27]

Slow slip events, a type of slow motion earthquake that occurs over days to weeks, are thought to be capable of triggering larger, potentially damaging earthquakes. In a new study, scientists have documented the first clear-cut instance of the reverse -- a massive earthquake immediately triggering a series of large slow slip events.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [Converting waste toilet paper into electricity](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

- [A drone for last-centimeter delivery](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

- [Tough stuff: Spider silk enhanced with graphene-based materials](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [Immune system linked to alcohol drinking behavior](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- [Wolves understand cause and effect better than dogs](#) [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

- [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics

of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Physicists offer explanation for diverse galaxy rotations**](#) [周五, 15 9月 03:22]

Physicists have found a simple and viable explanation for the diversity observed in galactic rotations. They report that diverse galactic-rotation curves, a graph of rotation speeds at different distances from the center, can be naturally explained if dark matter particles are assumed to strongly collide with one another in the inner halo, close to the galaxy's center -- a process called dark matter self-interaction.

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**Long-range communication barrier for near-zero-power devices shattered**](#) [周四, 14 9月 07:30]

Researchers have demonstrated for the first time that devices that run on almost zero power can transmit data across distances of up to 2.8 kilometers -- breaking a long-held barrier and potentially enabling a vast

array of interconnected devices.

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**'The dark side' of quantum computers**](#) [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

- [**Squirrels use 'chunking' to organize their favorite nuts**](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

- [**The beam of invisibility**](#) [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

- [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

- [**Earthquake faults may have played key role in shaping the culture of ancient Greece**](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

· [AI -- Engineering: merging, morphing, mobile robots](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

· [Looking stressed can help keep the peace](#) [周一, 11 9月 21:59]

Scratching may have evolved as a communication tool to help social cohesion, new research suggests for the first time.

- [**Solar-to-fuel system recycles CO2 to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [**Copper catalyst yields high efficiency CO2-to-fuels conversion**](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of a creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [**When it comes to the threat of extinction, size matters**](#) [周二, 19 9月 01:27]

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

- [**RNA discovery could help boost plant heat, drought tolerance**](#) [周二, 19 9月 00:35]

The discovery of a RNA that can increase drought and salt tolerance in thale cress could illuminate a new research approach and hold implications for other plants, including food crops.

- [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

• [**Urgent emission reductions needed to achieve 1.5°C warming limit**](#) [周一, 18 9月 23:18]

Significant emission reductions are required if we are to achieve one of the key goals of the Paris Agreement, and limit the increase in global average temperatures to 1.5°C; a new partnership warns.

• [**Changes in Earth's crust caused oxygen to fill the atmosphere**](#) [周一, 18 9月 23:18]

New research has uncovered a direct link between changes in the earth's crust three billion years ago and the introduction of free oxygen to the atmosphere. Without these changes, oxygen could have been suppressed in earth's crust forever, so the findings help explain the emergence of life on our planet.

• [**Dogs' social skills linked to oxytocin sensitivity**](#) [周一, 18 9月 23:18]

The tendency of dogs to seek contact with their owners is associated with genetic variations in sensitivity for the hormone oxytocin, according to a new study. The results contribute to our knowledge of how dogs have changed during their development from wolf to household pet.

• [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

- [**Vaping doubles risk of smoking cigarettes for teens**](#) [周一, 18 9月 21:07]

Teenagers who try e-cigarettes double their risk for smoking tobacco cigarettes, according to a new study. The study found that students in grades seven to 12 who had tried an e-cigarette are 2.16 times more likely to be susceptible to cigarette smoking.

- [**NASA's Cassini spacecraft ends its historic exploration of Saturn**](#) [周六, 16 9月 22:30]

A thrilling epoch in the exploration of our solar system has come to a close, as NASA's Cassini spacecraft made a fateful plunge into the atmosphere of Saturn, ending its 13-year tour of the ringed planet. Cassini's plunge brings to a close a series of 22 dives between Saturn and its rings, a feat never before attempted by any spacecraft.

- [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

- [**Light on exoplanets may be quite different from Earth: Different photosynthesis?**](#) [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxygenic phototrophs are most likely to have evolved

underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

- [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Arctic sea ice once again shows considerable melting**](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

• [**Skin patch dissolves 'love handles' in mice**](#) [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

• [**Wolves understand cause and effect better than dogs**](#) [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

• [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

• [**Biomarkers in the blood prove strong role of food for type 2 diabetes**](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

• [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**Plant geneticists develop a new application of CRISPR to break yield barriers in crops**](#) [周五, 15 9月 03:23]

Scientists have finally harnessed the untapped power of genome editing to improve agricultural crops. In the tomato plant they have mobilized CRISPR to rapidly generate variants of the plant displaying a continuum of three agriculturally important traits: fruit size, branching architecture and overall plant shape. All are major components in determining yield. The method is designed to work in all food, feed, and fuel crops, including staples rice, maize, sorghum and wheat.

- [**Old fish few and far between under fishing pressure**](#) [周五, 15 9月 03:23]

A new study has found that, for dozens of fish populations around the globe, old fish are greatly depleted -- mainly because of fishing pressure. Old fish are increasingly missing in many populations around the world.

- [**Huge genetic diversity among Papuan New Guinean peoples revealed**](#) [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- ['Handedness' in scale-eating fish: Nature and nurture](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

Solar-to-fuel system recycles CO₂ to make ethanol and ethylene: Efficient, light-powered production of fuel via artificial photosynthesis -- ScienceDaily

Scientists at the Department of Energy's Lawrence Berkeley National Laboratory (Berkeley Lab) have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant milestone in the effort to move toward sustainable sources of fuel.

Many systems have successfully reduced carbon dioxide to chemical and fuel precursors, such as carbon monoxide or a mix of carbon monoxide and hydrogen known as syngas. This new work, described in a study published in the journal *Energy and Environmental Science*, is the first to successfully demonstrate the approach of going from carbon dioxide directly to target products, namely ethanol and ethylene, at energy conversion efficiencies rivaling natural counterparts.

The researchers did this by optimizing each component of a photovoltaic-electrochemical system to reduce voltage loss, and creating new materials when existing ones did not suffice.

"This is an exciting development," said study principal investigator Joel Ager, a Berkeley Lab scientist with joint appointments in the Materials Sciences and the Chemical Sciences divisions. "As rising atmospheric CO₂ levels change Earth's climate, the need to develop sustainable sources of power has become increasingly urgent. Our work here shows that we have a plausible path to making fuels directly from sunlight."

That sun-to-fuel path is among the key goals of the Joint Center for Artificial Photosynthesis (JCAP), a DOE Energy Innovation Hub established in 2010 to advance solar fuel research. The study was conducted at JCAP's Berkeley Lab campus.

The initial focus of JCAP research was tackling the efficient splitting of water in the photosynthesis process. Having largely achieved that task using several types of devices, JCAP scientists doing solar-driven carbon dioxide reduction began setting their sights on achieving efficiencies similar to those

demonstrated for water splitting, considered by many to be the next big challenge in artificial photosynthesis.

Another research group at Berkeley Lab is tackling this challenge by focusing on a specific component in a photovoltaic-electrochemical system. In a study published today, they describe a new catalyst that can achieve carbon dioxide to multicarbon conversion using record-low inputs of energy.

Not just for noon

For this JCAP study, researchers engineered a complete system to work at different times of day, not just at a light energy level of 1-sun illumination, which is equivalent to the peak of brightness at high noon on a sunny day. They varied the brightness of the light source to show that the system remained efficient even in low light conditions.

When the researchers coupled the electrodes to silicon photovoltaic cells, they achieved solar conversion efficiencies of 3 to 4 percent for 0.35 to 1-sun illumination. Changing the configuration to a high-performance, tandem solar cell connected in tandem yielded a conversion efficiency to hydrocarbons and

oxygenates exceeding 5 percent at 1-sun illumination.

"We did a little dance in the lab when we reached 5 percent," said Ager, who also holds an appointment as an adjunct professor at UC Berkeley's Materials Science and Engineering Department.

Among the new components developed by the researchers are a copper-silver nanocoral cathode, which reduces the carbon dioxide to hydrocarbons and oxygenates, and an iridium oxide nanotube anode, which oxidizes the water and creates oxygen.

"The nice feature of the nanocoral is that, like plants, it can make the target products over a wide range of conditions, and it is very stable," said Ager.

The researchers characterized the materials at the National Center for Electron Microscopy at the Molecular Foundry, a DOE Office of Science User Facility at Berkeley Lab. The results helped them understand how the metals functioned in the bimetallic cathode. Specifically, they learned that silver aids in the reduction of carbon dioxide to carbon monoxide, while the copper picks up from there to reduce carbon monoxide further to hydrocarbons and alcohols.

Seeking better, low-energy breakups

Because carbon dioxide is a stubbornly stable molecule, breaking it up typically involves a significant input of energy.

"Reducing CO₂ to a hydrocarbon end product like ethanol or ethylene can take up to 5 volts, start to finish," said study lead author Gurudayal, postdoctoral fellow at Berkeley Lab. "Our system reduced that by half while maintaining the selectivity of products."

Notably, the electrodes operated well in water, a neutral pH environment.

"Research groups working on anodes mostly do so using alkaline conditions since anodes typically require a high pH environment, which is not ideal for the solubility of CO₂," said Gurudayal. "It is very difficult to find an anode that works in neutral conditions."

The researchers customized the anode by growing the iridium oxide nanotubes on a zinc oxide surface to create a more uniform surface area to better support chemical reactions.

"By working through each step so carefully, these researchers demonstrated a level of performance and efficiency that people did not think was possible at this point," said Berkeley Lab chemist Frances Houle, JCAP deputy director for Science and Research Integration, who was not part of the study. "This is a big step forward in the design of devices for efficient CO₂ reduction and testing of new materials, and it provides a clear framework for the future advancement of fully integrated solar-driven CO₂-reduction devices."

Copper catalyst yields high efficiency CO₂-to-fuels conversion: Critical role of nanoparticle transformation discovered -- ScienceDaily

Scientists at the Department of Energy's Lawrence Berkeley National Laboratory (Berkeley Lab) have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies coming out of Berkeley Lab tackling the challenge of creating a clean chemical manufacturing system that can put carbon dioxide to good use.

In the new study, published this week in the *Proceedings of the National Academy of Sciences (PNAS)*, a team led by Berkeley Lab scientist Peidong Yang discovered that an electrocatalyst made up of copper nanoparticles provided the conditions necessary to break down carbon dioxide to form ethylene, ethanol, and propanol.

All those products contain two to three carbon atoms, and all are considered high-value products in modern life. Ethylene is the basic ingredient used to make plastic films and bottles as well as polyvinyl chloride (PVC) pipes. Ethanol, commonly made from biomass, has already established its place as a biofuel additive for gasoline. While propanol is a very effective fuel, it is currently too costly to manufacture to be used for that purpose.

To gauge the energy efficiency of the catalyst, scientists consider the thermodynamic potential of products -- the amount of energy that can be gained in an electrochemical reaction -- and the amount of extra voltage needed above that thermodynamic potential to drive the reaction at sufficient reaction rates. That extra voltage is called the overpotential; the lower the overpotential, the more efficient the catalyst.

"It is now quite common in this field to make catalysts that can produce multicarbon products from CO₂, but those processes typically operate at high overpotentials of 1 volt to attain appreciable amounts," said Yang, a senior faculty scientist at Berkeley Lab's Materials Sciences Division. "What we are reporting here is much more challenging. We discovered a catalyst for

carbon dioxide reduction operating at high current density with a record low overpotential that is about 300 millivolts less than typical electrocatalysts."

Cube-like copper catalyst

The researchers characterized the electrocatalyst at Berkeley Lab's Molecular Foundry using a combination of X-ray photoelectron spectroscopy, transmission electron microscopy, and scanning electron microscopy.

The catalyst consisted of tightly packed copper spheres, each about 7 nanometers in diameter, layered on top of carbon paper in a densely packed manner. The researchers found that during the very early period of electrolysis, clusters of nanoparticles fused and transformed into cube-like nanostructures. The cube-like shapes ranged in size from 10 to 40 nanometers.

"It is after this transition that the reactions to form multicarbon products are occurring," said study lead author Dohyung Kim, a graduate student in Berkeley Lab's Chemical Sciences Division and at UC Berkeley's Department of Materials Science and Engineering. "We tried to start off with pre-formed

nanoscale copper cubes, but that did not yield significant amounts of multicarbon products. It is this real-time structural change from copper nanospheres to the cube-like structures that is facilitating the formation of multicarbon hydrocarbons and oxygenates."

Exactly how that is happening is still unclear, said Yang, who is also a professor at UC Berkeley's Department of Materials Science and Engineering.

"What we know is that this unique structure provides a beneficial chemical environment for CO₂ conversion to multicarbon products," he said. "The cube-like shapes and associated interface may be providing an ideal meeting place where the carbon dioxide, water, and electrons can come together."

Many paths in the CO₂-to-fuel journey

This latest study exemplifies how carbon dioxide reduction has become an increasingly active area in energy research over the past several years. Instead of harnessing the sun's energy to convert carbon dioxide into plant food, artificial photosynthesis seeks to use the same starting ingredients to produce chemical precursors commonly used in synthetic products as

well as fuels like ethanol.

Researchers at Berkeley Lab have taken on various aspects of this challenge, such as controlling the product that comes out of the catalytic reactions. For instance, in 2016, a hybrid semiconductor-bacteria system was developed for the production of acetate from CO₂ and sunlight. Earlier this year, another research team used a photocatalyst to convert carbon dioxide almost exclusively to carbon monoxide. More recently, a new catalyst was reported for the effective production of synthesis gas mixtures, or syngas.

Researchers have also worked on increasing the energy efficiency of carbon dioxide reduction so that systems can be scaled up for industrial use.

A recent paper led by Berkeley Lab researchers at the Joint Center for Artificial Photosynthesis leverages fundamental science to show how optimizing each component of an entire system can accomplish the goal of solar-powered fuel production with impressive rates of energy efficiency.

This new *PNAS* study focuses on the efficiency of the catalyst rather than an entire system, but the

researchers point out that the catalyst can be hooked up to a variety of renewable energy sources, including solar cells.

"By utilizing values already established for other components, such as commercial solar cells and electrolyzers, we project electricity-to-product and solar-to-product energy efficiencies up to 24.1 and 4.3 percent for two-to-three carbon products, respectively," said Kim.

Kim estimates that if this catalyst were incorporated into an electrolyzer as part of a solar fuel system, a material only 10 square centimeters could produce about 1.3 grams of ethylene, 0.8 grams of ethanol, and 0.2 grams of propanol a day.

"With continued improvements in individual components of a solar fuel system, those numbers should keep improving over time," he said.

When it comes to the threat of extinction, size matters: Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale -- ScienceDaily

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

Reporting today in the *Proceedings of the National Academy of Sciences*, researchers who determined body masses for thousands of vertebrate animal species showed that the largest and smallest species face a greater risk of extinction than do mid-sized animals.

Disproportionate losses at the large and small ends of the scale raise the likelihood of significant changes to the way natural ecosystems function in forests,

grasslands, oceans and even rivers and streams -- "the living architecture of the planet," the researchers wrote.

"Knowing how animal body size correlates with the likelihood of a species being threatened provides us with a tool to assess extinction risk for the many species we know very little about," said William Ripple, a distinguished professor of ecology at Oregon State University and lead author of the study.

Ripple and colleagues from the United States, Australia and Switzerland looked at the more than 27,000 vertebrate animal species assessed by the International Union for the Conservation of Nature in the so-called Red List. About 4,400 are threatened with extinction.

Among the groups of animals evaluated were birds, reptiles, amphibians, bony fishes, cartilaginous fishes (mostly sharks and rays) and mammals.

The largest animals are threatened principally with harvesting by humans. "Many of the larger species are being killed and consumed by humans, and about 90 percent of all threatened species larger than 2.2 pounds (1 kilogram) in size are being threatened by harvesting," said Ripple.

"Harvesting of these larger animals takes a variety of forms including regulated and unregulated fishing, hunting and trapping for meat consumption, the use of body parts as medicine and killing due to unintentional bycatch," the authors wrote.

Meanwhile, threats to the smallest animals may be grossly underestimated. The smallest species with high extinction risk consist of tiny vertebrate animals generally less than about 3 ounces (77 grams) in body weight. These diminutive species are mostly threatened by loss or modification of habitat. Examples include the Clarke's banana frog, sapphire-bellied hummingbird, gray gecko, hog-nosed bat and the waterfall climbing cave fish. Small species that require freshwater habitats are especially imperiled.

Different conservation strategies will be needed to address threats to the largest and smallest animals, the scientists said. Well known mammals at the large end of the scale -- whales, elephants, rhinos, lions -- have been the target of protection programs, but conservation attention is also needed for large-bodied species that are not mammals. They include large fish, birds, amphibians and reptiles such as the whale shark, Atlantic sturgeon, Somali ostrich, Chinese giant

salamander and the Komodo dragon.

Human activity seems poised to chop off both the head and tail of the size distribution of life, the authors added, which will fundamentally restructure many ecological communities.

RNA discovery could help boost plant heat, drought tolerance -- ScienceDaily

Texas A&M; AgriLife Research scientists have discovered a ribonucleic acid, or RNA, that can increase the thale cress plant's resistance to stress from drought and salt.

The discovery could help illuminate a new pathway to engineering drought- and salt-tolerant plants, including food crops, said Dr. Liming Xiong, AgriLife Research associate professor, Dallas.

"This is the first finding of a long non-coding RNA, or lncRNA, that regulates plant tolerance to adverse, non-physiological external factors," Xiong said.

The lncRNA his team discovered in thale cress plants existed in low numbers under non-stress conditions, but levels increased when the plants encountered drought or salt stress, he said. Manually increasing the level of the lncRNA showed corresponding increases in drought and salt tolerance compared with plants where the lncRNA level was unaltered.

Most RNA direct or "code" cell machinery to produce proteins. Non-coding RNA, or ncRNA, does not direct protein production but could affect how gene expressions manifest in innumerable other ways. As such, they are considered regulators of important biological processes, Xiong said.

"And there are different types of ncRNA," he said. "Small ncRNA have received much attention in recent years, but in many long, or lncRNA, like the one we found to affect drought and salt tolerance in thale cress, the biological functions remain unknown."

The basic difference between small and long non-coding RNA is the number of nucleotides -- the structural building blocks of RNA. Long have more.

Xiong said investigating the effects of lncRNA is a novel approach to plant drought and salt tolerance research.

"Most of the current work on improving plant stress tolerance does not focus on lncRNA but on the genes that code protein production," he said. "However, manipulation of those protein-encoding genes often impairs plant growth and development."

But the lncRNA studied by Xiong's team can be tweaked without any apparent detriment to the plant's health, he said.

"It's early still, but we could be on the brink of a whole new approach to engineering drought and salt tolerance in plants, including food plants," Xiong said. "Our next step will be to engineer the lncRNA levels in plants other than thale cress and to test whether it might improve drought and salt tolerance across a broader spectrum."

More evidence of water on Mars: New Geological Society of America Bulletin paper -- ScienceDaily

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

These deposits are observable with satellite images because they have undergone a process called "topographic inversion," where the deposits filling once topographically low river channels have been exhumed in such a way that they now exist as ridges at the surface of the planet.

With the use of high-resolution images and topographic data from cameras on orbiting satellites, B.T. Cardenas and colleagues from the Jackson School of Geosciences identify fluvial deposit stacking patterns and changes in sedimentation styles controlled

by a migratory coastline. They also develop a method to measure river paleo-transport direction for a subset of these ridges.

Together, these measurements demonstrate that the studied river deposits once filled incised valleys. On Earth, incised valleys are commonly cut and filled during falling and rising eustatic sea level, respectively.

Cardenas and colleagues conclude that similar falling and rising water levels in a large water body forced the formation of the paleo-valleys in their study area. Cross-cutting relationships are observed at the valley-scale, indicating multiple episodes of water level fall and rise, each well over 50 meters, a similar scale to eustatic sea level changes on Earth.

The conclusion that such large water level fluctuations and coastline movements were recorded by these river deposits suggests some long-term stability in the controlling, downstream water body, which would not be expected from catastrophic hydrologic events.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Blood tests: Sound waves separate biological nanoparticles for 'liquid biopsies'**](#) [周二, 19 9月 04:34]

A prototype device developed by an international team of engineers can sift exceedingly tiny particles called exosomes from blood samples without having to send samples off to a lab. The device, which combines acoustic cell-sorting and microfluidic technologies, could be a boon to both scientific research and medical applications.

- [**Potential pathway to treat flesh-eating bacteria**](#) [周二, 19 9月 04:33]

Researchers have solved a 100-year-old mystery, providing them a possible key to unlock a pathway for treating diseases caused by flesh-eating bacteria. Medical researchers have found a critical target on which to focus for developing a potential Group A Streptococcus vaccine or antibiotic to fight it. By manipulating this target, they hope to either reduce the severity of these infections or clear them up faster.

- [**How patients are likely to respond to DNA drugs**](#) [周二, 19 9月 02:31]

Research could lead to improvements in treating patients with diseases caused by mutations in genes, such as cancer, cystic fibrosis and potentially up to 6,000 other inherited conditions.

- [**Reliance on 'gut feelings' linked to belief in fake news**](#) [周二, 19 9月 02:21]

People who tend to trust their intuition or to believe that the facts they hear are politically biased are more likely to stand behind inaccurate beliefs, a new study suggests.

- [**HIV risk and individual and community level educational status**](#) [周二, 19 9月 02:21]

African-American men who have sex with men (MSM) remain at heightened risk for HIV infection and account for the largest number of African-Americans living with HIV/AIDS. It has long been understood that there is a clear and persistent association between poverty, transactional sex behavior, and HIV risk. A new study has investigated how educational status relates to HIV risk in this population.

- [**Why bad sleep doesn't always lead to depression**](#) [周二, 19 9月 01:27]

Poor sleep is both a risk factor, and a common symptom, of depression. But not everyone who tosses and turns at night becomes depressed. Individuals whose brains are more attuned to rewards may be protected from the negative mental health effects of poor sleep, says a new study.

- [**People's love of the seas could be the key for plastic pollution solution**](#) [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to reducing the threats to it posed by plastic pollution.

- [**Re-interventions are common in long-term survivors of childhood heart operation**](#) [周二, 19 9月 00:35]

Among patients who undergo childhood heart surgery for the severe birth defect single-ventricle disease, two-thirds of survivors require a surgical or catheter-based procedure within 20 years. Pediatric cardiology researchers note that doctors should counsel families about the likelihood of re-interventions.

- [**To predict how climate change will affect disease, researchers must fuse climate science and biology**](#) [周二, 19 9月 00:35]

To predict how climate change will affect disease, researchers must fuse climate science and biology, according to a new review.

- [**Myth Debunked that OCD Is Associated With**](#)

[Superior Intelligence](#) [周二, 19 9月 00:35]

Researchers conducted a meta-analysis of all the available literature on IQ in OCD samples versus non-psychiatric controls (98 studies), and found that contrary to the prevailing myth, OCD is not associated with superior IQ, but with normative IQ that is slightly lower compared to control samples. The authors suggested that the small reduction in IQ scores in OCD sufferers may be largely attributed to OCD-related slowness and not to intellectual ability.

• [Eight children born after uterus transplants](#) [周二, 19 9月 00:35]

Eight children born -- and the first robot-assisted operation performed. These are some of the results of 18 years of research on uterus transplants.

• [New assay leads to step toward gene therapy for deaf patients](#) [周二, 19 9月 00:35]

Scientists at have taken an important step toward gene therapy for deaf patients by developing a way to better study a large protein essential for hearing and finding a truncated version of it.

• [MicroRNA helps cancer evade immune system](#) [周二, 19 9月 00:35]

Researchers have discovered how oxygen-deprived tumors survive body's immune response, explains a new report.

• [Biologists identify gene involved in kidney-related birth defects](#) [周二, 19 9月 00:35]

Researchers have identified a gene linked to rare kidney-related birth defects. When working properly, a gene called GREB1L activates a cascade of signals that ultimately tells other genes what they need to do to create a kidney.

• [Video game boosts sex health IQ and attitudes in minority teens](#) [周一, 18 9月 23:18]

A video game to promote health and reduce risky behavior in teens improves sexual health knowledge and attitudes among minority youth, according to a new study. The findings validate the value of the video

game as a tool to engage and educate teens at risk for HIV and other sexually transmitted infections, said the researchers.

- [**Genomic recycling: Ancestral genes take on new roles**](#) [周一, 18 9月 23:18]

One often hears about the multitude of genes we have in common with chimps, birds or other living creatures, but such comparisons are sometimes misleading. The shared percentage usually refers only to genes that encode instructions for making proteins -- while overlooking regulatory genes, which nonetheless make up a large part of the genome.

- [**How bacteria hinder chemotherapy**](#) [周一, 18 9月 22:06]

Scientists have found bacteria in pancreatic tumors that metabolize a common drug, explains a new report.

- [**Altitude training for cancer-fighting cells**](#) [周一, 18 9月 22:06]

Oxygen starvation could toughen up immune T cells for cancer immunotherapy, reports a team of investigators.

- [**Antimalarial drug combined with light sensitive molecules for promising treatment of cancer**](#) [周一, 18 9月 21:33]

Scientists have discovered that a combination of artemisinin, which is a potent anti-malarial drug, and aminolaevulinic acid, which is a photosensitizer, could kill colorectal cancer cells and suppress tumor growth more effectively than administering artemisinin alone. This novel combination therapy could also have fewer side effects.

- [**Cells programmed like computers to fight disease**](#) [周一, 18 9月 21:33]

Cells can be programmed like a computer to fight cancer, influenza, and other serious conditions -- thanks to a breakthrough in synthetic biology.

- [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to

secondary particles and ozone can be traced back to excess NO_x emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NO_x as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**Parents not confident schools can assist child with chronic disease, mental health**](#) [周一, 18 9月 21:08]

Most parents are sure schools would be able to provide basic first aid but are less confident about a school's ability to respond to more complex health situations, such as an asthma attack or mental health problem.

- [**People with schizophrenia are dying younger**](#) [周一, 18 9月 21:08]

People with schizophrenia have a mortality rate that is three times greater each year than those without schizophrenia, and die on average, eight years earlier than people without schizophrenia according to a new study.

- [**A fat-regulating enzyme could hold the key to obesity, diabetes, cancer, other diseases**](#) [周一, 18 9月 21:07]

It had already been known that the enzyme known as phosphatidic acid phosphatase plays a crucial role in regulating the amount of fat in the human body. Controlling it is therefore of interest in the fight against obesity. But scientists have now found that getting rid of the enzyme entirely can increase the risk of cancer, inflammation and other ills.

- [**Congenital hyperinsulinism: A serious yet poorly understood condition**](#) [周一, 18 9月 21:07]

Diabetes is characterized by a deficiency of insulin. The opposite is the case in congenital hyperinsulinism: patients produce the hormone in excessive quantities. This leads to chronic hypoglycemia. The disorder can lead to serious brain damage and even death in the worst cases.

- [**Genetically altered mice bear some hallmarks of human bipolar behavior**](#) [周一, 18 9月 21:07]

Researchers have genetically engineered mice that display many of the

behavioral hallmarks of human bipolar disorder, and that the abnormal behaviors the rodents show can be reversed using well-established drug treatments for bipolar disorder, such as lithium.

- [**HIV-AIDS: Following your gut**](#) [周一, 18 9月 21:07]

Researchers find a way to reduce replication of the AIDS virus in the gastrointestinal tract.

- [**Membrane vesicles released by bacteria may play different roles during infection**](#) [周一, 18 9月 21:07]

Bacteria release membrane-derived vesicles (MVs), which are small particles that can transport virulence factors to neighboring bacteria or to the cells of a mammalian host. This special MV-based system for delivering toxic proteins and nucleic acids in a protected manner to the target cells may have different specific functions depending on whether the bacterium acts as an extracellular or intracellular pathogen.

- [**Vaping doubles risk of smoking cigarettes for teens**](#) [周一, 18 9月 21:07]

Teenagers who try e-cigarettes double their risk for smoking tobacco cigarettes, according to a new study. The study found that students in grades seven to 12 who had tried an e-cigarette are 2.16 times more likely to be susceptible to cigarette smoking.

- [**American Academy of Pediatrics announces its first recommendations on tattoos, piercings**](#) [周一, 18 9月 21:06]

Tattoos and body piercings are an increasingly popular form of self-expression, but it is important for young people to carefully consider the consequences and potential risks associated with body modifications, according to the first clinical report on the topic.

- [**High blood pressure reasons differ by gender in teens; young adults**](#) [周一, 18 9月 03:10]

Gender matters when it comes to what's most likely to elevate blood pressure in young to middle-aged adults. The volume of blood pumped from the left ventricle during heartbeats, i.e., stroke volume, is the main

determinant of blood pressure levels in women, while blood pressure in men is more likely to be determined by the amount of resistance in the body's blood vessels.

- [**Blood pressure better controlled with 'MAP' for doctors**](#) [周一, 18 9月 03:09]

Primary care practices using the Measure accurately, Act rapidly and Partner with patients (MAP) program drove down hypertension rates among patients. In six months of MAP, hypertension control rose from 65.6 percent to 74.8 percent, among more than 21,000 hypertension patients at US primary care practices.

- [**Teens also at risk for organ damage from high blood pressure**](#) [周一, 18 9月 03:09]

Organ damage from high blood pressure doesn't only occur in adults; it can also happen in teenagers, according to new research.

- [**Sugary secrets of a cancer-related protein**](#) [周一, 18 9月 00:03]

The proteins in human cells are extensively decorated with different types of sugars, a phenomenon called glycosylation. These modifications greatly increase the diversity of protein structure and function, affecting how proteins fold, how they behave, and where they go in cells. New research demonstrates that a rare type of glycosylation profoundly affects the function of a protein important for human development and cancer progression.

- [**Fertility research brings death of dogma, birth of hope**](#) [周六, 16 9月 20:01]

A new study shows unequivocally that stem cells in the ovaries are a critical piece of the mammal fertility puzzle, and may be harnessed to revolutionize fertility treatments and perhaps even delay menopause.

- [**Hormone replacement therapy can slow decline in lung function for middle-aged women**](#) [周六, 16 9月 05:05]

Hormone replacement therapy (HRT) can slow the decline in lung function in middle-aged women, according to new research.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.

- [**Differences in aggression among people with dementia**](#) [周六, 16 9月 04:50]

Physical aggression among people with dementia is not unusual. A study showed that one-third of patients with the diagnosis Alzheimer's disease or frontotemporal dementia were physically aggressive towards healthcare staff, other patients, relatives, animals and complete strangers. This manifestation of disease must be both understood and addressed in the right way.

- [**Teens come 'jet lagged' to school: Shifting sleeping patterns at weekends**](#) [周六, 16 9月 04:48]

A lack of sleep is associated with more absence and teens turn up jet lagged to school on Mondays, as shown in new research.

- [**Innate immunity: To operate, insert dimers**](#) [周六, 16 9月 04:46]

The presence of DNA in mammalian cell cytoplasm triggers an immune response by binding to a dimeric enzyme, which inserts between DNA double helices to form the "rungs" of a ladder-like structure, as an LMU team has now shown.

- [**Memory decline after head injury may be prevented by slowing brain cell growth**](#) [周六, 16 9月 02:42]

Scientists say a new study indicates that the excessive burst of new brain cells after a traumatic head injury that researchers have traditionally believed helped in recovery could instead lead to epileptic seizures and long-term cognitive decline.

- [**The body's own fat-metabolism protects against the harmful effects of sugar**](#) [周六, 16 9月 02:41]

Researchers have discovered that the fat-metabolism in the cells takes place simultaneously with a detoxification of the harmful substances from the blood sugar, which can avert the damage that can in turn lead

to age-related diseases such as diabetes, Alzheimer's and cancer. This indicates that we have a detoxification system which we were not previously aware of.

- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Immune system linked to alcohol drinking behavior**](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- [**Time to dial back on diabetes treatment in older patients? Study finds 11 percent are overtreated**](#) [周六, 16 9月 02:41]

Almost 11 percent of Medicare participants with diabetes had very low blood sugar levels that suggested they were being over-treated, a new study finds. But only 14 percent of these patients had a reduction in blood sugar medication refills in the next six months.

- [**Quality initiatives can reduce harm to newborns, shorten hospital stay and save millions**](#) [周六, 16 9月 02:41]

A quality-improvement initiative at a neonatal intensive care unit finds that chest X-rays can be performed just twice weekly, lessening the chances of a breathing tube popping out accidentally, reducing infants' exposure to radiation and saving an estimated \$1.6 million per year.

- [**Couples weather bickering with a little help from their friends**](#) [周六, 16 9月 02:41]

New research finds that having good friends and family members to turn to alleviates the stress of everyday conflict between marital partners. Social networks may help provide protection against health problems brought about by ordinary tension between spouses.

- [**Decreased glucose metabolism in medial prefrontal areas is associated with nutritional status in patients with prodromal and early Alzheimer's disease**](#) [周六, 16 9月 02:41]

A new study shows that hypometabolism in the medial prefrontal areas is specifically associated with Alzheimer's disease-related nutritional problems, and decrease in fat mass may have a key role.

- [**Medical students not trained to prescribe medical marijuana**](#) [周六, 16 9月 02:41]

More than half of the states in the US now allow some type of legal marijuana use, primarily medical marijuana. But, in a survey of medical residents and deans at the nation's medical schools, researchers have found that the majority of schools are not teaching their students about medical marijuana, and the majority of students don't feel prepared to discuss the subject with patients.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [2-D Electronics' metal or semiconductor? Both](#) [周二, 19 9月 04:15]

Researchers produced the first 2-D field-effect transistor (FET) made of a single material.

- [Solar-to-fuel system recycles CO2 to make ethanol and ethylene](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [Copper catalyst yields high efficiency CO2-to-fuels conversion](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of a creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [New quantum phenomena in graphene superlattices](#) [周二, 19 9月 00:36]

Researchers have just shown the first new type of quantum oscillation to be reported for thirty years. It is the first of its kind to be present at high temperature and on the mesoscale and sheds light on the Hofstadter butterfly phenomenon.

- [Just squeeze in -- when spaces are tight, nature](#)

[loosens its laws](#) [周二, 19 9月 00:35]

It turns out that when they're in a hurry and space is limited, ions, like people, will find a way to cram in -- even if that means defying nature's norms. Researchers have now shown that the charged particles will actually forgo their 'opposites attract' behavior, called Coulombic ordering, when confined in the tiny pores of a nanomaterial.

• [Step towards better 'beyond lithium' batteries](#) [周二, 19 9月 00:35]

A step towards new 'beyond lithium' rechargeable batteries with superior performance has been made.

• [Scalable process discovered to produce structural colors inspired by bird feathers](#) [周二, 19 9月 00:35]

Researchers made nano-sized balls of melanin aggregate into clusters called supraballs. Melanin appears black in individual nanoparticles. But altering spacing of the nanoparticles in the ball affects how the particles scatter light. A thin silica coating on the outside of melanin nanoparticles acts like a bumper, limiting how close the particles can pack together. Varying the diameter of the melanin core and the thickness of the silica shell creates supraballs in a range of colors.

• [Physicists discover a tri-anion particle with colossal stability](#) [周二, 19 9月 00:35]

Chemists have created the most stable tri-anion particle currently known to science. A tri-anion particle is a combination of atoms that contains three more electrons than protons. This discovery is novel because previously known tri-anion particles were unstable due to their numerical imbalance.

• [A new approach to ultrafast light pulses](#) [周二, 19 9月 00:35]

A team of researchers has found a new way of producing high-speed pulses of light using two-dimensional molecular aggregates, which could enable new photonic devices such as optically based microchips.

• [More evidence of water on Mars](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface

environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

- [**Chemists make playdough/lego-like hybrid to create tiny building blocks**](#) [周一, 18 9月 23:43]

Playdough and Legos are among the most popular childhood building toys. But what could you use if you wanted to create something really small — a structure less than the width of a human hair? It turns out, a team of chemists has found, this can be achieved by creating particles that have both playdough and Lego traits.

- [**Secrets of bright, rapidly spinning star revealed**](#) [周一, 18 9月 23:18]

Almost 50 years after it was first predicted that rapidly rotating stars would emit polarized light, scientists have succeeded in observing the phenomenon for the first time. They have now detected the polarized light from Regulus, one of the brightest stars in the night sky.

- [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

- [**Video game boosts sex health IQ and attitudes in minority teens**](#) [周一, 18 9月 23:18]

A video game to promote health and reduce risky behavior in teens improves sexual health knowledge and attitudes among minority youth, according to a new study. The findings validate the value of the video game as a tool to engage and educate teens at risk for HIV and other sexually transmitted infections, said the researchers.

- [**Developing roads that can generate power from passing traffic**](#) [周一, 18 9月 23:18]

Researchers are looking at advanced materials for roads and pavements

that could generate electricity from passing traffic. Engineers are working on smart materials such as 'piezoelectric' ceramics that when embedded in road surfaces would be able to harvest and convert vehicle vibration into electrical energy.

- [**An original method of cooling ions could have new and interesting uses**](#) [周一, 18 9月 23:18]

When investigating atoms, scientists face a challenge: At room temperature, individual atoms in a gas have kinetic energy, and fly around at large velocities. Temperature is, in essence, the relative movement between atoms; thus the goal of getting the atoms to have small relative velocities involves freezing them to extremely cold temperatures. A group has now developed new universal method for cooling ions.

- [**Wireless high-speed data and power transfer integrated**](#) [周一, 18 9月 23:18]

Researchers have developed a system that can simultaneously deliver watts of power and transmit data at rates high enough to stream video over the same wireless connection. By integrating power and high-speed data, a true single 'wireless' connection can be achieved.

- [**More efficient use of raw materials with the aid of 'molecular conveyor belts'**](#) [周一, 18 9月 21:34]

Making valuable products, such as fuels, synthetic materials or pharmaceuticals, from renewable raw materials is to date not efficient enough because the microorganisms used only process the raw materials very slowly and generate many by-products in addition to the substances actually wanted. Biotechnologists have now succeeded in optimizing sugar utilization in baker's yeast.

- [**Tiny electrically pumped micro-lasers epitaxially grown on industry standard silicon substrates**](#) [周一, 18 9月 21:33]

A group of researchers successfully demonstrated record-small

electrically pumped micro-lasers epitaxially grown on industry standard (001) silicon substrates in a recent study. The thresholds and footprints are orders of magnitude smaller than those previously reported lasers epitaxially grown on Si.

• [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

• [**Devilish source of dust in atmosphere of Earth and Mars**](#) [周一, 18 9月 21:28]

Swirling columns of sand and dust, known as dust devils, are a feature of desert areas on Mars and on Earth. Now, a study of terrestrial dust devils has shown that around two thirds of the fine particles lifted by these vortices can remain suspended in the atmosphere and be transported around the globe. The findings have implications for the climate and weather of both planets and, potentially, human health here on Earth.

• [**World first: 'Storing lightning inside thunder'**](#) [周一, 18 9月 21:07]

In a world first, researchers have stored photonic information on a microchip as an acoustic wave. This allows precious extra time to store, process and then redistribute the data without relying on electronics, which produce excess heat. Such a hybrid chip could have a huge impact in cloud computing and telecommunication centers, which are overheating as we churn through data on our phones.

• [**NASA's Cassini spacecraft ends its historic exploration of Saturn**](#) [周六, 16 9月 22:30]

A thrilling epoch in the exploration of our solar system has come to a close, as NASA's Cassini spacecraft made a fateful plunge into the atmosphere of Saturn, ending its 13-year tour of the ringed planet.

Cassini's plunge brings to a close a series of 22 dives between Saturn and its rings, a feat never before attempted by any spacecraft.

• [**Sensing with a twist: A new kind of optical nanosensor uses torque for signal processing**](#) [周六, 16 9月 20:01]

As electronic devices get smaller, their ability to provide precise, chip-based sensing of dynamic physical properties such as motion become challenging to develop. An international group of researchers have put a literal twist on this challenge, demonstrating a new nanoscale optomechanical resonator that can detect torsional motion at near state-of-the-art sensitivity. Their resonator, into which they couple light, also demonstrates torsional frequency mixing, a novel ability to impact optical e...

• [**Converting waste toilet paper into electricity**](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

• [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

• [**Light on exoplanets may be quite different from Earth: Different photosynthesis?**](#) [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxgenic phototrophs are most likely to have evolved underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs

struggle to adapt to chan...

- [**Tracing the light inside a LED**](#) [周六, 16 9月 04:54]

The performance of white LED's can be improved, based on better knowledge of the absorption and scattering of light inside the LED. A new method can lead to efficiency improvement and powerful design tools.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

- [**Star formation influenced by local environmental conditions**](#) [周五, 15 9月 22:36]

Three scientists have carried out extensive computer simulations related to star formation. They conclude that the present idealized models are lacking when it comes to describing details in the star formation process.

- [**Golf carts causing serious injuries to children**](#) [周五, 15 9月 21:52]

As golf carts become increasingly popular in communities beyond the fairway, new research shows, a significant number of children are being seriously injured while using them.

- [**Skin patch dissolves 'love handles' in mice**](#) [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and

diabetes.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

- [**New insights into nanocrystal growth in liquid**](#) [周五, 15 9月 09:06]

Researchers have measured the forces that cause certain crystals to assemble, revealing competing factors that researchers might be able to control. The work has a variety of implications in both discovery and applied science. In addition to providing insights into the formation of minerals and semiconductor nanomaterials, it might also help scientists understand soil as it expands and contracts through wetting and drying cycles.

- [**Water conservation can have unintended consequences**](#) [周五, 15 9月 03:24]

Conventional wisdom dictates water conservation can only benefit communities affected by drought. But researchers have deduced that indoor residential conservation can have unintended consequences in places where systems of wastewater reuse have already been implemented, diminishing both the quantity and quality of influent available for treatment.

- [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**Discovery could reduce nuclear waste with**](#)

[improved method to chemically engineer molecules](#) [周五, 15 9月 03:23]

A new chemical principle has the potential to revolutionize the creation of specially engineered molecules whose uses include the reduction of nuclear waste and the extraction of chemical pollutants from water and soil.

• [The return of the comet-like exoplanet](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

• [Quantum machine learning](#) [周五, 15 9月 03:23]

Scientists have presented a thorough review on quantum machine learning, its current status and future prospects. The reports contrasts machine learning using classical and quantum resources, identifying opportunities that quantum computing brings to this field.

• [Filtering molecules from the water or air with nanomembranes](#) [周五, 15 9月 03:23]

Free-standing carbon membranes that are a millionth of a millimeter thin. The nanomembranes can serve as ultrafine filters and as a protective layer.

• [Self-healing gold particles](#) [周五, 15 9月 03:23]

Self-healing materials are able to repair autonomously defects, such as scratches, cracks or dents, and resume their original shape. For this purpose, they must be composed of several components whose combined properties result in the desired characteristics. Scientists have now discovered that also tiny particles of pure gold have surprising self-healing capacities.

• [Could interstellar ice provide the answer to](#)

birth of DNA? [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

• **Google Glass app helps autistic children with social interactions** [周五, 15 9月 03:22]

A new study demonstrates the potential of wearable technology as a social-skills aid for children with autism spectrum disorder.

• **The bilingual brain calculates differently depending on the language used** [周五, 15 9月 03:22]

How do multilingual people solve arithmetical tasks presented to them in different languages? The question will gain in importance in the future, as an increasingly globalized job market and accelerated migration will mean that ever more people seek work and study outside of the linguistic area of their home countries.

• **Hubble observes pitch black planet** [周五, 15 9月 03:22]

Astronomers have discovered that the well-studied exoplanet WASP-12b reflects almost no light, making it appear essentially pitch black. This discovery sheds new light on the atmospheric composition of the planet and also refutes previous hypotheses about WASP-12b's atmosphere. The results are also in stark contrast to observations of another similarly sized exoplanet.

• **Physicists offer explanation for diverse galaxy rotations** [周五, 15 9月 03:22]

Physicists have found a simple and viable explanation for the diversity observed in galactic rotations. They report that diverse galactic-rotation curves, a graph of rotation speeds at different distances from the center, can be naturally explained if dark matter particles are assumed to strongly collide with one another in the inner halo, close to the galaxy's center -- a process called dark matter self-interaction.

• **Hydrogen power moves a step closer** [周五, 15 9月 03:22]

Physicists are developing methods of creating renewable fuel from water

using quantum technology. Renewable hydrogen can already be produced by photoelectrolysis where solar power is used to split water molecules into oxygen and hydrogen. But fundamental problems remain before this can be adopted commercially due to inefficiency. A new study demonstrates that the novel use of nanostructures could increase the maximum photovoltage generated in a photoelectrochemical cell, increasing the productivi...

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [Potential pathway to treat flesh-eating bacteria](#) [周二, 19 9月 04:33]

Researchers have solved a 100-year-old mystery, providing them a possible key to unlock a pathway for treating diseases caused by flesh-eating bacteria. Medical researchers have found a critical target on which to focus for developing a potential Group A Streptococcus vaccine or antibiotic to fight it. By manipulating this target, they hope to either reduce the severity of these infections or clear them up faster.

- [Solar-to-fuel system recycles CO2 to make ethanol and ethylene](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [Copper catalyst yields high efficiency CO2-to-fuels conversion](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [A cereal crop survives heat and drought](#) [周二, 19 9月 02:30]

Scientists have published the genome sequence of Pearl millet, a drought resistant crop plant most important in arid regions in Africa and Asia. This plant is important to small and medium farmers who grow the plant

without larger irrigation. Pearl millet delivers a good harvest index under drought and heat conditions when rice, maize or wheat already have no grains anymore.

- [**'King Tide' mapping project**](#) [周二, 19 9月 02:21]

'Dress rehearsal' will help quantify local flooding risk and validate storm-surge models, while laying groundwork for a long-term network of volunteer data collectors.

- [**When it comes to the threat of extinction, size matters**](#) [周二, 19 9月 01:27]

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

- [**People's love of the seas could be the key for plastic pollution solution**](#) [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to reducing the threats to it posed by plastic pollution.

- [**An effective way to eliminate atrazine and its by-products in surface water**](#) [周二, 19 9月 00:36]

Atrazine, widely used as a weedkiller, is known to have harmful effects on aquatic wildlife and presents a risk to human health by altering the action of certain hormones. Researchers have now compared various processes used to degrade atrazine, one of the most common pesticides detected in surface water in Quebec.

- [**RNA discovery could help boost plant heat, drought tolerance**](#) [周二, 19 9月 00:35]

The discovery of a RNA that can increase drought and salt tolerance in thale cress could illuminate a new research approach and hold implications for other plants, including food crops.

- [**To predict how climate change will affect disease, researchers must fuse climate science**](#)

[and biology](#) [周二, 19 9月 00:35]

To predict how climate change will affect disease, researchers must fuse climate science and biology, according to a new review.

• [Scientists show molecular basis for ants acting as 'bodyguards' for plants](#) [周二, 19 9月 00:35]

Though you might not think of ants as formidable bodyguards, some do an impressive job protecting plants from enemies. Examining the relationship between the Amazon rainforest plant *Cordia nodosa* in Peru and the ant species *Allomerus octoarticulatus*, scientists found the degree to which the ants express two genes significantly impacts the amount of protection they provide to their hosts.

• [Urgent emission reductions needed to achieve 1.5°C warming limit](#) [周一, 18 9月 23:18]

Significant emission reductions are required if we are to achieve one of the key goals of the Paris Agreement, and limit the increase in global average temperatures to 1.5°C; a new partnership warns.

• [Changes in Earth's crust caused oxygen to fill the atmosphere](#) [周一, 18 9月 23:18]

New research has uncovered a direct link between changes in the earth's crust three billion years ago and the introduction of free oxygen to the atmosphere. Without these changes, oxygen could have been suppressed in earth's crust forever, so the findings help explain the emergence of life on our planet.

• [A solar cell you can put in the wash](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

• [Dogs' social skills linked to oxytocin sensitivity](#) [周一, 18 9月 23:18]

The tendency of dogs to seek contact with their owners is associated with genetic variations in sensitivity for the hormone oxytocin,

according to a new study. The results contribute to our knowledge of how dogs have changed during their development from wolf to household pet.

- [**Genomic recycling: Ancestral genes take on new roles**](#) [周一, 18 9月 23:18]

One often hears about the multitude of genes we have in common with chimps, birds or other living creatures, but such comparisons are sometimes misleading. The shared percentage usually refers only to genes that encode instructions for making proteins -- while overlooking regulatory genes, which nonetheless make up a large part of the genome.

- [**Six new sponge species and new symbiotic associations from the Indonesian coral triangle**](#) [周一, 18 9月 23:18]

The Indonesian coral reefs, located in the so-called coral triangle, are considered amongst the richest and most biodiverse places on Earth. Surprisingly, this impressive species diversity is still poorly known. Biologists now report the presence of 94 species of sponges, including six new to science and two new symbiotic sponge associations.

- [**How bacteria hinder chemotherapy**](#) [周一, 18 9月 22:06]

Scientists have found bacteria in pancreatic tumors that metabolize a common drug, explains a new report.

- [**Sheep gene insights could help farmers breed healthier animals**](#) [周一, 18 9月 22:06]

Fresh insights into the genetic code of sheep could aid breeding programs to improve their health and productivity. Scientists have now mapped which genes are turned on and off in the different tissues and organs in a sheep's body.

- [**More efficient use of raw materials with the aid of 'molecular conveyor belts'**](#) [周一, 18 9月 21:34]

Making valuable products, such as fuels, synthetic materials or pharmaceuticals, from renewable raw materials is to date not efficient enough because the microorganisms used only process the raw materials

very slowly and generate many by-products in addition to the substances actually wanted. Biotechnologists have now succeeded in optimizing sugar utilization in baker's yeast.

- [**Welfare of zoo animals set to improve**](#) [周一, 18 9月 21:33]

The wellbeing of zoological animals is set to improve following the successful trial of a new welfare assessment grid.

- [**Fuel from waste and electricity?**](#) [周一, 18 9月 21:33]

Researchers have shown that the combination of microbial and electrochemical conversion of biomass can yield valuable products. For the example of corn beer and corn silage they have gained energy-dense alkanes with diesel-fuel like properties at high carbon and energetic yield.

- [**Cells programmed like computers to fight disease**](#) [周一, 18 9月 21:33]

Cells can be programmed like a computer to fight cancer, influenza, and other serious conditions -- thanks to a breakthrough in synthetic biology.

- [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**Studies of 'Crater Capital' in the Baltics show impactful history**](#) [周一, 18 9月 21:28]

Studies of craters in the Baltics (Estonia) are giving insights into the many impacts that have peppered the Earth over its long history. In southeastern Estonia, scientists have dated charcoal from trees destroyed in an impact to prove a common origin for two small craters, named Illumetsa. A third submarine crater located on the seabed in the Gulf of

Finland has been measured and dated with with precision.

- [**Devilish source of dust in atmosphere of Earth and Mars**](#) [周一, 18 9月 21:28]

Swirling columns of sand and dust, known as dust devils, are a feature of desert areas on Mars and on Earth. Now, a study of terrestrial dust devils has shown that around two thirds of the fine particles lifted by these vortices can remain suspended in the atmosphere and be transported around the globe. The findings have implications for the climate and weather of both planets and, potentially, human health here on Earth.

- [**Membrane vesicles released by bacteria may play different roles during infection**](#) [周一, 18 9月 21:07]

Bacteria release membrane-derived vesicles (MVs), which are small particles that can transport virulence factors to neighboring bacteria or to the cells of a mammalian host. This special MV-based system for delivering toxic proteins and nucleic acids in a protected manner to the target cells may have different specific functions depending on whether the bacterium acts as an extracellular or intracellular pathogen.

- [**Damage to monarch butterfly colonies in 2016 storm worse than thought**](#) [周一, 18 9月 08:14]

A much greater number of monarch butterflies perished in a snowstorm in March 2016 in Mexico than previously estimated, according to new research. Analysis of damage from the storm -- and the ensuing salvage logging -- sheds further light on the precarious state of the famed butterflies' overwintering colonies.

- [**Converting waste toilet paper into electricity**](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

- [**Light on exoplanets may be quite different from**](#)

Earth: Different photosynthesis? [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxygenic phototrophs are most likely to have evolved underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

Tough stuff: Spider silk enhanced with graphene-based materials [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

Delayed weaning reduces behavioural problems in cats [周六, 16 9月 04:52]

Early weaning increases aggression and stereotypic behavior in cats. Based on the study, the recommended weaning age of 12 weeks should be raised by at least two weeks. Delaying weaning is an easy and cost-efficient way of improving the quality of life of cats.

Innate immunity: To operate, insert dimers [周六, 16 9月 04:46]

The presence of DNA in mammalian cell cytoplasm triggers an immune response by binding to a dimeric enzyme, which inserts between DNA double helices to form the “rungs” of a ladder-like structure, as an LMU team has now shown.

Secrets of Bonsai: Uncovering the mechanism of root regeneration [周六, 16 9月 04:38]

The molecular mechanism behind root regeneration after root cutting in plants has been discovered. A finding which could lead to the development of new methods for regulating plant growth in agriculture

and horticulture.

- [**Black Sea water temperatures may buck global trend**](#) [周六, 16 9月 04:29]

Scientists have successfully simulated the Black Sea's long term currents, salt water content and temperature for the first time.

- [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- [**Scientists question study about plastic-eating caterpillars**](#) [周六, 16 9月 02:41]

Do the larvae of the wax moth really solve the world's plastic problem? Sensational report of biochemical degradation of polyethylene by caterpillars not confirmed.

- [**'Exciting' discovery on path to develop new type of vaccine to treat global viruses**](#) [周六, 16 9月 02:41]

Scientists have made a significant discovery in efforts to develop a vaccine against Zika, dengue and Hepatitis C viruses that affect millions of people around the world.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Medical students not trained to prescribe**](#)

[medical marijuana](#) [周六, 16 9月 02:41]

More than half of the states in the US now allow some type of legal marijuana use, primarily medical marijuana. But, in a survey of medical residents and deans at the nation's medical schools, researchers have found that the majority of schools are not teaching their students about medical marijuana, and the majority of students don't feel prepared to discuss the subject with patients.

• [New organelle discovered in parasitic wasp venom](#) [周六, 16 9月 02:41]

Biologists have identified the composition of 'virus-like particles' (VLPs) found in the venom of a wasp that is a parasite of fruit flies. Invisible to the eye, wasp VLPs suppress the flies' immune responses by killing their blood cells.

• [Arctic sea ice once again shows considerable melting](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

• [Celebrity fossil reveals all for science](#) [周五, 15 9月 22:35]

With the help of an artist, a geology professor has figuratively speaking breathed life into one of science's most well-known fossil species; *Agnostus pisiformis*. The trilobite-like arthropod lived in huge numbers in Scandinavia a half-billion years ago. Today, this extinct species provides important clues for science in several ways.

• [Humans no longer have ancient defense mechanism against viruses](#) [周五, 15 9月 21:53]

Insects and plants have an important ancient defense mechanism that helps them to fight viruses. This is encoded in their DNA. Scientists have long assumed that vertebrates -- including humans -- also had this same mechanism. But researchers have found that vertebrates lost this particular asset in the course of their evolution.

• [300,000 families living in US-Mexico border](#)

[towns face exposure to toxic stress](#) [周五, 15 9月 21:52]

Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.

[Carbohydrates may be the key to a better malaria vaccine](#) [周五, 15 9月 21:52]

An international research team has shown for the first time that carbohydrates on the surface of malaria parasites play a critical role in malaria's ability to infect mosquito and human hosts. The discovery also suggests steps that may improve the only malaria vaccine approved to protect people against Plasmodium falciparum malaria -- the most deadly form of the disease.

[New Orleans greenery post-Katrina reflects social demographics more than hurricane impact](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

[Contaminants in food: Health risks of natural origin are frequently underestimated](#) [周五, 15 9月 21:51]

Just under 60 percent of the German population view undesirable substances in food as a high or very high health risk. The most well-known of these substances, which are scientifically denoted as contaminants, are mercury compounds and dioxins. In contrast, only around 13 percent of respondents have heard of the natural contaminants pyrrolizidine alkaloids (PAs) in honey or tea - and only roughly one in three of those who have heard of PAs believe these substances pose a significant health risk.

[Wolves understand cause and effect better than](#)

dogs [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

Scientific explanation for why spurned males abandon courtship attempts [周五, 15 9月 09:06]

Unsuccessful courtship attempts by males create aversive memories that can reduce their level of enthusiasm for subsequent courtship attempts. Scientists have attempted to understand this behavior at the molecular level.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Reliance on 'gut feelings' linked to belief in fake news**](#) [周二, 19 9月 02:21]

People who tend to trust their intuition or to believe that the facts they hear are politically biased are more likely to stand behind inaccurate beliefs, a new study suggests.

- [**People's love of the seas could be the key for plastic pollution solution**](#) [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to reducing the threats to it posed by plastic pollution.

- [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**Parents not confident schools can assist child with chronic disease, mental health**](#) [周一, 18 9月 21:08]

Most parents are sure schools would be able to provide basic first aid but are less confident about a school's ability to respond to more complex health situations, such as an asthma attack or mental health problem.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.

- [**Teens come 'jet lagged' to school: Shifting sleeping patterns at weekends**](#) [周六, 16 9月 04:48]

A lack of sleep is associated with more absence and teens turn up jet lagged to school on Mondays, as shown in new research.

- [**Insult to injury: US workers without paid sick leave suffer from mental distress**](#) [周六, 16 9月 02:41]

Only seven states in the US have mandatory paid sick leave laws, yet, 15 states have passed preemptive legislation prohibiting localities from passing sick leave. Paid sick leave is gaining momentum as a social justice issue with important implications for health and wellness. But what are the implications for the mental well-being of Americans without paid sick leave? A new study is the first to show the link between mental distress and paid sick leave among US workers.

- [**300,000 families living in US-Mexico border towns face exposure to toxic stress**](#) [周五, 15 9月 21:52]

Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.

- [**Need for epinephrine in schools -- and staff trained to administer it**](#) [周五, 15 9月 21:52]

With school nurses often covering multiple buildings, researchers find that nearly one in five students who experience severe allergic reactions are given potentially life-saving epinephrine injections from unlicensed staff or students.

- [**Green schoolyards offer physical and mental health benefits for children**](#) [周五, 15 9月 21:52]

A growing body of evidence suggests access to safe, natural areas

improves health across a wide variety of areas, including heart health, mental health, weight management, ADHD, and stress among children.

- [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

- [**New climate risk classification created to account for potential 'existential' threats**](#) [周五, 15 9月 09:06]

A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.

- [**One vaccine injection could carry many doses**](#) [周五, 15 9月 03:23]

A new 3-D fabrication method has been developed that can create a new type of drug-carrying particle that could allow several doses of a drug or vaccine to be delivered over an extended time period with just one injection.

- [**Cost of not adapting to climate change would be at least five times higher**](#) [周五, 15 9月 03:22]

A study on damage to coastal considered only real estate loss. If nothing is done, researchers say, losses might be up to ten times higher if the predicament includes the spreading of flood- and global warming -

related diseases.

- [**Quicker learning: Brief reactivations of visual memories are enough to complete a full learning curve**](#) [周四, 14 9月 07:30]

A new study finds that brief memory reactivations can replace the repeated extensive practice and training known as 'practice makes perfect' as a learning technique.

- [**Lion conservation requires effective international cooperation**](#) [周三, 13 9月 22:44]

In response to the alarming population declines of one of the most charismatic representatives of the megafauna, the lion, a team of international wildlife lawyers and lion experts joined efforts to assess the current and potential future role of international treaties regarding the carnivore's conservation.

- [**Decade of data shows FEMA flood maps missed 3 in 4 claims**](#) [周三, 13 9月 05:05]

An analysis of flood claims in three Houston suburbs from 1999-2009 found that the Federal Emergency Management Agency's 100-year flood plain maps failed to capture 75 percent of flood damages from five serious floods, none of which reached the threshold rainfall of a 100-year event.

- [**Kids praised for being smart are more likely to cheat**](#) [周三, 13 9月 03:48]

Kids who are praised for being smart, or who are told they have a reputation for being smart, are more likely to be dishonest and cheat, a pair of studies has found.

- [**Historic legacies affect climate change survival in Caribbean**](#) [周三, 13 9月 01:48]

Discussion of climate change has failed to pay enough attention to the social, political and historic factors which increase the vulnerability of Caribbean societies, and calls for a new approach focused on

understanding and addressing these historic inequalities.

• **[How should we handle boys who can't read?](#)** [周二, 12 9

月 21:31]

Boys are much worse at reading than girls. The disparities have been quite consistent over 15 years. New insights may give hope -- if they're put to use.

• **['Keep it local' approach more effective than government schemes at protecting rainforest](#)** [周二, 12

9月 21:31]

Conservation initiatives led by local and indigenous groups can be just as effective as schemes led by government, according to new research. In some cases in the Amazon rainforest, grassroots initiatives can be even more effective at protecting this vital ecosystem.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Scientists show molecular basis for ants acting as 'bodyguards' for plants**](#) [周二, 19 9月 00:35]

Though you might not think of ants as formidable bodyguards, some do an impressive job protecting plants from enemies. Examining the relationship between the Amazon rainforest plant *Cordia nodosa* in Peru and the ant species *Allomerus octoarticulatus*, scientists found the degree to which the ants express two genes significantly impacts the amount of protection they provide to their hosts.

- [**When radio galaxies collide, supermassive black holes form tightly bound pairs**](#) [周二, 19 9月 00:35]

Supermassive black holes found in the centers of galaxies can form gravitationally bound pairs when galaxies merge, according to a new study.

- [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

- [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

- [**Developing roads that can generate power from passing traffic**](#) [周一, 18 9月 23:18]

Researchers are looking at advanced materials for roads and pavements that could generate electricity from passing traffic. Engineers are working on smart materials such as 'piezoelectric' ceramics that when embedded in road surfaces would be able to harvest and convert vehicle vibration into electrical energy.

- [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

- [**World first: 'Storing lightning inside thunder'**](#) [周一, 18 9月 21:07]

In a world first, researchers have stored photonic information on a microchip as an acoustic wave. This allows precious extra time to store, process and then redistribute the data without relying on electronics, which produce excess heat. Such a hybrid chip could have a huge impact in cloud computing and telecommunication centers, which are overheating as we churn through data on our phones.

- [**Converting waste toilet paper into electricity**](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

- [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can

be carried around in a backpack and used in total safety.

- **[Tough stuff: Spider silk enhanced with graphene-based materials](#)** [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- **[Immune system linked to alcohol drinking behavior](#)** [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- **[Wolves understand cause and effect better than dogs](#)** [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

- **[Electric eels leap to deliver painful, Taser-like jolt](#)** [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- **[Sorting molecules with DNA robots](#)** [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Physicists offer explanation for diverse galaxy rotations**](#) [周五, 15 9月 03:22]

Physicists have found a simple and viable explanation for the diversity observed in galactic rotations. They report that diverse galactic-rotation curves, a graph of rotation speeds at different distances from the center, can be naturally explained if dark matter particles are assumed to strongly collide with one another in the inner halo, close to the galaxy's center -- a process called dark matter self-interaction.

- [**Artificial 'skin' gives robotic hand a sense of**](#)

touch [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

• **'Peel-and-go' printable structures fold themselves** [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

• **Long-range communication barrier for near-zero-power devices shattered** [周四, 14 9月 07:30]

Researchers have demonstrated for the first time that devices that run on almost zero power can transmit data across distances of up to 2.8 kilometers -- breaking a long-held barrier and potentially enabling a vast array of interconnected devices.

• **Marijuana may produce psychotic-like effects in high-risk individuals** [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

• **'The dark side' of quantum computers** [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

• **Squirrels use 'chunking' to organize their favorite nuts** [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

• [**The beam of invisibility**](#) [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

• [**A one-of-a-kind star found to change over decades**](#) [周三, 13 9月 03:48]

Researchers recently found new evidence that lends support to an existing theory of how the unusual star emits energy.

• [**Earthquake faults may have played key role in shaping the culture of ancient Greece**](#) [周二, 12 9月 22:35]

The Ancient Greeks may have built sacred sites deliberately on land affected by previous earthquake activity, according to a new study.

• [**AI -- Engineering: merging, morphing, mobile robots**](#) [周二, 12 9月 22:35]

Researchers have developed self-reconfiguring modular robots that can merge, split and even self-heal while retaining full sensorimotor control. The work may take us closer to producing robots that can autonomously change their size, shape and function.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [Risks vary widely in drone-human impacts](#) [周三, 20 9月 04:03]

New research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

- [Gulf Spill oil dispersants associated with health symptoms in cleanup workers](#) [周三, 20 9月 04:03]

Workers who were likely exposed to dispersants while cleaning up the 2010 Deepwater Horizon oil spill experienced a range of health symptoms including cough and wheeze, and skin and eye irritation.

- [Tiny lasers from a gallery of whispers](#) [周三, 20 9月 04:03]

Whispering gallery mode resonators rely on a phenomenon similar to an effect observed in circular galleries, and the same phenomenon applies to light. When light is stored in ring-shaped or spherical active resonators, the waves superimpose in such a way that it can result in laser light. Investigators now report a new type of dye-doped WGM micro-laser that produces light with tunable wavelengths.

- [Security cameras vulnerable to attacks using infrared light](#) [周三, 20 9月 04:02]

Researchers have demonstrated that security cameras infected with malware can receive covert signals and leak sensitive information from

the very same surveillance devices used to protect facilities.

- [**Emerging disease further jeopardizes North American frogs**](#) [周三, 20 9月 04:02]

A deadly amphibian disease called severe Perkinsea infections, or SPI, is the cause of many large-scale frog die-offs in the United States, according to a new study.

- [**End-of-summer Arctic sea ice extent is eighth lowest on record**](#) [周三, 20 9月 04:01]

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

- [**Home blood pressure monitoring for hypertension best combined with intensive support**](#) [周三, 20 9月 02:04]

People who monitor their own blood pressure at home are most likely to see a benefit if they combine it with individually tailored intensive support, according to a new systematic literature review and meta-analysis.

- [**Screening for cervical abnormalities in women offered HPV vaccination**](#) [周三, 20 9月 02:04]

Human papillomavirus (HPV) testing detects a higher number of precancerous cervical lesions than cytology-based Pap smears in a female population including a proportion offered HPV vaccination, according to a new study.

- [**What web browsers and proteins have in common**](#) [周三, 20 9月 02:04]

The discovery of a previously overlooked site on protein molecules may solve a mystery about how proteins are able to carry out specialized functions in living cells.

- **[Groundbreaking investigative effort identifies gonorrhea vaccine candidates](#)** [周三, 20 9月 02:04]

Researchers have identified a pair of proteins that show promise as the basis for a gonorrhea vaccine.

- **[Management studies: Dishonesty shift](#)** [周三, 20 9月 02:04]

Lying comes more easily to people in teams: Behavioral scientists have shown in an experimental study why groups are more likely to behave unethically than individuals.

- **[A study switches from genetic to metabolic analysis to reconstitute evolutionary process](#)** [周三, 20 9月 02:04]

A new method for analyzing a living being chemical compositions is tested in Andean plants and attest the genesis of species by means of geographic isolation. Scientists analyzed chemical compounds which express specific biogeographic trends in the evolutionary process, validating a Smithsonian hypothesis on the evolution of the genus Espeletia in the process.

- **[Wikipedia used to give AI context clues](#)** [周三, 20 9月 02:04]

A team of computer scientists is teaching artificial intelligence agents how to interact with the world in a way that makes sense.

- **[North Atlantic right whales decline confirmed: 458 remaining](#)** [周三, 20 9月 02:04]

Marine biologists have developed a new model to improve estimates of abundance and population trends of endangered North Atlantic right whales, which have declined in numbers and productivity in recent years. Between 1990 and 2010 abundance increased to 482 animals, but since 2010 the numbers have declined to 458 in 2015, with 14 known deaths this year.

- **[Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests](#)** [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

- [**Brain powered: Increased physical activity among breast cancer survivors boosts cognition**](#)

[周三, 20 9月 02:04]

It is estimated that up to 75 percent of breast cancer survivors experience problems with cognitive difficulties following treatments, perhaps lasting years. Currently, few science-based options are available to help. Researchers report in a pilot study of 87 female breast cancer survivors an increase in physical activity more than doubled the women's post-treatment mental processing speed.

- [**Proteins' role in development of spinal sensory cells redefined**](#)

[周三, 20 9月 02:04]

A recent study has overturned a common belief about how a certain class of proteins in the spinal cord regulate the formation of nervous system cells -- called neurons -- during embryonic development.

- [**Mercury's poles may be icier than scientists thought**](#)

[周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice inventory.

- [**Advanced lithium-ion and metal-air batteries**](#)

[周三, 20 9月 00:31]

Engineers are developing energy storage technologies that are cheaper, safer and more efficient.

- [**Winner takes all: Success enhances taste for luxury goods, study suggests**](#)

[周三, 20 9月 00:31]

Footballers in flashy cars, City workers in Armani suits, reality TV celebrities sipping expensive champagne while sitting in hot tubs: what drives people to purchase luxury goods? New research suggests that it

may be a sense of being a 'winner' -- but that contrary to expectations, it is not driven by testosterone.

- [**One-way track for microwaves based on mechanical interference**](#) [周三, 20 9月 00:31]

Researchers use interference in the motion of a micrometer-size drum to route microwave signals in a single direction.

- [**How to remove a tick and prevent future bites**](#) [周二, 19 9月 23:12]

As tick populations grow and spread across the country, their prevalence is increasing the public's risk for some troubling diseases. Of these diseases, say dermatologists, Lyme disease, Rocky Mountain spotted fever, Powassan virus and alpha-gal syndrome — a mysterious red meat allergy — are among the most serious.

- [**Rogue wave analysis supports investigation of the El Faro sinking**](#) [周二, 19 9月 23:12]

A new analysis done to support the investigation into the 2015 sinking of the El Faro cargo ship has calculated the likelihood of a massive rogue wave during Hurricane Joaquin in October of that year – and demonstrated a new technique for evaluating the probability of rogue waves over space and time.

- [**Getting emotional after failure helps you improve next time, study finds**](#) [周二, 19 9月 23:12]

Emotional responses to failure rather than cognitive ones are more effective at improving people's results for the next time they tackle the next related task, new research indicates.

- [**Fluorescence microscopy on a chip: no lenses required**](#) [周二, 19 9月 23:11]

Fluorescence microscopy gives researchers incredible power to illuminate the tiniest structures and capture the real-time activities of live cells by tagging biological molecules with a veritable rainbow of fluorescent dyes. This power comes at a cost: The technology can be expensive and time-consuming and, so far, has resisted attempts at

automation.

- [**Antibiotics following C-section among obese women reduces risk of surgical infection**](#) [周二, 19 9月 23:06]

Among obese women undergoing cesarean delivery, a postoperative 48-hour course of antibiotics significantly decreased the rate of surgical site infection within 30 days after delivery, according to a study.

- [**Contribution of opioid-related deaths to the change in life expectancy in the US**](#) [周二, 19 9月 23:06]

Between 2000 and 2015 in the US, life expectancy increased overall but drug-poisoning deaths, mostly related to opioids, contributed to reducing life expectancy, according to a study.

- [**How the shape and size of your face relates to your sexuality**](#) [周二, 19 9月 23:06]

Men and women with shorter, wider faces tend to be more sexually motivated and to have a stronger sex drive than those with faces of other dimensions. The research investigates the role that facial features play in sexual relationships and mate selection.

- [**Key regulator of male fertility identified**](#) [周二, 19 9月 23:06]

When it comes to male reproductive fertility, timing is everything. Now scientists are finding new details on how disruption of this timing may contribute to male infertility or congenital illness. Researchers are identifying the key molecular and genetic switch that activates production of healthy male sperm -- but only when the time is right.

- [**Nonlinear physics bridges thoughts to sounds in birdsong**](#) [周二, 19 9月 23:05]

The beautiful sound of birdsongs emerging from the trees is a wonderful example of how much nature can still teach us, even as much about their origins are still mysterious to us. About 40 percent of bird species learn to vocalize when they are exposed to a tutor, a behavior of interest to many neurologists and neurobiologists. The other 60 percent can vocalize instinctually in isolation. The variety across species, and the

relationship between the nervous system and biomechanics makes birdsong p...

- [**Cell-based therapy success could be boosted by new antioxidant**](#) [周二, 19 9月 22:52]

Cell therapies being developed to treat a range of conditions could be improved by a chemical compound that aids their survival, research suggests. Lab tests found that the human-made molecule -- a type of antioxidant -- helps to shield healthy cells from damage such as would be caused when they are transplanted into a patient during cell therapy.

- [**New hosts for Chagas disease vectors identified**](#) [周二, 19 9月 22:26]

Solitary weasel-like animals called tayra might look pretty harmless, but some may actually be incubators for a parasite that causes Chagas disease, a chronic, debilitating condition that is spread by insects called kissing bugs and affects more than 8 million people worldwide.

- [**Cost effective quantum moves a step closer**](#) [周二, 19 9月 22:26]

Researchers have taken an important step towards enabling quantum networks to be cost-effective and truly secure from attack. The experiments prove the viability of a measurement-device-independent quantum key distribution (QKD) system, based on readily available hardware.

- [**Playing American football before age 12 could have long-term health effects**](#) [周二, 19 9月 22:25]

Playing American football before the age of 12 may have long-term consequences for players' mood and behavior, according to a study involving 214 professional and amateur football players.

- [**Exposure to pet and pest allergens during infancy linked to reduced asthma risk**](#) [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

- [**A dream of foam: better concrete, beer froth and ice cream**](#) [周二, 19 9月 22:25]

Researchers have discovered a new method to design stable foams. Their findings could make beer froth and ice cream last longer -- and revolutionize construction materials such as concrete.

Researchers have developed a novel strategy for controlling chirality of single-walled carbon nanotubes.

- [**An interconnection between the nervous and immune system**](#) [周二, 19 9月 22:25]

Researchers have shown that the increased incidence of infections seen in spinal cord injury patients is directly linked to a disruption of the normal central nervous system.

- [**A piece of the puzzle: Eight autism-related mutations in one gene**](#) [周二, 19 9月 22:25]

Researchers discover a large number of clustered mutations in a single gene, TRIO, that disrupt the development of the brain's connections and likely contribute to the development of autism-spectrum disorders. The scientists also find that a sister gene linked to schizophrenia, KALRN, is inactive in early brain development, but becomes active in adolescence.

- [**Guidelines for handling CAR T cell side effects**](#) [周二, 19 9月 21:28]

Immune-cell based therapies opening a new frontier for cancer treatment carry unique, potentially lethal side effects that provide a new challenge for oncologists, one addressed by proposed guidelines for systematically dealing with the toxicities of these drugs.

- [**Cell model of the brain provides new knowledge on developmental disease**](#) [周二, 19 9月 21:26]

By reprogramming skin cells into nerve cells, researchers are creating cell models of the human brain. In a new study, the researchers describe

how cells from patients with the severe developmental disease lissencephaly differ from healthy cells. The method can provide vital new knowledge on difficult-to-study congenital diseases.

• [Size matters in the detection of exoplanet atmospheres](#) [周二, 19 9月 21:26]

A group-analysis of 30 exoplanets orbiting distant stars suggests that size, not mass, is a key factor in whether a planet's atmosphere can be detected. The largest population-study of exoplanets to date successfully detected atmospheres around 16 'hot Jupiters', and found that water vapor was present in every case.

• [What do we need to know to mine an asteroid?](#) [周二, 19 9月 21:26]

The mining of resources contained in asteroids, for use as propellant, building materials or in life-support systems, has the potential to revolutionise exploration of our Solar System. To make this concept a reality, we need to increase our knowledge of the very diverse population of accessible Near Earth Asteroids (NEA).

• [Nanosat fleet proposed for voyage to 300 asteroids](#) [周二, 19 9月 21:26]

A fleet of tiny spacecraft could visit over 300 asteroids in just over three years, according to a mission study. The Asteroid Touring Nanosat Fleet concept comprises 50 spacecraft propelled by innovative electric solar wind sails (E-sails) and equipped with instruments to take images and collect spectroscopic data on the composition of the asteroids. Each nanosat would visit six or seven asteroids before returning to Earth to deliver the data.

• [Molecular motors: Slowing the clockwork](#) [周二, 19 9月 21:26]

Progress on the way to smart nanomachines: Chemists have modified the synthesis of a molecular motor so as to reduce the speed of its light-driven rotation, thus permitting the researchers to analyze the mechanism of motion in complete detail.

• [Local epileptic seizure shows long distance](#)

[**interaction**](#) [周二, 19 9月 21:26]

An epileptic seizure may be highly local, but it also influences brain activity at a distance of over ten centimeters from the core. This, in turn, affects the active area, scientists report.

• [**New treatment for osteoporosis provides better protection against fractures**](#) [周二, 19 9月 21:24]

A new treatment for osteoporosis provides major improvements in bone density and more effective protection against fractures than the current standard treatment. This study is the first that compares the effect of two osteoporosis medicines on fractures.

• [**Nanocapsules enable cell-inspired metabolic reactions**](#) [周二, 19 9月 21:24]

Researchers have succeeded in developing capsules capable of producing the bio-molecule glucose-6-phosphate that plays an important role in metabolic processes. The researchers were able to produce the metabolite in conditions very similar to the biochemical reaction inside natural cells.

• [**Ricin only lethal in combination with sugar**](#) [周二, 19 9月 21:23]

Researchers have discovered a means of immunizing cells against the biological weapon ricin, which, they report, is only lethal when combined with sugar.

• [**'Language of stem cells' discovered**](#) [周二, 19 9月 21:23]

Stem cells control the cells around them, inducing them to perform specific functions. This phenomenon of the "language of stem cells", which has now been discovered for the very first time, report investigators.

Risks vary widely in drone-human impacts -- ScienceDaily

New Virginia Tech research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

Many of the most promising applications for these aircraft -- including package delivery, public safety, and traffic management -- entail flights over people and raise the possibility, however unlikely, of an impact between the aircraft and a human.

So before unmanned aircraft systems -- also known as UAS or drones -- can be utilized efficiently by the many industries eager to employ them, policymakers need to understand what injuries these aircraft could potentially cause and what design features, operational limitations, and regulations could help prevent them.

Without robust experimental data on these topics, Federal Aviation Administration (FAA) regulations currently prohibit UAS operations over people. (Operators can apply for a waiver, but the FAA has

granted only three, all extremely limited in scope.)

Virginia Tech's injury biomechanics group and its FAA-approved UAS test site teamed up to fill that gap and have just released the first peer-reviewed academic study to offer quantitative data on injury risk associated with potential drone-human collisions.

The research, published in the *Annals of Biomedical Engineering*, assessed head and neck injury risk from three small commercially available aircraft in a variety of impact scenarios. It represents a critical step toward developing UAS safety standards that can minimize the risk of catastrophic or fatal injury from operations over people.

The injury biomechanics team is led by Steven Rowson, an assistant professor of biomedical engineering and mechanics in the College of Engineering, and Stefan Duma, the Harry Wyatt Professor of Engineering and interim director of the Institute for Critical Technology and Applied Science.

The group's wide-ranging experience evaluating injury risk includes extensive work in the automotive and sports industries -- both areas in which evidence-based

safety standards have been effective at reducing catastrophic and fatal injuries.

The Virginia Tech Mid-Atlantic Aviation Partnership, which runs the UAS test site, helped design and conduct the experiments.

The team used three commercially available aircraft, with masses ranging from 1.2 kilograms to 11 kilograms; the aircraft impacted a test dummy whose head and neck contained sensors to measure acceleration and force.

In one set of tests, the aircraft were flown into the dummy at full speed; in another, aircraft were dropped directly onto the dummy's head in different orientations.

The forces produced by these impacts were evaluated relative to standard benchmarks for forces likely to cause potentially severe or life-threatening injuries -- skull fractures, for example.

In general, the injury risk increased with aircraft mass. For example, in drop tests with the smallest drone, the risk of severe neck injury was less than 10 percent; for

the largest aircraft, the median risk rose to 70 percent.

These results suggest that a subset of small drones may already be safe to operate over people. Other aircraft, however, present significant injury risk, even those well within mass and speed limits outlined in the FAA's Part 107 guidelines for commercial operations by small UAS.

The data also shows that despite greater impact speeds in the live flight tests, the drop tests -- which facilitated more direct contact between the aircraft center of mass and the dummy's head -- tended to result in more severe hits. That reflects a common thread in the numbers: The nature of the impact had a significant influence on the resulting injury probability.

"There's a wide range of risk," Rowson said. "In some instances it was low, and in some instances it was high, and there are lessons we can take away from that to reduce injury risk in a deliberate way through product design."

During impacts in which the aircraft was deflected away from the body -- by a protruding rotor arm, for example -- the force and resulting injury risk were

reduced. Aircraft features specifically designed to redirect its center of mass in the event of an impact could make severe injuries less likely.

The data showed that injury risk was also reduced when the aircraft deformed upon impact or when pieces broke off. Those deformations and fractures absorb some of the energy of the crash and offer another route for risk mitigation.

"If you reduce the energy that's able to be transferred to be head, you reduce the injury risk," said Eamon Campolettano, a doctoral student from Hicksville, New York, and the paper's first author. "The overarching goal for manufacturers should be to limit energy transfer."

The fact that some of the trials in the study yielded risk values greater than 50 percent highlights the potential for UAS-human impacts to lead to severe injuries. The significant variation in the data points to the need for comprehensive testing, especially considering the range of shapes, sizes, and materials in the commercial UAS market.

"What happens when the arm strikes first, or the center

of mass?" asked Campolettano. "What we set out to do with this study was to explore some of the many different ways drones and people can interact, and then use that baseline to choose different impact orientations for future studies."

The team is using these initial results to guide the development of a broader set of controlled experiments in a laboratory environment, which will represent a necessary foundation for future regulations on UAS operations over people.

"There's a tremendous demand for more research in this area," said Mark Blanks, the director of the Virginia Tech Mid-Atlantic Aviation Partnership. "The first step was to establish a baseline for how to perform these tests. Now we're doing a lot of work with individual companies, looking at specific airframes and potential mitigations."

"The big question right now is, what is the acceptable level of safety?" said Blanks, who also chairs an industry standards subcommittee developing recommendations for safe operations over people.

"How much proof does the FAA need before they say, 'Yes, that's okay'? Once those standards are in place,

we're going to see huge expansion in the industry."

Gulf Spill oil dispersants associated with health symptoms in cleanup workers -- ScienceDaily

Workers who were likely exposed to dispersants while cleaning up the 2010 Deepwater Horizon oil spill experienced a range of health symptoms including cough and wheeze, and skin and eye irritation, according to scientists at the National Institutes of Health (NIH). The study appeared online Sept. 15 in *Environmental Health Perspectives* and is the first research to examine dispersant-related health symptoms in humans.

Oil dispersants are a blend of chemical compounds used to break down oil slicks into smaller drops of oil, making them easily degraded by natural processes or diluted by large volumes of water. The study estimated the likelihood of exposure to dispersants, based on the types of jobs the workers did and where. Individuals who handled dispersants, worked near where dispersants were being applied, or had contact with dispersant equipment reported the symptoms they

experienced during oil spill cleanup as part of the Gulf Long-term Follow-up (GuLF) STUDY.

The research team found that workers exposed to dispersants were more likely to experience certain symptoms -- cough, wheeze, tightness in the chest, and burning in the eyes, nose, throat, or lungs -- than those who were not exposed to dispersants.

Dale Sandler, Ph.D., the lead GuLF STUDY researcher at the National Institute of Environmental Health Sciences (NIEHS), part of NIH, said the findings only apply to workers involved in the cleanup effort and not the general public.

"The health effects that we see in the workers don't necessarily apply to the community at large, although many of the workers live in affected areas," Sandler said.

After the oil spill, two chemical dispersants, Corexit EC9500A or Corexit EC9527A, were used in some areas where oil was present. Sandler said since it was the first time oil dispersants had been used on such a large scale, it was important to examine the possible health effects. Most of the previous research on

dispersants focused on how well the compounds dispersed oil and the potential environmental impacts. Several small animal studies that tested the chemicals in dispersants suggested some of the compounds were toxic.

One of the challenges the researchers faced was distinguishing whether the effects they saw were associated with the dispersants or petroleum products from the spill. Sandler said the scientists were able to consider both exposures and isolate the effects associated with the dispersants.

The researchers also considered the association between having been exposed to the dispersants during cleanup work and having current symptoms at the time the workers joined the study. Many of those who reported symptoms while they were involved in the oil spill response and cleanup, no longer had them one to three years later when the telephone interviews were conducted. Sandler explained that these findings were consistent with a short-term effect of dispersants on health symptoms. She noted, however, that a small percentage of oil spill workers were still having these symptoms.

"While symptoms are not disease, many people who worked on the oil spill underwent a stressful experience," said NIEHS Director Linda Birnbaum, Ph.D. "Some of them are continuing to not feel well, and we don't know what factors are contributing to it. The ongoing GuLF STUDY research is important for shedding light on the potential health impacts associated with an oil spill."

GuLF STUDY participants completed telephone interviews during enrollment, a subsequent home visit that included medical assessments and collecting biological samples, and one follow-up telephone interview. A new follow-up interview is scheduled to start fall 2017. The data used in this study came from enrollment interviews with 31,609 English or Spanish-speaking persons who were involved in oil spill response or cleanup.

Tiny lasers from a gallery of whispers: New technique promises tunable laser devices -- ScienceDaily

Whispering gallery mode (WGM) resonators are used to make tiny micro-lasers, sensors, switches, routers and other devices. These tiny structures rely on a phenomenon similar to an effect observed in circular galleries, such as in some cathedrals or museums, where sound waves travel across the gallery and are reflected and refocused tightly enough that a whisper on one side can be heard on the other.

The same phenomenon applies to light. When light is stored in ring-shaped or spherical active resonators, the waves superimpose in such a way that it can result in laser light. This week in *APL Photonics*, by AIP Publishing, investigators report a new type of dye-doped WGM micro-laser that produces light with tunable wavelengths. Not only is the tuning range of the new devices broader than has been possible in the past, it is completely reversible.

A unique feature of the design, according to lead author Tobias Siegle of Karlsruhe Institute of Technology in Germany, is that tuning is made possible by changing the size of a flexible substrate. Stretching the substrate changes the distance between the two sides of the split disk in the resonator and thus, the wavelength of the light produced.

The disk itself is typically about 25 microns across, with an initial gap between its two halves of roughly 2.5 microns, just 3 percent the diameter of a typical human hair. The disk is mounted on an elastomer, or stretchy plastic substrate, which can be pulled in a direction perpendicular to the disk's split, decreasing the gap size. The light produced by these micro-lasers shifts toward the blue range of the spectrum when the gap size decreases. They observed wavelength shifts of several nanometers in the visible range.

"Our new design produces a broad tuning range that cannot be easily achieved with other WGM resonators," Siegle said. "Additionally, the tuning mechanism is completely reversible."

This feature allows the device to be used in fundamental optics research. Another feature of the

split-disk technology is enhanced sensitivity in refractive index sensing.

"For a gap width of 1.4 microns, the sensing performance is increased by 65 percent," Siegle said, when comparing to a reference disk resonator without a gap.

The most useful devices have a low lasing threshold, since this allows the use of small amounts of energy. A low threshold reduces or prevents photo-bleaching of the dye molecules used in the device and increases its expected lifetime. The investigators tested their design and found low-threshold lasing for split disks fabricated using a 3-D or electron-beam lithography technique.

Another quantity they studied is the quality, or Q factor, which corresponds to the photon storage time in the laser cavity. A high Q value is desirable, and although investigators found that their split-disk design reduced Q somewhat, the lasing threshold was within an appropriate range, making the design valuable.

Future work will be focused on developing tunable coupled resonator waveguides, which can be used as

optical delay lines or filters, and in other applications.

Emerging disease further jeopardizes North American frogs -- ScienceDaily

Frogs and salamanders are currently among the most threatened groups of animals on the planet. The two most common frog diseases, chytridiomycosis and ranavirus infection, are linked to frog population declines worldwide. The new study suggests that that SPI is the third most common infectious disease of frogs.

Scientists with the USGS studied 247 frog die-offs in 43 states from 1999 through 2015. The researchers found that SPI caused 21 of the mass mortalities in 10 states spanning from Alaska to Florida, all involving tadpoles. Up to 95 percent of the tadpole populations died during the SPI mortality events.

"Amphibians such as frogs are valuable because they serve as pest control by eating insects like mosquitos, and they are food for larger predators," said Marcos Isidoro Ayza, a USGS scientist, University of Wisconsin-Madison post-doctoral fellow and the lead author of the study. "They're also exceptional

indicators of ecosystem health. Like the proverbial canary in a coal mine, amphibians let us know when something in our environment is going awry."

The SPI die-offs occurred in tadpoles of 11 frog species, including the critically endangered dusky gopherfrog in its only remaining breeding locations in Mississippi. Most of the SPI events occurred in states bordering the Atlantic Ocean and Gulf of Mexico. However, SPI was also detected in Alaska, Oregon and Minnesota.

"Habitat loss, habitat fragmentation and disease are among the factors that contribute to amphibian declines," said Jonathan Sleeman, director of the USGS National Wildlife Health Center. "This study indicates that SPI is an additional disease that can further threaten vulnerable frog populations."

SPI is caused by a tiny one-celled parasitic organism called a protist. The SPI-causing protist, called *Perkinsea*, is highly resistant to disinfection agents such as common bleach. As a result, it is difficult to prevent the spread of *Perkinsea*, and SPI is able to reoccur at known locations.

"SPI in frogs may be under-diagnosed because it is not a disease for which they are typically screened," Isidoro Ayza said. "Incorporating routine screening of critical habitats for infected frogs is crucial to help understand the distribution of this destructive disease."

The disease kills tadpoles by causing multi-organ failure, and there is no cure or treatment for SPI at this time. SPI is not known to affect humans or pets.

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

· [**North Atlantic right whales decline confirmed: 458 remaining**](#) [周三, 20 9月 02:04]

Marine biologists have developed a new model to improve estimates of abundance and population trends of endangered North Atlantic right whales, which have declined in numbers and productivity in recent years. Between 1990 and 2010 abundance increased to 482 animals, but since 2010 the numbers have declined to 458 in 2015, with 14 known deaths this year.

· [**Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests**](#) [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient

settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

- [**Mercury's poles may be icier than scientists thought**](#) [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice inventory.

- [**Getting emotional after failure helps you improve next time, study finds**](#) [周二, 19 9月 23:12]

Emotional responses to failure rather than cognitive ones are more effective at improving people's results for the next time they tackle the next related task, new research indicates.

- [**Playing American football before age 12 could have long-term health effects**](#) [周二, 19 9月 22:25]

Playing American football before the age of 12 may have long-term consequences for players' mood and behavior, according to a study involving 214 professional and amateur football players.

- [**Exposure to pet and pest allergens during infancy linked to reduced asthma risk**](#) [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

- [**New mirror-coating technology promises dramatic improvements in telescopes**](#) [周二, 19 9月 10:23]

An electrical engineer has teamed up with astronomers to improve telescope mirrors using thin-film technology from the electronics industry. They are developing new protective coatings using an atomic layer deposition system large enough to accommodate telescope mirrors.

- [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [**Solar-to-fuel system recycles CO2 to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [**Copper catalyst yields high efficiency CO2-to-fuels conversion**](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of a creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [**When it comes to the threat of extinction, size matters**](#) [周二, 19 9月 01:27]

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

- [**RNA discovery could help boost plant heat, drought tolerance**](#) [周二, 19 9月 00:35]

The discovery of a RNA that can increase drought and salt tolerance in thale cress could illuminate a new research approach and hold implications for other plants, including food crops.

- [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface

environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

• [**Urgent emission reductions needed to achieve 1.5°C warming limit**](#) [周一, 18 9月 23:18]

Significant emission reductions are required if we are to achieve one of the key goals of the Paris Agreement, and limit the increase in global average temperatures to 1.5°C; a new partnership warns.

• [**Changes in Earth's crust caused oxygen to fill the atmosphere**](#) [周一, 18 9月 23:18]

New research has uncovered a direct link between changes in the earth's crust three billion years ago and the introduction of free oxygen to the atmosphere. Without these changes, oxygen could have been suppressed in earth's crust forever, so the findings help explain the emergence of life on our planet.

• [**Dogs' social skills linked to oxytocin sensitivity**](#) [周一, 18 9月 23:18]

The tendency of dogs to seek contact with their owners is associated with genetic variations in sensitivity for the hormone oxytocin, according to a new study. The results contribute to our knowledge of how dogs have changed during their development from wolf to household pet.

• [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

- [**Vaping doubles risk of smoking cigarettes for teens**](#) [周一, 18 9月 21:07]

Teenagers who try e-cigarettes double their risk for smoking tobacco cigarettes, according to a new study. The study found that students in grades seven to 12 who had tried an e-cigarette are 2.16 times more likely to be susceptible to cigarette smoking.

- [**NASA's Cassini spacecraft ends its historic exploration of Saturn**](#) [周六, 16 9月 22:30]

A thrilling epoch in the exploration of our solar system has come to a close, as NASA's Cassini spacecraft made a fateful plunge into the atmosphere of Saturn, ending its 13-year tour of the ringed planet. Cassini's plunge brings to a close a series of 22 dives between Saturn and its rings, a feat never before attempted by any spacecraft.

- [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

- [**Light on exoplanets may be quite different from Earth: Different photosynthesis?**](#) [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxygenic phototrophs are most likely to have evolved

underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Ultrafast snapshots of relaxing electrons in solids**](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

- [**Ancient amphibian had mouthful of teeth ready to grab you**](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- [**Why we did not evolve to live forever: Unveiling the mystery of why we age**](#) [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- [**Arctic sea ice once again shows considerable melting**](#) [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

• [**Skin patch dissolves 'love handles' in mice**](#) [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

• [**Wolves understand cause and effect better than dogs**](#) [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

• [**In step toward controlling chemistry, physicists create a new molecule, atom by atom**](#) [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

• [**Biomarkers in the blood prove strong role of food for type 2 diabetes**](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

• [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**Plant geneticists develop a new application of CRISPR to break yield barriers in crops**](#) [周五, 15 9月 03:23]

Scientists have finally harnessed the untapped power of genome editing to improve agricultural crops. In the tomato plant they have mobilized CRISPR to rapidly generate variants of the plant displaying a continuum of three agriculturally important traits: fruit size, branching architecture and overall plant shape. All are major components in determining yield. The method is designed to work in all food, feed, and fuel crops, including staples rice, maize, sorghum and wheat.

- [**Old fish few and far between under fishing pressure**](#) [周五, 15 9月 03:23]

A new study has found that, for dozens of fish populations around the globe, old fish are greatly depleted -- mainly because of fishing pressure. Old fish are increasingly missing in many populations around the world.

- [**Huge genetic diversity among Papuan New Guinean peoples revealed**](#) [周五, 15 9月 03:23]

The first large-scale genetic study of people in Papua New Guinea has shown that different groups within the country are genetically highly different from each other. Scientists reveal that the people there have remained genetically independent from Europe and Asia for most of the last 50,000 years, and that people from the country's isolated highlands region have been completely independent even until the present day.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- ['Handedness' in scale-eating fish: Nature and nurture](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [Could interstellar ice provide the answer to birth of DNA?](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [How does a cell maintain its identity during replication?](#) [周五, 15 9月 03:22]

Prior to cell division, chromosomes are seemingly a jumbled mess. During cell division, parent cell chromosomes and their duplicates sort themselves out by condensing, becoming thousands of times more compact than at any other time. Researchers have long assumed that genes become "silent" during cell division, not being transcribed into proteins or regulatory molecules. This has left open the question of how genes get properly re-activated after cell division. Now, researchers have found that gen...

- [Hubble observes pitch black planet](#) [周五, 15 9月 03:22]

Astronomers have discovered that the well-studied exoplanet WASP-12b reflects almost no light, making it appear essentially pitch black. This discovery sheds new light on the atmospheric composition of the planet and also refutes previous hypotheses about WASP-12b's atmosphere. The results are also in stark contrast to observations of another similarly sized exoplanet.

- [**New supernova analysis reframes dark energy debate**](#) [周四, 14 9月 07:31]

The accelerating expansion of the Universe may not be real, but could just be an apparent effect, according to new research. The new study finds the fit of Type Ia supernovae to a model universe with no dark energy to be very slightly better than the fit to the standard dark energy model.

- [**Evolution of 'true frogs' defies long-held expectations of science**](#) [周四, 14 9月 07:31]

New research shows, in contrast to expectations, 'the rapid global range expansion of true frogs was not associated with increased net-diversification.'

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**In-utero treatment reverses cleft palate in mice**](#) [周四, 14 9月 07:30]

Researchers clarified a molecular pathway responsible for the formation of cleft palate and identified a new treatment to reverse this defect in mouse pups in utero.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**First global map of water in moon's soil**](#) [周四, 14 9月 07:30]

A new study maps the trace concentrations of water implanted in the lunar soil by the solar wind, a water source that could be used as resource in future lunar exploration.

- [**New gravity map suggests Mars has a porous crust**](#) [周四, 14 9月 07:30]

Scientists have found evidence that Mars' crust is not as dense as previously thought, a clue that could help researchers better understand the Red Planet's interior structure and evolution.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [Risks vary widely in drone-human impacts](#) [周三, 20 9月 04:03]

New research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

- [Gulf Spill oil dispersants associated with health symptoms in cleanup workers](#) [周三, 20 9月 04:03]

Workers who were likely exposed to dispersants while cleaning up the 2010 Deepwater Horizon oil spill experienced a range of health symptoms including cough and wheeze, and skin and eye irritation.

- [Home blood pressure monitoring for hypertension best combined with intensive support](#) [周三, 20 9月 02:04]

People who monitor their own blood pressure at home are most likely to see a benefit if they combine it with individually tailored intensive support, according to a new systematic literature review and meta-analysis.

- [Screening for cervical abnormalities in women offered HPV vaccination](#) [周三, 20 9月 02:04]

Human papillomavirus (HPV) testing detects a higher number of precancerous cervical lesions than cytology-based Pap smears in a female population including a proportion offered HPV vaccination, according to a new study.

- [What web browsers and proteins have in](#)

common [周三, 20 9月 02:04]

The discovery of a previously overlooked site on protein molecules may solve a mystery about how proteins are able to carry out specialized functions in living cells.

• **Groundbreaking investigative effort identifies gonorrhea vaccine candidates** [周三, 20 9月 02:04]

Researchers have identified a pair of proteins that show promise as the basis for a gonorrhea vaccine.

• **Management studies: Dishonesty shift** [周三, 20 9月 02:04]

Lying comes more easily to people in teams: Behavioral scientists have shown in an experimental study why groups are more likely to behave unethically than individuals.

• **Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests** [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

• **Brain powered: Increased physical activity among breast cancer survivors boosts cognition** [周三, 20 9月 02:04]

It is estimated that up to 75 percent of breast cancer survivors experience problems with cognitive difficulties following treatments, perhaps lasting years. Currently, few science-based options are available to help. Researchers report in a pilot study of 87 female breast cancer survivors an increase in physical activity more than doubled the women's post-treatment mental processing speed.

• **Proteins' role in development of spinal sensory cells redefined** [周三, 20 9月 02:04]

A recent study has overturned a common belief about how a certain

class of proteins in the spinal cord regulate the formation of nervous system cells -- called neurons -- during embryonic development.

- [**Winner takes all: Success enhances taste for luxury goods, study suggests**](#) [周三, 20 9月 00:31]

Footballers in flashy cars, City workers in Armani suits, reality TV celebrities sipping expensive champagne while sitting in hot tubs: what drives people to purchase luxury goods? New research suggests that it may be a sense of being a 'winner' -- but that contrary to expectations, it is not driven by testosterone.

- [**How to remove a tick and prevent future bites**](#) [周二, 19 9月 23:12]

As tick populations grow and spread across the country, their prevalence is increasing the public's risk for some troubling diseases. Of these diseases, say dermatologists, Lyme disease, Rocky Mountain spotted fever, Powassan virus and alpha-gal syndrome — a mysterious red meat allergy — are among the most serious.

- [**Getting emotional after failure helps you improve next time, study finds**](#) [周二, 19 9月 23:12]

Emotional responses to failure rather than cognitive ones are more effective at improving people's results for the next time they tackle the next related task, new research indicates.

- [**Antibiotics following C-section among obese women reduces risk of surgical infection**](#) [周二, 19 9月 23:06]

Among obese women undergoing cesarean delivery, a postoperative 48-hour course of antibiotics significantly decreased the rate of surgical site infection within 30 days after delivery, according to a study.

- [**Contribution of opioid-related deaths to the change in life expectancy in the US**](#) [周二, 19 9月 23:06]

Between 2000 and 2015 in the US, life expectancy increased overall but drug-poisoning deaths, mostly related to opioids, contributed to reducing life expectancy, according to a study.

- [**How the shape and size of your face relates to your sexuality**](#) [周二, 19 9月 23:06]

Men and women with shorter, wider faces tend to be more sexually motivated and to have a stronger sex drive than those with faces of other dimensions. The research investigates the role that facial features play in sexual relationships and mate selection.

- [**Key regulator of male fertility identified**](#) [周二, 19 9月 23:06]

When it comes to male reproductive fertility, timing is everything. Now scientists are finding new details on how disruption of this timing may contribute to male infertility or congenital illness. Researchers are identifying the key molecular and genetic switch that activates production of healthy male sperm -- but only when the time is right.

- [**Cell-based therapy success could be boosted by new antioxidant**](#) [周二, 19 9月 22:52]

Cell therapies being developed to treat a range of conditions could be improved by a chemical compound that aids their survival, research suggests. Lab tests found that the human-made molecule -- a type of antioxidant -- helps to shield healthy cells from damage such as would be caused when they are transplanted into a patient during cell therapy.

- [**New hosts for Chagas disease vectors identified**](#) [周二, 19 9月 22:26]

Solitary weasel-like animals called tayra might look pretty harmless, but some may actually be incubators for a parasite that causes Chagas disease, a chronic, debilitating condition that is spread by insects called kissing bugs and affects more than 8 million people worldwide.

- [**Playing American football before age 12 could have long-term health effects**](#) [周二, 19 9月 22:25]

Playing American football before the age of 12 may have long-term consequences for players' mood and behavior, according to a study involving 214 professional and amateur football players.

- [**Exposure to pet and pest allergens during infancy linked to reduced asthma risk**](#) [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

- [**An interconnection between the nervous and immune system**](#) [周二, 19 9月 22:25]

Researchers have shown that the increased incidence of infections seen in spinal cord injury patients is directly linked to a disruption of the normal central nervous system.

- [**A piece of the puzzle: Eight autism-related mutations in one gene**](#) [周二, 19 9月 22:25]

Researchers discover a large number of clustered mutations in a single gene, TRIO, that disrupt the development of the brain's connections and likely contribute to the development of autism-spectrum disorders. The scientists also find that a sister gene linked to schizophrenia, KALRN, is inactive in early brain development, but becomes active in adolescence.

- [**Guidelines for handling CAR T cell side effects**](#) [周二, 19 9月 21:28]

Immune-cell based therapies opening a new frontier for cancer treatment carry unique, potentially lethal side effects that provide a new challenge for oncologists, one addressed by proposed guidelines for systematically dealing with the toxicities of these drugs.

- [**Cell model of the brain provides new knowledge on developmental disease**](#) [周二, 19 9月 21:26]

By reprogramming skin cells into nerve cells, researchers are creating cell models of the human brain. In a new study, the researchers describe how cells from patients with the severe developmental disease lissencephaly differ from healthy cells. The method can provide vital new knowledge on difficult-to-study congenital diseases.

- [**Local epileptic seizure shows long distance interaction**](#) [周二, 19 9月 21:26]

An epileptic seizure may be highly local, but it also influences brain

activity at a distance of over ten centimeters from the core. This, in turn, affects the active area, scientists report.

- [**New treatment for osteoporosis provides better protection against fractures**](#) [周二, 19 9月 21:24]

A new treatment for osteoporosis provides major improvements in bone density and more effective protection against fractures than the current standard treatment. This study is the first that compares the effect of two osteoporosis medicines on fractures.

- [**Nanocapsules enable cell-inspired metabolic reactions**](#) [周二, 19 9月 21:24]

Researchers have succeeded in developing capsules capable of producing the bio-molecule glucose-6-phosphate that plays an important role in metabolic processes. The researchers were able to produce the metabolite in conditions very similar to the biochemical reaction inside natural cells.

- [**Ricin only lethal in combination with sugar**](#) [周二, 19 9月 21:23]

Researchers have discovered a means of immunizing cells against the biological weapon ricin, which, they report, is only lethal when combined with sugar.

- [**'Language of stem cells' discovered**](#) [周二, 19 9月 21:23]

Stem cells control the cells around them, inducing them to perform specific functions. This phenomenon of the "language of stem cells", which has now been discovered for the very first time, report investigators.

- [**How eyes get clogged in glaucoma and how to free them**](#) [周二, 19 9月 21:15]

Biologists have found an explanation for the increase in intraocular pressure in glaucoma and a promising therapeutic option to rejuvenate the eye.

- [**Overcoming the brain's fortress-like barrier**](#) [周二, 19 9月 21:10]

Scientists have helped provide a way to better understand how to enable drugs to enter the brain and how cancer cells make it past the blood brain barrier.

- [**Changes in teenage parenthood**](#) [周二, 19 9月 21:10]

The US birth rate hasn't changed for two generations of teenage girls, but other aspects of young parenthood are shifting, especially regarding young fathers.

- [**The brain at work: Spotting half-hidden objects**](#)

[周二, 19 9月 21:10]

The human and non-human primate brain is remarkable in recognizing partially hidden objects. A study, conducted during a shape recognition task, shows as more of the shape is hidden, a brain area involved in cognition starts to send signals to the visual cortex. The findings make the scientists wonder if this communication between different brain areas might be impaired in people with autism or Alzheimer's. Both conditions can cause confusion in cluttered surroundings and problems recognizing ob...

- [**Students' self-concepts of ability in math, reading predict later math, reading attainment**](#) [周二, 19 9月 21:10]

A new longitudinal study looked at how youths' self-concepts are linked to their actual academic achievement in math and reading from middle childhood to adolescence. The study found that students' self-concepts of their abilities in these two academic domains play an important role in motivating their achievements over time and across levels of achievement.

- [**The wrong first step to revive athletes in cardiac arrest**](#) [周二, 19 9月 21:09]

New research suggests that the main obstacle to an appropriate bystander response during athletes' cardiac arrest could be an apparently widespread myth: that 'tongue swallowing' is a common complication of sudden loss of consciousness that must be avoided or relieved at all costs to prevent death from asphyxia.

- [**Treatment-resistant melanoma may be vulnerable to a drug holiday, study finds**](#) [周二, 19 9月 11:23]

A new study has uncovered the mechanisms by which treatment-resistant melanoma become vulnerable to cessation of a class of drugs called MAP kinase (MAPK)-targeted inhibitors. By identifying these mechanisms, the scientists discovered that therapeutic benefits for patients could derive from a one-two punch of a drug holiday of MAPK inhibitors followed by a class of drugs called DNA repair inhibitors.

- [**ADHD kids can be still, if they're not straining their brains**](#) [周二, 19 9月 10:22]

Lack of motivation or boredom with school isn't to blame for squirming by children with Attention Deficit Hyperactivity Disorder. Symptoms such as fidgeting, foot-tapping and chair-swiveling are triggered by cognitively demanding tasks - like school and homework. But movies and video games don't typically require brain strain, so the excessive movement doesn't manifest.

- [**Owners of seriously ill pets at risk of stress, anxiety and depressive symptoms**](#) [周二, 19 9月 10:22]

Owners of seriously or terminally ill pets are more likely to suffer with stress and symptoms of depression and anxiety, as well as poorer quality of life, compared with owners of healthy animals, finds a study.

- [**Toy gun popular with kids can cause serious eye injury, warn doctors**](#) [周二, 19 9月 10:22]

A toy gun that is popular with children can cause serious eye injuries, warn doctors in a new article.

- [**Taking a break from dieting may improve weight loss**](#) [周二, 19 9月 10:22]

Avoiding continuous dieting may be the key to losing weight and keeping the kilos off, the latest research shows. Researchers showed in a randomized controlled trial, that taking a two-week break during dieting may improve weight loss.

- [**Analyzing the language of color**](#) [周二, 19 9月 04:34]

Languages tend to divide the "warm" part of the color spectrum into more color words, such as orange, yellow, and red, compared to the "cooler" regions, which include blue and green, cognitive scientists have found. This pattern, which they found across more than 100 languages, may reflect the fact that most objects that stand out in a scene are warm-colored, while cooler colors such as green and blue tend to be found in backgrounds, the researchers say.

- [**Fake news more likely to thrive online due to lowered fact-checking**](#) [周二, 19 9月 04:34]

Fake news is more likely to thrive online due to lowered fact-checking, according to new American research.

- [**New lung cell type discovered**](#) [周二, 19 9月 04:34]

A new lung cell type that is implicated in the body's innate immune defense against the bacteria *Streptococcus pneumoniae* -- one of the leading causes of pneumonia worldwide -- has been discovered by researchers.

- [**Blood tests: Sound waves separate biological nanoparticles for 'liquid biopsies'**](#) [周二, 19 9月 04:34]

A prototype device developed by an international team of engineers can sift exceedingly tiny particles called exosomes from blood samples without having to send samples off to a lab. The device, which combines acoustic cell-sorting and microfluidic technologies, could be a boon to both scientific research and medical applications.

- [**Urine output to disease: Study sheds light on the importance of hormone quality control**](#) [周二, 19 9月 04:34]

A discovery about the endoplasmic reticulum in hormone-producing cells shed lights on water balance under normal physiology and could open doors to better understanding of diseases related to misfolded proteins.

- [**Horses working in therapeutic riding programs**](#)

[**do not experience additional stress**](#) [周二, 19 9月 04:34]

In the US, therapeutic horseback riding offers equine-assisted therapy to diverse populations who have anxiety disorders. Veterans diagnosed with post-traumatic stress disorder often are prescribed this type of therapy to cope with anxiety, but little is known about how these programs affect the stress levels in horses. Now, a study has revealed that horses ridden by veterans with PTSD did not have undue physiological stress responses while participating in a therapy program.

• [**Potential pathway to treat flesh-eating bacteria**](#) [周二, 19 9月 04:33]

Researchers have solved a 100-year-old mystery, providing them a possible key to unlock a pathway for treating diseases caused by flesh-eating bacteria. Medical researchers have found a critical target on which to focus for developing a potential Group A Streptococcus vaccine or antibiotic to fight it. By manipulating this target, they hope to either reduce the severity of these infections or clear them up faster.

• [**Beta blockers not needed after heart attack if other medications taken**](#) [周二, 19 9月 04:33]

Beta blockers are not needed after a heart attack if heart-attack survivors are taking ACE inhibitors and statins, new research suggests. The study is the first to challenge the current clinical guideline that heart-attack survivors should take all three drugs -- beta blockers, ACE inhibitors and statins -- for the rest of their lives.

• [**New self-powered paper patch could help diabetics measure glucose during exercise**](#) [周二, 19 9月 04:33]

A new paper-based sensor patch developed by researchers at Binghamton University, State University of New York could allow diabetics to effectively measure glucose levels during exercise.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [Risks vary widely in drone-human impacts](#) [周三, 20 9月 04:03]

New research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

- [Tiny lasers from a gallery of whispers](#) [周三, 20 9月 04:03]

Whispering gallery mode resonators rely on a phenomenon similar to an effect observed in circular galleries, and the same phenomenon applies to light. When light is stored in ring-shaped or spherical active resonators, the waves superimpose in such a way that it can result in laser light. Investigators now report a new type of dye-doped WGM micro-laser that produces light with tunable wavelengths.

- [Security cameras vulnerable to attacks using infrared light](#) [周三, 20 9月 04:02]

Researchers have demonstrated that security cameras infected with malware can receive covert signals and leak sensitive information from the very same surveillance devices used to protect facilities.

- [Wikipedia used to give AI context clues](#) [周三, 20 9月 02:04]

A team of computer scientists is teaching artificial intelligence agents how to interact with the world in a way that makes sense.

- [Mercury's poles may be icier than scientists thought](#) [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice

inventory.

- [**Advanced lithium-ion and metal-air batteries**](#) [周三, 20 9月 00:31]

Engineers are developing energy storage technologies that are cheaper, safer and more efficient.

- [**One-way track for microwaves based on mechanical interference**](#) [周三, 20 9月 00:31]

Researchers use interference in the motion of a micrometer-size drum to route microwave signals in a single direction.

- [**Rogue wave analysis supports investigation of the El Faro sinking**](#) [周二, 19 9月 23:12]

A new analysis done to support the investigation into the 2015 sinking of the El Faro cargo ship has calculated the likelihood of a massive rogue wave during Hurricane Joaquin in October of that year – and demonstrated a new technique for evaluating the probability of rogue waves over space and time.

- [**Fluorescence microscopy on a chip: no lenses required**](#) [周二, 19 9月 23:11]

Fluorescence microscopy gives researchers incredible power to illuminate the tiniest structures and capture the real-time activities of live cells by tagging biological molecules with a veritable rainbow of fluorescent dyes. This power comes at a cost: The technology can be expensive and time-consuming and, so far, has resisted attempts at automation.

- [**Nonlinear physics bridges thoughts to sounds in birdsong**](#) [周二, 19 9月 23:05]

The beautiful sound of birdsongs emerging from the trees is a wonderful example of how much nature can still teach us, even as much about their origins are still mysterious to us. About 40 percent of bird species learn to vocalize when they are exposed to a tutor, a behavior of interest to many neurologists and neurobiologists. The other 60 percent can vocalize instinctually in isolation. The variety across species, and the

relationship between the nervous system and biomechanics makes birdsong p...

• [**Cost effective quantum moves a step closer**](#) [周二, 19 9月 22:26]

Researchers have taken an important step towards enabling quantum networks to be cost-effective and truly secure from attack. The experiments prove the viability of a measurement-device-independent quantum key distribution (QKD) system, based on readily available hardware.

• [**A dream of foam: better concrete, beer froth and ice cream**](#) [周二, 19 9月 22:25]

Researchers have discovered a new method to design stable foams. Their findings could make beer froth and ice cream last longer -- and revolutionize construction materials such as concrete.

• [**Novel strategy for chirality controlled synthesis of single-walled carbon nanotubes**](#) [周二, 19 9月 22:25]

Researchers have developed a novel strategy for controlling chirality of single-walled carbon nanotubes.

• [**Size matters in the detection of exoplanet atmospheres**](#) [周二, 19 9月 21:26]

A group-analysis of 30 exoplanets orbiting distant stars suggests that size, not mass, is a key factor in whether a planet's atmosphere can be detected. The largest population-study of exoplanets to date successfully detected atmospheres around 16 'hot Jupiters', and found that water vapor was present in every case.

• [**What do we need to know to mine an asteroid?**](#) [周二, 19 9月 21:26]

The mining of resources contained in asteroids, for use as propellant, building materials or in life-support systems, has the potential to revolutionise exploration of our Solar System. To make this concept a reality, we need to increase our knowledge of the very diverse population of accessible Near Earth Asteroids (NEA).

[**Nanosat fleet proposed for voyage to 300 asteroids**](#) [周二, 19 9月 21:26]

A fleet of tiny spacecraft could visit over 300 asteroids in just over three years, according to a mission study. The Asteroid Touring Nanosat Fleet concept comprises 50 spacecraft propelled by innovative electric solar wind sails (E-sails) and equipped with instruments to take images and collect spectroscopic data on the composition of the asteroids. Each nanosat would visit six or seven asteroids before returning to Earth to deliver the data.

[**Molecular motors: Slowing the clockwork**](#) [周二, 19 9月 21:26]

Progress on the way to smart nanomachines: Chemists have modified the synthesis of a molecular motor so as to reduce the speed of its light-driven rotation, thus permitting the researchers to analyze the mechanism of motion in complete detail.

[**Nanocapsules enable cell-inspired metabolic reactions**](#) [周二, 19 9月 21:24]

Researchers have succeeded in developing capsules capable of producing the bio-molecule glucose-6-phosphate that plays an important role in metabolic processes. The researchers were able to produce the metabolite in conditions very similar to the biochemical reaction inside natural cells.

[**Supercontinuum lasers can lead to better bread and beer**](#) [周二, 19 9月 21:10]

Researchers have analyzed whole grains with long near-infrared wavelengths using a new type of light source, the supercontinuum laser. The research has significance for our knowledge of food ingredients and may, for example, eventually lead to better quality of bread and beer.

[**Graphene and other carbon nanomaterials can replace scarce metals**](#) [周二, 19 9月 21:10]

Scarce metals are found in a wide range of everyday objects around us. They are complicated to extract, difficult to recycle and so rare that

several of them have become "conflict minerals" which can promote conflicts and oppression. New research shows that there are potential technology-based solutions that can replace many of the metals with carbon nanomaterials, such as graphene.

• **[One step closer to lifelike robots](#)** [周二, 19 9月 21:10]

Researchers have developed a 3-D-printable synthetic soft muscle that can lift 1,000 times its own weight. The muscle has intrinsic expansion ability and, unlike previous artificial muscles, it does not require an external compressor or high voltage equipment, signaling a breakthrough in the creation of soft robots that can move independently. The new material also has a strain density -- an ability to expand -- that is 15 times larger than natural muscle.

• **[The sublime challenge of jet noise](#)** [周二, 19 9月 11:22]

A scientist is using ALCF resources to create high fidelity simulations of jet turbulence to determine how and where noise is produced. The results may lead to novel engineering designs that reduce noise over commercial flight paths and on aircraft carrier decks.

• **[Optical, electrical bistability study sheds light on next-gen high speed data transfer](#)** [周二, 19 9月 11:22]

Today, electrical bistable devices are the foundation of digital electronics, serving as building blocks of switches, logic gates and memories in computer systems. However, the bandwidth of these electronic computers is limited by the signal delay of time constants important to electronic logic operations. In an attempt to mitigate these problems, scientists have considered the development of an optical digital computer, and one team has gone so far as to demonstrate the optical and electrical bi...

• **[New mirror-coating technology promises dramatic improvements in telescopes](#)** [周二, 19 9月 10:23]

An electrical engineer has teamed up with astronomers to improve telescope mirrors using thin-film technology from the electronics industry. They are developing new protective coatings using an atomic layer deposition system large enough to accommodate telescope mirrors.

• [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

• [**Fake news more likely to thrive online due to lowered fact-checking**](#) [周二, 19 9月 04:34]

Fake news is more likely to thrive online due to lowered fact-checking, according to new American research.

• [**Blood tests: Sound waves separate biological nanoparticles for 'liquid biopsies'**](#) [周二, 19 9月 04:34]

A prototype device developed by an international team of engineers can sift exceedingly tiny particles called exosomes from blood samples without having to send samples off to a lab. The device, which combines acoustic cell-sorting and microfluidic technologies, could be a boon to both scientific research and medical applications.

• [**Enzyme's worth to biofuels shown in recent research**](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

• [**New self-powered paper patch could help diabetics measure glucose during exercise**](#) [周二, 19 9月 04:33]

A new paper-based sensor patch developed by researchers at Binghamton University, State University of New York could allow diabetics to effectively measure glucose levels during exercise.

• [**2-D Electronics' metal or semiconductor? Both**](#) [周二, 19 9月 04:15]

Researchers produced the first 2-D field-effect transistor (FET) made of a single material.

- [**Solar-to-fuel system recycles CO2 to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [**Copper catalyst yields high efficiency CO2-to-fuels conversion**](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [**Coatings needed for concentrating solar power**](#) [周二, 19 9月 03:17]

Next-generation concentrating solar power (CSP) plants require high-temperature fluids, like molten salts, in the range of 550-750 degrees Celsius to store heat and generate electricity. At those high temperatures, however, the molten salts eat away at common alloys used in the heat exchangers, piping, and storage vessels of CSP systems. New research is aimed at mitigating corrosion levels in CSP plants with nickel-based coatings.

- [**New quantum phenomena in graphene superlattices**](#) [周二, 19 9月 00:36]

Researchers have just shown the first new type of quantum oscillation to be reported for thirty years. It is the first of its kind to be present at high temperature and on the mesoscale and sheds light on the Hofstadter butterfly phenomenon.

- [**Just squeeze in -- when spaces are tight, nature loosens its laws**](#) [周二, 19 9月 00:35]

It turns out that when they're in a hurry and space is limited, ions, like people, will find a way to cram in -- even if that means defying nature's

norms. Researchers have now shown that the charged particles will actually forgo their 'opposites attract' behavior, called Coulombic ordering, when confined in the tiny pores of a nanomaterial.

- [**Step towards better 'beyond lithium' batteries**](#) [周二, 19 9月 00:35]

A step towards new 'beyond lithium' rechargeable batteries with superior performance has been made.

- [**Scalable process discovered to produce structural colors inspired by bird feathers**](#) [周二, 19 9月 00:35]

Researchers made nano-sized balls of melanin aggregate into clusters called supraballs. Melanin appears black in individual nanoparticles. But altering spacing of the nanoparticles in the ball affects how the particles scatter light. A thin silica coating on the outside of melanin nanoparticles acts like a bumper, limiting how close the particles can pack together. Varying the diameter of the melanin core and the thickness of the silica shell creates supraballs in a range of colors.

- [**Physicists discover a tri-anion particle with colossal stability**](#) [周二, 19 9月 00:35]

Chemists have created the most stable tri-anion particle currently known to science. A tri-anion particle is a combination of atoms that contains three more electrons than protons. This discovery is novel because previously known tri-anion particles were unstable due to their numerical imbalance.

- [**When radio galaxies collide, supermassive black holes form tightly bound pairs**](#) [周二, 19 9月 00:35]

Supermassive black holes found in the centers of galaxies can form gravitationally bound pairs when galaxies merge, according to a new study.

- [**A new approach to ultrafast light pulses**](#) [周二, 19 9月 00:35]

A team of researchers has found a new way of producing high-speed pulses of light using two-dimensional molecular aggregates, which could enable new photonic devices such as optically based microchips.

• [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

• [**Chemists make playdough/lego-like hybrid to create tiny building blocks**](#) [周一, 18 9月 23:43]

Playdough and Legos are among the most popular childhood building toys. But what could you use if you wanted to create something really small — a structure less than the width of a human hair? It turns out, a team of chemists has found, this can be achieved by creating particles that have both playdough and Lego traits.

• [**Secrets of bright, rapidly spinning star revealed**](#) [周一, 18 9月 23:18]

Almost 50 years after it was first predicted that rapidly rotating stars would emit polarized light, scientists have succeeded in observing the phenomenon for the first time. They have now detected the polarized light from Regulus, one of the brightest stars in the night sky.

• [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

• [**Video game boosts sex health IQ and attitudes in minority teens**](#) [周一, 18 9月 23:18]

A video game to promote health and reduce risky behavior in teens improves sexual health knowledge and attitudes among minority youth, according to a new study. The findings validate the value of the video game as a tool to engage and educate teens at risk for HIV and other sexually transmitted infections, said the researchers.

• [**Developing roads that can generate power from**](#)

[passing traffic](#) [周一, 18 9月 23:18]

Researchers are looking at advanced materials for roads and pavements that could generate electricity from passing traffic. Engineers are working on smart materials such as 'piezoelectric' ceramics that when embedded in road surfaces would be able to harvest and convert vehicle vibration into electrical energy.

• [An original method of cooling ions could have new and interesting uses](#) [周一, 18 9月 23:18]

When investigating atoms, scientists face a challenge: At room temperature, individual atoms in a gas have kinetic energy, and fly around at large velocities. Temperature is, in essence, the relative movement between atoms; thus the goal of getting the atoms to have small relative velocities involves freezing them to extremely cold temperatures. A group has now developed new universal method for cooling ions.

• [Wireless high-speed data and power transfer integrated](#) [周一, 18 9月 23:18]

Researchers have developed a system that can simultaneously deliver watts of power and transmit data at rates high enough to stream video over the same wireless connection. By integrating power and high-speed data, a true single 'wireless' connection can be achieved.

• [More efficient use of raw materials with the aid of 'molecular conveyor belts'](#) [周一, 18 9月 21:34]

Making valuable products, such as fuels, synthetic materials or pharmaceuticals, from renewable raw materials is to date not efficient enough because the microorganisms used only process the raw materials very slowly and generate many by-products in addition to the substances actually wanted. Biotechnologists have now succeeded in optimizing sugar utilization in baker's yeast.

• [Tiny electrically pumped micro-lasers epitaxially grown on industry standard silicon](#)

substrates [周一, 18 9月 21:33]

A group of researchers successfully demonstrated record-small electrically pumped micro-lasers epitaxially grown on industry standard (001) silicon substrates in a recent study. The thresholds and footprints are orders of magnitude smaller than those previously reported lasers epitaxially grown on Si.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Gulf Spill oil dispersants associated with health symptoms in cleanup workers**](#) [周三, 20 9月 04:03]

Workers who were likely exposed to dispersants while cleaning up the 2010 Deepwater Horizon oil spill experienced a range of health symptoms including cough and wheeze, and skin and eye irritation.

- [**Emerging disease further jeopardizes North American frogs**](#) [周三, 20 9月 04:02]

A deadly amphibian disease called severe Perkinsea infections, or SPI, is the cause of many large-scale frog die-offs in the United States, according to a new study.

- [**End-of-summer Arctic sea ice extent is eighth lowest on record**](#) [周三, 20 9月 04:01]

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

- [**What web browsers and proteins have in common**](#) [周三, 20 9月 02:04]

The discovery of a previously overlooked site on protein molecules may solve a mystery about how proteins are able to carry out specialized functions in living cells.

- [**A study switches from genetic to metabolic**](#)

[analysis to reconstitute evolutionary process](#) [周三, 20 9

月 02:04]

A new method for analyzing a living being chemical compositions is tested in Andean plants and attest the genesis of species by means of geographic isolation. Scientists analyzed chemical compounds which express specific biogeographic trends in the evolutionary process, validating a Smithsonian hypothesis on the evolution of the genus *Espeletia* in the process.

• [How to remove a tick and prevent future bites](#) [周二,

19 9月 23:12]

As tick populations grow and spread across the country, their prevalence is increasing the public's risk for some troubling diseases. Of these diseases, say dermatologists, Lyme disease, Rocky Mountain spotted fever, Powassan virus and alpha-gal syndrome — a mysterious red meat allergy — are among the most serious.

• [Nonlinear physics bridges thoughts to sounds in birdsong](#) [周二, 19 9月 23:05]

The beautiful sound of birdsongs emerging from the trees is a wonderful example of how much nature can still teach us, even as much about their origins are still mysterious to us. About 40 percent of bird species learn to vocalize when they are exposed to a tutor, a behavior of interest to many neurologists and neurobiologists. The other 60 percent can vocalize instinctually in isolation. The variety across species, and the relationship between the nervous system and biomechanics makes birdsong p...

• [New hosts for Chagas disease vectors identified](#) [周

二, 19 9月 22:26]

Solitary weasel-like animals called tayra might look pretty harmless, but some may actually be incubators for a parasite that causes Chagas disease, a chronic, debilitating condition that is spread by insects called kissing bugs and affects more than 8 million people worldwide.

• [Exposure to pet and pest allergens during infancy linked to reduced asthma risk](#) [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during

infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

- [**Supercontinuum lasers can lead to better bread and beer**](#) [周二, 19 9月 21:10]

Researchers have analyzed whole grains with long near-infrared wavelengths using a new type of light source, the supercontinuum laser. The research has significance for our knowledge of food ingredients and may, for example, eventually lead to better quality of bread and beer.

- [**Declining queen conch populations are fragmented and that's changing the conservation game**](#) [周二, 19 9月 21:10]

To provide a vital scientific foundation for conservation efforts, an international team has conducted a genetic analysis comparing queen conch at 19 sites throughout the Caribbean. Their findings will help scientists understand how local subpopulations of conch are fragmented throughout the Caribbean, an essential first step needed to develop effective science-driven management plans and practices.

- [**Catching a diversity of fish species — instead of specializing — means more stable income for fishers**](#) [周二, 19 9月 11:23]

A team of scientists analyzed nearly 30 years of revenue and permitting records for individuals fishing in Alaskan waters and tracked how their fishing choices, in terms of permits purchased and species caught, influenced their year-to-year income volatility.

- [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

• [**Parasitic eye infection poses significant threat to UK dogs, warn experts**](#) [周二, 19 9月 10:22]

A parasitic worm that is becoming increasingly common in Europe poses a significant threat to UK dogs, warn experts in a new report.

• [**Owners of seriously ill pets at risk of stress, anxiety and depressive symptoms**](#) [周二, 19 9月 10:22]

Owners of seriously or terminally ill pets are more likely to suffer with stress and symptoms of depression and anxiety, as well as poorer quality of life, compared with owners of healthy animals, finds a study.

• [**Importance of early season control of herbicide-resistant kochia**](#) [周二, 19 9月 04:34]

Researchers are providing new insights into the control of herbicide-resistant kochia, a weed that competes with both dryland and irrigated crops across the Great Plains states.

• [**Horses working in therapeutic riding programs do not experience additional stress**](#) [周二, 19 9月 04:34]

In the US, therapeutic horseback riding offers equine-assisted therapy to diverse populations who have anxiety disorders. Veterans diagnosed with post-traumatic stress disorder often are prescribed this type of therapy to cope with anxiety, but little is known about how these programs affect the stress levels in horses. Now, a study has revealed that horses ridden by veterans with PTSD did not have undue physiological stress responses while participating in a therapy program.

• [**Enzyme's worth to biofuels shown in recent research**](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

• [**Potential pathway to treat flesh-eating bacteria**](#) [周二, 19 9月 04:33]

Researchers have solved a 100-year-old mystery, providing them a

possible key to unlock a pathway for treating diseases caused by flesh-eating bacteria. Medical researchers have found a critical target on which to focus for developing a potential Group A Streptococcus vaccine or antibiotic to fight it. By manipulating this target, they hope to either reduce the severity of these infections or clear them up faster.

- [**Sex, aggression controlled separately in female animal brains, but overlap in male brains**](#) [周二, 19 9月 04:14]

Brain structures that control sexual and aggressive behavior in mice are wired differently in females than in males, new research shows.

- [**Solar-to-fuel system recycles CO2 to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [**Copper catalyst yields high efficiency CO2-to-fuels conversion**](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [**Coatings needed for concentrating solar power**](#) [周二, 19 9月 03:17]

Next-generation concentrating solar power (CSP) plants require high-temperature fluids, like molten salts, in the range of 550-750 degrees Celsius to store heat and generate electricity. At those high temperatures, however, the molten salts eat away at common alloys used in the heat exchangers, piping, and storage vessels of CSP systems. New research is aimed at mitigating corrosion levels in CSP plants with nickel-based coatings.

- [**A cereal crop survives heat and drought**](#) [周二, 19 9月 02:30]

Scientists have published the genome sequence of Pearl millet, a drought resistant crop plant most important in arid regions in Africa and Asia. This plant is important to small and medium farmers who grow the plant without larger irrigation. Pearl millet delivers a good harvest index under drought and heat conditions when rice, maize or wheat already have no grains anymore.

- **['King Tide' mapping project](#)** [周二, 19 9月 02:21]

'Dress rehearsal' will help quantify local flooding risk and validate storm-surge models, while laying groundwork for a long-term network of volunteer data collectors.

- **[When it comes to the threat of extinction, size matters](#)** [周二, 19 9月 01:27]

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

- **[People's love of the seas could be the key for plastic pollution solution](#)** [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to reducing the threats to it posed by plastic pollution.

- **[An effective way to eliminate atrazine and its by-products in surface water](#)** [周二, 19 9月 00:36]

Atrazine, widely used as a weedkiller, is known to have harmful effects on aquatic wildlife and presents a risk to human health by altering the action of certain hormones. Researchers have now compared various processes used to degrade atrazine, one of the most common pesticides detected in surface water in Quebec.

- **[RNA discovery could help boost plant heat, drought tolerance](#)** [周二, 19 9月 00:35]

The discovery of a RNA that can increase drought and salt tolerance in thale cress could illuminate a new research approach and hold implications for other plants, including food crops.

- [**To predict how climate change will affect disease, researchers must fuse climate science and biology**](#) [周二, 19 9月 00:35]

To predict how climate change will affect disease, researchers must fuse climate science and biology, according to a new review.

- [**Scientists show molecular basis for ants acting as 'bodyguards' for plants**](#) [周二, 19 9月 00:35]

Though you might not think of ants as formidable bodyguards, some do an impressive job protecting plants from enemies. Examining the relationship between the Amazon rainforest plant *Cordia nodosa* in Peru and the ant species *Allomerus octoarticulatus*, scientists found the degree to which the ants express two genes significantly impacts the amount of protection they provide to their hosts.

- [**Urgent emission reductions needed to achieve 1.5°C warming limit**](#) [周一, 18 9月 23:18]

Significant emission reductions are required if we are to achieve one of the key goals of the Paris Agreement, and limit the increase in global average temperatures to 1.5°C; a new partnership warns.

- [**Changes in Earth's crust caused oxygen to fill the atmosphere**](#) [周一, 18 9月 23:18]

New research has uncovered a direct link between changes in the earth's crust three billion years ago and the introduction of free oxygen to the atmosphere. Without these changes, oxygen could have been suppressed in earth's crust forever, so the findings help explain the emergence of life on our planet.

- [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

- [**Dogs' social skills linked to oxytocin sensitivity**](#) [周

—, 18 9月 23:18]

The tendency of dogs to seek contact with their owners is associated with genetic variations in sensitivity for the hormone oxytocin, according to a new study. The results contribute to our knowledge of how dogs have changed during their development from wolf to household pet.

• [**Genomic recycling: Ancestral genes take on new roles**](#) [周一, 18 9月 23:18]

One often hears about the multitude of genes we have in common with chimps, birds or other living creatures, but such comparisons are sometimes misleading. The shared percentage usually refers only to genes that encode instructions for making proteins -- while overlooking regulatory genes, which nonetheless make up a large part of the genome.

• [**Six new sponge species and new symbiotic associations from the Indonesian coral triangle**](#) [周

—, 18 9月 23:18]

The Indonesian coral reefs, located in the so-called coral triangle, are considered amongst the richest and most biodiverse places on Earth. Surprisingly, this impressive species diversity is still poorly known. Biologists now report the presence of 94 species of sponges, including six new to science and two new symbiotic sponge associations.

• [**How bacteria hinder chemotherapy**](#) [周一, 18 9月 22:06]

Scientists have found bacteria in pancreatic tumors that metabolize a common drug, explains a new report.

• [**Sheep gene insights could help farmers breed healthier animals**](#) [周一, 18 9月 22:06]

Fresh insights into the genetic code of sheep could aid breeding programs to improve their health and productivity. Scientists have now mapped which genes are turned on and off in the different tissues and organs in a sheep's body.

• [**More efficient use of raw materials with the aid of 'molecular conveyor belts'**](#) [周一, 18 9月 21:34]

Making valuable products, such as fuels, synthetic materials or

pharmaceuticals, from renewable raw materials is to date not efficient enough because the microorganisms used only process the raw materials very slowly and generate many by-products in addition to the substances actually wanted. Biotechnologists have now succeeded in optimizing sugar utilization in baker's yeast.

- [**Welfare of zoo animals set to improve**](#) [周一, 18 9月 21:33]

The wellbeing of zoological animals is set to improve following the successful trial of a new welfare assessment grid.

- [**Fuel from waste and electricity?**](#) [周一, 18 9月 21:33]

Researchers have shown that the combination of microbial and electrochemical conversion of biomass can yield valuable products. For the example of corn beer and corn silage they have gained energy-dense alkanes with diesel-fuel like properties at high carbon and energetic yield.

- [**Cells programmed like computers to fight disease**](#) [周一, 18 9月 21:33]

Cells can be programmed like a computer to fight cancer, influenza, and other serious conditions -- thanks to a breakthrough in synthetic biology.

- [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**Studies of 'Crater Capital' in the Baltics show impactful history**](#) [周一, 18 9月 21:28]

Studies of craters in the Baltics (Estonia) are giving insights into the many impacts that have peppered the Earth over its long history. In southeastern Estonia, scientists have dated charcoal from trees destroyed

in an impact to prove a common origin for two small craters, named Illumetsa. A third submarine crater located on the seabed in the Gulf of Finland has been measured and dated with with precision.

[Devilish source of dust in atmosphere of Earth and Mars](#) [周一, 18 9月 21:28]

Swirling columns of sand and dust, known as dust devils, are a feature of desert areas on Mars and on Earth. Now, a study of terrestrial dust devils has shown that around two thirds of the fine particles lifted by these vortices can remain suspended in the atmosphere and be transported around the globe. The findings have implications for the climate and weather of both planets and, potentially, human health here on Earth.

[Membrane vesicles released by bacteria may play different roles during infection](#) [周一, 18 9月 21:07]

Bacteria release membrane-derived vesicles (MVs), which are small particles that can transport virulence factors to neighboring bacteria or to the cells of a mammalian host. This special MV-based system for delivering toxic proteins and nucleic acids in a protected manner to the target cells may have different specific functions depending on whether the bacterium acts as an extracellular or intracellular pathogen.

[Damage to monarch butterfly colonies in 2016 storm worse than thought](#) [周一, 18 9月 08:14]

A much greater number of monarch butterflies perished in a snowstorm in March 2016 in Mexico than previously estimated, according to new research. Analysis of damage from the storm -- and the ensuing salvage logging -- sheds further light on the precarious state of the famed butterflies' overwintering colonies.

[Converting waste toilet paper into electricity](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Management studies: Dishonesty shift**](#) [周三, 20 9月 02:04]

Lying comes more easily to people in teams: Behavioral scientists have shown in an experimental study why groups are more likely to behave unethically than individuals.

- [**Students' self-concepts of ability in math, reading predict later math, reading attainment**](#) [周二, 19 9月 21:10]

A new longitudinal study looked at how youths' self-concepts are linked to their actual academic achievement in math and reading from middle childhood to adolescence. The study found that students' self-concepts of their abilities in these two academic domains play an important role in motivating their achievements over time and across levels of achievement.

- [**Catching a diversity of fish species — instead of specializing — means more stable income for fishers**](#) [周二, 19 9月 11:23]

A team of scientists analyzed nearly 30 years of revenue and permitting records for individuals fishing in Alaskan waters and tracked how their fishing choices, in terms of permits purchased and species caught, influenced their year-to-year income volatility.

- [**The sublime challenge of jet noise**](#) [周二, 19 9月 11:22]

A scientist is using ALCF resources to create high fidelity simulations of jet turbulence to determine how and where noise is produced. The results may lead to novel engineering designs that reduce noise over

commercial flight paths and on aircraft carrier decks.

- [**Fake news more likely to thrive online due to lowered fact-checking**](#) [周二, 19 9月 04:34]

Fake news is more likely to thrive online due to lowered fact-checking, according to new American research.

- [**Enzyme's worth to biofuels shown in recent research**](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

- [**Reliance on 'gut feelings' linked to belief in fake news**](#) [周二, 19 9月 02:21]

People who tend to trust their intuition or to believe that the facts they hear are politically biased are more likely to stand behind inaccurate beliefs, a new study suggests.

- [**People's love of the seas could be the key for plastic pollution solution**](#) [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to reducing the threats to it posed by plastic pollution.

- [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**Parents not confident schools can assist child with chronic disease, mental health**](#) [周一, 18 9月 21:08]

Most parents are sure schools would be able to provide basic first aid but are less confident about a school's ability to respond to more complex health situations, such as an asthma attack or mental health problem.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.

- [**Teens come 'jet lagged' to school: Shifting sleeping patterns at weekends**](#) [周六, 16 9月 04:48]

A lack of sleep is associated with more absence and teens turn up jet lagged to school on Mondays, as shown in new research.

- [**Insult to injury: US workers without paid sick leave suffer from mental distress**](#) [周六, 16 9月 02:41]

Only seven states in the US have mandatory paid sick leave laws, yet, 15 states have passed preemptive legislation prohibiting localities from passing sick leave. Paid sick leave is gaining momentum as a social justice issue with important implications for health and wellness. But what are the implications for the mental well-being of Americans without paid sick leave? A new study is the first to show the link between mental distress and paid sick leave among US workers.

- [**300,000 families living in US-Mexico border towns face exposure to toxic stress**](#) [周五, 15 9月 21:52]

Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.

- [**Need for epinephrine in schools -- and staff trained to administer it**](#) [周五, 15 9月 21:52]

With school nurses often covering multiple buildings, researchers find that nearly one in five students who experience severe allergic reactions are given potentially life-saving epinephrine injections from unlicensed staff or students.

- [**Green schoolyards offer physical and mental health benefits for children**](#) [周五, 15 9月 21:52]

A growing body of evidence suggests access to safe, natural areas improves health across a wide variety of areas, including heart health, mental health, weight management, ADHD, and stress among children.

- [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's sports is less overt but remains a problem.

- [**New climate risk classification created to account for potential 'existential' threats**](#) [周五, 15 9月 09:06]

A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.

- [**One vaccine injection could carry many doses**](#) [周五, 15 9月 03:23]

A new 3-D fabrication method has been developed that can create a new type of drug-carrying particle that could allow several doses of a drug or vaccine to be delivered over an extended time period with just one injection.

- [**Cost of not adapting to climate change would be**](#)

at least five times higher [周五, 15 9月 03:22]

A study on damage to coastal considered only real estate loss. If nothing is done, researchers say, losses might be up to ten times higher if the predicament includes the spreading of flood- and global warming - related diseases.

Quicker learning: Brief reactivations of visual memories are enough to complete a full learning curve [周四, 14 9月 07:30]

A new study finds that brief memory reactivations can replace the repeated extensive practice and training known as 'practice makes perfect' as a learning technique.

Lion conservation requires effective international cooperation [周三, 13 9月 22:44]

In response to the alarming population declines of one of the most charismatic representatives of the megafauna, the lion, a team of international wildlife lawyers and lion experts joined efforts to assess the current and potential future role of international treaties regarding the carnivore's conservation.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [Scientists show molecular basis for ants acting as 'bodyguards' for plants](#) [周二, 19 9月 00:35]

Though you might not think of ants as formidable bodyguards, some do an impressive job protecting plants from enemies. Examining the relationship between the Amazon rainforest plant *Cordia nodosa* in Peru and the ant species *Allomerus octoarticulatus*, scientists found the degree to which the ants express two genes significantly impacts the amount of protection they provide to their hosts.

- [When radio galaxies collide, supermassive black holes form tightly bound pairs](#) [周二, 19 9月 00:35]

Supermassive black holes found in the centers of galaxies can form gravitationally bound pairs when galaxies merge, according to a new study.

- [More evidence of water on Mars](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named *Aeolis Dorsa* contains some of the most spectacular and densely packed river deposits

seen on Mars.

- [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

- [**Developing roads that can generate power from passing traffic**](#) [周一, 18 9月 23:18]

Researchers are looking at advanced materials for roads and pavements that could generate electricity from passing traffic. Engineers are working on smart materials such as 'piezoelectric' ceramics that when embedded in road surfaces would be able to harvest and convert vehicle vibration into electrical energy.

- [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

- [**World first: 'Storing lightning inside thunder'**](#) [周一, 18 9月 21:07]

In a world first, researchers have stored photonic information on a microchip as an acoustic wave. This allows precious extra time to store, process and then redistribute the data without relying on electronics, which produce excess heat. Such a hybrid chip could have a huge impact in cloud computing and telecommunication centers, which are overheating as we churn through data on our phones.

- [**Converting waste toilet paper into electricity**](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic

installations.

- [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

- [**Tough stuff: Spider silk enhanced with graphene-based materials**](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

- [**Immune system linked to alcohol drinking behavior**](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

- [**Wolves understand cause and effect better than dogs**](#) [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

- [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators:

they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through experience.

- [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

- [**Physicists offer explanation for diverse galaxy rotations**](#) [周五, 15 9月 03:22]

Physicists have found a simple and viable explanation for the diversity observed in galactic rotations. They report that diverse galactic-rotation

curves, a graph of rotation speeds at different distances from the center, can be naturally explained if dark matter particles are assumed to strongly collide with one another in the inner halo, close to the galaxy's center -- a process called dark matter self-interaction.

- [**Artificial 'skin' gives robotic hand a sense of touch**](#) [周四, 14 9月 07:30]

A team of researchers from the University of Houston has reported a breakthrough in stretchable electronics that can serve as an artificial skin, allowing a robotic hand to sense the difference between hot and cold, while also offering advantages for a wide range of biomedical devices.

- [**'Peel-and-go' printable structures fold themselves**](#) [周四, 14 9月 07:30]

Researchers have created a printable structure that begins to fold itself up as soon as it's peeled off the printing platform.

- [**Long-range communication barrier for near-zero-power devices shattered**](#) [周四, 14 9月 07:30]

Researchers have demonstrated for the first time that devices that run on almost zero power can transmit data across distances of up to 2.8 kilometers -- breaking a long-held barrier and potentially enabling a vast array of interconnected devices.

- [**Marijuana may produce psychotic-like effects in high-risk individuals**](#) [周四, 14 9月 07:30]

Marijuana may bring on temporary paranoia and other psychosis-related effects in individuals at high risk of developing a psychotic disorder, finds a preliminary study.

- [**'The dark side' of quantum computers**](#) [周四, 14 9月 07:29]

The era of fully fledged quantum computers threatens to destroy internet security as we know it. Researchers are in a race against time to prepare new cryptographic techniques before the arrival of quantum computers, as cryptographers now describe.

• [Squirrels use 'chunking' to organize their favorite nuts](#) [周四, 14 9月 07:29]

Like trick-or-treaters sorting their Halloween candy haul, fox squirrels apparently organize their stashes of nuts by variety, quality and possibly even preference, according to new research.

• [The beam of invisibility](#) [周三, 13 9月 22:45]

A new idea for a cloaking technology has been created by scientists. A completely opaque material is irradiated from above with a specific wave pattern -- with the effect that light waves from the left can now pass through the material without any obstruction. This surprising result opens up completely new possibilities for active camouflage.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**One e-cigarette with nicotine leads to adrenaline changes in nonsmokers' hearts**](#) [周四, 21 9月 06:21]

Electronic cigarettes have been touted as both a safer alternative for smokers and as an effective way for people to gradually quit smoking altogether. But a new study shows that nicotine inhaled from e-cigarettes can greatly increase a person's heart rate and aggravate the sympathetic nervous system.

- **[3-D analysis of dog fossils sheds light on domestication debate](#)** [周四, 21 9月 06:20]

In an effort to settle the debate about the origin of dog domestication, a technique that uses 3-D scans of fossils is helping researchers determine the difference between dogs and wolves.

- **[Protected waters foster resurgence of West Coast rockfish](#)** [周四, 21 9月 03:49]

West Coast rockfish species in deep collapse only 20 years ago have multiplied rapidly in large marine protected areas off Southern California, likely seeding surrounding waters with enough offspring to offer promise of renewed fishing, a new study has found.

- **[Unique type of object discovered in our solar system](#)** [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

- **[Immune cells may heal bleeding brain after strokes](#)** [周四, 21 9月 02:47]

By studying rodents, researchers showed that instead of attacking germs, some neutrophils may help heal the brain after an intracerebral hemorrhage, a form of stroke caused by ruptured blood vessels. The study suggests that two neutrophil-related proteins may play critical roles in protecting the brain from stroke-induced damage and could be used as treatments for intracerebral hemorrhage.

- **[Communication among health care facilities key to preventing spread of drug-resistant bacteria](#)** [周四, 21 9月 02:47]

Communication breakdowns between care facilities can pave the way for outbreaks of infection, according to research on the spread of an extensively drug-resistant bacterium.

- [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

- [**Fly away home? Ice age may have clipped bird migration**](#) [周四, 21 9月 02:46]

The onset of the last ice age may have forced some bird species to abandon their northerly migrations for thousands of years, says new research led by an ornithologist. The study challenges a long-held presumption that birds merely shortened their migratory flights when glaciers advanced south to cover much of North America and northern Europe about 21,000 years ago.

- [**Automatic code reuse: System automatically modifies code for transfer to other programs**](#) [周四, 21 9月 02:46]

Researchers have developed a new system that allows programmers to transplant code from one program into another. The programmer can select the code from one program and an insertion point in a second program, and the system will automatically make modifications necessary -- such as changing variable names -- to integrate the code into its new context.

- [**Species abundance: Winter restricts innovation**](#) [周四, 21 9月 01:17]

Why are there so many more species in the tropics? The 'storage effect' is stronger there than in temperate forests.

- [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called Beelzebufo that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus Ceratophrys, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

- [**Small intestine permeable peptides facilitate digestive tract absorption**](#) [周四, 21 9月 01:17]

Biopharmaceuticals, medium- and high-molecular weight biologically active macromolecules, are not easily absorbed by the small intestine, the main organ responsible for gastrointestinal absorption, resulting in a bottleneck for oral administration type biopharmaceutical development. Now, researchers have found a new small intestine permeable peptide that can facilitate digestive tract absorption of biopharmaceutical products. The discovery should make it possible for oral administration of drugs ...

- [**Animal acoustic activity decline shows forest fire pollution wreaks havoc on wildlife**](#) [周四, 21 9月 01:17]

Forest fires in Southeast Asia during the El Niño droughts of 2015 caused considerable disruption to the biodiversity of the region due to the smoke-induced 'haze' they created, according to new research.

- [**New concept of terrestrial planet formation**](#) [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- [**Dinosaur evolution: Lumbering giants had agile ancestors**](#) [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

- [**Oxytocin turns up the volume of your social environment**](#) [周四, 21 9月 01:17]

A new study shows that the so-called 'love hormone' oxytocin can intensify negative as well as positive experiences.

- [**Parents: How you manage conflict has an impact on your kids**](#) [周四, 21 9月 01:17]

It's not always bad for children to be exposed to their parents' disagreements. It's how those disagreements are handled that really matters, according to a new study.

- [**Newly ID'd role of major Alzheimer's gene suggests possible therapeutic target**](#) [周四, 21 9月 01:17]

A new role has been identified for the major Alzheimer's risk factor ApoE4, suggesting that targeting the protein may help treat the disease. Researchers show that ApoE4 exacerbates the brain damage caused by toxic tangles of a different Alzheimer's-associated protein: tau. In the absence of ApoE, tau tangles did very little harm to brain cells.

- [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- [**Brain cancer growth halted by absence of protein**](#) [周四, 21 9月 01:16]

The growth of certain aggressive brain tumors can be halted by cutting off their access to a signaling molecule produced by the brain's nerve

cells, according to a new study.

- [**Millions of new genes in human microbiome**](#) [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of previously unknown genes from microbial communities in the human gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

- [**Hold the phone: An ambulance might lower your chances of surviving some injuries**](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

- [**Genome editing reveals role of gene important for human embryo development**](#) [周四, 21 9月 01:16]

Researchers have used genome editing technology to reveal the role of a key gene in human embryos in the first few days of development. This is the first time that genome editing has been used to study gene function in human embryos, which could help scientists to better understand the biology of our early development.

- [**Guess who? Facial expressions can cause confusion**](#) [周三, 20 9月 23:36]

Photos of the same person can look substantially different. For example, your passport photo may look quite different from your driving license, or your face in holiday photos. Research has shown when photos of an individual's face are judged too dissimilar to go together, people will tend to think they show several different identities. Scientists have tested this concept further by exploring what happens when the photos show faces with different expressions.

- [**Spinning a lighter, safer electrode**](#) [周三, 20 9月 23:35]

A fabric-like material electrode has been created that could help make energy storage devices -- batteries and supercapacitors -- faster and less

susceptible to leaks or disastrous meltdowns. Their design for a new supercapacitor, which looks something like a furry sponge infused with gelatin, offers a unique alternative to the flammable electrolyte solution that is a common component in these devices.

- **[Midlife depression may stem from tension with mothers and siblings, study finds](#)** [周三, 20 9月 23:35]

Relationships with our mothers and siblings continue to have an effect on our well-being, particularly at midlife. A new study found that tension with our mothers and siblings, similar to our spouses, is associated with symptoms of depression.

- **[Smokers who quit have metabolite levels that resemble those of nonsmokers](#)** [周三, 20 9月 23:35]

Even after years of smoking, the body has a remarkable ability to repair itself. Now in a study shows that certain metabolic changes occur soon after quitting, and these changes could help explain how some ill-effects of smoking might be reversible.

- **[Immune cells produce wound healing factor, could lead to new IBD treatment](#)** [周三, 20 9月 23:35]

Specific immune cells have the ability to produce a healing factor that can promote wound repair in the intestine, a finding that could lead to new, potential therapeutic treatments for inflammatory bowel disease (IBD), according to a new research study.

- **[Straining the memory: Prototype strain engineered materials are the future of data storage](#)** [周三, 20 9月 23:34]

Researchers have strain-engineered a data storage material to store data by exploiting a process of avalanche atomic switching. Memory cells using this material substantially outperform state-of-the-art phase change memory devices.

- **[Imagining a world without species](#)** [周三, 20 9月 23:34]

Categorizing species can get hazy at small, microbial scales. After all,

the classical definition of species as interbreeding individuals with sexually viable offspring doesn't apply to asexual organisms. Examining shared DNA doesn't help either: collectively, E. coli bacteria have only 20 percent of genes in common. In new research, a researcher asks: could organism interactions be described without mentioning species at all?

• [**Mathematicians ask: What's in a ripple?**](#) [周三, 20 9月 23:34]

When a fluid or a gas experiences a sudden disturbance, it often gives rise to a phenomenon known as an undular bore, which consists of a series of rapid oscillations that propagate and spread. But how to describe what transpires? New mathematics research brings us closer to finding an answer.

• [**Researchers identify new target, develop new drug for cancer therapies**](#) [周三, 20 9月 23:33]

Opening up a new pathway to fight cancer, researchers have found a way to target an enzyme that is crucial to tumor growth while also blocking the mechanism that has made past attempts to target that enzyme resistant to treatment. Researchers were able to use this finding to develop a drug that successfully inhibits tumor growth of melanoma as well as pancreatic and colorectal cancer in mice.

• [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• [**Real or fake? Creating fingers to protect identities**](#) [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake

finger containing multiple key properties of human skin. Commonly called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

- [**How Teotihuacan's urban design was lost and found**](#) [周三, 20 9月 23:33]

A new article outlines how the urban design of the city of Teotihuacan differed from past and subsequent cities, only to be rediscovered and partially modeled on many centuries later by the Aztecs.

- [**Cellular backup plan for keeping iron levels just right**](#) [周三, 20 9月 23:33]

Researchers have uncovered a new connection in the network of checks and balances underlying cellular iron regulation.

- [**Plant physiology: Adjusting to fluctuating temperatures**](#) [周三, 20 9月 22:45]

The average vegetation periods of trees and shrubs in North America are intrinsically three weeks shorter than those of comparable species in Europe and Asia, new research indicates.

- [**10,000 year-old DNA proves when fish colonized our lakes**](#) [周三, 20 9月 22:45]

DNA in lake sediment forms a natural archive displaying when various fish species colonized lakes after the glacial period. Scientists' analyses of the prevalence of whitefish DNA in sediment reveal that the whitefish came to Lake Stora Lögdsjön in Västerbotten already 10,000 years ago, whereas Lake Hotagen in Jämtland had its whitefish only 2,200 years ago.

- [**Foster tadpoles trigger parental instinct in poison frogs**](#) [周三, 20 9月 22:43]

Poison frogs, especially male poison frogs, are very caring parents. After the tadpoles hatch, the males piggyback their offspring to distant pools spread around the rainforest where they can feed and develop. A recent

study shows that this parental behavior can be triggered experimentally. When unrelated tadpoles are placed on the backs of adult frogs, male – and even female – “foster parents” make their way to pools in the forest in the same way as if they had picked up the tadpoles themselves.

- [**Mathematical simulations shed new light on epilepsy surgery**](#) [周三, 20 9月 22:43]

Results from an unexpected quarter is could help neurologists to identify which brain region to remove to eliminate an epilepsy patient’s symptoms. Mathematicians have shown that it is sensible to examine the interconnections between different brain regions closely, instead of searching for abnormal regions only.

- [**Naked molecules dancing in liquid become visible**](#) [周三, 20 9月 22:42]

Moving, vibrating and leaping molecules make up our world. However, capturing their movement is not an easy task. Scientists were able to see the movement of molecules stored inside a graphene pocket without the need to stain them. This study paves the way for observing the dynamics of life building blocks, like proteins and DNA, as well as the self-assembly of other materials.

- [**Building social communication skills in shy children helps with peer likeability**](#) [周三, 20 9月 22:00]

A new study has discovered that shy children with low English vocabulary skills, can still be popular among their peers if they have high-functioning social communication skills that enable them to engage and interact well with their peers in social settings.

- [**Rolling dice for cell size specification in plant leaf epidermis**](#) [周三, 20 9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

Efforts to save sea turtles are a 'global conservation success story' -- ScienceDaily

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations. Sea turtles have historically suffered population declines for reasons that include accidental catch and harvesting adults and eggs.

Such decreases have motivated worldwide conservation efforts since the 1950s to employ tactics like strict fishing regulations and beach protection measures. To examine the current global status of sea turtles, Antonios Mazaris and colleagues studied 4,417 annual estimates of sea turtle nesting abundance based on specific time periods of nesting data collection that ranged in length from six to 47 years.

They used estimates from 2010 or later to evaluate the

length of time periods required to detect significant trends in abundance within Regional Management Units (which represent discrete groups of nesting sites in certain areas that are distinct from one another based on genetics, distribution, movement, and demography) for each species, finding a majority of population increases (95 significant increases compared to 35 significant decreases).

Despite the encouraging upward population trends, Mazaris et al.'s results complement International Union of Conservation for Nature (IUCN) assessments of sea turtle status, which lists six sea turtle species as endangered.

The authors also found that while longer time periods of nesting data collection are important for detecting population trends, shorter intervals not currently used by IUCN could still provide important information, though they highlight the need for more updated and continuous nesting site information.

Mathematics predicts a sixth mass extinction: By 2100, oceans may hold enough carbon to launch mass extermination of species in future millennia -- ScienceDaily

In the past 540 million years, the Earth has endured five mass extinction events, each involving processes that upended the normal cycling of carbon through the atmosphere and oceans. These globally fatal perturbations in carbon each unfolded over thousands to millions of years, and are coincident with the widespread extermination of marine species around the world.

The question for many scientists is whether the carbon cycle is now experiencing a significant jolt that could tip the planet toward a sixth mass extinction. In the modern era, carbon dioxide emissions have risen steadily since the 19th century, but deciphering whether this recent spike in carbon could lead to mass extinction has been challenging. That's mainly because

it's difficult to relate ancient carbon anomalies, occurring over thousands to millions of years, to today's disruptions, which have taken place over just a little more than a century.

Now Daniel Rothman, professor of geophysics in the MIT Department of Earth, Atmospheric and Planetary Sciences and co-director of MIT's Lorenz Center, has analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. He has identified "thresholds of catastrophe" in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

In a paper published in *Science Advances*, he proposes that mass extinction occurs if one of two thresholds are crossed: For changes in the carbon cycle that occur over long timescales, extinctions will follow if those changes occur at rates faster than global ecosystems can adapt. For carbon perturbations that take place over shorter timescales, the pace of carbon-cycle changes will not matter; instead, the size or magnitude of the change will determine the likelihood of an extinction event.

Taking this reasoning forward in time, Rothman predicts that, given the recent rise in carbon dioxide emissions over a relatively short timescale, a sixth extinction will depend on whether a critical amount of carbon is added to the oceans. That amount, he calculates, is about 310 gigatons, which he estimates to be roughly equivalent to the amount of carbon that human activities will have added to the world's oceans by the year 2100.

Does this mean that mass extinction will soon follow at the turn of the century? Rothman says it would take some time -- about 10,000 years -- for such ecological disasters to play out. However, he says that by 2100 the world may have tipped into "unknown territory."

"This is not saying that disaster occurs the next day," Rothman says. "It's saying that, if left unchecked, the carbon cycle would move into a realm which would be no longer stable, and would behave in a way that would be difficult to predict. In the geologic past, this type of behavior is associated with mass extinction."

History follows theory

Rothman had previously done work on the end-

Permian extinction, the most severe extinction in Earth's history, in which a massive pulse of carbon through the Earth's system was involved in wiping out more than 95 percent of marine species worldwide. Since then, conversations with colleagues spurred him to consider the likelihood of a sixth extinction, raising an essential question:

"How can you really compare these great events in the geologic past, which occur over such vast timescales, to what's going on today, which is centuries at the longest?" Rothman says. "So I sat down one summer day and tried to think about how one might go about this systematically."

He eventually derived a simple mathematical formula based on basic physical principles that relates the critical rate and magnitude of change in the carbon cycle to the timescale that separates fast from slow change. He hypothesized that this formula should predict whether mass extinction, or some other sort of global catastrophe, should occur.

Rothman then asked whether history followed his hypothesis. By searching through hundreds of published geochemistry papers, he identified 31 events

in the last 542 million years in which a significant change occurred in Earth's carbon cycle. For each event, including the five mass extinctions, Rothman noted the change in carbon, expressed in the geochemical record as a change in the relative abundance of two isotopes, carbon-12 and carbon-13. He also noted the duration of time over which the changes occurred.

He then devised a mathematical transformation to convert these quantities into the total mass of carbon that was added to the oceans during each event. Finally, he plotted both the mass and timescale of each event.

"It became evident that there was a characteristic rate of change that the system basically didn't like to go past," Rothman says.

In other words, he observed a common threshold that most of the 31 events appeared to stay under. While these events involved significant changes in carbon, they were relatively benign -- not enough to destabilize the system toward catastrophe. In contrast, four of the five mass extinction events lay over the threshold, with the most severe end-Permian extinction being the

farthest over the line.

"Then it became a question of figuring out what it meant," Rothman says.

A hidden leak

Upon further analysis, Rothman found that the critical rate for catastrophe is related to a hidden process within the Earth's natural carbon cycle. The cycle is essentially a loop between photosynthesis and respiration. Normally, there is a "leak" in the cycle, in which a small amount of organic carbon sinks to the ocean bottom and, over time, is buried as sediment and sequestered from the rest of the carbon cycle.

Rothman found that the critical rate was equivalent to the rate of excess production of carbon dioxide that would result from plugging the leak. Any additional carbon dioxide injected into the cycle could not be described by the loop itself. One or more other processes would instead have taken the carbon cycle into unstable territory.

He then determined that the critical rate applies only beyond the timescale at which the marine carbon cycle

can re-establish its equilibrium after it is disturbed. Today, this timescale is about 10,000 years. For much shorter events, the critical threshold is no longer tied to the rate at which carbon is added to the oceans but instead to the carbon's total mass. Both scenarios would leave an excess of carbon circulating through the oceans and atmosphere, likely resulting in global warming and ocean acidification.

The century's the limit

From the critical rate and the equilibrium timescale, Rothman calculated the critical mass of carbon for the modern day to be about 310 gigatons.

He then compared his prediction to the total amount of carbon added to the Earth's oceans by the year 2100, as projected in the most recent report of the Intergovernmental Panel on Climate Change. The IPCC projections consider four possible pathways for carbon dioxide emissions, ranging from one associated with stringent policies to limit carbon dioxide emissions, to another related to the high range of scenarios with no limitations.

The best-case scenario projects that humans will add

300 gigatons of carbon to the oceans by 2100, while more than 500 gigatons will be added under the worst-case scenario, far exceeding the critical threshold. In all scenarios, Rothman shows that by 2100, the carbon cycle will either be close to or well beyond the threshold for catastrophe.

"There should be ways of pulling back [emissions of carbon dioxide]," Rothman says. "But this work points out reasons why we need to be careful, and it gives more reasons for studying the past to inform the present."

One e-cigarette with nicotine leads to adrenaline changes in nonsmokers' hearts -- ScienceDaily

A new UCLA study found that healthy nonsmokers experienced increased adrenaline levels in their heart after one electronic cigarette (e-cigarette) with nicotine but there were no increased adrenaline levels when the study subjects used an a nicotine-free or empty e-cig.

The findings are published in *Journal of the American Heart Association*, the Open Access Journal of the American Heart Association/American Stroke Association.

Unlike cigarettes, e-cigs have no combustion or tobacco. Instead, these electronic, handheld devices deliver nicotine with flavoring and other chemicals in a vapor instead of smoke.

"While e-cigarettes typically deliver fewer carcinogens than are found in the tar of tobacco cigarette smoke, they also usually deliver nicotine. Many believe that

the tar -- not the nicotine -- is what leads to increased cancer and heart attack risks," said Dr. Holly R. Middlekauff, senior study author and professor of medicine (cardiology) and physiology at the David Geffen School of Medicine at UCLA. "So, we asked the question, are e-cigarettes safe?"

The researchers had previously reported that chronic e-cig users have elevated sympathetic nerve activity which increases adrenaline directed to the heart and are more susceptible to oxidative stress. Both are risks factors for heart attack. This study aimed to find out if nicotine caused these events.

Middlekauff and her team used a technique called "heart rate variability" obtained from a prolonged, non-invasive heart rhythm recording. Heart rate variability is calculated from the degree of variability in the time between heartbeats. This variability may be indicative of the amount of adrenaline on the heart.

Prior studies have used a heart rate variability test to link increased adrenaline activity in the heart with increased cardiac risk. People with known heart disease and people without known heart disease who have this pattern of high adrenaline levels in the heart have

increased risk of death, Middlekauff said.

In the first study to separate the nicotine from the non-nicotine components when looking at the heart impact of e-cigarettes on humans, researchers studied 33 healthy adults who were not current e-cigarette or tobacco cigarette smokers. On different days, each participant used an e-cigarette with nicotine, an e-cigarette without nicotine or an empty 'sham' device. Researchers measured cardiac adrenaline activity by assessing heart rate variability and oxidative stress in blood samples by measuring the enzyme plasma paraoxonase (PON1).

They found:

- Exposure to e-cigarettes with nicotine, but not e-cigarettes without nicotine, led to increased adrenaline levels to the heart, as indicated by abnormal heart rate variability.
- Oxidative stress, which increases risks for atherosclerosis and heart attack, showed no changes after exposure to e-cigarettes with and without nicotine. The number of markers they studied for oxidative stress were minimal, however and more studies are warranted, according to Middlekauff.

"While it's reassuring that the non-nicotine components do not have an obvious effect on adrenaline levels to the heart, these findings challenge the concept that inhaled nicotine is benign, or safe. Our study showed that acute electronic cigarette use with nicotine increases cardiac adrenaline levels. And it's in the same pattern that is associated with increased cardiac risk in patients who have known cardiac disease, and even in patients without known cardiac disease," Middlekauff said. "I think that just seeing this pattern at all is very concerning and it would hopefully discourage nonsmokers from taking up electronic cigarettes."

Future studies should look more closely at oxidative stress and e-cigarette use, using a broader number of cardiac markers, in a larger population of people, researchers said.

3-D analysis of dog fossils sheds light on domestication debate -- ScienceDaily

In an effort to settle the debate about the origin of dog domestication, a technique that uses 3-D scans of fossils is helping researchers determine the difference between dogs and wolves.

In the ongoing debate, one camp believes dogs were domesticated in the Paleolithic age (more than 17,000 years ago), when humans were hunter-gatherers. The other camp believes domestication occurred in the Neolithic age (17,000 to 7,000 years ago), when humans first established agriculture and civilizations.

Abby Grace Drake, a senior lecturer in the Department of Ecology and Evolutionary Biology, and her colleagues have been analyzing 3-D scans of ancient fossil canid mandibles to determine whether they belong to dogs or wolves. The answer, they find, is not so simple.

The researchers found that in the early stages of domestication, the skull changed shape but evolution of the mandible lagged behind and did not co-evolve with the skull. Their study is reported in the Aug. 25 issue of the journal *Scientific Reports*.

"A lot of the fossil evidence for the date of dog domestication is based on morphological [structural] analysis of mandibles," said Drake, the paper's first author. Robert Losey, an anthropologist at the University of Alberta, Canada, is a senior co-author of the paper. "Our study shows that when you measure modern dog mandibles and wolf mandibles using 3-D measurements you can distinguish them, and yet when we looked at these fossil mandibles, they don't look like dogs or wolves."

Wolves have fairly straight mandibles while dog mandibles are curved, structural features that become evident in a 3-D scan. In a proof of principle, when analyzing the 3-D structures of mandibles of modern dogs, Drake and colleagues correctly classified 99.5 percent of the samples as being dog or wolf.

However, 3-D analysis of fossil records from four ancient sites, two from Russia and two from Alaska,

found that most of those fossil mandibles could not be classified as either dog or wolf, even though features in canid skulls from the same sites as well as other data proved that the samples were dog remains.

Other evidence also showed that these canids were domesticated: The remains were found within human dwellings, remains at both the Russian sites revealed butchery marks, indicating that they were eaten, and isotope analysis of canid and human remains from one of the sites -- Ust'-Polui, in the Russian Arctic -- showed canids and humans were both eating fish, and humans were feeding their canids.

Since mandibles do not appear to evolve as rapidly as the skull, the results show they are not reliable for identifying early dog fossils, Drake said.

Four of 26 fossil mandibles from Ust'-Polui, which was occupied from 250 B.C. to 150 B.C., were identified as dogs, while three of the mandibles from the site were identified as wolves.

At another site, Ivolgin, in southern Russia, occupied between 300 B.C. and 200 B.C., none of the 20 mandibles were identified as dogs, though 8 were

identified as wolves. All of the skulls found at these sites, 12 from Ivolgin and five from Ust'-Polui, were clearly identified as dogs.

Canid fossils of wolves and dogs from the Alaskan sites from 1600 CE were used as controls and to compare genetic testing against the structural 3-D data.

A 2015 paper by Drake and Michael Coquerelle, an anthropologist at the University Rey Juan Carlos in Alcorcon, Spain, and a co-author on the current paper, used the 3-D technique to refute a claim that dogs existed 30,000 years ago. That claim was based on linear caliper measurements of skulls. Linear measurements are inaccurate because dog and wolf skull sizes overlap, Drake said. On the other hand, 3-D analysis of skulls uses landmarks across the skull to identify differences between dogs and wolves in the angle of the muzzle, or snout, and in the angling of the eye orbits.

"The earliest dogs I've seen in my analysis are from 7,000 to 9,000 years ago," Drake said.

The study was funded by the Social Sciences and Humanities Research Council of Canada and the

European Research Council.

Protected waters foster resurgence of West Coast rockfish: Recovering species likely seeding surrounding waters with offspring, new research shows -- ScienceDaily

West Coast rockfish species in deep collapse only 20 years ago have multiplied rapidly in large marine protected areas off Southern California, likely seeding surrounding waters with enough offspring to offer promise of renewed fishing, a new study has found.

The research published in *Royal Society Open Science* shows that protecting important ocean habitat promotes the long-term recovery of rockfish such as cowcod and bocaccio that have long been a staple of West Coast fishermen. Favorable ocean conditions also played a role, according to the study by scientists from NOAA Fisheries' Southwest Fisheries Science Center (SWFSC), University of San Diego, and the University of Massachusetts Amherst.

"The larvae of several species of rockfish that were

once heavily fished increased in number within protected areas over the past decade," said Andrew Thompson, a research scientist at the SWFSC in La Jolla, Calif. "The larvae have the potential to drift outside the protected region. That's good for fisheries because it can build populations beyond the protected waters too."

The research drew on long-running surveys of California waters by the California Cooperative Oceanic Fisheries Investigations (CalCOFI), a partnership between the California Department of Fish and Wildlife, NOAA Fisheries and the Scripps Institution of Oceanography. The collaboration began in the 1940s to study the factors behind the collapse of the California sardine fishery and continues quarterly surveys to study ocean conditions and fish populations.

"We would have never known this if not for the trove of data we get from those ships out on the water regularly looking at everything from temperature to, in this case, numbers of larval rockfish," said Kristen Koch, Acting Director of the SWFSC. "We've discovered this conservation success story thanks to long-term monitoring that gives us new insight into how the ocean works and changes."

The study used CalCOFI data to examine larval numbers of 15 rockfish species inside and outside two large protected areas southwest of Los Angeles called Cowcod Conservation Areas (CCAs), designated by NOAA Fisheries in 2001 at the recommendation of the Pacific Fishery Management Council. The CCAs prohibit fishing deeper than 110 feet, since many adult rockfish species live at such depths. Therefore, the 4,300-square-mile areas protect numerous species of rockfish in addition to cowcod.

Researchers examined trends from 1998 to 2013 in eight species that were historically fished and seven that were not. The same period brought largely cool ocean conditions, which support increased rockfish reproduction.

Scientists found that larvae of most of the rockfish species historically targeted by fishing increased throughout Southern California waters, but especially within the protected conservation areas. Species that were not historically fished increased at about the same rate both inside and outside the protected areas, indicating that rockfish spawning was high within the protected areas.

"This is the first research we know of to demonstrate that marine protected areas are producing high abundances of fish larvae that can seed surrounding areas," Thompson said. "That was an important part of the vision for these areas when they were established, and it's rewarding that management actions are contributing to the recovery of rockfish in Southern California."

- [**Fly away home? Ice age may have clipped bird migration**](#) [周四, 21 9月 02:46]

The onset of the last ice age may have forced some bird species to abandon their northerly migrations for thousands of years, says new research led by an ornithologist. The study challenges a long-held

presumption that birds merely shortened their migratory flights when glaciers advanced south to cover much of North America and northern Europe about 21,000 years ago.

- **[Species abundance: Winter restricts innovation](#)** [周四, 21 9月 01:17]

Why are there so many more species in the tropics? The 'storage effect' is stronger there than in temperate forests.

- **[Bite force research reveals dinosaur-eating frog](#)** [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called *Beelzebufo* that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

- **[Animal acoustic activity decline shows forest fire pollution wreaks havoc on wildlife](#)** [周四, 21 9月 01:17]

Forest fires in Southeast Asia during the El Niño droughts of 2015 caused considerable disruption to the biodiversity of the region due to the smoke-induced 'haze' they created, according to new research.

- **[New concept of terrestrial planet formation](#)** [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- **[World's first 'molecular robot' capable of building molecules](#)** [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- **[Dinosaur evolution: Lumbering giants had agile ancestors](#)** [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their

evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

- [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- [**Brain cancer growth halted by absence of protein**](#) [周四, 21 9月 01:16]

The growth of certain aggressive brain tumors can be halted by cutting off their access to a signaling molecule produced by the brain's nerve cells, according to a new study.

- [**Millions of new genes in human microbiome**](#) [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of previously unknown genes from microbial communities in the human gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

- [**Genome editing reveals role of gene important for human embryo development**](#) [周四, 21 9月 01:16]

Researchers have used genome editing technology to reveal the role of a key gene in human embryos in the first few days of development. This is the first time that genome editing has been used to study gene function in human embryos, which could help scientists to better understand the biology of our early development.

- [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey

indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

- [**How Teotihuacan's urban design was lost and found**](#) [周三, 20 9月 23:33]

A new article outlines how the urban design of the city of Teotihuacan differed from past and subsequent cities, only to be rediscovered and partially modeled on many centuries later by the Aztecs.

- [**10,000 year-old DNA proves when fish colonized our lakes**](#) [周三, 20 9月 22:45]

DNA in lake sediment forms a natural archive displaying when various fish species colonized lakes after the glacial period. Scientists' analyses of the prevalence of whitefish DNA in sediment reveal that the whitefish came to Lake Stora Lögdasjön in Västerbotten already 10,000 years ago, whereas Lake Hotagen in Jämtland had its whitefish only 2,200 years ago.

- [**Emerging disease further jeopardizes North American frogs**](#) [周三, 20 9月 04:02]

A deadly amphibian disease called severe Perkinsea infections, or SPI, is the cause of many large-scale frog die-offs in the United States, according to a new study.

- [**End-of-summer Arctic sea ice extent is eighth lowest on record**](#) [周三, 20 9月 04:01]

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

- [**North Atlantic right whales decline confirmed: 458 remaining**](#) [周三, 20 9月 02:04]

Marine biologists have developed a new model to improve estimates of abundance and population trends of endangered North Atlantic right whales, which have declined in numbers and productivity in recent years. Between 1990 and 2010 abundance increased to 482 animals, but since 2010 the numbers have declined to 458 in 2015, with 14 known deaths this year.

- [**Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests**](#) [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

- [**Mercury's poles may be icier than scientists thought**](#) [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice inventory.

- [**Getting emotional after failure helps you improve next time, study finds**](#) [周二, 19 9月 23:12]

Emotional responses to failure rather than cognitive ones are more effective at improving people's results for the next time they tackle the next related task, new research indicates.

- [**Playing American football before age 12 could have long-term health effects**](#) [周二, 19 9月 22:25]

Playing American football before the age of 12 may have long-term consequences for players' mood and behavior, according to a study involving 214 professional and amateur football players.

- [**Exposure to pet and pest allergens during infancy linked to reduced asthma risk**](#) [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

- [**New mirror-coating technology promises dramatic improvements in telescopes**](#) [周二, 19 9月 10:23]

An electrical engineer has teamed up with astronomers to improve telescope mirrors using thin-film technology from the electronics industry. They are developing new protective coatings using an atomic layer deposition system large enough to accommodate telescope mirrors.

- [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [**Solar-to-fuel system recycles CO₂ to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [**Copper catalyst yields high efficiency CO₂-to-fuels conversion**](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [**When it comes to the threat of extinction, size matters**](#) [周二, 19 9月 01:27]

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

- [**RNA discovery could help boost plant heat, drought tolerance**](#) [周二, 19 9月 00:35]

The discovery of a RNA that can increase drought and salt tolerance in thale cress could illuminate a new research approach and hold implications for other plants, including food crops.

- [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

- [**Urgent emission reductions needed to achieve 1.5°C warming limit**](#) [周一, 18 9月 23:18]

Significant emission reductions are required if we are to achieve one of the key goals of the Paris Agreement, and limit the increase in global average temperatures to 1.5°C; a new partnership warns.

- [**Changes in Earth's crust caused oxygen to fill the atmosphere**](#) [周一, 18 9月 23:18]

New research has uncovered a direct link between changes in the earth's crust three billion years ago and the introduction of free oxygen to the atmosphere. Without these changes, oxygen could have been suppressed in earth's crust forever, so the findings help explain the emergence of life on our planet.

- [**Dogs' social skills linked to oxytocin sensitivity**](#) [周一, 18 9月 23:18]

The tendency of dogs to seek contact with their owners is associated with genetic variations in sensitivity for the hormone oxytocin, according to a new study. The results contribute to our knowledge of how dogs have changed during their development from wolf to

household pet.

- [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

- [**Vaping doubles risk of smoking cigarettes for teens**](#) [周一, 18 9月 21:07]

Teenagers who try e-cigarettes double their risk for smoking tobacco cigarettes, according to a new study. The study found that students in grades seven to 12 who had tried an e-cigarette are 2.16 times more likely to be susceptible to cigarette smoking.

- [**NASA's Cassini spacecraft ends its historic exploration of Saturn**](#) [周六, 16 9月 22:30]

A thrilling epoch in the exploration of our solar system has come to a close, as NASA's Cassini spacecraft made a fateful plunge into the atmosphere of Saturn, ending its 13-year tour of the ringed planet. Cassini's plunge brings to a close a series of 22 dives between Saturn and its rings, a feat never before attempted by any spacecraft.

- [**A drone for last-centimeter delivery**](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

• [Light on exoplanets may be quite different from Earth: Different photosynthesis?](#) [周六, 16 9月 05:00]

Researchers have proposed a prediction that red-edge could be observed as on the Earth even on exoplanets around M-dwarfs. They pointed out that the first oxygenic phototrophs are most likely to have evolved underwater to utilize visible light just like what had happened in the primordial ocean on the Earth. They examined light adaptation mechanisms of visible- and IR-radiation-using phototrophs required for adapting to land habitats and found out that IR-using phototrophs struggle to adapt to chan...

• [Tough stuff: Spider silk enhanced with graphene-based materials](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

• [Ultrafast snapshots of relaxing electrons in solids](#) [周六, 16 9月 04:37]

A team of scientists has been able to capture the dynamics of core-excited excitons in solids in real-time.

• [Ancient amphibian had mouthful of teeth ready to grab you](#) [周六, 16 9月 03:58]

The idea of being bitten by a nearly toothless modern frog or salamander sounds laughable, but their ancient ancestors had a full array of teeth, large fangs and thousands of tiny hook-like structures called denticles on the roofs of their mouths that would snare prey, according to paleontologists.

- **[Why we did not evolve to live forever: Unveiling the mystery of why we age](#)** [周六, 16 9月 02:41]

Researchers have made a breakthrough in understanding the origin of the ageing process. They have identified that genes belonging to a process called autophagy -- one of the cells most critical survival processes -- promote health and fitness in young worms but drive the process of ageing later in life.

- **[Arctic sea ice once again shows considerable melting](#)** [周五, 15 9月 22:36]

This September, the extent of Arctic sea ice shrank to roughly 4.7 million square kilometres, scientists have determined.

- **[Skin patch dissolves 'love handles' in mice](#)** [周五, 15 9月 21:52]

Researchers have developed a medicated skin patch that can turn energy-storing white fat into energy-burning brown fat locally while raising the body's metabolism. The patch could be used to burn off pockets of unwanted fat and treat metabolic disorders like obesity and diabetes.

- **[Wolves understand cause and effect better than dogs](#)** [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

- **[In step toward controlling chemistry, physicists create a new molecule, atom by atom](#)** [周五, 15 9月 03:24]

Physicists have discovered a unique new molecule that could lead to many useful applications, and show how chemical reactions can be studied on a microscopic scale using tools of physics.

[Biomarkers in the blood prove strong role of food for type 2 diabetes](#) [周五, 15 9月 03:24]

A pioneering method has demonstrated its potential in a large study, showing that metabolic fingerprints from blood samples could render important new knowledge on the connection between food and health. The study finds that diet is one of the strongest predictors of type 2 diabetes risk in older women.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**One e-cigarette with nicotine leads to adrenaline changes in nonsmokers' hearts**](#) [周四, 21 9月 06:21]

Electronic cigarettes have been touted as both a safer alternative for smokers and as an effective way for people to gradually quit smoking altogether. But a new study shows that nicotine inhaled from e-cigarettes can greatly increase a person's heart rate and aggravate the sympathetic nervous system.

- [**Immune cells may heal bleeding brain after strokes**](#) [周四, 21 9月 02:47]

By studying rodents, researchers showed that instead of attacking germs, some neutrophils may help heal the brain after an intracerebral hemorrhage, a form of stroke caused by ruptured blood vessels. The study suggests that two neutrophil-related proteins may play critical roles in protecting the brain from stroke-induced damage and could be used as treatments for intracerebral hemorrhage.

- [**Communication among health care facilities key to preventing spread of drug-resistant bacteria**](#) [周四, 21 9月 02:47]

Communication breakdowns between care facilities can pave the way for outbreaks of infection, according to research on the spread of an extensively drug-resistant bacterium.

- [**Small intestine permeable peptides facilitate digestive tract absorption**](#) [周四, 21 9月 01:17]

Biopharmaceuticals, medium- and high-molecular weight biologically

active macromolecules, are not easily absorbed by the small intestine, the main organ responsible for gastrointestinal absorption, resulting in a bottleneck for oral administration type biopharmaceutical development. Now, researchers have found a new small intestine permeable peptide that can facilitate digestive tract absorption of biopharmaceutical products. The discovery should make it possible for oral administration of drugs ...

- [**Oxytocin turns up the volume of your social environment**](#) [周四, 21 9月 01:17]

A new study shows that the so-called 'love hormone' oxytocin can intensify negative as well as positive experiences.

- [**Parents: How you manage conflict has an impact on your kids**](#) [周四, 21 9月 01:17]

It's not always bad for children to be exposed to their parents' disagreements. It's how those disagreements are handled that really matters, according to a new study.

- [**Newly ID'd role of major Alzheimer's gene suggests possible therapeutic target**](#) [周四, 21 9月 01:17]

A new role has been identified for the major Alzheimer's risk factor ApoE4, suggesting that targeting the protein may help treat the disease. Researchers show that ApoE4 exacerbates the brain damage caused by toxic tangles of a different Alzheimer's-associated protein: tau. In the absence of ApoE, tau tangles did very little harm to brain cells.

- [**Brain cancer growth halted by absence of protein**](#) [周四, 21 9月 01:16]

The growth of certain aggressive brain tumors can be halted by cutting off their access to a signaling molecule produced by the brain's nerve cells, according to a new study.

- [**Millions of new genes in human microbiome**](#) [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of previously unknown genes from microbial communities in the human

gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

- [**Hold the phone: An ambulance might lower your chances of surviving some injuries**](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

- [**Genome editing reveals role of gene important for human embryo development**](#) [周四, 21 9月 01:16]

Researchers have used genome editing technology to reveal the role of a key gene in human embryos in the first few days of development. This is the first time that genome editing has been used to study gene function in human embryos, which could help scientists to better understand the biology of our early development.

- [**Guess who? Facial expressions can cause confusion**](#) [周三, 20 9月 23:36]

Photos of the same person can look substantially different. For example, your passport photo may look quite different from your driving license, or your face in holiday photos. Research has shown when photos of an individual's face are judged too dissimilar to go together, people will tend to think they show several different identities. Scientists have tested this concept further by exploring what happens when the photos show faces with different expressions.

- [**Midlife depression may stem from tension with mothers and siblings, study finds**](#) [周三, 20 9月 23:35]

Relationships with our mothers and siblings continue to have an effect on our well-being, particularly at midlife. A new study found that tension with our mothers and siblings, similar to our spouses, is associated with symptoms of depression.

- [**Smokers who quit have metabolite levels that**](#)

resemble those of nonsmokers [周三, 20 9月 23:35]

Even after years of smoking, the body has a remarkable ability to repair itself. Now in a study shows that certain metabolic changes occur soon after quitting, and these changes could help explain how some ill-effects of smoking might be reversible.

Immune cells produce wound healing factor, could lead to new IBD treatment [周三, 20 9月 23:35]

Specific immune cells have the ability to produce a healing factor that can promote wound repair in the intestine, a finding that could lead to new, potential therapeutic treatments for inflammatory bowel disease (IBD), according to a new research study.

Researchers identify new target, develop new drug for cancer therapies [周三, 20 9月 23:33]

Opening up a new pathway to fight cancer, researchers have found a way to target an enzyme that is crucial to tumor growth while also blocking the mechanism that has made past attempts to target that enzyme resistant to treatment. Researchers were able to use this finding to develop a drug that successfully inhibits tumor growth of melanoma as well as pancreatic and colorectal cancer in mice.

Cellular backup plan for keeping iron levels just right [周三, 20 9月 23:33]

Researchers have uncovered a new connection in the network of checks and balances underlying cellular iron regulation.

Building social communication skills in shy children helps with peer likeability [周三, 20 9月 22:00]

A new study has discovered that shy children with low English vocabulary skills, can still be popular among their peers if they have high-functioning social communication skills that enable them to engage and interact well with their peers in social settings.

PTSD linked with increased Lupus risk [周三, 20 9月 21:59]

Trauma exposure and posttraumatic stress disorder (PTSD) in civilian

women were strongly associated with increased risk of developing lupus, an autoimmune disease.

• [**New tool to assess individual's level of wisdom**](#) [周三, 20 9月 21:59]

Researchers have developed a new tool called the San Diego Wisdom Scale (SD-WISE) to assess an individual's level of wisdom, based upon a conceptualization of wisdom as a trait with a neurobiological as well as psychosocial basis.

• [**Foot pain? New study says look at hip and knee for complete diagnosis**](#) [周三, 20 9月 06:15]

New guidelines may be in order for evaluating and treating lower extremity pain. Investigators set out to determine if there was a relation between foot pain and lower extremity joint pain, and they found a significant association between foot pain and knee or hip pain.

• [**New markers for severe form of multiple sclerosis uncovered**](#) [周三, 20 9月 04:41]

Scientists have uncovered two closely related cytokines -- molecules involved in cell communication and movement -- that may explain why some people develop progressive multiple sclerosis (MS), the most severe form of the disease. The findings point the way toward developing a novel treatment to prevent progressive forms of the disease.

• [**PET imaging tracks Zika virus infection, disease progression in mouse model**](#) [周三, 20 9月 04:41]

For the first time, scientists have used Positron Emission Tomography (PET) imaging to study brain inflammation following Zika virus infection in mice, according to a study. Traditional methods of infectious disease research using animal models provide limited information about disease progression until the study's endpoint, when investigators can analyze tissues from those animals. Imaging studies allow longitudinal studies of the same animal during the course of infection.

- **[Red cosmetic powder used in Hindu ceremonies contains unsafe lead levels](#)** [周三, 20 9月 04:03]

Sindoor -- a cosmetic powder sold in the United States and used during Hindu religious and cultural ceremonies -- has unsafe levels of lead, according to a study. Researchers say at a minimum there is a need to monitor sindoor lead levels and make the public aware of the potential hazards.

- **[Risks vary widely in drone-human impacts](#)** [周三, 20 9月 04:03]

New research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

- **[Gulf Spill oil dispersants associated with health symptoms in cleanup workers](#)** [周三, 20 9月 04:03]

Workers who were likely exposed to dispersants while cleaning up the 2010 Deepwater Horizon oil spill experienced a range of health symptoms including cough and wheeze, and skin and eye irritation.

- **[Managing negative emotions can help pregnant smokers quit](#)** [周三, 20 9月 04:02]

Pregnant smokers are more likely to quit if they can learn to manage negative emotions that lead to smoking, new research indicates.

- **[Clear tactics, but few easy solutions, for hospitals combating ransomware](#)** [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

- **[Cell model of brain provides new knowledge of developmental disease](#)** [周三, 20 9月 02:48]

By reprogramming skin cells into nerve cells, researchers are creating cell models of the human brain. The researchers describe how cells from patients with the severe developmental disease lissencephaly differ from

healthy cells. The method can provide vital new knowledge on difficult-to-study congenital diseases.

- [**Home blood pressure monitoring for hypertension best combined with intensive support**](#) [周三, 20 9月 02:04]

People who monitor their own blood pressure at home are most likely to see a benefit if they combine it with individually tailored intensive support, according to a new systematic literature review and meta-analysis.

- [**Screening for cervical abnormalities in women offered HPV vaccination**](#) [周三, 20 9月 02:04]

Human papillomavirus (HPV) testing detects a higher number of precancerous cervical lesions than cytology-based Pap smears in a female population including a proportion offered HPV vaccination, according to a new study.

- [**What web browsers and proteins have in common**](#) [周三, 20 9月 02:04]

The discovery of a previously overlooked site on protein molecules may solve a mystery about how proteins are able to carry out specialized functions in living cells.

- [**Groundbreaking investigative effort identifies gonorrhea vaccine candidates**](#) [周三, 20 9月 02:04]

Researchers have identified a pair of proteins that show promise as the basis for a gonorrhea vaccine.

- [**What's the latest on gut microbiota?**](#) [周三, 20 9月 02:04]

How many undergraduate classes in microbiology -- or any scientific field, for that matter -- can say they're published in a peer-reviewed journal? Now there is a new review of the primary literature and latest discoveries on the interactions between gut microbiota and the human host.

• [**Political polarization? Don't blame the web**](#) [周三, 20 9月 02:04]

Despite the popular narrative that the web is to blame for rising political polarization, a study by economists has found that recent growth in polarization is greatest for demographic groups in which individuals are least likely to use the internet and social media. This means that data does not support the claim that the internet is the most significant driver of partisanship.

• [**Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests**](#) [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

• [**Brain powered: Increased physical activity among breast cancer survivors boosts cognition**](#) [周三, 20 9月 02:04]

It is estimated that up to 75 percent of breast cancer survivors experience problems with cognitive difficulties following treatments, perhaps lasting years. Currently, few science-based options are available to help. Researchers report in a pilot study of 87 female breast cancer survivors an increase in physical activity more than doubled the women's post-treatment mental processing speed.

• [**Proteins' role in development of spinal sensory cells redefined**](#) [周三, 20 9月 02:04]

A recent study has overturned a common belief about how a certain class of proteins in the spinal cord regulate the formation of nervous system cells -- called neurons -- during embryonic development.

• [**Winner takes all: Success enhances taste for luxury goods, study suggests**](#) [周三, 20 9月 00:31]

Footballers in flashy cars, City workers in Armani suits, reality TV

celebrities sipping expensive champagne while sitting in hot tubs: what drives people to purchase luxury goods? New research suggests that it may be a sense of being a 'winner' -- but that contrary to expectations, it is not driven by testosterone.

- [**Scientists discover complex axis of immune suppression exploited by cancers**](#) [周三, 20 9月 00:30]

A new mechanism by which cancer cells evade destruction by the immune system has been discovered by a team of researchers. Their paper describes how immune cells known as group 2 innate lymphoid cells (ILC2s) are recruited by leukemic cells to suppress an essential anticancer immune response.

- [**How to remove a tick and prevent future bites**](#) [周二, 19 9月 23:12]

As tick populations grow and spread across the country, their prevalence is increasing the public's risk for some troubling diseases. Of these diseases, say dermatologists, Lyme disease, Rocky Mountain spotted fever, Powassan virus and alpha-gal syndrome — a mysterious red meat allergy — are among the most serious.

- [**Getting emotional after failure helps you improve next time, study finds**](#) [周二, 19 9月 23:12]

Emotional responses to failure rather than cognitive ones are more effective at improving people's results for the next time they tackle the next related task, new research indicates.

- [**Antibiotics following C-section among obese women reduces risk of surgical infection**](#) [周二, 19 9月 23:06]

Among obese women undergoing cesarean delivery, a postoperative 48-hour course of antibiotics significantly decreased the rate of surgical site infection within 30 days after delivery, according to a study.

- [**Contribution of opioid-related deaths to the change in life expectancy in the US**](#) [周二, 19 9月 23:06]

Between 2000 and 2015 in the US, life expectancy increased overall but drug-poisoning deaths, mostly related to opioids, contributed to reducing

life expectancy, according to a study.

• [How the shape and size of your face relates to your sexuality](#) [周二, 19 9月 23:06]

Men and women with shorter, wider faces tend to be more sexually motivated and to have a stronger sex drive than those with faces of other dimensions. The research investigates the role that facial features play in sexual relationships and mate selection.

• [Key regulator of male fertility identified](#) [周二, 19 9月 23:06]

When it comes to male reproductive fertility, timing is everything. Now scientists are finding new details on how disruption of this timing may contribute to male infertility or congenital illness. Researchers are identifying the key molecular and genetic switch that activates production of healthy male sperm -- but only when the time is right.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

- [**Automatic code reuse: System automatically modifies code for transfer to other programs**](#) [周四, 21 9月 02:46]

Researchers have developed a new system that allows programmers to transplant code from one program into another. The programmer can select the code from one program and an insertion point in a second program, and the system will automatically make modifications

necessary -- such as changing variable names -- to integrate the code into its new context.

- [**New concept of terrestrial planet formation**](#) [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- [**Spinning a lighter, safer electrode**](#) [周三, 20 9月 23:35]

A fabric-like material electrode has been created that could help make energy storage devices -- batteries and supercapacitors -- faster and less susceptible to leaks or disastrous meltdowns. Their design for a new supercapacitor, which looks something like a furry sponge infused with gelatin, offers a unique alternative to the flammable electrolyte solution that is a common component in these devices.

- [**Straining the memory: Prototype strain engineered materials are the future of data storage**](#) [周三, 20 9月 23:34]

Researchers have strain-engineered a data storage material to store data by exploiting a process of avalanche atomic switching. Memory cells using this material substantially outperform state-of-the-art phase change memory devices.

- [**Mathematicians ask: What's in a ripple?**](#) [周三, 20 9月 23:34]

When a fluid or a gas experiences a sudden disturbance, it often gives rise to a phenomenon known as an undular bore, which consists of a series of rapid oscillations that propagate and spread. But how to describe what transpires? New mathematics research brings us closer to finding an answer.

- [**Is the Milky Way an 'outlier' galaxy? Studying**](#)

[its 'siblings' for clues](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• [Real or fake? Creating fingers to protect identities](#) [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

• [Mathematical simulations shed new light on epilepsy surgery](#) [周三, 20 9月 22:43]

Results from an unexpected quarter is could help neurologists to identify which brain region to remove to eliminate an epilepsy patient's symptoms. Mathematicians have shown that it is sensible to examine the interconnections between different brain regions closely, instead of searching for abnormal regions only.

• [Naked molecules dancing in liquid become visible](#) [周三, 20 9月 22:42]

Moving, vibrating and leaping molecules make up our world. However, capturing their movement is not an easy task. Scientists were able to see the movement of molecules stored inside a graphene pocket without the need to stain them. This study paves the way for observing the dynamics of life building blocks, like proteins and DNA, as well as the self-assembly of other materials.

• [Gravity waves influence weather and climate](#) [周三, 20 9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

- [**Risks vary widely in drone-human impacts**](#) [周三, 20 9月 04:03]

New research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

- [**Tiny lasers from a gallery of whispers**](#) [周三, 20 9月 04:03]

Whispering gallery mode resonators rely on a phenomenon similar to an effect observed in circular galleries, and the same phenomenon applies to light. When light is stored in ring-shaped or spherical active resonators, the waves superimpose in such a way that it can result in laser light. Investigators now report a new type of dye-doped WGM micro-laser that produces light with tunable wavelengths.

- [**Security cameras vulnerable to attacks using infrared light**](#) [周三, 20 9月 04:02]

Researchers have demonstrated that security cameras infected with malware can receive covert signals and leak sensitive information from the very same surveillance devices used to protect facilities.

- [**Clear tactics, but few easy solutions, for hospitals combating ransomware**](#) [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

- [**Wikipedia used to give AI context clues**](#) [周三, 20 9月 02:04]

A team of computer scientists is teaching artificial intelligence agents how to interact with the world in a way that makes sense.

- [**Mercury's poles may be icier than scientists thought**](#) [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale

deposits that would dramatically increase the planet's surface ice inventory.

- [**Advanced lithium-ion and metal-air batteries**](#) [周三, 20 9月 00:31]

Engineers are developing energy storage technologies that are cheaper, safer and more efficient.

- [**UK oil and gas reserves may last only a decade, study suggests**](#) [周三, 20 9月 00:31]

The UK has low oil and gas resources and limited prospects for fracking, according to a new analysis by scientists, who recommend a shift towards greater use of renewable, clean energy.

- [**One-way track for microwaves based on mechanical interference**](#) [周三, 20 9月 00:31]

Researchers use interference in the motion of a micrometer-size drum to route microwave signals in a single direction.

- [**Rogue wave analysis supports investigation of the El Faro sinking**](#) [周二, 19 9月 23:12]

A new analysis done to support the investigation into the 2015 sinking of the El Faro cargo ship has calculated the likelihood of a massive rogue wave during Hurricane Joaquin in October of that year – and demonstrated a new technique for evaluating the probability of rogue waves over space and time.

- [**Fluorescence microscopy on a chip: no lenses required**](#) [周二, 19 9月 23:11]

Fluorescence microscopy gives researchers incredible power to illuminate the tiniest structures and capture the real-time activities of live cells by tagging biological molecules with a veritable rainbow of fluorescent dyes. This power comes at a cost: The technology can be expensive and time-consuming and, so far, has resisted attempts at automation.

- [**Nonlinear physics bridges thoughts to sounds in**](#)

[birdsong](#) [周二, 19 9月 23:05]

The beautiful sound of birdsongs emerging from the trees is a wonderful example of how much nature can still teach us, even as much about their origins are still mysterious to us. About 40 percent of bird species learn to vocalize when they are exposed to a tutor, a behavior of interest to many neurologists and neurobiologists. The other 60 percent can vocalize instinctually in isolation. The variety across species, and the relationship between the nervous system and biomechanics makes birdsong p...

• [Cost effective quantum moves a step closer](#) [周二, 19 9月 22:26]

Researchers have taken an important step towards enabling quantum networks to be cost-effective and truly secure from attack. The experiments prove the viability of a measurement-device-independent quantum key distribution (QKD) system, based on readily available hardware.

• [A dream of foam: better concrete, beer froth and ice cream](#) [周二, 19 9月 22:25]

Researchers have discovered a new method to design stable foams. Their findings could make beer froth and ice cream last longer -- and revolutionize construction materials such as concrete.

• [Novel strategy for chirality controlled synthesis of single-walled carbon nanotubes](#) [周二, 19 9月 22:25]

Researchers have developed a novel strategy for controlling chirality of single-walled carbon nanotubes.

• [Size matters in the detection of exoplanet atmospheres](#) [周二, 19 9月 21:26]

A group-analysis of 30 exoplanets orbiting distant stars suggests that size, not mass, is a key factor in whether a planet's atmosphere can be detected. The largest population-study of exoplanets to date successfully detected atmospheres around 16 'hot Jupiters', and found that water vapor was present in every case.

• [What do we need to know to mine an asteroid?](#) [周二, 19 9月 21:26]

The mining of resources contained in asteroids, for use as propellant, building materials or in life-support systems, has the potential to revolutionise exploration of our Solar System. To make this concept a reality, we need to increase our knowledge of the very diverse population of accessible Near Earth Asteroids (NEA).

• [Nanosat fleet proposed for voyage to 300 asteroids](#) [周二, 19 9月 21:26]

A fleet of tiny spacecraft could visit over 300 asteroids in just over three years, according to a mission study. The Asteroid Touring Nanosat Fleet concept comprises 50 spacecraft propelled by innovative electric solar wind sails (E-sails) and equipped with instruments to take images and collect spectroscopic data on the composition of the asteroids. Each nanosat would visit six or seven asteroids before returning to Earth to deliver the data.

• [Molecular motors: Slowing the clockwork](#) [周二, 19 9月 21:26]

Progress on the way to smart nanomachines: Chemists have modified the synthesis of a molecular motor so as to reduce the speed of its light-driven rotation, thus permitting the researchers to analyze the mechanism of motion in complete detail.

• [Nanocapsules enable cell-inspired metabolic reactions](#) [周二, 19 9月 21:24]

Researchers have succeeded in developing capsules capable of producing the bio-molecule glucose-6-phosphate that plays an important role in metabolic processes. The researchers were able to produce the metabolite in conditions very similar to the biochemical reaction inside natural cells.

• [Supercontinuum lasers can lead to better bread and beer](#) [周二, 19 9月 21:10]

Researchers have analyzed whole grains with long near-infrared wavelengths using a new type of light source, the supercontinuum laser.

The research has significance for our knowledge of food ingredients and may, for example, eventually lead to better quality of bread and beer.

- [**Graphene and other carbon nanomaterials can replace scarce metals**](#) [周二, 19 9月 21:10]

Scarce metals are found in a wide range of everyday objects around us. They are complicated to extract, difficult to recycle and so rare that several of them have become "conflict minerals" which can promote conflicts and oppression. New research shows that there are potential technology-based solutions that can replace many of the metals with carbon nanomaterials, such as graphene.

- [**Solar wind impacts on giant 'space hurricanes' may affect satellite safety**](#) [周二, 19 9月 21:10]

Could the flapping of a butterfly's wings in Costa Rica set off a hurricane in California? For most people, this hypothetical scenario may be difficult to imagine on Earth -- particularly when a real disaster strikes. Yet, in space, similarly small fluctuations in the solar wind as it streams toward the Earth's magnetic shield actually can affect the speed and strength of 'space hurricanes,' a researcher explains.

- [**One step closer to lifelike robots**](#) [周二, 19 9月 21:10]

Researchers have developed a 3-D-printable synthetic soft muscle that can lift 1,000 times its own weight. The muscle has intrinsic expansion ability and, unlike previous artificial muscles, it does not require an external compressor or high voltage equipment, signaling a breakthrough in the creation of soft robots that can move independently. The new material also has a strain density -- an ability to expand -- that is 15 times larger than natural muscle.

- [**The sublime challenge of jet noise**](#) [周二, 19 9月 11:22]

A scientist is using ALCF resources to create high fidelity simulations of jet turbulence to determine how and where noise is produced. The results may lead to novel engineering designs that reduce noise over commercial flight paths and on aircraft carrier decks.

- [**Optical, electrical bistability study sheds light on**](#)

[next-gen high speed data transfer](#) [周二, 19 9月 11:22]

Today, electrical bistable devices are the foundation of digital electronics, serving as building blocks of switches, logic gates and memories in computer systems. However, the bandwidth of these electronic computers is limited by the signal delay of time constants important to electronic logic operations. In an attempt to mitigate these problems, scientists have considered the development of an optical digital computer, and one team has gone so far as to demonstrate the optical and electrical bi...

· [New mirror-coating technology promises dramatic improvements in telescopes](#) [周二, 19 9月 10:23]

An electrical engineer has teamed up with astronomers to improve telescope mirrors using thin-film technology from the electronics industry. They are developing new protective coatings using an atomic layer deposition system large enough to accommodate telescope mirrors.

· [DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

· [Fake news more likely to thrive online due to lowered fact-checking](#) [周二, 19 9月 04:34]

Fake news is more likely to thrive online due to lowered fact-checking, according to new American research.

· [Blood tests: Sound waves separate biological nanoparticles for 'liquid biopsies'](#) [周二, 19 9月 04:34]

A prototype device developed by an international team of engineers can sift exceedingly tiny particles called exosomes from blood samples without having to send samples off to a lab. The device, which combines acoustic cell-sorting and microfluidic technologies, could be a boon to

both scientific research and medical applications.

• [**Enzyme's worth to biofuels shown in recent research**](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

• [**New self-powered paper patch could help diabetics measure glucose during exercise**](#) [周二, 19 9月 04:33]

A new paper-based sensor patch developed by researchers at Binghamton University, State University of New York could allow diabetics to effectively measure glucose levels during exercise.

• [**2-D Electronics' metal or semiconductor? Both**](#) [周二, 19 9月 04:15]

Researchers produced the first 2-D field-effect transistor (FET) made of a single material.

• [**Solar-to-fuel system recycles CO2 to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**3-D analysis of dog fossils sheds light on domestication debate**](#) [周四, 21 9月 06:20]

In an effort to settle the debate about the origin of dog domestication, a technique that uses 3-D scans of fossils is helping researchers determine the difference between dogs and wolves.

- [**Protected waters foster resurgence of West Coast rockfish**](#) [周四, 21 9月 03:49]

West Coast rockfish species in deep collapse only 20 years ago have multiplied rapidly in large marine protected areas off Southern California, likely seeding surrounding waters with enough offspring to offer promise of renewed fishing, a new study has found.

- [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

- [**Fly away home? Ice age may have clipped bird migration**](#) [周四, 21 9月 02:46]

The onset of the last ice age may have forced some bird species to abandon their northerly migrations for thousands of years, says new research led by an ornithologist. The study challenges a long-held presumption that birds merely shortened their migratory flights when glaciers advanced south to cover much of North America and northern Europe about 21,000 years ago.

- [**Species abundance: Winter restricts innovation**](#) [周四, 21 9月 01:17]

Why are there so many more species in the tropics? The 'storage effect' is stronger there than in temperate forests.

- [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called *Beelzebufo* that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

- [**Animal acoustic activity decline shows forest fire pollution wreaks havoc on wildlife**](#) [周四, 21 9月 01:17]

Forest fires in Southeast Asia during the El Niño droughts of 2015 caused considerable disruption to the biodiversity of the region due to the smoke-induced 'haze' they created, according to new research.

• [Dinosaur evolution: Lumbering giants had agile ancestors](#) [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

• [Millions of new genes in human microbiome](#) [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of previously unknown genes from microbial communities in the human gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

• [Imagining a world without species](#) [周三, 20 9月 23:34]

Categorizing species can get hazy at small, microbial scales. After all, the classical definition of species as interbreeding individuals with sexually viable offspring doesn't apply to asexual organisms. Examining shared DNA doesn't help either: collectively, E. coli bacteria have only 20 percent of genes in common. In new research, a researcher asks: could organism interactions be described without mentioning species at all?

• [How Teotihuacan's urban design was lost and found](#) [周三, 20 9月 23:33]

A new article outlines how the urban design of the city of Teotihuacan differed from past and subsequent cities, only to be rediscovered and partially modeled on many centuries later by the Aztecs.

• [Cellular backup plan for keeping iron levels just right](#) [周三, 20 9月 23:33]

Researchers have uncovered a new connection in the network of checks and balances underlying cellular iron regulation.

- [**Plant physiology: Adjusting to fluctuating temperatures**](#) [周三, 20 9月 22:45]

The average vegetation periods of trees and shrubs in North America are intrinsically three weeks shorter than those of comparable species in Europe and Asia, new research indicates.

- [**10,000 year-old DNA proves when fish colonized our lakes**](#) [周三, 20 9月 22:45]

DNA in lake sediment forms a natural archive displaying when various fish species colonized lakes after the glacial period. Scientists' analyses of the prevalence of whitefish DNA in sediment reveal that the whitefish came to Lake Stora Lögdasjön in Västerbotten already 10,000 years ago, whereas Lake Hotagen in Jämtland had its whitefish only 2,200 years ago.

- [**Foster tadpoles trigger parental instinct in poison frogs**](#) [周三, 20 9月 22:43]

Poison frogs, especially male poison frogs, are very caring parents. After the tadpoles hatch, the males piggyback their offspring to distant pools spread around the rainforest where they can feed and develop. A recent study shows that this parental behavior can be triggered experimentally. When unrelated tadpoles are placed on the backs of adult frogs, male – and even female – “foster parents” make their way to pools in the forest in the same way as if they had picked up the tadpoles themselves.

- [**Rolling dice for cell size specification in plant leaf epidermis**](#) [周三, 20 9月 22:00]

Scientists have discovered that endoreduplication, which promotes cellular enlargement in the epidermal tissue of *Arabidopsis thaliana*, occurs randomly as a Poisson process throughout cellular maturation.

- [**More mouths can be fed by boosting number of plant pores**](#) [周三, 20 9月 22:00]

Scientists have synthesized a new bioactive small molecule that has the ability to increase stomata numbers on flowering plants without stunting

their growth. The team's new discovery could help elucidate the stomatal development mechanism in plants.

• [**Gravity waves influence weather and climate**](#) [周三, 20 9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

• [**Atmospheric effects of Arctic snowmelt**](#) [周三, 20 9月 22:00]

Researchers are exploring the changing chemistry of the Arctic's atmosphere to help answer the question of what happens as snow and ice begin to melt.

• [**Could condors return to Northern California?**](#) [周三, 20 9月 22:00]

In 2003, Northern California's Yurok Tribe initiated efforts to reintroduce California condors on their lands. While wild condors have not existed in the region for more than a hundred years, a new study suggests that hunters transitioning from lead to non-lead ammunition may allow these apex scavengers to succeed there once again.

• [**Breaking legume's crop wild relative barrier**](#) [周三, 20 9月 21:59]

In a new study, scientists report significant strides in transferring disease- and stress-resistance traits from wild relatives of several legumes to their domesticated varieties.

• [**Gulf Spill oil dispersants associated with health symptoms in cleanup workers**](#) [周三, 20 9月 04:03]

Workers who were likely exposed to dispersants while cleaning up the 2010 Deepwater Horizon oil spill experienced a range of health symptoms including cough and wheeze, and skin and eye irritation.

• [**Emerging disease further jeopardizes North American frogs**](#) [周三, 20 9月 04:02]

A deadly amphibian disease called severe Perkinsea infections, or SPI, is the cause of many large-scale frog die-offs in the United States, according to a new study.

- [**End-of-summer Arctic sea ice extent is eighth lowest on record**](#) [周三, 20 9月 04:01]

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

- [**Monk parakeets invade Mexico**](#) [周三, 20 9月 02:04]

A recent, rapid, and ongoing invasion of monk parakeets in Mexico has been described in a new article, including the regulatory changes that affected the species' spread.

- [**What web browsers and proteins have in common**](#) [周三, 20 9月 02:04]

The discovery of a previously overlooked site on protein molecules may solve a mystery about how proteins are able to carry out specialized functions in living cells.

- [**What's the latest on gut microbiota?**](#) [周三, 20 9月 02:04]

How many undergraduate classes in microbiology -- or any scientific field, for that matter -- can say they're published in a peer-reviewed journal? Now there is a new review of the primary literature and latest discoveries on the interactions between gut microbiota and the human host.

- [**A study switches from genetic to metabolic analysis to reconstitute evolutionary process**](#) [周三, 20 9月 02:04]

A new method for analyzing a living being chemical compositions is tested in Andean plants and attest the genesis of species by means of geographic isolation. Scientists analyzed chemical compounds which express specific biogeographic trends in the evolutionary process, validating a Smithsonian hypothesis on the evolution of the genus *Espeletia* in the process.

- [**North Atlantic right whales decline confirmed:**](#)

[458 remaining](#) [周三, 20 9月 02:04]

Marine biologists have developed a new model to improve estimates of abundance and population trends of endangered North Atlantic right whales, which have declined in numbers and productivity in recent years. Between 1990 and 2010 abundance increased to 482 animals, but since 2010 the numbers have declined to 458 in 2015, with 14 known deaths this year.

• [Changes in non-extreme precipitation may have not-so-subtle consequences](#) [周三, 20 9月 00:31]

Extreme floods and droughts receive a lot of attention. But what happens when precipitation -- or lack thereof -- occurs in a more measured way?

• [UK oil and gas reserves may last only a decade, study suggests](#) [周三, 20 9月 00:31]

The UK has low oil and gas resources and limited prospects for fracking, according to a new analysis by scientists, who recommend a shift towards greater use of renewable, clean energy.

• [Running roaches, flapping moths create a new physics of organisms](#) [周三, 20 9月 00:31]

Sand-swimming lizards, slithering robotic snakes, dusk-flying moths and running roaches all have one thing in common: They're increasingly being studied by physicists interested in understanding the shared strategies these creatures have developed to overcome the challenges of moving through their environments.

• [How to remove a tick and prevent future bites](#) [周二, 19 9月 23:12]

As tick populations grow and spread across the country, their prevalence is increasing the public's risk for some troubling diseases. Of these diseases, say dermatologists, Lyme disease, Rocky Mountain spotted fever, Powassan virus and alpha-gal syndrome — a mysterious red meat allergy — are among the most serious.

• [Nonlinear physics bridges thoughts to sounds in](#)

[birdsong](#) [周二, 19 9月 23:05]

The beautiful sound of birdsongs emerging from the trees is a wonderful example of how much nature can still teach us, even as much about their origins are still mysterious to us. About 40 percent of bird species learn to vocalize when they are exposed to a tutor, a behavior of interest to many neurologists and neurobiologists. The other 60 percent can vocalize instinctually in isolation. The variety across species, and the relationship between the nervous system and biomechanics makes birdsong p...

• [New hosts for Chagas disease vectors identified](#) [周二, 19 9月 22:26]

Solitary weasel-like animals called tayra might look pretty harmless, but some may actually be incubators for a parasite that causes Chagas disease, a chronic, debilitating condition that is spread by insects called kissing bugs and affects more than 8 million people worldwide.

• [Exposure to pet and pest allergens during infancy linked to reduced asthma risk](#) [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

• [Supercontinuum lasers can lead to better bread and beer](#) [周二, 19 9月 21:10]

Researchers have analyzed whole grains with long near-infrared wavelengths using a new type of light source, the supercontinuum laser. The research has significance for our knowledge of food ingredients and may, for example, eventually lead to better quality of bread and beer.

• [Declining queen conch populations are fragmented and that's changing the conservation game](#) [周二, 19 9月 21:10]

To provide a vital scientific foundation for conservation efforts, an international team has conducted a genetic analysis comparing queen

conch at 19 sites throughout the Caribbean. Their findings will help scientists understand how local subpopulations of conch are fragmented throughout the Caribbean, an essential first step needed to develop effective science-driven management plans and practices.

- [**Catching a diversity of fish species — instead of specializing — means more stable income for fishers**](#) [周二, 19 9月 11:23]

A team of scientists analyzed nearly 30 years of revenue and permitting records for individuals fishing in Alaskan waters and tracked how their fishing choices, in terms of permits purchased and species caught, influenced their year-to-year income volatility.

- [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [**Parasitic eye infection poses significant threat to UK dogs, warn experts**](#) [周二, 19 9月 10:22]

A parasitic worm that is becoming increasingly common in Europe poses a significant threat to UK dogs, warn experts in a new report.

- [**Owners of seriously ill pets at risk of stress, anxiety and depressive symptoms**](#) [周二, 19 9月 10:22]

Owners of seriously or terminally ill pets are more likely to suffer with stress and symptoms of depression and anxiety, as well as poorer quality of life, compared with owners of healthy animals, finds a study.

- [**Importance of early season control of herbicide-resistant kochia**](#) [周二, 19 9月 04:34]

Researchers are providing new insights into the control of herbicide-resistant kochia, a weed that competes with both dryland and irrigated crops across the Great Plains states.

• [Horses working in therapeutic riding programs do not experience additional stress](#) [周二, 19 9月 04:34]

In the US, therapeutic horseback riding offers equine-assisted therapy to diverse populations who have anxiety disorders. Veterans diagnosed with post-traumatic stress disorder often are prescribed this type of therapy to cope with anxiety, but little is known about how these programs affect the stress levels in horses. Now, a study has revealed that horses ridden by veterans with PTSD did not have undue physiological stress responses while participating in a therapy program.

• [Enzyme's worth to biofuels shown in recent research](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

• [Potential pathway to treat flesh-eating bacteria](#) [周二, 19 9月 04:33]

Researchers have solved a 100-year-old mystery, providing them a possible key to unlock a pathway for treating diseases caused by flesh-eating bacteria. Medical researchers have found a critical target on which to focus for developing a potential Group A Streptococcus vaccine or antibiotic to fight it. By manipulating this target, they hope to either reduce the severity of these infections or clear them up faster.

• [Sex, aggression controlled separately in female animal brains, but overlap in male brains](#) [周二, 19 9月 04:14]

Brain structures that control sexual and aggressive behavior in mice are wired differently in females than in males, new research shows.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Communication among health care facilities key to preventing spread of drug-resistant bacteria**](#) [周四, 21 9月 02:47]

Communication breakdowns between care facilities can pave the way for outbreaks of infection, according to research on the spread of an extensively drug-resistant bacterium.

- [**Hold the phone: An ambulance might lower your chances of surviving some injuries**](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

- [**Building social communication skills in shy children helps with peer likeability**](#) [周三, 20 9月 22:00]

A new study has discovered that shy children with low English vocabulary skills, can still be popular among their peers if they have high-functioning social communication skills that enable them to engage and interact well with their peers in social settings.

- [**New tool to assess individual's level of wisdom**](#) [周三, 20 9月 21:59]

Researchers have developed a new tool called the San Diego Wisdom Scale (SD-WISE) to assess an individual's level of wisdom, based upon a conceptualization of wisdom as a trait with a neurobiological as well as psychosocial basis.

• [**Clear tactics, but few easy solutions, for hospitals combating ransomware**](#) [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

• [**Management studies: Dishonesty shift**](#) [周三, 20 9月 02:04]

Lying comes more easily to people in teams: Behavioral scientists have shown in an experimental study why groups are more likely to behave unethically than individuals.

• [**Political polarization? Don't blame the web**](#) [周三, 20 9月 02:04]

Despite the popular narrative that the web is to blame for rising political polarization, a study by economists has found that recent growth in polarization is greatest for demographic groups in which individuals are least likely to use the internet and social media. This means that data does not support the claim that the internet is the most significant driver of partisanship.

• [**Changes in non-extreme precipitation may have not-so-subtle consequences**](#) [周三, 20 9月 00:31]

Extreme floods and droughts receive a lot of attention. But what happens when precipitation -- or lack thereof -- occurs in a more measured way?

• [**UK oil and gas reserves may last only a decade, study suggests**](#) [周三, 20 9月 00:31]

The UK has low oil and gas resources and limited prospects for fracking, according to a new analysis by scientists, who recommend a shift towards greater use of renewable, clean energy.

• [**Students' self-concepts of ability in math, reading predict later math, reading attainment**](#) [周二, 19 9月 21:10]

A new longitudinal study looked at how youths' self-concepts are linked

to their actual academic achievement in math and reading from middle childhood to adolescence. The study found that students' self-concepts of their abilities in these two academic domains play an important role in motivating their achievements over time and across levels of achievement.

- [**Catching a diversity of fish species — instead of specializing — means more stable income for fishers**](#) [周二, 19 9月 11:23]

A team of scientists analyzed nearly 30 years of revenue and permitting records for individuals fishing in Alaskan waters and tracked how their fishing choices, in terms of permits purchased and species caught, influenced their year-to-year income volatility.

- [**The sublime challenge of jet noise**](#) [周二, 19 9月 11:22]

A scientist is using ALCF resources to create high fidelity simulations of jet turbulence to determine how and where noise is produced. The results may lead to novel engineering designs that reduce noise over commercial flight paths and on aircraft carrier decks.

- [**Fake news more likely to thrive online due to lowered fact-checking**](#) [周二, 19 9月 04:34]

Fake news is more likely to thrive online due to lowered fact-checking, according to new American research.

- [**Enzyme's worth to biofuels shown in recent research**](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

- [**Reliance on 'gut feelings' linked to belief in fake news**](#) [周二, 19 9月 02:21]

People who tend to trust their intuition or to believe that the facts they hear are politically biased are more likely to stand behind inaccurate beliefs, a new study suggests.

- [**People's love of the seas could be the key for plastic pollution solution**](#) [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to reducing the threats to it posed by plastic pollution.

- [**5,000 deaths annually from Diesel-gate in Europe**](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

- [**Parents not confident schools can assist child with chronic disease, mental health**](#) [周一, 18 9月 21:08]

Most parents are sure schools would be able to provide basic first aid but are less confident about a school's ability to respond to more complex health situations, such as an asthma attack or mental health problem.

- [**Magnetic fields to alleviate anxiety**](#) [周六, 16 9月 04:52]

It is possible to unlearn fears. And this works even better when a specific region of the brain has previously been stimulated magnetically.

- [**Teens come 'jet lagged' to school: Shifting sleeping patterns at weekends**](#) [周六, 16 9月 04:48]

A lack of sleep is associated with more absence and teens turn up jet lagged to school on Mondays, as shown in new research.

- [**Insult to injury: US workers without paid sick leave suffer from mental distress**](#) [周六, 16 9月 02:41]

Only seven states in the US have mandatory paid sick leave laws, yet, 15 states have passed preemptive legislation prohibiting localities from passing sick leave. Paid sick leave is gaining momentum as a social justice issue with important implications for health and wellness. But

what are the implications for the mental well-being of Americans without paid sick leave? A new study is the first to show the link between mental distress and paid sick leave among US workers.

- [**300,000 families living in US-Mexico border towns face exposure to toxic stress**](#) [周五, 15 9月 21:52]

Roughly 300,000 Texans living in impoverished border communities known as 'colonias' are facing substandard housing, lack of resources and exposure to toxic stress. New research finds these communities are also ill-equipped to face a natural disaster.

- [**Need for epinephrine in schools -- and staff trained to administer it**](#) [周五, 15 9月 21:52]

With school nurses often covering multiple buildings, researchers find that nearly one in five students who experience severe allergic reactions are given potentially life-saving epinephrine injections from unlicensed staff or students.

- [**Green schoolyards offer physical and mental health benefits for children**](#) [周五, 15 9月 21:52]

A growing body of evidence suggests access to safe, natural areas improves health across a wide variety of areas, including heart health, mental health, weight management, ADHD, and stress among children.

- [**New Orleans greenery post-Katrina reflects social demographics more than hurricane impact**](#) [周五, 15 9月 21:51]

Popular portrayals of "nature reclaiming civilization" in flood-damaged New Orleans, Louisiana, neighborhoods romanticize an urban ecology shaped by policy-driven socioecological disparities in redevelopment investment, ecologists argue.

- [**A subtler sexism now frames TV coverage of women in sports**](#) [周五, 15 9月 09:06]

An ongoing longitudinal study tracking national coverage of women's sports finds that coverage is still lacking and the sexism of women's

sports is less overt but remains a problem.

· [**New climate risk classification created to account for potential 'existential' threats**](#) [周五, 15 9月 09:06]

A new study evaluating models of future climate scenarios has led to the creation of the new risk categories 'catastrophic' and 'unknown' to characterize the range of threats posed by rapid global warming. Researchers propose that unknown risks imply existential threats to the survival of humanity.

· [**One vaccine injection could carry many doses**](#) [周五, 15 9月 03:23]

A new 3-D fabrication method has been developed that can create a new type of drug-carrying particle that could allow several doses of a drug or vaccine to be delivered over an extended time period with just one injection.

· [**Cost of not adapting to climate change would be at least five times higher**](#) [周五, 15 9月 03:22]

A study on damage to coastal considered only real estate loss. If nothing is done, researchers say, losses might be up to ten times higher if the predicament includes the spreading of flood- and global warming - related diseases.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

- [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

- [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called *Beelzebufo* that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable

of performing basic tasks including building other molecules.

• [**Dinosaur evolution: Lumbering giants had agile ancestors**](#) [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

• [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

• [**Hold the phone: An ambulance might lower your chances of surviving some injuries**](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

• [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• [**Real or fake? Creating fingers to protect identities**](#) [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

• [**Gravity waves influence weather and climate**](#) [周三, 20 9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

• [**Solar wind impacts on giant 'space hurricanes' may affect satellite safety**](#) [周二, 19 9月 21:10]

Could the flapping of a butterfly's wings in Costa Rica set off a hurricane in California? For most people, this hypothetical scenario may be difficult to imagine on Earth -- particularly when a real disaster strikes. Yet, in space, similarly small fluctuations in the solar wind as it streams toward the Earth's magnetic shield actually can affect the speed and strength of 'space hurricanes,' a researcher explains.

• [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

• [**Scientists show molecular basis for ants acting as 'bodyguards' for plants**](#) [周二, 19 9月 00:35]

Though you might not think of ants as formidable bodyguards, some do an impressive job protecting plants from enemies. Examining the relationship between the Amazon rainforest plant *Cordia nodosa* in Peru and the ant species *Allomerus octoarticulatus*, scientists found the degree to which the ants express two genes significantly impacts the amount of protection they provide to their hosts.

• [**When radio galaxies collide, supermassive black holes form tightly bound pairs**](#) [周二, 19 9月 00:35]

Supermassive black holes found in the centers of galaxies can form gravitationally bound pairs when galaxies merge, according to a new study.

• [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

• [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

• [**Developing roads that can generate power from passing traffic**](#) [周一, 18 9月 23:18]

Researchers are looking at advanced materials for roads and pavements that could generate electricity from passing traffic. Engineers are working on smart materials such as 'piezoelectric' ceramics that when embedded in road surfaces would be able to harvest and convert vehicle vibration into electrical energy.

• [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

• [**World first: 'Storing lightning inside thunder'**](#) [周一, 18 9月 21:07]

In a world first, researchers have stored photonic information on a microchip as an acoustic wave. This allows precious extra time to store, process and then redistribute the data without relying on electronics, which produce excess heat. Such a hybrid chip could have a huge impact in cloud computing and telecommunication centers, which are overheating as we churn through data on our phones.

• [Converting waste toilet paper into electricity](#) [周六, 16 9月 05:02]

Chemists have performed a techno-economic analysis of converting waste toilet paper into electricity. They propose a two-step process and calculate a cost per kWh comparable to that of residential photovoltaic installations.

• [A drone for last-centimeter delivery](#) [周六, 16 9月 05:01]

A new drone uses cutting-edge technology to deliver parcels weighing up to 500 grams. The device will never get stuck in traffic, it's programmed to avoid obstacles, and it can reach destinations on steep or uneven terrain. Its protective cage and foldable design mean that it can be carried around in a backpack and used in total safety.

• [Tough stuff: Spider silk enhanced with graphene-based materials](#) [周六, 16 9月 04:52]

Natural spider silk has excellent mechanical properties. Researchers have now found a way to boost the strength of spider's silk using graphene-based materials, paving the way for a novel class of high-performance bionic composites.

• [Immune system linked to alcohol drinking behavior](#) [周六, 16 9月 02:41]

Researchers have found a new link between the brain's immune system and the desire to drink alcohol in the evening.

• [Wolves understand cause and effect better than dogs](#) [周五, 15 9月 21:51]

A rattle will only make noise if you shake it. Animals like the wolf also understand such connections and are better at this than their

domesticated descendants. Researchers say that wolves have a better causal understanding than dogs and that they follow human-given communicative cues equally well. The study provides insight that the process of domestication can also affect an animal's causal understanding.

- [**Electric eels leap to deliver painful, Taser-like jolt**](#) [周五, 15 9月 03:24]

The electric eel has always been noted for its impressive ability to shock and subdue its prey. It's recently become clear that electric eels also use a clever trick to deliver an intense, Taser-like jolt to potential predators: they leap from the water to target threatening animals, humans included, above water. Now, a researcher has measured (and experienced) just how strong that jolt can be.

- [**Sorting molecules with DNA robots**](#) [周五, 15 9月 03:24]

Scientists have programmed a 'robot' made of DNA to pick up and sort molecules into predetermined locations.

- [**The return of the comet-like exoplanet**](#) [周五, 15 9月 03:23]

Astronomers have focused the Hubble Space Telescope on an exoplanet that had already been seen losing its atmosphere, which forms an enormous cloud of hydrogen, giving the planet the appearance of a giant comet. During earlier observations, it was not possible to cover the whole cloud, whose shape was predicted by numerical simulations. Thanks to these new observations, the scientists have finally been able to confirm the initial predictions.

- [**'Handedness' in scale-eating fish: Nature and nurture**](#) [周五, 15 9月 03:23]

Lateralized behaviors are thought to be strengthened during development. However, little is known about how they are acquired during development. In the scale-eating cichlid model, researchers demonstrated the attack side preference of juveniles was developed with scale-eating experience, regardless of age. They also found that kinetics of attack behavior is superior on one side by nature. Therefore, they concluded that the fish learn to use the naturally dominant side through

experience.

· [**Could interstellar ice provide the answer to birth of DNA?**](#) [周五, 15 9月 03:22]

Molecules brought to Earth in meteorite strikes could potentially be converted into the building blocks of DNA, researchers have shown.

· [**Physicists offer explanation for diverse galaxy rotations**](#) [周五, 15 9月 03:22]

Physicists have found a simple and viable explanation for the diversity observed in galactic rotations. They report that diverse galactic-rotation curves, a graph of rotation speeds at different distances from the center, can be naturally explained if dark matter particles are assumed to strongly collide with one another in the inner halo, close to the galaxy's center -- a process called dark matter self-interaction.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**NASA'S OSIRIS-REx spacecraft slingshots past Earth**](#) [周六, 23 9月 04:25]

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

- [**Mechanism that underlies age-associated bone loss**](#) [周六, 23 9月 03:05]

A major health problem in older people is age-associated osteoporosis -- the thinning of bone and the loss of bone density that increases the risk of fractures. Researchers have now detailed an underlying mechanism leading to that osteoporosis. When this mechanism malfunctions, progenitor cells stop creating bone-producing cells, and instead create fat cells. Knowledge of this mechanism can provide targets in the search for novel bone-loss.

- [**Two Group A Streptococcus genes linked to 'flesh-eating' bacterial infections**](#) [周六, 23 9月 03:05]

Group A Streptococcus bacteria cause illnesses ranging from mild nuisances like strep throat to life-threatening conditions such as flesh-eating disease, also known as necrotizing fasciitis. Life-threatening infections occur when the bacteria spread underneath the surface of the

skin or throat and invade the underlying soft tissue. Researchers have found two group A Streptococcus genes involved in invasive infections, which may be potential targets for therapeutics.

- [**Enhancing the sensing capabilities of diamonds with quantum properties**](#) [周六, 23 9月 00:29]

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs.

- [**700 years old saint myth has been proven \(almost\) true**](#) [周五, 22 9月 23:17]

Scientists confirm that the age and content of an old sack is in accordance with a medieval myth about Saint Francis of Assisi.

- [**Our weight tells how we assess food**](#) [周五, 22 9月 23:17]

A new study demonstrated that people of normal weight tend to associate natural foods such as apples with their sensory characteristics. On the other hand, processed foods such as pizzas are generally associated with their function or the context in which they are eaten. But that's not all. The research also highlighted the ways in which underweight people pay greater attention to natural foods and overweight people to processed foods.

- [**Residents: Frontline defenders against antibiotic resistance?**](#) [周五, 22 9月 23:17]

Residents often decide which antibiotics to start a patient on so they could become the first line of defense against antibiotic resistance.

- [**Strategy might prevent infections in patients with spinal cord injuries**](#) [周五, 22 9月 23:17]

A new study sheds light on how to reduce the number of infections in patients with spinal cord injuries without using antibiotics.

- [**Usher syndrome: Gene therapy restores hearing**](#)

and balance [周五, 22 9月 23:17]

Scientists have recently restored hearing and balance in a mouse model of Usher syndrome type 1G characterized by profound congenital deafness and vestibular disorders caused by severe dysmorphogenesis of the mechano-electrical transduction apparatus of the inner ear's sensory cells. These findings open up new possibilities for the development of gene therapy treatments for hereditary forms of deafness.

• **A sustainable future powered by sea** [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

• **Assembly of nanoparticles proceeds like a zipper**

[周五, 22 9月 21:40]

It has always been the Holy Grail of materials science to describe and control the material's structure-function relationship. Nanoparticles are an attractive class of components to be used in functional materials because they exhibit size-dependent properties, such as superparamagnetism and plasmonic absorption of light. Furthermore, controlling the arrangement of nanoparticles can result in unforeseen properties, but such studies are hard to carry out due to limited efficient approaches to prod...

• **Stimuli fading away en route to consciousness** [周五, 22 9月 21:40]

Whether or not we consciously perceive the stimuli projected onto our retina is decided in our brain. A recent study shows how some signals dissipate along the processing path to conscious perception. This process begins at rather late stages of signal processing. By contrast, in earlier stages there is hardly any difference in the reaction of neurons to conscious and unconscious stimuli.

• **Ancient textiles reveal differences in Mediterranean fabrics in the 1st millennium BC**

[周五, 22 9月 21:40]

Analysis of Iron Age textiles indicates that during c. 1000-400 BC Italy shared the textile culture of Central Europe, while Greece was largely influenced by the traditions of ancient Near East.

- [**Crowning the 'king of the crops': Sequencing the white guinea yam genome**](#) [周五, 22 9月 21:40]

Scientists have, for the first time, provided a genome sequence for the white Guinea yam, a staple crop with huge economic and cultural significance on the African continent and a lifeline for millions of people.

- [**Winter cold extremes linked to high-altitude polar vortex weakening**](#) [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Effective help is available for migraine sufferers**](#) [周五, 22 9月 21:15]

Although it's the third most prevalent illness in the world, migraine is widely misunderstood and frequently undiagnosed. Until quite recently a common "remedy" for migraine was to lie in a dark room and wait for

the pain to pass. But today there are treatments that work – and new medications formulated specifically for migraine are in the pipeline.

- [**Rainbow colors reveal cell history**](#) [周五, 22 9月 21:14]

A system called "Beta-bow", which allows the history of beta-cells to be traced by genetic bar-coding and multicolor imaging, has been developed by researchers.

- [**New genetic syndrome predisposes the body to cancer**](#) [周五, 22 9月 21:14]

A new syndrome caused by biallelic mutations -- those produced in both gene copies inherited from the mother and father -- in the FANCM gene predisposes the body to the appearance of tumors and causes rejection to chemotherapy treatments. Contrary to what scientists believed, the gene does not cause Fanconi anemia. Researchers recommend modifying the clinical monitoring of patients with these mutations.

- [**Improving techniques for joint defect treatment**](#) [周五, 22 9月 21:12]

Different surface topographies and materials provide interesting ways to study cell behavior and potentially provide novel solutions for treating joint defects. Tissue engineering methods that simulate native cartilage could prove useful to create cartilage implants in the laboratory, according to new research.

- [**Smartphone apps can reduce depression**](#) [周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible interventions for the millions of people around the world diagnosed with this condition.

- [**Party discipline for jumping genes**](#) [周五, 22 9月 21:09]

Jumping genes, transposons, are part of the genome of most organisms, aggregated into families and can damage the genome by jumping. How hosts suppress the jumping is well investigated. Why they still can jump has hardly been understood so far. Researchers investigated for the first time in all transposons of the host organism, which properties and host environments facilitate jumping. They showed that family affiliation is

more important than position.

- [**Personality changes don't precede clinical onset of Alzheimer's, study shows**](#) [周五, 22 9月 21:09]

No evidence has been found to support the idea that personality changes begin before the clinical onset of mild cognitive impairment (MCI) or dementia, a new and comprehensive study reports.

- [**Ultra-light aluminum: Chemist reports breakthrough in material design**](#) [周五, 22 9月 21:09]

Chemists report a new, metastable, ultra-light crystalline form of aluminum has been computationally designed using density functional calculations with imposing periodic boundary conditions.

- [**Artificial orchid cultivation kit**](#) [周五, 22 9月 21:09]

Orchids are loved by gardeners around the world but are notoriously difficult to cultivate. Researchers have developed a new orchid cultivation kit and have succeeded in complete artificial cultivation of an autonomous orchid. Since this kit can be made cheaply, it can broaden the opportunities for orchid cultivation in general households. It is also expected to be useful in preserving the genetic diversity of orchidaceous plants, many of which are in danger of extinction.

- [**Quick test may speed antibiotic treatment, combat drug resistance**](#) [周五, 22 9月 21:09]

Researchers have demonstrated a potential new tactic for rapidly determining whether an antibiotic combats a given infection, thus hastening effective medical treatment and limiting the development of drug-resistant bacteria. Their method can quickly sense mechanical fluctuations of bacterial cells and any changes induced by an antibiotic.

- [**The math of doughnuts: 'Moonshine' sheds light on elliptic curves**](#) [周五, 22 9月 21:09]

Mathematicians have opened a new chapter in the theory of moonshine, one which begins to harness the power of the pariahs -- sporadic simple groups that previously had no known application.

- [**Positive, negative or neutral, it all matters: NASA explains space radiation**](#) [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- [**Being active saves lives whether a gym workout, walking to work or washing the floor**](#) [周五, 22 9月 06:50]

Any activity is good for people to meet the current guideline of 30 minutes of activity a day, or 150 minutes a week to raise the heart rate, new research indicates.

- [**Alternative splicing, an important mechanism for cancer**](#) [周五, 22 9月 06:50]

Scientists discover several alterations in this cellular process with implications in cancer by analyzing samples from more than 4,000 patients.

- [**Preterm children have more medical sleep problems but fall asleep more independently**](#) [周五, 22 9月 04:13]

A new study suggests that while healthy preterm children have more medical sleep problems than full-term children, they are more likely to fall asleep independently.

- [**New technique accurately digitizes transparent objects**](#) [周五, 22 9月 04:12]

A new imaging technique makes it possible to precisely digitize clear objects and their surroundings, an achievement that has eluded current state-of-the-art 3-D rendering methods.

- [**Strong alcohol policies help reduce alcohol-involved homicides**](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among

homicide victims, according to a new study.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**Ozark grasslands experience major increase in trees and shrubs**](#) [周五, 22 9月 04:12]

Woody vegetation, such as trees and shrubs, has increased dramatically in Ozark grasslands over the past 75 years, according to a study. If these ecosystems continue to favor woody vegetation, will it be possible to maintain open grasslands for the foreseeable future?

- [**'Labyrinth' chip could help monitor aggressive cancer stem cells**](#) [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to separate out rare circulating cancer cells into a relatively clean stream for analysis. It is already in use in a breast cancer clinical trial.

- [**New hope for people with fibromyalgia**](#) [周五, 22 9月 04:12]

A novel psychological therapy that encourages addressing emotional experiences related to trauma, conflict and relationship problems has been found helpful for people with the chronic pain condition fibromyalgia.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Into more thin air: Exploring the adaptation extremes of human high altitude sickness and**](#)

fitness [周五, 22 9月 04:12]

Many research groups have explored human adaptation to high altitude living among three major far-flung global populations: Tibetans, Ethiopians and Peruvians. But few have simultaneously explored the other extreme---maladaptation----in the form of chronic mountain sickness (CMS). Now, in the largest whole genome study of its kind, an international research team led by University of California San Diego's Chairman of Pediatrics, Dr. Gabriel Haddad, has expanded on their recent study of understand...

• **Dancing electrons lose the race** [周五, 22 9月 02:13]

Ultrashort pulses of light were employed by physicists to start a race between electrons emitted from different initial states in a solid material. Timing this race revealed an unexpected result: the fastest electrons arrived in last place.

• **Synthetic molecule 'kicks and kills' some persistent HIV in mice** [周五, 22 9月 02:13]

Scientists have designed a synthetic molecule that can reactivate dormant human immunodeficiency virus (HIV) in mice and lead to the death of some of the infected cells, according to a new study.

• **Japanese encephalitis vaccine cuts disease rate in Nepal** [周五, 22 9月 02:13]

From 2006 through 2011, Nepal conducted a mass immunization campaign against Japanese encephalitis -- a mosquito-borne viral disease. Now, investigators have reported that the vaccination effort prevented thousands of cases of Japanese encephalitis (JE) and cut JE rates in Nepal by at least 78 percent.

• **Your neurons register familiar faces, whether you notice them or not** [周五, 22 9月 02:13]

When people see an image of a person they recognize particular cells light up in the brain. Now, researchers have found that those cells light up even when a person sees a familiar face or object but fails to notice it. The only difference is that the neural activity is weaker and delayed in

comparison to what happens when an observer consciously registers and can recall having seen a particular image.

- [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

- [**A rapid alternative to standard safety tests for lentiviral vectors**](#) [周五, 22 9月 02:13]

A new, publicly available test to assess the safety of cell therapy products altered by lentivirus generates results within a few hours, potentially hastening the pace at which viral immunotherapies move into clinical trial. Current assays required by the US Food and Drug Administration take about six weeks to complete. The rapid test, which does not have a significant risk of false positives, is also a fraction of the cost of the standard approach.

NASA'S OSIRIS-REx spacecraft slingshots past Earth -- ScienceDaily

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

At 12:52 p.m. EDT on Sept. 22, the OSIRIS-REx (Origins, Spectral Interpretation, Resource Identification, and Security -- Regolith Explorer) spacecraft came within 10,711 miles (17,237 km) of Antarctica, just south of Cape Horn, Chile, before following a route north over the Pacific Ocean.

OSIRIS-REx launched from Cape Canaveral Air Force Station in Florida on Sept. 8, 2016, on an Atlas V 411 rocket. Although the rocket provided the spacecraft with the all the momentum required to propel it forward to Bennu, OSIRIS-REx needed an extra boost from the Earth's gravity to change its orbital plane. Bennu's orbit around the Sun is tilted six degrees from Earth's orbit, and this maneuver changed the spacecraft's direction to put it on the path toward

Bennu.

As a result of the flyby, the velocity change to the spacecraft was 8,451 miles per hour (3.778 kilometers per second).

"The encounter with Earth is fundamental to our rendezvous with Bennu," said Rich Burns, OSIRIS-REx project manager at NASA's Goddard Space Flight Center in Greenbelt, Maryland. "The total velocity change from Earth's gravity far exceeds the total fuel load of the OSIRIS-REx propulsion system, so we are really leveraging our Earth flyby to make a massive change to the OSIRIS-REx trajectory, specifically changing the tilt of the orbit to match Bennu."

The mission team also is using OSIRIS-REx's Earth flyby as an opportunity to test and calibrate the spacecraft's instrument suite. Approximately four hours after the point of closest approach, and on three subsequent days over the next two weeks, the spacecraft's instruments will be turned on to scan Earth and the Moon. These data will be used to calibrate the spacecraft's science instruments in preparation for OSIRIS-REx's arrival at Bennu in late 2018.

"The opportunity to collect science data over the next two weeks provides the OSIRIS-REx mission team with an excellent opportunity to practice for operations at Bennu," said Dante Lauretta, OSIRIS-REx principal investigator at the University of Arizona, Tucson.

"During the Earth flyby, the science and operations teams are co-located, performing daily activities together as they will during the asteroid encounter."

The OSIRIS-REx spacecraft is currently on a seven-year journey to rendezvous with, study, and return a sample of Bennu to Earth. This sample of a primitive asteroid will help scientists understand the formation of our solar system more than 4.5 billion years ago.

NASA's Goddard Space Flight Center provides overall mission management, systems engineering and the safety and mission assurance for OSIRIS-REx. Dante Lauretta of the University of Arizona, Tucson, is the principal investigator, and the University of Arizona also leads the science team and the mission's science observation planning and data processing. Lockheed Martin Space Systems in Denver built the spacecraft and is providing flight operations. Goddard and KineticX Aerospace are responsible for navigating the OSIRIS-REx spacecraft. OSIRIS-REx is the third mission in

NASA's New Frontiers Program. NASA's Marshall Space Flight Center in Huntsville, Alabama, manages the agency's New Frontiers Program for the Science Mission Directorate in Washington.

Mechanism that underlies age-associated bone loss -- ScienceDaily

A major health problem in older people is age-associated osteoporosis -- the thinning of bone and the loss of bone density that increases the risk of fractures. Often this is accompanied by an increase in fat cells in the bone marrow.

University of Alabama at Birmingham researchers have now detailed an underlying mechanism leading to that osteoporosis. When this mechanism malfunctions, progenitor cells stop creating bone-producing cells, and instead create fat cells. Knowledge of this mechanism can provide targets in the search for novel bone-loss therapeutics to treat human osteoporosis with minimal side effects.

The UAB researchers found that a protein called Cbf-beta plays a critical role in maintaining the bone-producing cells. Furthermore, examination of aged mice showed dramatically reduced levels of Cbf-beta in bone marrow cells, as compared to younger mice.

Thus, they propose, maintaining Cbf-beta may be essential to preventing human age-associated osteoporosis that is due to elevated creation of fat cells.

Bone is a living tissue that constantly rebuilds. Bones need a constant new creation of cells specific to their tissue, including the bone-producing cells called osteoblasts. Osteoblasts live only about three months and do not divide.

The progenitor cells for osteoblasts are bone marrow mesenchymal stem cells. Besides osteoblasts, mesenchymal stem cells can also differentiate into the chondrocyte cells that make cartilage, the myocyte cells that help form muscles and the adipocytes, or fat cells. Thus, the same progenitor cell has four possible tracks of differentiation.

UAB researchers and colleagues focused on the molecular mechanism that controls the lineage commitment switch between the osteoblast and adipocyte tracks. Led by Yi-Ping Li, Ph.D., UAB professor of pathology, and Wei Chen, M.D., UAB associate professor of pathology, they investigated the key role played by Cbf-beta, or core-binding factor subunit beta.

Study details

The team led by Li and Chen generated three mouse models by deleting Cbf-beta at various stages of the osteoblast lineage. All three mouse models showed severe osteoporosis with accumulation of fat cells in the bone marrow, a pathology that resembles aged bone from enhanced adipocyte creation.

Bone marrow mesenchymal stem cells and bone cells from the skulls of Cbf-beta-deficient mice showed increased expression of adipocyte genes.

Looking at the mechanism downstream, the researchers found that the loss of Cbf-beta impeded the canonical Wnt signaling pathway, particularly through decreased Wnt10b expression. In nonmutant mice, they found that the protein complex composed of Cbf-beta and the Runx2 transcription factor binds to the Wnt10b promoter to drive Wnt10b expression. The Cbf-beta/Runx2 complex also inhibited expression of the enhancer protein C/EBP-alpha that promotes differentiation of adipocytes.

In addition, the researchers showed that Cbf-beta maintains the osteoblast lineage commitment in two

ways -- through the Wnt paracrine pathway to affect nearby cells and through endogenous signaling within the cell to suppress adipogenesis gene expression.

Altogether, this knowledge of the mechanism driven by Cbf-beta can help explain the imbalance in bone maintenance seen in older people.

Two Group A Streptococcus genes linked to 'flesh-eating' bacterial infections -- ScienceDaily

Group A Streptococcus bacteria cause a variety of illnesses that range from mild nuisances like strep throat to life-threatening conditions including pneumonia, toxic shock syndrome and the flesh-eating disease formally known as necrotizing fasciitis. The life-threatening infections occur when the bacteria spread underneath the surface of the skin or throat and invade the underlying soft tissue. A 2005 study published in *The Lancet* attributed half a million deaths worldwide each year to group A Streptococcus.

"In 24 to 48 hours, you can go from being healthy to having a limb amputated to save your life," said Kevin McIver, professor of cell biology and molecular genetics at the University of Maryland, College Park. "And we don't really know why or how the bacteria do that."

In a new study, McIver's laboratory and researchers at

the University of Maryland School of Medicine identified two genes important for invasive group A Streptococcus infections in mice. The genes, subcutaneous fitness genes A (scfA) and B (scfB), may prove to be promising clinical targets in the fight against these infections, as there are no vaccines against group A Streptococcus or effective treatments for invasive infections. The study was published online on August 23, 2017, in the journal PLOS Pathogens.

Led by Yoann Le Breton, the study's first author and a research assistant professor in McIver's group, the researchers discovered scfA and scfB by performing transposon sequencing on the entire group A Streptococcus genome. Transposons, also known as jumping genes, are short sequences of DNA that physically move within a genome, mutating genes by jumping into them. If the mutation causes an interesting effect, scientists can identify the mutated gene by locating the transposon, sequencing the DNA surrounding the transposon and mapping its location in the genome.

"Invasion under the skin, or subcutaneously, is not the norm for group A Streptococcus bacteria; it's actually very rare," McIver explained. "We hypothesized that

there must be genes in the bacteria important for invading soft tissues and surviving under the skin. And we tested that theory by using transposons to make thousands of different individual mutants that we used to infect a subcutaneous environment in mice."

McIver and his colleagues used a transposon called Krmit -- which they created in a previous study -- to generate a collection of approximately 85,000 unique mutants in a group A Streptococcus strain. They injected the mutant strains into mice, which resulted in humanlike infections. The transposon was named for the Muppets character Kermit the frog, whose creator Jim Henson, a 1960 College Park alumnus, died of toxic shock syndrome following group A Streptococcal pneumonia.

"We were particularly interested in the mutations that didn't come out the other end -- the ones not found in the surviving bacteria from the infected tissue," McIver said. "These genes would be good targets for a vaccine or treatment because the bacteria missing these genes did not flourish in the infection site."

The researchers identified 273 scf genes as potentially involved in establishing infection under the skin, but

two genes stood out: scfA and scfB. Based on patterns in their DNA sequences, these genes likely encode proteins in the bacterial membrane. This is a prime location for gene products involved in infection because many dangerous bacteria secrete toxins or proteins through the membrane to attack the host. Additional experiments showed that bacteria lacking scfA or scfB had difficulty spreading from under the skin to the bloodstream and other organs.

The results suggest that these two genes are involved in the invasion process and may be potential targets for therapeutics.

"The next steps will be to expand the study to include multiple animal models, and these experiments are already underway," said Mark Shirtliff, a co-author of the study and a professor in the Department of Microbiology and Immunology at the University of Maryland School of Medicine and the Department of Microbial Pathogenesis at the University of Maryland School of Dentistry. "We can also begin to formulate improved therapies and vaccines against group A streptococcus infections and their complications such as rheumatic heart disease, pneumonia and necrotizing fasciitis."

McIver also looks forward to using transposon sequencing to study other ways bacteria attack humans.

"Transposon sequencing can be used to probe how bacteria infect humans in any environment you can think of," McIver said. "Like group A Streptococcus, many pathogenic bacteria have completely sequenced genomes, but we don't know what most of the genes are doing. We're excited to have a method to interrogate all that unknown genetic material to better understand human infections."

Enhancing the sensing capabilities of diamonds with quantum properties: Simple method can give diamonds the special properties needed for quantum applications such as sensing magnetic fields -- ScienceDaily

Pure diamond consists of carbon atoms in a perfect crystal lattice. But remove a few carbons and swap some others for nitrogen, and you get a diamond with special quantum-sensing properties. These properties are useful for quantum information applications and sensing magnetic fields, and as a platform for probing the mysteries of quantum physics.

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy (NV) center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs. They describe their results this week in *Applied Physics Letters*, from AIP

Publishing.

Magnetic field sensing presents a prime example for the importance of this sensing. Green light can induce the NV centers to fluoresce and emit red light, but the amount of this fluorescence changes in the presence of a magnetic field. By measuring the brightness of the fluorescence, diamond NV centers can help determine magnetic field strength. Such a device can make magnetic images of a range of sample types, including rocks and biological tissue.

The sensitivity of this type of magnetic detection is determined by the concentration of NV centers while vacancies that are not paired with nitrogen create noise. Efficient conversion of vacancies into NV centers, therefore, as well as maximizing the concentration of NV centers, plays a key role in advancing these detection methods.

Researchers typically purchase nitrogen-doped diamonds from a separate company. They then bombard the diamond with electrons, protons or other particles, which strip away some of the carbon atoms, leaving behind vacancies. Finally, a heating process called annealing nudges the vacancies next to the

nitrogen atoms to form the NV centers. The problem is that irradiation often requires sending your sample to a separate facility, which is expensive and time-consuming.

"What is special about our approach is that it's very simple and very straightforward," said Dima Farfurnik of the Hebrew University of Jerusalem in Israel. "You get sufficiently high NV concentrations that are appropriate for many applications with a simple procedure that can be done in-house."

Their method uses high energy electron bombardment in a transmission electron microscope (TEM), an instrument accessible to many researchers, to locally create NV centers. Normally, a TEM is used to image materials down to subnanometer resolutions, but its narrow electron beam can also irradiate diamonds.

Others have shown TEMs can create NV centers in specialized diamond samples, but the researchers in this study successfully tested the method on several commercially available diamond samples.

In a typical, untreated sample, less than 1 percent of the nitrogen atoms form NV centers. But by using a TEM,

the researchers increased this conversion efficiency to as high as 10 percent. In certain cases, the samples reached their saturation limit, and more irradiation was no longer effective. For other samples, however, the researchers didn't hit this limit, suggesting that additional irradiation could boost efficiencies further. With higher conversion efficiencies, and small irradiation volumes possible with a TEM, devices like magnetic sensors could be more compact.

To make sure the method didn't hinder the effectiveness of NVs in applications like sensing magnetic fields, the researchers confirmed that the length of time the NV centers remain in their states -- the coherence time -- didn't change.

Packing enough NV centers in a diamond would allow physicists to probe the quantum interactions among the centers themselves. This research could enable the creation of a unique quantum state called a squeezed state, which has never been demonstrated before in a solid and could push the sensing capabilities of these systems beyond today's classical limits.

"We hope the enhanced number of NV centers due to irradiation will serve as a stepping stone for this long-

term and ambitious goal," Farfurnik said.

700 years old saint myth has been proven (almost) true -- ScienceDaily

Scientists confirm that the age and content of an old sack is in accordance with a medieval myth about Saint Francis of Assisi.

For more than 700 years the Friary of Folloni near Montella in Italy has protected and guarded some small fragments of textile.

According to the legend the textile fragments originate from a sack that appeared on the doorstep of the friary in the winter of 1224 containing bread sent from Saint Francis of Assisi, who at that time was in France. The bread was allegedly brought to the friary by an angel.

Ever since that cold winter's night the sack has been guarded by the friary, and today the last few remaining fragments are kept as a relic in a well protected shrine.

In line with the legend

A Danish/Italian/Dutch team of researchers led by

Associate Professor Kaare Lund Rasmussen from University of Southern Denmark has had the opportunity to conduct scientific studies of the alleged bread sack fragments. Their study is published in the journal Radiocarbon.

C-14 analysis revealed that the textile can be dated to 1220-1295.

The age is in line with the legend, says Kaare Lund Rasmussen, a chemist, and specialized in archeo-chemical analyses.

There was probably bread in the sack

The researchers also looked for traces of bread in the textile. They did this by looking for ergosterol, a sterol for the fungal kingdom and encountered in several types of mould. Ergosterol can be a potential biomarker for brewing, baking or agriculture.

Our studies show that there was probably bread in the sack. We don't know when, but it seems unlikely that it was after 1732, where the sack fragments were immured in order to protect them. It is more likely that bread was in contact with the textile in the 300 years

before 1732; a period, where the textile was used as altar cloth -- or maybe it was indeed on the cold winter's night in 1224 -- it is possible, says Rasmussen.

Scientific measurements cannot prove a legend or belief. What they can do, is either to de-authenticate the object or show accordance between the physical/chemical evidence and the legend, say the researchers in their paper, published in the journal *Radiocarbon*.

Belief versus science

The researchers have not addressed the issue of how the bread sack ended up on the doorstep of the friary.

This is maybe more a question of belief than science, says Rasmussen.

The bread sack: According to legend the bread sack miraculously appeared on the doorstep of the friary in 1224. For 300 years it was used as an altar cloth. During this time pieces were cut off and given to other religious institutions in Italy. After an earthquake in 1732 a new friary was built and the remaining sack fragments were immured. In 1807 the fragments were

moved to the main church, Santa Maria del piano. In 1817 half of the textile was returned to the friary. In 1999 the remaining half returned. Today the fragments of the textile are kept in a reliquary.

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal *Cell* on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

- [**Scientists sequence asexual tiny worm whose lineage stretches back 18 million years**](#) [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Jellyfish, with no brains, still seem to sleep**](#) [周五, 22 9月 02:12]

The discovery that primitive jellyfish sleep suggests that sleep is an ancient, evolutionarily conserved behavior.

- [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

- [**Reconstructing how Neanderthals grew, based on an El Sidrón child**](#) [周五, 22 9月 02:12]

How did Neanderthals grow? Does modern man develop in the same way as *Homo neanderthalensis* did? How does the size of the brain affect the development of the body? Researchers have studied the fossil

remains of a Neanderthal child's skeleton in order to establish whether there are differences between the growth of Neanderthals and that of sapiens.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Dino-killing asteroid's impact on bird evolution**](#) [周五, 22 9月 00:11]

Human activities could change the pace of evolution, similar to what occurred 66 million years ago when a giant asteroid wiped out the dinosaurs, leaving modern birds as their only descendants.

- [**One in four girls is depressed at age 14**](#) [周四, 21 9月 23:07]

New research shows a quarter of girls (24%) and one in 10 boys (9%) are depressed at age 14.

- [**Surprising discovery: How the African tsetse fly really drinks your blood**](#) [周四, 21 9月 23:06]

Researchers have been taking a close-up look at the biting mouthparts of the African tsetse fly as part of ongoing work on the animal diseases it carries. Using a new high-powered scanning electron microscope, researchers were able to see the rows of sharp teeth and rasps that the fly uses to chew through the skin when it bites.

- [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

- [**Changing of the guard: Research sheds light on how plants breathe**](#) [周四, 21 9月 22:17]

New research is set to change the textbook understanding of how plants breathe. Researchers have developed the first full 3D model of a guard cell.

- [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

- [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**Immune system is critical to regeneration, study finds**](#) [周四, 21 9月 03:49]

The answer to the question of why some organisms can regenerate major body parts while others, such as humans, cannot may lie with the body's innate immune system, according to a new study of heart regeneration in the Mexican salamander.

- [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

• [**Fly away home? Ice age may have clipped bird migration**](#) [周四, 21 9月 02:46]

The onset of the last ice age may have forced some bird species to abandon their northerly migrations for thousands of years, says new research led by an ornithologist. The study challenges a long-held presumption that birds merely shortened their migratory flights when glaciers advanced south to cover much of North America and northern Europe about 21,000 years ago.

• [**Species abundance: Winter restricts innovation**](#) [周四, 21 9月 01:17]

Why are there so many more species in the tropics? The 'storage effect' is stronger there than in temperate forests.

• [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called *Beelzebufo* that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

• [**Animal acoustic activity decline shows forest fire pollution wreaks havoc on wildlife**](#) [周四, 21 9月 01:17]

Forest fires in Southeast Asia during the El Niño droughts of 2015 caused considerable disruption to the biodiversity of the region due to the smoke-induced 'haze' they created, according to new research.

• [**New concept of terrestrial planet formation**](#) [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects

the generation of the volcanic terrains that dominate the rocky planets.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- [**Dinosaur evolution: Lumbering giants had agile ancestors**](#) [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

- [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- [**Brain cancer growth halted by absence of protein**](#) [周四, 21 9月 01:16]

The growth of certain aggressive brain tumors can be halted by cutting off their access to a signaling molecule produced by the brain's nerve cells, according to a new study.

- [**Millions of new genes in human microbiome**](#) [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of previously unknown genes from microbial communities in the human gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

- [**Genome editing reveals role of gene important for human embryo development**](#) [周四, 21 9月 01:16]

Researchers have used genome editing technology to reveal the role of a key gene in human embryos in the first few days of development. This is the first time that genome editing has been used to study gene function in human embryos, which could help scientists to better understand the biology of our early development.

- [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

- [**How Teotihuacan's urban design was lost and found**](#) [周三, 20 9月 23:33]

A new article outlines how the urban design of the city of Teotihuacan differed from past and subsequent cities, only to be rediscovered and partially modeled on many centuries later by the Aztecs.

- [**10,000 year-old DNA proves when fish colonized our lakes**](#) [周三, 20 9月 22:45]

DNA in lake sediment forms a natural archive displaying when various fish species colonized lakes after the glacial period. Scientists' analyses of the prevalence of whitefish DNA in sediment reveal that the whitefish came to Lake Stora Lögdsjön in Västerbotten already 10,000 years ago, whereas Lake Hotagen in Jämtland had its whitefish only 2,200 years ago.

- [**Solving the Easter Island population puzzle**](#) [周三, 20 9月 22:01]

The nearly nine hundred giant stone statues discovered by the first Europeans to land on Easter Island seemed at odds with the small population found living there. It is believed a once thriving community witnessed sweeping ecological change and suffered internal conflict,

resulting in a population crash. A new detailed study of the farming potential of the Island suggests it could have sustained 17,500 people at its peak.

- [**Emerging disease further jeopardizes North American frogs**](#) [周三, 20 9月 04:02]

A deadly amphibian disease called severe Perkinsea infections, or SPI, is the cause of many large-scale frog die-offs in the United States, according to a new study.

- [**End-of-summer Arctic sea ice extent is eighth lowest on record**](#) [周三, 20 9月 04:01]

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

- [**North Atlantic right whales decline confirmed: 458 remaining**](#) [周三, 20 9月 02:04]

Marine biologists have developed a new model to improve estimates of abundance and population trends of endangered North Atlantic right whales, which have declined in numbers and productivity in recent years. Between 1990 and 2010 abundance increased to 482 animals, but since 2010 the numbers have declined to 458 in 2015, with 14 known deaths this year.

- [**Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests**](#) [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

- [**Mercury's poles may be icier than scientists**](#)

thought [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice inventory.

• **Getting emotional after failure helps you improve next time, study finds** [周二, 19 9月 23:12]

Emotional responses to failure rather than cognitive ones are more effective at improving people's results for the next time they tackle the next related task, new research indicates.

• **Playing American football before age 12 could have long-term health effects** [周二, 19 9月 22:25]

Playing American football before the age of 12 may have long-term consequences for players' mood and behavior, according to a study involving 214 professional and amateur football players.

• **Exposure to pet and pest allergens during infancy linked to reduced asthma risk** [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

• **New mirror-coating technology promises dramatic improvements in telescopes** [周二, 19 9月 10:23]

An electrical engineer has teamed up with astronomers to improve telescope mirrors using thin-film technology from the electronics industry. They are developing new protective coatings using an atomic layer deposition system large enough to accommodate telescope mirrors.

• **DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'** [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic

to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [**Solar-to-fuel system recycles CO₂ to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [**Copper catalyst yields high efficiency CO₂-to-fuels conversion**](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of a creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [**When it comes to the threat of extinction, size matters**](#) [周二, 19 9月 01:27]

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Mechanism that underlies age-associated bone loss**](#) [周六, 23 9月 03:05]

A major health problem in older people is age-associated osteoporosis -- the thinning of bone and the loss of bone density that increases the risk of fractures. Researchers have now detailed an underlying mechanism leading to that osteoporosis. When this mechanism malfunctions, progenitor cells stop creating bone-producing cells, and instead create fat cells. Knowledge of this mechanism can provide targets in the search for novel bone-loss.

- [**Two Group A Streptococcus genes linked to 'flesh-eating' bacterial infections**](#) [周六, 23 9月 03:05]

Group A Streptococcus bacteria cause illnesses ranging from mild nuisances like strep throat to life-threatening conditions such as flesh-eating disease, also known as necrotizing fasciitis. Life-threatening infections occur when the bacteria spread underneath the surface of the skin or throat and invade the underlying soft tissue. Researchers have found two group A Streptococcus genes involved in invasive infections, which may be potential targets for therapeutics.

- [**Our weight tells how we assess food**](#) [周五, 22 9月 23:17]

A new study demonstrated that people of normal weight tend to associate natural foods such as apples with their sensory characteristics. On the other hand, processed foods such as pizzas are generally associated with their function or the context in which they are eaten. But that's not all. The research also highlighted the ways in which underweight people pay greater attention to natural foods and

overweight people to processed foods.

- [**Residents: Frontline defenders against antibiotic resistance?**](#) [周五, 22 9月 23:17]

Residents often decide which antibiotics to start a patient on so they could become the first line of defense against antibiotic resistance.

- [**Strategy might prevent infections in patients with spinal cord injuries**](#) [周五, 22 9月 23:17]

A new study sheds light on how to reduce the number of infections in patients with spinal cord injuries without using antibiotics.

- [**Usher syndrome: Gene therapy restores hearing and balance**](#) [周五, 22 9月 23:17]

Scientists have recently restored hearing and balance in a mouse model of Usher syndrome type 1G characterized by profound congenital deafness and vestibular disorders caused by severe dysmorphogenesis of the mechano-electrical transduction apparatus of the inner ear's sensory cells. These findings open up new possibilities for the development of gene therapy treatments for hereditary forms of deafness.

- [**Stimuli fading away en route to consciousness**](#) [周五, 22 9月 21:40]

Whether or not we consciously perceive the stimuli projected onto our retina is decided in our brain. A recent study shows how some signals dissipate along the processing path to conscious perception. This process begins at rather late stages of signal processing. By contrast, in earlier stages there is hardly any difference in the reaction of neurons to conscious and unconscious stimuli.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

• [Effective help is available for migraine sufferers](#)

[周五, 22 9月 21:15]

Although it's the third most prevalent illness in the world, migraine is widely misunderstood and frequently undiagnosed. Until quite recently a common "remedy" for migraine was to lie in a dark room and wait for the pain to pass. But today there are treatments that work – and new medications formulated specifically for migraine are in the pipeline.

• [Rainbow colors reveal cell history](#)

[周五, 22 9月 21:14]

A system called "Beta-bow", which allows the history of beta-cells to be traced by genetic bar-coding and multicolor imaging, has been developed by researchers.

• [New genetic syndrome predisposes the body to cancer](#)

[周五, 22 9月 21:14]

A new syndrome caused by biallelic mutations -- those produced in both gene copies inherited from the mother and father -- in the FANCM gene predisposes the body to the appearance of tumors and causes rejection to chemotherapy treatments. Contrary to what scientists believed, the gene does not cause Fanconi anemia. Researchers recommend modifying the clinical monitoring of patients with these mutations.

• [Improving techniques for joint defect treatment](#)

[周五, 22 9月 21:12]

Different surface topographies and materials provide interesting ways to study cell behavior and potentially provide novel solutions for treating joint defects. Tissue engineering methods that simulate native cartilage could prove useful to create cartilage implants in the laboratory, according to new research.

- **[Smartphone apps can reduce depression](#)** [周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible interventions for the millions of people around the world diagnosed with this condition.

- **[Party discipline for jumping genes](#)** [周五, 22 9月 21:09]

Jumping genes, transposons, are part of the genome of most organisms, aggregated into families and can damage the genome by jumping. How hosts suppress the jumping is well investigated. Why they still can jump has hardly been understood so far. Researchers investigated for the first time in all transposons of the host organism, which properties and host environments facilitate jumping. They showed that family affiliation is more important than position.

- **[Personality changes don't precede clinical onset of Alzheimer's, study shows](#)** [周五, 22 9月 21:09]

No evidence has been found to support the idea that personality changes begin before the clinical onset of mild cognitive impairment (MCI) or dementia, a new and comprehensive study reports.

- **[Quick test may speed antibiotic treatment, combat drug resistance](#)** [周五, 22 9月 21:09]

Researchers have demonstrated a potential new tactic for rapidly determining whether an antibiotic combats a given infection, thus hastening effective medical treatment and limiting the development of drug-resistant bacteria. Their method can quickly sense mechanical fluctuations of bacterial cells and any changes induced by an antibiotic.

- **[Positive, negative or neutral, it all matters: NASA explains space radiation](#)** [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- **[Being active saves lives whether a gym workout, walking to work or washing the floor](#)** [周五, 22 9月 06:50]

Any activity is good for people to meet the current guideline of 30 minutes of activity a day, or 150 minutes a week to raise the heart rate, new research indicates.

- **[Alternative splicing, an important mechanism for cancer](#)** [周五, 22 9月 06:50]

Scientists discover several alterations in this cellular process with implications in cancer by analyzing samples from more than 4,000 patients.

- **[Preterm children have more medical sleep problems but fall asleep more independently](#)** [周五, 22 9月 04:13]

A new study suggests that while healthy preterm children have more medical sleep problems than full-term children, they are more likely to fall asleep independently.

- **[Strong alcohol policies help reduce alcohol-involved homicides](#)** [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among homicide victims, according to a new study.

- **[Babies can learn that hard work pays off](#)** [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- **['Labyrinth' chip could help monitor aggressive cancer stem cells](#)** [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to separate out rare circulating cancer cells into a relatively clean stream

for analysis. It is already in use in a breast cancer clinical trial.

- [**New hope for people with fibromyalgia**](#) [周五, 22 9月 04:12]

A novel psychological therapy that encourages addressing emotional experiences related to trauma, conflict and relationship problems has been found helpful for people with the chronic pain condition fibromyalgia.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Into more thin air: Exploring the adaptation extremes of human high altitude sickness and fitness**](#) [周五, 22 9月 04:12]

Many research groups have explored human adaptation to high altitude living among three major far-flung global populations: Tibetans, Ethiopians and Peruvians. But few have simultaneously explored the other extreme---maladaptation---in the form of chronic mountain sickness (CMS). Now, in the largest whole genome study of its kind, an international research team led by University of California San Diego's Chairman of Pediatrics, Dr. Gabriel Haddad, has expanded on their recent study of understand...

- [**Synthetic molecule 'kicks and kills' some persistent HIV in mice**](#) [周五, 22 9月 02:13]

Scientists have designed a synthetic molecule that can reactivate dormant human immunodeficiency virus (HIV) in mice and lead to the death of some of the infected cells, according to a new study.

- [**Japanese encephalitis vaccine cuts disease rate in Nepal**](#) [周五, 22 9月 02:13]

From 2006 through 2011, Nepal conducted a mass immunization campaign against Japanese encephalitis -- a mosquito-borne viral

disease. Now, investigators have reported that the vaccination effort prevented thousands of cases of Japanese encephalitis (JE) and cut JE rates in Nepal by at least 78 percent.

• [**Your neurons register familiar faces, whether you notice them or not**](#) [周五, 22 9月 02:13]

When people see an image of a person they recognize particular cells light up in the brain. Now, researchers have found that those cells light up even when a person sees a familiar face or object but fails to notice it. The only difference is that the neural activity is weaker and delayed in comparison to what happens when an observer consciously registers and can recall having seen a particular image.

• [**A rapid alternative to standard safety tests for lentiviral vectors**](#) [周五, 22 9月 02:13]

A new, publicly available test to assess the safety of cell therapy products altered by lentivirus generates results within a few hours, potentially hastening the pace at which viral immunotherapies move into clinical trial. Current assays required by the US Food and Drug Administration take about six weeks to complete. The rapid test, which does not have a significant risk of false positives, is also a fraction of the cost of the standard approach.

• [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

• [**Neuron types in brain are defined by gene activity shaping their communication patterns**](#) [周五, 22 9月 02:12]

Neurons are the basic building blocks that wire up brain circuits supporting mental activities and behavior. In a major step forward, scientists have described a discovery about the molecular-genetic basis

of neuronal cell types. The study, which involves sophisticated computational analysis of the messages transcribed from genes that are active in a neuron, points to patterns of cell-to-cell communication as the core feature that makes possible rigorous distinctions among neuron types across the...

- [**Rapid hepatitis C testing may help better screen young adults**](#) [周五, 22 9月 02:12]

Routine and rapid hepatitis C virus testing among young adults who use injection drugs improves life expectancy and may provide a good use of limited resources, according to new research.

- [**Exosomes are the missing link to insulin resistance in diabetes**](#) [周五, 22 9月 02:11]

Chronic tissue inflammation resulting from obesity is an underlying cause of insulin resistance and type 2 diabetes. But the mechanism by which this occurs has remained cloaked, until now. In a new paper, researchers identified exosomes -- extremely small vesicles or sacs secreted from most cell types -- as the missing link.

- [**Locking down the big bang of immune cells**](#) [周五, 22 9月 01:44]

Ignored pieces of DNA play a critical role in the development of immune cells (T cells), scientists have found. These areas activate a change in the structure of DNA that brings together crucial elements necessary for T cell formation. This “big bang” discovery may aid in combating diseases.

- [**How staph cells dodge the body's immune system**](#) [周五, 22 9月 00:58]

For years, medical investigators have tried and failed to develop vaccines for a type of staph bacteria associated with the deadly superbug MRSA. But a new study shows how staph cells evade the body's immune system, offering a clearer picture of how a successful vaccine would work.

- [**Blood metal ion levels can identify hip**](#)

[replacement patients at low risk of ARMD](#) [周五, 22 9月 00:58]

Patients with 'metal on metal' artificial hips are at risk of complications caused by adverse reactions to metal debris (ARMD). A study confirms that blood metal ion levels specific to the type of hip implant used can help predict patients who are at low risk of ARMD.

• [Flu vaccine used in elderly may benefit middle-aged adults with chronic conditions](#) [周五, 22 9月 00:11]

Expanding the high-dose influenza vaccine recommendation to include middle-aged adults with chronic health conditions may make economic sense and save lives. The findings may justify for clinical trials of the high-dose and new recombinant trivalent influenza vaccines in 50- to 64-year-old adults with chronic illnesses, such as heart or lung disease, diabetes, or cancer, to determine if they do provide considerably better protection than the currently recommended standard dose quadrivalent vaccin...

• [One in four girls is depressed at age 14](#) [周四, 21 9月 23:07]

New research shows a quarter of girls (24%) and one in 10 boys (9%) are depressed at age 14.

• [Mitochondria drive cell survival in times of need](#) [周四, 21 9月 23:07]

Researchers have discovered a mechanism through which mitochondria, the energy factory of our body's cells, play a role in preventing cells from dying when the cells are deprived of nutrients -- a finding that points to a potential target for next-generation cancer drugs.

• [Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

• [Brain inflammation linked to suicidal thinking](#)

in depression [周四, 21 9月 22:42]

Patients with major depressive disorder (MDD) have increased brain levels of a marker of microglial activation, a sign of inflammation, according to a new study. Scientists have found that the increase in the inflammatory marker was present specifically in patients with MDD who were experiencing suicidal thoughts, pinning the role of inflammation to suicidality rather than a diagnosis of MDD itself.

Production of key diabetes cells can be improved

[周四, 21 9月 22:17]

In the future diabetics might benefit from getting insulin-regulating beta cells transplanted into their body because their own beta cells are destroyed or less functional. However, according to new stem cell research, the current way of producing beta cells from stem cells has significant shortfalls. The beta cells produced have some features resembling alpha cells.

Whole food diet may help prevent colon cancer, other chronic conditions [周四, 21 9月 22:17]

A diet that includes plenty of colorful vegetables and fruits may contain compounds that can stop colon cancer and inflammatory bowel diseases in pigs, according to an international team of researchers. Understanding how these compounds work on a molecular level could be an initial step toward finding treatments for people with cancer, they added.

Increasing frequency of blood donation has no major side effects [周四, 21 9月 21:55]

Giving blood more frequently - up to every 8 weeks for men and every 12 weeks for women - has no major side effects and could help to increase blood stocks, according to the first ever randomized trial of blood donation involving more than 45000 people in England.

Treating asthma or COPD with steroid inhaler increases the risk of hard-to-treat infections [周四, 21 9月 21:55]

Older people who use steroid inhalers for asthma or chronic obstructive pulmonary disease (COPD) are more likely to suffer particular bacterial

infections, according to a large study.

- [**New genetic test for predicting cancer recurrence**](#) [周四, 21 9月 21:50]

Researchers have discovered a new genetic test which could help predict cancer recurrence - paving the way for more precise, personalised treatments.

- [**Cannabis, 'spice' – better think twice**](#) [周四, 21 9月 21:49]

Marijuana is the most commonly abused drug in the world, and the advent of synthetic cannabinoids creates additional challenges to the society because of their higher potency and ability to escape drug detection screenings. Scientists have a warning about a new danger coming from cannabinoid abuse.

- [**Football helmet smartfoam signals potential concussions in real time, study suggests**](#) [周四, 21 9月 21:03]

While football-related concussions have been top of mind in recent years, people have struggled to create technology to accurately measure them in real time. Engineers have now developed and tested a nano composite smartfoam that can be placed inside a football helmet (and pads) to more accurately test the impact and power of hits.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**NASA'S OSIRIS-REx spacecraft slingshots past Earth**](#) [周六, 23 9月 04:25]

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

- [**Enhancing the sensing capabilities of diamonds with quantum properties**](#) [周六, 23 9月 00:29]

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Assembly of nanoparticles proceeds like a zipper**](#) [周五, 22 9月 21:40]

It has always been the Holy Grail of materials science to describe and control the material's structure-function relationship. Nanoparticles are an attractive class of components to be used in functional materials because they exhibit size-dependent properties, such as superparamagnetism and plasmonic absorption of light. Furthermore, controlling the arrangement of nanoparticles can result in unforeseen properties, but such studies are hard to carry out due to limited efficient approaches to prod...

- [**Smartphone apps can reduce depression**](#) [周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible interventions for the millions of people around the world diagnosed with this condition.

- [**Ultra-light aluminum: Chemist reports breakthrough in material design**](#) [周五, 22 9月 21:09]

Chemists report a new, metastable, ultra-light crystalline form of aluminum has been computationally designed using density functional calculations with imposing periodic boundary conditions.

- [**The math of doughnuts: 'Moonshine' sheds light on elliptic curves**](#) [周五, 22 9月 21:09]

Mathematicians have opened a new chapter in the theory of moonshine, one which begins to harness the power of the pariahs -- sporadic simple groups that previously had no known application.

- [**Positive, negative or neutral, it all matters: NASA explains space radiation**](#) [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- [**New technique accurately digitizes transparent objects**](#) [周五, 22 9月 04:12]

A new imaging technique makes it possible to precisely digitize clear objects and their surroundings, an achievement that has eluded current state-of-the-art 3-D rendering methods.

- [**'Labyrinth' chip could help monitor aggressive cancer stem cells**](#) [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to separate out rare circulating cancer cells into a relatively clean stream

for analysis. It is already in use in a breast cancer clinical trial.

- [**Dancing electrons lose the race**](#) [周五, 22 9月 02:13]

Ultrashort pulses of light were employed by physicists to start a race between electrons emitted from different initial states in a solid material. Timing this race revealed an unexpected result: the fastest electrons arrived in last place.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Breaking Coulomb's law: Scientists find a way around the rule that 'opposites attract'**](#) [周五, 22 9月 01:43]

Scientists have taken a big step towards creating the next generation of batteries, as well as more effective water treatment and better alternative energy after defying one of nature's most fundamental rules on an atomic scale.

- [**Quantum teleportation of patterns of light**](#) [周五, 22 9月 00:11]

Researchers have demonstrated entanglement swapping and teleportation of orbital angular momentum 'patterns' of light. This is a crucial step towards realizing a quantum repeater for high-dimensional entangled states.

- [**Rapid imaging of granular matter**](#) [周五, 22 9月 00:11]

Granular systems such as gravel or powders can be found everywhere, but studying them is not easy. Researchers have now developed a method by which pictures of the inside of granular systems can be taken 10,000 times faster than before.

- [**New analysis explains role of defects in metal oxides**](#) [周五, 22 9月 00:11]

Researchers have determined formulas to guide development of a promising new high-tech material, composed of insulating metal oxides

known as alkaline-earth-metal binary oxides, that could lead to better computer memory chips, refrigeration systems, and other devices.

• [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

• [**Better rechargeable batteries coming soon?**](#) [周四, 21 9月 22:17]

Novel lithium electrodes coated with indium could be the basis for more powerful, longer-lasting, rechargeable batteries. The coating hinders undesirable side-reactions between the electrode and electrolyte, provide a more uniform deposition of lithium when charging, and augments storage in the lithium anode via alloying reactions between lithium and indium. Their success stems from the good diffusion of lithium ions along the interfacial layer.

• [**Astonishing time limit for ultrafast perovskite solar cells set**](#) [周四, 21 9月 22:17]

Researchers have quantified the astonishingly high speeds at which future solar cells would have to operate in order to stretch what are presently seen as natural limits on their energy conversion efficiency.

• [**Diamonds show Earth still capable of 'superhot' surprises**](#) [周四, 21 9月 21:55]

Diamonds may be 'forever' but some may have formed more recently than geologists thought. A study of 26 diamonds, formed under extreme melting conditions in the Earth's mantle, found two populations, one of which has geologically 'young' ages. The results show that certain volcanic events on Earth may still be able to create super-heated conditions previously thought to have only existed early in the planet's history before it cooled. The findings may have implications for diamond prospecting.

- [**Solar eruption ‘photobombed’ Mars encounter with Comet Siding Spring**](#) [周四, 21 9月 21:50]

When Comet C/2013 A1 (Siding Spring) passed just 140,000 kilometers from Mars on 19th October 2014, depositing a large amount of debris in the Martian atmosphere, space agencies coordinated multiple spacecraft to witness the largest meteor shower in recorded history. It was a rare opportunity, as this kind of planetary event occurs only once every 100,000 years.

- [**Football helmet smartfoam signals potential concussions in real time, study suggests**](#) [周四, 21 9月 21:03]

While football-related concussions have been top of mind in recent years, people have struggled to create technology to accurately measure them in real time. Engineers have now developed and tested a nano composite smartfoam that can be placed inside a football helmet (and pads) to more accurately test the impact and power of hits.

- [**Precisely defined polymer chains now a reality**](#) [周四, 21 9月 21:03]

The materiality exhibited by humanmade polymers currently relies on simple chemical bonds and the sequence order taken by molecules in the polymer chain. We now no longer need to rely on fate to determine such materiality with this new technique for precisely defining polymer-chain order. This system uses highly specific 'grabber' ends on each molecule that bond with only one type of 'pin' end on another molecule.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**Bio-inspired approach to RNA delivery**](#) [周四, 21 9月 03:50]

A team of chemical engineers, inspired by the way that cells translate their own mRNA into proteins, has designed a synthetic delivery system

that is four times more effective than delivering mRNA on its own.

- [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

- [**New biomaterial could replace plastic laminates, greatly reduce pollution**](#) [周四, 21 9月 02:47]

An inexpensive biomaterial that can be used to sustainably replace plastic barrier coatings in packaging and many other applications has been developed by researchers, who predict its adoption would greatly reduce pollution.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

- [**Automatic code reuse: System automatically modifies code for transfer to other programs**](#) [周四, 21 9月 02:46]

Researchers have developed a new system that allows programmers to transplant code from one program into another. The programmer can select the code from one program and an insertion point in a second program, and the system will automatically make modifications necessary -- such as changing variable names -- to integrate the code into its new context.

- [**New concept of terrestrial planet formation**](#) [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- [**Unique property of critical methane-producing enzyme discovered**](#) [周三, 20 9月 23:53]

An unexpected discovery has given a group of scientists a greater understanding of an important methane-producing enzyme called methyl-coenzyme M reductase, or MCR. Their findings overturn what was previously believed to be true in the field: that a set of unique modifications present in MCR were essential to how the enzyme functions.

- [**Spinning a lighter, safer electrode**](#) [周三, 20 9月 23:35]

A fabric-like material electrode has been created that could help make energy storage devices -- batteries and supercapacitors -- faster and less susceptible to leaks or disastrous meltdowns. Their design for a new supercapacitor, which looks something like a furry sponge infused with gelatin, offers a unique alternative to the flammable electrolyte solution that is a common component in these devices.

- [**Straining the memory: Prototype strain engineered materials are the future of data storage**](#) [周三, 20 9月 23:34]

Researchers have strain-engineered a data storage material to store data by exploiting a process of avalanche atomic switching. Memory cells

using this material substantially outperform state-of-the-art phase change memory devices.

• [**Mathematicians ask: What's in a ripple?**](#) [周三, 20 9月 23:34]

When a fluid or a gas experiences a sudden disturbance, it often gives rise to a phenomenon known as an undular bore, which consists of a series of rapid oscillations that propagate and spread. But how to describe what transpires? New mathematics research brings us closer to finding an answer.

• [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• [**Real or fake? Creating fingers to protect identities**](#) [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

• [**Mathematical simulations shed new light on epilepsy surgery**](#) [周三, 20 9月 22:43]

Results from an unexpected quarter is could help neurologists to identify which brain region to remove to eliminate an epilepsy patient's symptoms. Mathematicians have shown that it is sensible to examine the interconnections between different brain regions closely, instead of searching for abnormal regions only.

• [**Naked molecules dancing in liquid become**](#)

[**visible**](#) [周三, 20 9月 22:42]

Moving, vibrating and leaping molecules make up our world. However, capturing their movement is not an easy task. Scientists were able to see the movement of molecules stored inside a graphene pocket without the need to stain them. This study paves the way for observing the dynamics of life building blocks, like proteins and DNA, as well as the self-assembly of other materials.

• [**Gravity waves influence weather and climate**](#) [周三, 20 9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

• [**Getting to the heart of the matter: Nanogels for heart attack patients**](#) [周三, 20 9月 22:00]

Heart disease and heart-related illnesses are a leading cause of death around the world, but treatment options are limited. Now, one group reports that encapsulating stem cells in a nanogel could help repair damage to the heart.

• [**Risks vary widely in drone-human impacts**](#) [周三, 20 9月 04:03]

New research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

• [**Tiny lasers from a gallery of whispers**](#) [周三, 20 9月 04:03]

Whispering gallery mode resonators rely on a phenomenon similar to an effect observed in circular galleries, and the same phenomenon applies to light. When light is stored in ring-shaped or spherical active resonators, the waves superimpose in such a way that it can result in laser light. Investigators now report a new type of dye-doped WGM micro-laser that produces light with tunable wavelengths.

• [**Security cameras vulnerable to attacks using infrared light**](#) [周三, 20 9月 04:02]

Researchers have demonstrated that security cameras infected with malware can receive covert signals and leak sensitive information from

the very same surveillance devices used to protect facilities.

- [Clear tactics, but few easy solutions, for hospitals combating ransomware](#) [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

- [Wikipedia used to give AI context clues](#) [周三, 20 9月 02:04]

A team of computer scientists is teaching artificial intelligence agents how to interact with the world in a way that makes sense.

- [Political polarization? Don't blame the web](#) [周三, 20 9月 02:04]

Despite the popular narrative that the web is to blame for rising political polarization, a study by economists has found that recent growth in polarization is greatest for demographic groups in which individuals are least likely to use the internet and social media. This means that data does not support the claim that the internet is the most significant driver of partisanship.

- [Mercury's poles may be icier than scientists thought](#) [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice inventory.

- [Advanced lithium-ion and metal-air batteries](#) [周三, 20 9月 00:31]

Engineers are developing energy storage technologies that are cheaper, safer and more efficient.

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**700 years old saint myth has been proven \(almost\) true**](#) [周五, 22 9月 23:17]

Scientists confirm that the age and content of an old sack is in accordance with a medieval myth about Saint Francis of Assisi.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Ancient textiles reveal differences in Mediterranean fabrics in the 1st millennium BC**](#) [周五, 22 9月 21:40]

Analysis of Iron Age textiles indicates that during c. 1000-400 BC Italy shared the textile culture of Central Europe, while Greece was largely influenced by the traditions of ancient Near East.

- [**Crowning the 'king of the crops': Sequencing the white guinea yam genome**](#) [周五, 22 9月 21:40]

Scientists have, for the first time, provided a genome sequence for the white Guinea yam, a staple crop with huge economic and cultural significance on the African continent and a lifeline for millions of people.

- [**Winter cold extremes linked to high-altitude polar vortex weakening**](#) [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern

hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

• [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

• [**Rainbow colors reveal cell history**](#) [周五, 22 9月 21:14]

A system called "Beta-bow", which allows the history of beta-cells to be traced by genetic bar-coding and multicolor imaging, has been developed by researchers.

• [**Party discipline for jumping genes**](#) [周五, 22 9月 21:09]

Jumping genes, transposons, are part of the genome of most organisms, aggregated into families and can damage the genome by jumping. How hosts suppress the jumping is well investigated. Why they still can jump has hardly been understood so far. Researchers investigated for the first time in all transposons of the host organism, which properties and host environments facilitate jumping. They showed that family affiliation is more important than position.

• [**Artificial orchid cultivation kit**](#) [周五, 22 9月 21:09]

Orchids are loved by gardeners around the world but are notoriously difficult to cultivate. Researchers have developed a new orchid cultivation kit and have succeeded in complete artificial cultivation of an autonomous orchid. Since this kit can be made cheaply, it can broaden the opportunities for orchid cultivation in general households. It is also expected to be useful in preserving the genetic diversity of orchidaceous plants, many of which are in danger of extinction.

• [**Ozark grasslands experience major increase in**](#)

trees and shrubs [周五, 22 9月 04:12]

Woody vegetation, such as trees and shrubs, has increased dramatically in Ozark grasslands over the past 75 years, according to a study. If these ecosystems continue to favor woody vegetation, will it be possible to maintain open grasslands for the foreseeable future?

Into more thin air: Exploring the adaptation extremes of human high altitude sickness and fitness [周五, 22 9月 04:12]

Many research groups have explored human adaptation to high altitude living among three major far-flung global populations: Tibetans, Ethiopians and Peruvians. But few have simultaneously explored the other extreme---maladaptation----in the form of chronic mountain sickness (CMS). Now, in the largest whole genome study of its kind, an international research team led by University of California San Diego's Chairman of Pediatrics, Dr. Gabriel Haddad, has expanded on their recent study of understand...

Ancient DNA data fills in thousands of years of human prehistory in Africa [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

Scientists sequence asexual tiny worm whose lineage stretches back 18 million years [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

Green algae could hold clues for engineering

[**faster-growing crops**](#) [周五, 22 9月 02:13]

Two new studies provide a detailed look at an essential part of algae's growth machinery, with the eventual goal of applying this knowledge to improving the growth of crops.

• [**Jellyfish, with no brains, still seem to sleep**](#) [周五, 22 9月 02:12]

The discovery that primitive jellyfish sleep suggests that sleep is an ancient, evolutionarily conserved behavior.

• [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

• [**We must accelerate transitions for sustainability and climate change, experts say**](#) [周五, 22 9月 02:12]

We must move faster towards a low-carbon world if we are to limit global warming to 2 degrees C this century, experts have warned.

• [**Heat-loving Australian ants believe in diversity, hint 74 species new to science**](#) [周五, 22 9月 02:12]

A genus of Australian ants, many of whose members prefer to forage in blistering temperatures of up to 50°C (122°F), is revised to include 74 new species. The ants include seed-eaters, ant and termite raiders, 'honeypot ants' that store nectar and honeydew, and numerous others whose biology is not yet understood. Some are bizarre: one species has eyes like inverted ice-cream cones.

• [**Reconstructing how Neanderthals grew, based on an El Sidrón child**](#) [周五, 22 9月 02:12]

How did Neanderthals grow? Does modern man develop in the same way as Homo neanderthalensis did? How does the size of the brain affect the development of the body? Researchers have studied the fossil remains of a Neanderthal child's skeleton in order to establish whether

there are differences between the growth of Neanderthals and that of sapiens.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Wildlife rangers: What motivates them?**](#) [周五, 22 9月 00:11]

Wildlife rangers are on the front lines protecting our most iconic species -- tigers, elephants, gorillas and many others. But their challenges involve more than confrontations with wild animals and poachers.

- [**Dino-killing asteroid's impact on bird evolution**](#) [周五, 22 9月 00:11]

Human activities could change the pace of evolution, similar to what occurred 66 million years ago when a giant asteroid wiped out the dinosaurs, leaving modern birds as their only descendants.

- [**Surprising discovery: How the African tsetse fly really drinks your blood**](#) [周四, 21 9月 23:06]

Researchers have been taking a close-up look at the biting mouthparts of the African tsetse fly as part of ongoing work on the animal diseases it carries. Using a new high-powered scanning electron microscope, researchers were able to see the rows of sharp teeth and rasps that the fly uses to chew through the skin when it bites.

- [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

• [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

• [**New hermit crab uses live coral as its home**](#) [周四, 21 9月 22:42]

A new hermit crab species can live in a walking coral's cavity in a reciprocal relationship, replacing the usual marine worm partner, according to a new study.

• [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

• [**Recipe for forest restoration discovered**](#) [周四, 21 9月 22:17]

A new study has uncovered some valuable information on ways to maximize the success of replanting efforts, bringing new hope for restoring these threatened ecosystems.

• [**Changing of the guard: Research sheds light on how plants breathe**](#) [周四, 21 9月 22:17]

New research is set to change the textbook understanding of how plants breathe. Researchers have developed the first full 3D model of a guard cell.

• [**Scientists and farmers work together to wipe out African lovegrass**](#) [周四, 21 9月 22:17]

New research and collaboration could lead to the eventual eradication of the highly invasive African lovegrass threatening pastures and native grasslands Australia-wide. What they discovered is that local knowledge

is the key to a successful management approach.

• [**Obese dogs helped by 'effective' weight loss trials**](#) [周四, 21 9月 22:17]

On average overweight dogs lose an average of 11 percent of their body weight when enrolled on a weight loss trial according to researchers who have conducted the largest international multi-center weight study.

• [**Lightning-fast trappers: Biomechanics of suction traps in carnivorous bladderworts**](#) [周四, 21 9月 22:17]

New findings have been gained on the biomechanics and evolution of suction traps in carnivorous bladderworts.

• [**Whole food diet may help prevent colon cancer, other chronic conditions**](#) [周四, 21 9月 22:17]

A diet that includes plenty of colorful vegetables and fruits may contain compounds that can stop colon cancer and inflammatory bowel diseases in pigs, according to an international team of researchers. Understanding how these compounds work on a molecular level could be an initial step toward finding treatments for people with cancer, they added.

• [**Diamonds show Earth still capable of 'superhot' surprises**](#) [周四, 21 9月 21:55]

Diamonds may be 'forever' but some may have formed more recently than geologists thought. A study of 26 diamonds, formed under extreme melting conditions in the Earth's mantle, found two populations, one of which has geologically 'young' ages. The results show that certain volcanic events on Earth may still be able to create super-heated conditions previously thought to have only existed early in the planet's history before it cooled. The findings may have implications for diamond prospecting.

• [**In times of climate change: What a lake's color can tell about its condition**](#) [周四, 21 9月 21:50]

With the help of satellite observations from 188 lakes worldwide, scientists have shown that the warming of large lakes amplifies their

color. Lakes which are green due to their high phytoplankton content tend to become greener in warm years as phytoplankton content increases. Clear, blue lakes with little phytoplankton, on the other hand, tend to become even bluer in warm years caused by declines in phytoplankton. Thus, contrary to previous assumptions, the warming of lakes tends to amplify thei...

- [**Cannabis, 'spice' – better think twice**](#) [周四, 21 9月 21:49]

Marijuana is the most commonly abused drug in the world, and the advent of synthetic cannabinoids creates additional challenges to the society because of their higher potency and ability to escape drug detection screenings. Scientists have a warning about a new danger coming from cannabinoid abuse.

- [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

- [**An extraordinary cave animal found in Eastern Turkmenistan**](#) [周四, 21 9月 21:02]

A remote cave in Eastern Turkmenistan was found to shelter a marvelous cave-adapted inhabitant that turned out to represent a species and genus new to science. This new troglodyte is the first of its order from Central Asia and the first strictly subterranean terrestrial creature recorded in the country.

- [**Going diving in the tropics? Don't eat the reef fish!**](#) [周四, 21 9月 21:02]

Reducing tourist consumption of reef fish is critical for Palau's ocean sustainability, finds a new study that suggests other small island nations might also consider adopting this strategy.

- [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

• [**When residents take charge of their rainforests, fewer trees die**](#) [周四, 21 9月 06:21]

When the government gives citizens a personal stake in forested land, trees don't disappear as quickly and environmental harm slows down, research finds.

• [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

• [**3-D analysis of dog fossils sheds light on domestication debate**](#) [周四, 21 9月 06:20]

In an effort to settle the debate about the origin of dog domestication, a technique that uses 3-D scans of fossils is helping researchers determine the difference between dogs and wolves.

• [**Convergent evolution of mimetic butterflies confounds classification**](#) [周四, 21 9月 06:20]

A new paper on butterflies may revise the taxonomy of Asian palmflies in the genus *Elymnias* in light of a forthcoming study on the butterflies' evolutionary history.

• [**Protected waters foster resurgence of West Coast rockfish**](#) [周四, 21 9月 03:49]

West Coast rockfish species in deep collapse only 20 years ago have multiplied rapidly in large marine protected areas off Southern California, likely seeding surrounding waters with enough offspring to offer promise of renewed fishing, a new study has found.

- [**Immune system is critical to regeneration, study finds**](#) [周四, 21 9月 03:49]

The answer to the question of why some organisms can regenerate major body parts while others, such as humans, cannot may lie with the body's innate immune system, according to a new study of heart regeneration in the Mexican salamander.

- [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

- [**New biomaterial could replace plastic laminates, greatly reduce pollution**](#) [周四, 21 9月 02:47]

An inexpensive biomaterial that can be used to sustainably replace plastic barrier coatings in packaging and many other applications has been developed by researchers, who predict its adoption would greatly reduce pollution.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Strong alcohol policies help reduce alcohol-involved homicides**](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among homicide victims, according to a new study.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- **[We must accelerate transitions for sustainability and climate change, experts say](#)** [周五, 22 9月 02:12]

We must move faster towards a low-carbon world if we are to limit global warming to 2 degrees C this century, experts have warned.

- **[Rapid hepatitis C testing may help better screen young adults](#)** [周五, 22 9月 02:12]

Routine and rapid hepatitis C virus testing among young adults who use injection drugs improves life expectancy and may provide a good use of limited resources, according to new research.

- **[Wildlife rangers: What motivates them?](#)** [周五, 22 9月 00:11]

Wildlife rangers are on the front lines protecting our most iconic species -- tigers, elephants, gorillas and many others. But their challenges involve more than confrontations with wild animals and poachers.

- **[Recipe for forest restoration discovered](#)** [周四, 21 9月 22:17]

A new study has uncovered some valuable information on ways to maximize the success of replanting efforts, bringing new hope for restoring these threatened ecosystems.

- **[Premature births cost health plans \\$6 billion annually](#)** [周四, 21 9月 21:02]

A new study estimates employer-sponsored health plans spent at least \$6 billion extra on infants born prematurely in 2013 and a substantial portion of that sum was spent on infants with major birth defects.

- **[Pay more, smoke less: Possible effects of raising tobacco taxes across the EU](#)** [周四, 21 9月 11:22]

Raising tobacco taxes to increase cigarette prices could reduce cigarette consumption and smoking-associated deaths (SADs) in all 28 EU countries, according to a new study. In higher income countries, raising tobacco taxes could increase revenues that could be spend on prevention and control programs, while in lower income countries tax revenues may be negatively affected, researchers suggest.

- [**When residents take charge of their rainforests, fewer trees die**](#) [周四, 21 9月 06:21]

When the government gives citizens a personal stake in forested land, trees don't disappear as quickly and environmental harm slows down, research finds.

- [**Communication among health care facilities key to preventing spread of drug-resistant bacteria**](#) [周四, 21 9月 02:47]

Communication breakdowns between care facilities can pave the way for outbreaks of infection, according to research on the spread of an extensively drug-resistant bacterium.

- [**Hold the phone: An ambulance might lower your chances of surviving some injuries**](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

- [**Building social communication skills in shy children helps with peer likeability**](#) [周三, 20 9月 22:00]

A new study has discovered that shy children with low English vocabulary skills, can still be popular among their peers if they have high-functioning social communication skills that enable them to engage and interact well with their peers in social settings.

- [**New tool to assess individual's level of wisdom**](#) [周三, 20 9月 21:59]

Researchers have developed a new tool called the San Diego Wisdom Scale (SD-WISE) to assess an individual's level of wisdom, based upon a conceptualization of wisdom as a trait with a neurobiological as well as psychosocial basis.

- [**Clear tactics, but few easy solutions, for hospitals combating ransomware**](#) [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that

afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

- [**Management studies: Dishonesty shift**](#) [周三, 20 9月 02:04]

Lying comes more easily to people in teams: Behavioral scientists have shown in an experimental study why groups are more likely to behave unethically than individuals.

- [**Political polarization? Don't blame the web**](#) [周三, 20 9月 02:04]

Despite the popular narrative that the web is to blame for rising political polarization, a study by economists has found that recent growth in polarization is greatest for demographic groups in which individuals are least likely to use the internet and social media. This means that data does not support the claim that the internet is the most significant driver of partisanship.

- [**Changes in non-extreme precipitation may have not-so-subtle consequences**](#) [周三, 20 9月 00:31]

Extreme floods and droughts receive a lot of attention. But what happens when precipitation -- or lack thereof -- occurs in a more measured way?

- [**UK oil and gas reserves may last only a decade, study suggests**](#) [周三, 20 9月 00:31]

The UK has low oil and gas resources and limited prospects for fracking, according to a new analysis by scientists, who recommend a shift towards greater use of renewable, clean energy.

- [**Students' self-concepts of ability in math, reading predict later math, reading attainment**](#) [周二, 19 9月 21:10]

A new longitudinal study looked at how youths' self-concepts are linked to their actual academic achievement in math and reading from middle childhood to adolescence. The study found that students' self-concepts of their abilities in these two academic domains play an important role in motivating their achievements over time and across levels of

achievement.

- [**Catching a diversity of fish species — instead of specializing — means more stable income for fishers**](#) [周二, 19 9月 11:23]

A team of scientists analyzed nearly 30 years of revenue and permitting records for individuals fishing in Alaskan waters and tracked how their fishing choices, in terms of permits purchased and species caught, influenced their year-to-year income volatility.

- [**The sublime challenge of jet noise**](#) [周二, 19 9月 11:22]

A scientist is using ALCF resources to create high fidelity simulations of jet turbulence to determine how and where noise is produced. The results may lead to novel engineering designs that reduce noise over commercial flight paths and on aircraft carrier decks.

- [**Fake news more likely to thrive online due to lowered fact-checking**](#) [周二, 19 9月 04:34]

Fake news is more likely to thrive online due to lowered fact-checking, according to new American research.

- [**Enzyme's worth to biofuels shown in recent research**](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

- [**Reliance on 'gut feelings' linked to belief in fake news**](#) [周二, 19 9月 02:21]

People who tend to trust their intuition or to believe that the facts they hear are politically biased are more likely to stand behind inaccurate beliefs, a new study suggests.

- [**People's love of the seas could be the key for plastic pollution solution**](#) [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to

reducing the threats to it posed by plastic pollution.

· [5,000 deaths annually from Diesel-gate in Europe](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

· [Parents not confident schools can assist child with chronic disease, mental health](#) [周一, 18 9月 21:08]

Most parents are sure schools would be able to provide basic first aid but are less confident about a school's ability to respond to more complex health situations, such as an asthma attack or mental health problem.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

- [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

• [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

• [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

• [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

• [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called Beelzebufo that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus Ceratophrys, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

• [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

• [**Dinosaur evolution: Lumbering giants had agile**](#)

ancestors [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

• **Scientists make atoms-thick 'Post-It notes' for solar cells and circuits** [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

• **Hold the phone: An ambulance might lower your chances of surviving some injuries** [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

• **Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues** [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• **Real or fake? Creating fingers to protect identities** [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly

called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

- [**Gravity waves influence weather and climate**](#) [周三, 20

9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

- [**Solar wind impacts on giant 'space hurricanes' may affect satellite safety**](#) [周二, 19 9月 21:10]

Could the flapping of a butterfly's wings in Costa Rica set off a hurricane in California? For most people, this hypothetical scenario may be difficult to imagine on Earth -- particularly when a real disaster strikes. Yet, in space, similarly small fluctuations in the solar wind as it streams toward the Earth's magnetic shield actually can affect the speed and strength of 'space hurricanes,' a researcher explains.

- [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [**Scientists show molecular basis for ants acting as 'bodyguards' for plants**](#) [周二, 19 9月 00:35]

Though you might not think of ants as formidable bodyguards, some do an impressive job protecting plants from enemies. Examining the relationship between the Amazon rainforest plant *Cordia nodosa* in Peru and the ant species *Allomerus octoarticulatus*, scientists found the degree to which the ants express two genes significantly impacts the amount of protection they provide to their hosts.

- [**When radio galaxies collide, supermassive black holes form tightly bound pairs**](#) [周二, 19 9月 00:35]

Supermassive black holes found in the centers of galaxies can form gravitationally bound pairs when galaxies merge, according to a new study.

• [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

• [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

• [**Developing roads that can generate power from passing traffic**](#) [周一, 18 9月 23:18]

Researchers are looking at advanced materials for roads and pavements that could generate electricity from passing traffic. Engineers are working on smart materials such as 'piezoelectric' ceramics that when embedded in road surfaces would be able to harvest and convert vehicle vibration into electrical energy.

• [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

• [**World first: 'Storing lightning inside thunder'**](#) [周一, 18 9月 21:07]

In a world first, researchers have stored photonic information on a microchip as an acoustic wave. This allows precious extra time to store, process and then redistribute the data without relying on electronics,

which produce excess heat. Such a hybrid chip could have a huge impact in cloud computing and telecommunication centers, which are overheating as we churn through data on our phones.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Chronic migraine cases are amplified by jawbone disorder**](#) [周日, 24 9月 22:37]

A new study shows patients with chronic migraine are three times as likely to suffer from severe temporomandibular disorder. Though not a primary cause, the disorder is thought to accentuate and perpetuate sensitivity to pain; therefore, researchers recommend in chronic migraine clinical practice the assessment of the disorder's symptoms.

- [**NASA'S OSIRIS-REx spacecraft slingshots past Earth**](#) [周六, 23 9月 04:25]

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

- [**Mechanism that underlies age-associated bone loss**](#) [周六, 23 9月 03:05]

A major health problem in older people is age-associated osteoporosis -- the thinning of bone and the loss of bone density that increases the risk of fractures. Researchers have now detailed an underlying mechanism leading to that osteoporosis. When this mechanism malfunctions, progenitor cells stop creating bone-producing cells, and instead create fat cells. Knowledge of this mechanism can provide targets in the search

for novel bone-loss.

- [**Two Group A Streptococcus genes linked to 'flesh-eating' bacterial infections**](#) [周六, 23 9月 03:05]

Group A Streptococcus bacteria cause illnesses ranging from mild nuisances like strep throat to life-threatening conditions such as flesh-eating disease, also known as necrotizing fasciitis. Life-threatening infections occur when the bacteria spread underneath the surface of the skin or throat and invade the underlying soft tissue. Researchers have found two group A Streptococcus genes involved in invasive infections, which may be potential targets for therapeutics.

- [**Enhancing the sensing capabilities of diamonds with quantum properties**](#) [周六, 23 9月 00:29]

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs.

- [**700 years old saint myth has been proven \(almost\) true**](#) [周五, 22 9月 23:17]

Scientists confirm that the age and content of an old sack is in accordance with a medieval myth about Saint Francis of Assisi.

- [**Our weight tells how we assess food**](#) [周五, 22 9月 23:17]

A new study demonstrated that people of normal weight tend to associate natural foods such as apples with their sensory characteristics. On the other hand, processed foods such as pizzas are generally associated with their function or the context in which they are eaten. But that's not all. The research also highlighted the ways in which underweight people pay greater attention to natural foods and overweight people to processed foods.

- [**Residents: Frontline defenders against antibiotic resistance?**](#) [周五, 22 9月 23:17]

Residents often decide which antibiotics to start a patient on so they could become the first line of defense against antibiotic resistance.

- [**Strategy might prevent infections in patients with spinal cord injuries**](#) [周五, 22 9月 23:17]

A new study sheds light on how to reduce the number of infections in patients with spinal cord injuries without using antibiotics.

- [**Usher syndrome: Gene therapy restores hearing and balance**](#) [周五, 22 9月 23:17]

Scientists have recently restored hearing and balance in a mouse model of Usher syndrome type 1G characterized by profound congenital deafness and vestibular disorders caused by severe dysmorphogenesis of the mechano-electrical transduction apparatus of the inner ear's sensory cells. These findings open up new possibilities for the development of gene therapy treatments for hereditary forms of deafness.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Assembly of nanoparticles proceeds like a zipper**](#) [周五, 22 9月 21:40]

It has always been the Holy Grail of materials science to describe and control the material's structure-function relationship. Nanoparticles are an attractive class of components to be used in functional materials because they exhibit size-dependent properties, such as superparamagnetism and plasmonic absorption of light. Furthermore, controlling the arrangement of nanoparticles can result in unforeseen properties, but such studies are hard to carry out due to limited efficient approaches to prod...

- [**Stimuli fading away en route to consciousness**](#) [周五, 22 9月 21:40]

Whether or not we consciously perceive the stimuli projected onto our retina is decided in our brain. A recent study shows how some signals dissipate along the processing path to conscious perception. This process begins at rather late stages of signal processing. By contrast, in earlier

stages there is hardly any difference in the reaction of neurons to conscious and unconscious stimuli.

- [**Ancient textiles reveal differences in Mediterranean fabrics in the 1st millennium BC**](#)

[周五, 22 9月 21:40]

Analysis of Iron Age textiles indicates that during c. 1000-400 BC Italy shared the textile culture of Central Europe, while Greece was largely influenced by the traditions of ancient Near East.

- [**Crowning the 'king of the crops': Sequencing the white guinea yam genome**](#) [周五, 22 9月 21:40]

Scientists have, for the first time, provided a genome sequence for the white Guinea yam, a staple crop with huge economic and cultural significance on the African continent and a lifeline for millions of people.

- [**Winter cold extremes linked to high-altitude polar vortex weakening**](#) [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function

to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- **[Effective help is available for migraine sufferers](#)**

[周五, 22 9月 21:15]

Although it's the third most prevalent illness in the world, migraine is widely misunderstood and frequently undiagnosed. Until quite recently a common "remedy" for migraine was to lie in a dark room and wait for the pain to pass. But today there are treatments that work – and new medications formulated specifically for migraine are in the pipeline.

- **[Rainbow colors reveal cell history](#)**

[周五, 22 9月 21:14]

A system called "Beta-bow", which allows the history of beta-cells to be traced by genetic bar-coding and multicolor imaging, has been developed by researchers.

- **[New genetic syndrome predisposes the body to cancer](#)**

[周五, 22 9月 21:14]

A new syndrome caused by biallelic mutations -- those produced in both gene copies inherited from the mother and father -- in the FANCM gene predisposes the body to the appearance of tumors and causes rejection to chemotherapy treatments. Contrary to what scientists believed, the gene does not cause Fanconi anemia. Researchers recommend modifying the clinical monitoring of patients with these mutations.

- **[Improving techniques for joint defect treatment](#)**

[周五, 22 9月 21:12]

Different surface topographies and materials provide interesting ways to study cell behavior and potentially provide novel solutions for treating joint defects. Tissue engineering methods that simulate native cartilage could prove useful to create cartilage implants in the laboratory, according to new research.

- **[Smartphone apps can reduce depression](#)**

[周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible interventions for the millions of people around the world diagnosed with this condition.

- [**Party discipline for jumping genes**](#) [周五, 22 9月 21:09]

Jumping genes, transposons, are part of the genome of most organisms, aggregated into families and can damage the genome by jumping. How hosts suppress the jumping is well investigated. Why they still can jump has hardly been understood so far. Researchers investigated for the first time in all transposons of the host organism, which properties and host environments facilitate jumping. They showed that family affiliation is more important than position.

- [**Personality changes don't precede clinical onset of Alzheimer's, study shows**](#) [周五, 22 9月 21:09]

No evidence has been found to support the idea that personality changes begin before the clinical onset of mild cognitive impairment (MCI) or dementia, a new and comprehensive study reports.

- [**Ultra-light aluminum: Chemist reports breakthrough in material design**](#) [周五, 22 9月 21:09]

Chemists report a new, metastable, ultra-light crystalline form of aluminum has been computationally designed using density functional calculations with imposing periodic boundary conditions.

- [**Artificial orchid cultivation kit**](#) [周五, 22 9月 21:09]

Orchids are loved by gardeners around the world but are notoriously difficult to cultivate. Researchers have developed a new orchid cultivation kit and have succeeded in complete artificial cultivation of an autonomous orchid. Since this kit can be made cheaply, it can broaden the opportunities for orchid cultivation in general households. It is also expected to be useful in preserving the genetic diversity of orchidaceous plants, many of which are in danger of extinction.

- [**Quick test may speed antibiotic treatment, combat drug resistance**](#) [周五, 22 9月 21:09]

Researchers have demonstrated a potential new tactic for rapidly determining whether an antibiotic combats a given infection, thus hastening effective medical treatment and limiting the development of drug-resistant bacteria. Their method can quickly sense mechanical

fluctuations of bacterial cells and any changes induced by an antibiotic.

- [**The math of doughnuts: 'Moonshine' sheds light on elliptic curves**](#) [周五, 22 9月 21:09]

Mathematicians have opened a new chapter in the theory of moonshine, one which begins to harness the power of the pariahs -- sporadic simple groups that previously had no known application.

- [**Positive, negative or neutral, it all matters: NASA explains space radiation**](#) [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- [**Being active saves lives whether a gym workout, walking to work or washing the floor**](#) [周五, 22 9月 06:50]

Any activity is good for people to meet the current guideline of 30 minutes of activity a day, or 150 minutes a week to raise the heart rate, new research indicates.

- [**Alternative splicing, an important mechanism for cancer**](#) [周五, 22 9月 06:50]

Scientists discover several alterations in this cellular process with implications in cancer by analyzing samples from more than 4,000 patients.

- [**Preterm children have more medical sleep problems but fall asleep more independently**](#) [周五, 22 9月 04:13]

A new study suggests that while healthy preterm children have more medical sleep problems than full-term children, they are more likely to fall asleep independently.

- [**New technique accurately digitizes transparent objects**](#) [周五, 22 9月 04:12]

A new imaging technique makes it possible to precisely digitize clear

objects and their surroundings, an achievement that has eluded current state-of-the-art 3-D rendering methods.

- [**Strong alcohol policies help reduce alcohol-involved homicides**](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among homicide victims, according to a new study.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**Ozark grasslands experience major increase in trees and shrubs**](#) [周五, 22 9月 04:12]

Woody vegetation, such as trees and shrubs, has increased dramatically in Ozark grasslands over the past 75 years, according to a study. If these ecosystems continue to favor woody vegetation, will it be possible to maintain open grasslands for the foreseeable future?

- [**'Labyrinth' chip could help monitor aggressive cancer stem cells**](#) [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to separate out rare circulating cancer cells into a relatively clean stream for analysis. It is already in use in a breast cancer clinical trial.

- [**New hope for people with fibromyalgia**](#) [周五, 22 9月 04:12]

A novel psychological therapy that encourages addressing emotional experiences related to trauma, conflict and relationship problems has been found helpful for people with the chronic pain condition fibromyalgia.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Into more thin air: Exploring the adaptation extremes of human high altitude sickness and fitness**](#) [周五, 22 9月 04:12]

Many research groups have explored human adaptation to high altitude living among three major far-flung global populations: Tibetans, Ethiopians and Peruvians. But few have simultaneously explored the other extreme---maladaptation---in the form of chronic mountain sickness (CMS). Now, in the largest whole genome study of its kind, an international research team led by University of California San Diego's Chairman of Pediatrics, Dr. Gabriel Haddad, has expanded on their recent study of understand...

- [**Synthetic molecule 'kicks and kills' some persistent HIV in mice**](#) [周五, 22 9月 02:13]

Scientists have designed a synthetic molecule that can reactivate dormant human immunodeficiency virus (HIV) in mice and lead to the death of some of the infected cells, according to a new study.

- [**Japanese encephalitis vaccine cuts disease rate in Nepal**](#) [周五, 22 9月 02:13]

From 2006 through 2011, Nepal conducted a mass immunization campaign against Japanese encephalitis -- a mosquito-borne viral disease. Now, investigators have reported that the vaccination effort prevented thousands of cases of Japanese encephalitis (JE) and cut JE rates in Nepal by at least 78 percent.

- [**Your neurons register familiar faces, whether you notice them or not**](#) [周五, 22 9月 02:13]

When people see an image of a person they recognize particular cells light up in the brain. Now, researchers have found that those cells light up even when a person sees a familiar face or object but fails to notice it.

The only difference is that the neural activity is weaker and delayed in comparison to what happens when an observer consciously registers and can recall having seen a particular image.

- [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

- [**A rapid alternative to standard safety tests for lentiviral vectors**](#) [周五, 22 9月 02:13]

A new, publicly available test to assess the safety of cell therapy products altered by lentivirus generates results within a few hours, potentially hastening the pace at which viral immunotherapies move into clinical trial. Current assays required by the US Food and Drug Administration take about six weeks to complete. The rapid test, which does not have a significant risk of false positives, is also a fraction of the cost of the standard approach.

- [**Scientists sequence asexual tiny worm whose lineage stretches back 18 million years**](#) [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

- [**Green algae could hold clues for engineering faster-growing crops**](#) [周五, 22 9月 02:13]

Two new studies provide a detailed look at an essential part of algae's growth machinery, with the eventual goal of applying this knowledge to improving the growth of crops.

[. Detecting cosmic rays from a galaxy far, far away](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

Chronic migraine cases are amplified by jawbone disorder -- ScienceDaily

In a study, researchers at the University of São Paulo's Ribeirão Preto School of Medicine (FMRP-USP), in Brazil, finds that the more frequent the migraine attacks, the more severe will be the so-called temporomandibular disorder, or TMD. The temporomandibular joint acts like a sliding hinge connecting the jawbone to the skull, therefore the disorder's symptoms includes difficulty chewing and joint tension.

"Our study shows that patients with chronic migraine, meaning attacks occurring on more than 15 days per month, are three times as likely to report more severe symptoms of TMD than patients with episodic migraine," said Lidiane Florencio, the first author of the study, which is part of the Thematic Project "Association study of clinical, functional and neuroimaging in women with migraine," supported by the São Paulo Research Foundation -- FAPESP.

Previous studies already indicated that migraine is

somehow associated with pain in the chewing muscles. However, this research was the first to consider the frequency of migraine attacks when analyzing its connection with TMD: eighty-four women in their early to mid-thirties were assessed, being that 21 were chronic migraine patients, 32 had episodic migraine, while 32 with no history of migraine were included as controls -- the results were published in the *Journal of Manipulative and Physiological Therapeutics*.

Signs and symptoms of TMD were observed in 54% of the control participants without migraine, 80% of participants with episodic migraine, and 100% of those with chronic migraine.

For Florencio, central sensitization may explain the association between the frequency of migraine attacks and the severity of TMD.

"The repetition of migraine attacks may increase sensitivity to pain," she said. "Our hypothesis is that migraine acts as a factor that predisposes patients to TMD. On the other hand, TMD can be considered a potential perpetuating factor for migraine because it acts as a constant nociceptive input that contributes to maintaining central sensitization and abnormal pain

processes." Nociceptive pain is caused by a painful stimulus on special nerve endings called nociceptors.

Migraine and TMD have very similar pathological mechanisms. Migraine affects 15% of the general population, and progression to the chronic form is expected in about 2.5% of migraine sufferers. On the other hand TMD is stress-related as much as it has to do with muscle overload. Patients display joint symptoms -- such as joint pain, reduced jaw movement, clicking or popping of the temporomandibular joint -- but also develop a muscular condition, including muscle pain and fatigue, and/or radiating face and neck pain.

Which came first?

TMD and migraine are comorbidities. However, while people who suffer from migraine are predisposed to have TMD, people with TMD will not necessarily have migraine.

"Migraine patients are more likely to have signs and symptoms of TMD, but the reverse is not true. There are cases of patients with severe TMD who don't present with migraine," said Débora Grossi, the lead

researcher for the study and principal investigator for the Thematic Project.

The researchers believe that TMD may increase the frequency and severity of migraine attacks, even though it does not directly cause migraine.

"We do know migraine isn't caused by TMD," Florencio said. "Migraine is a neurological disease with multifactorial causes, whereas TMD, like cervicalgia -- neck pain -- and other musculoskeletal disorders, is a series of factors that intensify the sensitivity of migraine sufferers. Having TMD may worsen one's migraine attacks in terms of both severity and frequency."

The journal article concludes that an examination of TMD signs and symptoms should be clinically conducted in patients with migraine.

"Our findings show the association with TMD exists but is less frequent in patients with rare or episodic migraine," Grossi said. "This information alone should change the way clinicians examine patients with migraine. If migraine sufferers tend to have more severe TMD, then health professionals should assess

such patients specifically in terms of possible signs and symptoms of TMD."

NASA'S OSIRIS-REx spacecraft slingshots past Earth -- ScienceDaily

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

At 12:52 p.m. EDT on Sept. 22, the OSIRIS-REx (Origins, Spectral Interpretation, Resource Identification, and Security -- Regolith Explorer) spacecraft came within 10,711 miles (17,237 km) of Antarctica, just south of Cape Horn, Chile, before following a route north over the Pacific Ocean.

OSIRIS-REx launched from Cape Canaveral Air Force Station in Florida on Sept. 8, 2016, on an Atlas V 411 rocket. Although the rocket provided the spacecraft with the all the momentum required to propel it forward to Bennu, OSIRIS-REx needed an extra boost from the Earth's gravity to change its orbital plane. Bennu's orbit around the Sun is tilted six degrees from Earth's orbit, and this maneuver changed the spacecraft's direction to put it on the path toward

Bennu.

As a result of the flyby, the velocity change to the spacecraft was 8,451 miles per hour (3.778 kilometers per second).

"The encounter with Earth is fundamental to our rendezvous with Bennu," said Rich Burns, OSIRIS-REx project manager at NASA's Goddard Space Flight Center in Greenbelt, Maryland. "The total velocity change from Earth's gravity far exceeds the total fuel load of the OSIRIS-REx propulsion system, so we are really leveraging our Earth flyby to make a massive change to the OSIRIS-REx trajectory, specifically changing the tilt of the orbit to match Bennu."

The mission team also is using OSIRIS-REx's Earth flyby as an opportunity to test and calibrate the spacecraft's instrument suite. Approximately four hours after the point of closest approach, and on three subsequent days over the next two weeks, the spacecraft's instruments will be turned on to scan Earth and the Moon. These data will be used to calibrate the spacecraft's science instruments in preparation for OSIRIS-REx's arrival at Bennu in late 2018.

"The opportunity to collect science data over the next two weeks provides the OSIRIS-REx mission team with an excellent opportunity to practice for operations at Bennu," said Dante Lauretta, OSIRIS-REx principal investigator at the University of Arizona, Tucson.

"During the Earth flyby, the science and operations teams are co-located, performing daily activities together as they will during the asteroid encounter."

The OSIRIS-REx spacecraft is currently on a seven-year journey to rendezvous with, study, and return a sample of Bennu to Earth. This sample of a primitive asteroid will help scientists understand the formation of our solar system more than 4.5 billion years ago.

NASA's Goddard Space Flight Center provides overall mission management, systems engineering and the safety and mission assurance for OSIRIS-REx. Dante Lauretta of the University of Arizona, Tucson, is the principal investigator, and the University of Arizona also leads the science team and the mission's science observation planning and data processing. Lockheed Martin Space Systems in Denver built the spacecraft and is providing flight operations. Goddard and KineticX Aerospace are responsible for navigating the OSIRIS-REx spacecraft. OSIRIS-REx is the third mission in

NASA's New Frontiers Program. NASA's Marshall Space Flight Center in Huntsville, Alabama, manages the agency's New Frontiers Program for the Science Mission Directorate in Washington.

Mechanism that underlies age-associated bone loss -- ScienceDaily

A major health problem in older people is age-associated osteoporosis -- the thinning of bone and the loss of bone density that increases the risk of fractures. Often this is accompanied by an increase in fat cells in the bone marrow.

University of Alabama at Birmingham researchers have now detailed an underlying mechanism leading to that osteoporosis. When this mechanism malfunctions, progenitor cells stop creating bone-producing cells, and instead create fat cells. Knowledge of this mechanism can provide targets in the search for novel bone-loss therapeutics to treat human osteoporosis with minimal side effects.

The UAB researchers found that a protein called Cbf-beta plays a critical role in maintaining the bone-producing cells. Furthermore, examination of aged mice showed dramatically reduced levels of Cbf-beta in bone marrow cells, as compared to younger mice.

Thus, they propose, maintaining Cbf-beta may be essential to preventing human age-associated osteoporosis that is due to elevated creation of fat cells.

Bone is a living tissue that constantly rebuilds. Bones need a constant new creation of cells specific to their tissue, including the bone-producing cells called osteoblasts. Osteoblasts live only about three months and do not divide.

The progenitor cells for osteoblasts are bone marrow mesenchymal stem cells. Besides osteoblasts, mesenchymal stem cells can also differentiate into the chondrocyte cells that make cartilage, the myocyte cells that help form muscles and the adipocytes, or fat cells. Thus, the same progenitor cell has four possible tracks of differentiation.

UAB researchers and colleagues focused on the molecular mechanism that controls the lineage commitment switch between the osteoblast and adipocyte tracks. Led by Yi-Ping Li, Ph.D., UAB professor of pathology, and Wei Chen, M.D., UAB associate professor of pathology, they investigated the key role played by Cbf-beta, or core-binding factor subunit beta.

Study details

The team led by Li and Chen generated three mouse models by deleting Cbf-beta at various stages of the osteoblast lineage. All three mouse models showed severe osteoporosis with accumulation of fat cells in the bone marrow, a pathology that resembles aged bone from enhanced adipocyte creation.

Bone marrow mesenchymal stem cells and bone cells from the skulls of Cbf-beta-deficient mice showed increased expression of adipocyte genes.

Looking at the mechanism downstream, the researchers found that the loss of Cbf-beta impeded the canonical Wnt signaling pathway, particularly through decreased Wnt10b expression. In nonmutant mice, they found that the protein complex composed of Cbf-beta and the Runx2 transcription factor binds to the Wnt10b promoter to drive Wnt10b expression. The Cbf-beta/Runx2 complex also inhibited expression of the enhancer protein C/EBP-alpha that promotes differentiation of adipocytes.

In addition, the researchers showed that Cbf-beta maintains the osteoblast lineage commitment in two

ways -- through the Wnt paracrine pathway to affect nearby cells and through endogenous signaling within the cell to suppress adipogenesis gene expression.

Altogether, this knowledge of the mechanism driven by Cbf-beta can help explain the imbalance in bone maintenance seen in older people.

Two Group A Streptococcus genes linked to 'flesh-eating' bacterial infections -- ScienceDaily

Group A Streptococcus bacteria cause a variety of illnesses that range from mild nuisances like strep throat to life-threatening conditions including pneumonia, toxic shock syndrome and the flesh-eating disease formally known as necrotizing fasciitis. The life-threatening infections occur when the bacteria spread underneath the surface of the skin or throat and invade the underlying soft tissue. A 2005 study published in *The Lancet* attributed half a million deaths worldwide each year to group A Streptococcus.

"In 24 to 48 hours, you can go from being healthy to having a limb amputated to save your life," said Kevin McIver, professor of cell biology and molecular genetics at the University of Maryland, College Park. "And we don't really know why or how the bacteria do that."

In a new study, McIver's laboratory and researchers at

the University of Maryland School of Medicine identified two genes important for invasive group A Streptococcus infections in mice. The genes, subcutaneous fitness genes A (scfA) and B (scfB), may prove to be promising clinical targets in the fight against these infections, as there are no vaccines against group A Streptococcus or effective treatments for invasive infections. The study was published online on August 23, 2017, in the journal PLOS Pathogens.

Led by Yoann Le Breton, the study's first author and a research assistant professor in McIver's group, the researchers discovered scfA and scfB by performing transposon sequencing on the entire group A Streptococcus genome. Transposons, also known as jumping genes, are short sequences of DNA that physically move within a genome, mutating genes by jumping into them. If the mutation causes an interesting effect, scientists can identify the mutated gene by locating the transposon, sequencing the DNA surrounding the transposon and mapping its location in the genome.

"Invasion under the skin, or subcutaneously, is not the norm for group A Streptococcus bacteria; it's actually very rare," McIver explained. "We hypothesized that

there must be genes in the bacteria important for invading soft tissues and surviving under the skin. And we tested that theory by using transposons to make thousands of different individual mutants that we used to infect a subcutaneous environment in mice."

McIver and his colleagues used a transposon called Krmit -- which they created in a previous study -- to generate a collection of approximately 85,000 unique mutants in a group A Streptococcus strain. They injected the mutant strains into mice, which resulted in humanlike infections. The transposon was named for the Muppets character Kermit the frog, whose creator Jim Henson, a 1960 College Park alumnus, died of toxic shock syndrome following group A Streptococcal pneumonia.

"We were particularly interested in the mutations that didn't come out the other end -- the ones not found in the surviving bacteria from the infected tissue," McIver said. "These genes would be good targets for a vaccine or treatment because the bacteria missing these genes did not flourish in the infection site."

The researchers identified 273 scf genes as potentially involved in establishing infection under the skin, but

two genes stood out: scfA and scfB. Based on patterns in their DNA sequences, these genes likely encode proteins in the bacterial membrane. This is a prime location for gene products involved in infection because many dangerous bacteria secrete toxins or proteins through the membrane to attack the host. Additional experiments showed that bacteria lacking scfA or scfB had difficulty spreading from under the skin to the bloodstream and other organs.

The results suggest that these two genes are involved in the invasion process and may be potential targets for therapeutics.

"The next steps will be to expand the study to include multiple animal models, and these experiments are already underway," said Mark Shirtliff, a co-author of the study and a professor in the Department of Microbiology and Immunology at the University of Maryland School of Medicine and the Department of Microbial Pathogenesis at the University of Maryland School of Dentistry. "We can also begin to formulate improved therapies and vaccines against group A streptococcus infections and their complications such as rheumatic heart disease, pneumonia and necrotizing fasciitis."

McIver also looks forward to using transposon sequencing to study other ways bacteria attack humans.

"Transposon sequencing can be used to probe how bacteria infect humans in any environment you can think of," McIver said. "Like group A Streptococcus, many pathogenic bacteria have completely sequenced genomes, but we don't know what most of the genes are doing. We're excited to have a method to interrogate all that unknown genetic material to better understand human infections."

Enhancing the sensing capabilities of diamonds with quantum properties: Simple method can give diamonds the special properties needed for quantum applications such as sensing magnetic fields -- ScienceDaily

Pure diamond consists of carbon atoms in a perfect crystal lattice. But remove a few carbons and swap some others for nitrogen, and you get a diamond with special quantum-sensing properties. These properties are useful for quantum information applications and sensing magnetic fields, and as a platform for probing the mysteries of quantum physics.

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy (NV) center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs. They describe their results this week in *Applied Physics Letters*, from AIP

Publishing.

Magnetic field sensing presents a prime example for the importance of this sensing. Green light can induce the NV centers to fluoresce and emit red light, but the amount of this fluorescence changes in the presence of a magnetic field. By measuring the brightness of the fluorescence, diamond NV centers can help determine magnetic field strength. Such a device can make magnetic images of a range of sample types, including rocks and biological tissue.

The sensitivity of this type of magnetic detection is determined by the concentration of NV centers while vacancies that are not paired with nitrogen create noise. Efficient conversion of vacancies into NV centers, therefore, as well as maximizing the concentration of NV centers, plays a key role in advancing these detection methods.

Researchers typically purchase nitrogen-doped diamonds from a separate company. They then bombard the diamond with electrons, protons or other particles, which strip away some of the carbon atoms, leaving behind vacancies. Finally, a heating process called annealing nudges the vacancies next to the

nitrogen atoms to form the NV centers. The problem is that irradiation often requires sending your sample to a separate facility, which is expensive and time-consuming.

"What is special about our approach is that it's very simple and very straightforward," said Dima Farfurnik of the Hebrew University of Jerusalem in Israel. "You get sufficiently high NV concentrations that are appropriate for many applications with a simple procedure that can be done in-house."

Their method uses high energy electron bombardment in a transmission electron microscope (TEM), an instrument accessible to many researchers, to locally create NV centers. Normally, a TEM is used to image materials down to subnanometer resolutions, but its narrow electron beam can also irradiate diamonds.

Others have shown TEMs can create NV centers in specialized diamond samples, but the researchers in this study successfully tested the method on several commercially available diamond samples.

In a typical, untreated sample, less than 1 percent of the nitrogen atoms form NV centers. But by using a TEM,

the researchers increased this conversion efficiency to as high as 10 percent. In certain cases, the samples reached their saturation limit, and more irradiation was no longer effective. For other samples, however, the researchers didn't hit this limit, suggesting that additional irradiation could boost efficiencies further. With higher conversion efficiencies, and small irradiation volumes possible with a TEM, devices like magnetic sensors could be more compact.

To make sure the method didn't hinder the effectiveness of NVs in applications like sensing magnetic fields, the researchers confirmed that the length of time the NV centers remain in their states -- the coherence time -- didn't change.

Packing enough NV centers in a diamond would allow physicists to probe the quantum interactions among the centers themselves. This research could enable the creation of a unique quantum state called a squeezed state, which has never been demonstrated before in a solid and could push the sensing capabilities of these systems beyond today's classical limits.

"We hope the enhanced number of NV centers due to irradiation will serve as a stepping stone for this long-

term and ambitious goal," Farfurnik said.

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal *Cell* on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

- [**Scientists sequence asexual tiny worm whose lineage stretches back 18 million years**](#) [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Jellyfish, with no brains, still seem to sleep**](#) [周五, 22 9月 02:12]

The discovery that primitive jellyfish sleep suggests that sleep is an ancient, evolutionarily conserved behavior.

- [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

- [**Reconstructing how Neanderthals grew, based on an El Sidrón child**](#) [周五, 22 9月 02:12]

How did Neanderthals grow? Does modern man develop in the same way as *Homo neanderthalensis* did? How does the size of the brain affect the development of the body? Researchers have studied the fossil

remains of a Neanderthal child's skeleton in order to establish whether there are differences between the growth of Neanderthals and that of sapiens.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Dino-killing asteroid's impact on bird evolution**](#) [周五, 22 9月 00:11]

Human activities could change the pace of evolution, similar to what occurred 66 million years ago when a giant asteroid wiped out the dinosaurs, leaving modern birds as their only descendants.

- [**One in four girls is depressed at age 14**](#) [周四, 21 9月 23:07]

New research shows a quarter of girls (24%) and one in 10 boys (9%) are depressed at age 14.

- [**Surprising discovery: How the African tsetse fly really drinks your blood**](#) [周四, 21 9月 23:06]

Researchers have been taking a close-up look at the biting mouthparts of the African tsetse fly as part of ongoing work on the animal diseases it carries. Using a new high-powered scanning electron microscope, researchers were able to see the rows of sharp teeth and rasps that the fly uses to chew through the skin when it bites.

- [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

- [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

- [**Changing of the guard: Research sheds light on how plants breathe**](#) [周四, 21 9月 22:17]

New research is set to change the textbook understanding of how plants breathe. Researchers have developed the first full 3D model of a guard cell.

- [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

- [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**Immune system is critical to regeneration, study finds**](#) [周四, 21 9月 03:49]

The answer to the question of why some organisms can regenerate major

body parts while others, such as humans, cannot may lie with the body's innate immune system, according to a new study of heart regeneration in the Mexican salamander.

• [Unique type of object discovered in our solar system](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

• [Fly away home? Ice age may have clipped bird migration](#) [周四, 21 9月 02:46]

The onset of the last ice age may have forced some bird species to abandon their northerly migrations for thousands of years, says new research led by an ornithologist. The study challenges a long-held presumption that birds merely shortened their migratory flights when glaciers advanced south to cover much of North America and northern Europe about 21,000 years ago.

• [Species abundance: Winter restricts innovation](#) [周四, 21 9月 01:17]

Why are there so many more species in the tropics? The 'storage effect' is stronger there than in temperate forests.

• [Bite force research reveals dinosaur-eating frog](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called *Beelzebufo* that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

• [Animal acoustic activity decline shows forest fire pollution wreaks havoc on wildlife](#) [周四, 21 9月 01:17]

Forest fires in Southeast Asia during the El Niño droughts of 2015

caused considerable disruption to the biodiversity of the region due to the smoke-induced 'haze' they created, according to new research.

- **[New concept of terrestrial planet formation](#)** [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- **[World's first 'molecular robot' capable of building molecules](#)** [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- **[Dinosaur evolution: Lumbering giants had agile ancestors](#)** [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

- **[Brain cancer growth halted by absence of protein](#)** [周四, 21 9月 01:16]

The growth of certain aggressive brain tumors can be halted by cutting off their access to a signaling molecule produced by the brain's nerve cells, according to a new study.

- **[Millions of new genes in human microbiome](#)** [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of previously unknown genes from microbial communities in the human gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

- **[Genome editing reveals role of gene important for human embryo development](#)** [周四, 21 9月 01:16]

Researchers have used genome editing technology to reveal the role of a key gene in human embryos in the first few days of development. This is

the first time that genome editing has been used to study gene function in human embryos, which could help scientists to better understand the biology of our early development.

- [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

- [**How Teotihuacan's urban design was lost and found**](#) [周三, 20 9月 23:33]

A new article outlines how the urban design of the city of Teotihuacan differed from past and subsequent cities, only to be rediscovered and partially modeled on many centuries later by the Aztecs.

- [**10,000 year-old DNA proves when fish colonized our lakes**](#) [周三, 20 9月 22:45]

DNA in lake sediment forms a natural archive displaying when various fish species colonized lakes after the glacial period. Scientists' analyses of the prevalence of whitefish DNA in sediment reveal that the whitefish came to Lake Stora Lögdsjön in Västerbotten already 10,000 years ago, whereas Lake Hotagen in Jämtland had its whitefish only 2,200 years ago.

- [**Solving the Easter Island population puzzle**](#) [周三, 20 9月 22:01]

The nearly nine hundred giant stone statues discovered by the first Europeans to land on Easter Island seemed at odds with the small population found living there. It is believed a once thriving community witnessed sweeping ecological change and suffered internal conflict, resulting in a population crash. A new detailed study of the farming potential of the Island suggests it could have sustained 17,500 people at

its peak.

- [**Emerging disease further jeopardizes North American frogs**](#) [周三, 20 9月 04:02]

A deadly amphibian disease called severe Perkinsea infections, or SPI, is the cause of many large-scale frog die-offs in the United States, according to a new study.

- [**End-of-summer Arctic sea ice extent is eighth lowest on record**](#) [周三, 20 9月 04:01]

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

- [**North Atlantic right whales decline confirmed: 458 remaining**](#) [周三, 20 9月 02:04]

Marine biologists have developed a new model to improve estimates of abundance and population trends of endangered North Atlantic right whales, which have declined in numbers and productivity in recent years. Between 1990 and 2010 abundance increased to 482 animals, but since 2010 the numbers have declined to 458 in 2015, with 14 known deaths this year.

- [**Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests**](#) [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

- [**Mercury's poles may be icier than scientists thought**](#) [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's

north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice inventory.

- [**Getting emotional after failure helps you improve next time, study finds**](#) [周二, 19 9月 23:12]

Emotional responses to failure rather than cognitive ones are more effective at improving people's results for the next time they tackle the next related task, new research indicates.

- [**Playing American football before age 12 could have long-term health effects**](#) [周二, 19 9月 22:25]

Playing American football before the age of 12 may have long-term consequences for players' mood and behavior, according to a study involving 214 professional and amateur football players.

- [**Exposure to pet and pest allergens during infancy linked to reduced asthma risk**](#) [周二, 19 9月 22:25]

Children exposed to high indoor levels of pet or pest allergens during infancy have a lower risk of developing asthma by 7 years of age, new research reveals. The findings may provide clues for the design of strategies to prevent asthma from developing.

- [**New mirror-coating technology promises dramatic improvements in telescopes**](#) [周二, 19 9月 10:23]

An electrical engineer has teamed up with astronomers to improve telescope mirrors using thin-film technology from the electronics industry. They are developing new protective coatings using an atomic layer deposition system large enough to accommodate telescope mirrors.

- [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [**Solar-to-fuel system recycles CO2 to make ethanol and ethylene**](#) [周二, 19 9月 03:17]

Scientists have harnessed the power of photosynthesis to convert carbon dioxide into fuels and alcohols at efficiencies far greater than plants. The achievement marks a significant advance in the effort to move toward sustainable sources of fuel.

- [**Copper catalyst yields high efficiency CO2-to-fuels conversion**](#) [周二, 19 9月 03:17]

Scientists have developed a new electrocatalyst that can directly convert carbon dioxide into multicarbon fuels and alcohols using record-low inputs of energy. The work is the latest in a round of studies tackling the challenge of creating a clean chemical manufacturing system that can put carbon dioxide to good use.

- [**When it comes to the threat of extinction, size matters**](#) [周二, 19 9月 01:27]

Animals in the Goldilocks zone -- neither too big, nor too small, but just the right size -- face a lower risk of extinction than do those on both ends of the scale, according to an extensive global analysis.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Chronic migraine cases are amplified by jawbone disorder**](#) [周日, 24 9月 22:37]

A new study shows patients with chronic migraine are three times as likely to suffer from severe temporomandibular disorder. Though not a primary cause, the disorder is thought to accentuate and perpetuate sensitivity to pain; therefore, researchers recommend in chronic migraine clinical practice the assessment of the disorder's symptoms.

- [**Mechanism that underlies age-associated bone loss**](#) [周六, 23 9月 03:05]

A major health problem in older people is age-associated osteoporosis -- the thinning of bone and the loss of bone density that increases the risk of fractures. Researchers have now detailed an underlying mechanism leading to that osteoporosis. When this mechanism malfunctions, progenitor cells stop creating bone-producing cells, and instead create fat cells. Knowledge of this mechanism can provide targets in the search for novel bone-loss.

- [**Two Group A Streptococcus genes linked to 'flesh-eating' bacterial infections**](#) [周六, 23 9月 03:05]

Group A Streptococcus bacteria cause illnesses ranging from mild nuisances like strep throat to life-threatening conditions such as flesh-eating disease, also known as necrotizing fasciitis. Life-threatening infections occur when the bacteria spread underneath the surface of the skin or throat and invade the underlying soft tissue. Researchers have found two group A Streptococcus genes involved in invasive infections,

which may be potential targets for therapeutics.

- [**Our weight tells how we assess food**](#) [周五, 22 9月 23:17]

A new study demonstrated that people of normal weight tend to associate natural foods such as apples with their sensory characteristics. On the other hand, processed foods such as pizzas are generally associated with their function or the context in which they are eaten. But that's not all. The research also highlighted the ways in which underweight people pay greater attention to natural foods and overweight people to processed foods.

- [**Residents: Frontline defenders against antibiotic resistance?**](#) [周五, 22 9月 23:17]

Residents often decide which antibiotics to start a patient on so they could become the first line of defense against antibiotic resistance.

- [**Strategy might prevent infections in patients with spinal cord injuries**](#) [周五, 22 9月 23:17]

A new study sheds light on how to reduce the number of infections in patients with spinal cord injuries without using antibiotics.

- [**Usher syndrome: Gene therapy restores hearing and balance**](#) [周五, 22 9月 23:17]

Scientists have recently restored hearing and balance in a mouse model of Usher syndrome type 1G characterized by profound congenital deafness and vestibular disorders caused by severe dysmorphogenesis of the mechano-electrical transduction apparatus of the inner ear's sensory cells. These findings open up new possibilities for the development of gene therapy treatments for hereditary forms of deafness.

- [**Stimuli fading away en route to consciousness**](#) [周五, 22 9月 21:40]

Whether or not we consciously perceive the stimuli projected onto our retina is decided in our brain. A recent study shows how some signals dissipate along the processing path to conscious perception. This process begins at rather late stages of signal processing. By contrast, in earlier stages there is hardly any difference in the reaction of neurons to

conscious and unconscious stimuli.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Effective help is available for migraine sufferers**](#) [周五, 22 9月 21:15]

Although it's the third most prevalent illness in the world, migraine is widely misunderstood and frequently undiagnosed. Until quite recently a common "remedy" for migraine was to lie in a dark room and wait for the pain to pass. But today there are treatments that work – and new medications formulated specifically for migraine are in the pipeline.

- [**Rainbow colors reveal cell history**](#) [周五, 22 9月 21:14]

A system called "Beta-bow", which allows the history of beta-cells to be traced by genetic bar-coding and multicolor imaging, has been developed by researchers.

- [**New genetic syndrome predisposes the body to cancer**](#) [周五, 22 9月 21:14]

A new syndrome caused by biallelic mutations -- those produced in both gene copies inherited from the mother and father -- in the FANCM gene predisposes the body to the appearance of tumors and causes rejection to chemotherapy treatments. Contrary to what scientists believed, the gene does not cause Fanconi anemia. Researchers recommend modifying the

clinical monitoring of patients with these mutations.

- **[Improving techniques for joint defect treatment](#)**

[周五, 22 9月 21:12]

Different surface topographies and materials provide interesting ways to study cell behavior and potentially provide novel solutions for treating joint defects. Tissue engineering methods that simulate native cartilage could prove useful to create cartilage implants in the laboratory, according to new research.

- **[Smartphone apps can reduce depression](#)**

[周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible interventions for the millions of people around the world diagnosed with this condition.

- **[Party discipline for jumping genes](#)**

[周五, 22 9月 21:09]

Jumping genes, transposons, are part of the genome of most organisms, aggregated into families and can damage the genome by jumping. How hosts suppress the jumping is well investigated. Why they still can jump has hardly been understood so far. Researchers investigated for the first time in all transposons of the host organism, which properties and host environments facilitate jumping. They showed that family affiliation is more important than position.

- **[Personality changes don't precede clinical onset of Alzheimer's, study shows](#)**

[周五, 22 9月 21:09]

No evidence has been found to support the idea that personality changes begin before the clinical onset of mild cognitive impairment (MCI) or dementia, a new and comprehensive study reports.

- **[Quick test may speed antibiotic treatment, combat drug resistance](#)**

[周五, 22 9月 21:09]

Researchers have demonstrated a potential new tactic for rapidly determining whether an antibiotic combats a given infection, thus hastening effective medical treatment and limiting the development of drug-resistant bacteria. Their method can quickly sense mechanical fluctuations of bacterial cells and any changes induced by an antibiotic.

- [**Positive, negative or neutral, it all matters: NASA explains space radiation**](#) [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- [**Alternative splicing, an important mechanism for cancer**](#) [周五, 22 9月 06:50]

Scientists discover several alterations in this cellular process with implications in cancer by analyzing samples from more than 4,000 patients.

- [**Preterm children have more medical sleep problems but fall asleep more independently**](#) [周五, 22 9月 04:13]

A new study suggests that while healthy preterm children have more medical sleep problems than full-term children, they are more likely to fall asleep independently.

- [**Strong alcohol policies help reduce alcohol-involved homicides**](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among homicide victims, according to a new study.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**'Labyrinth' chip could help monitor aggressive cancer stem cells**](#) [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to

separate out rare circulating cancer cells into a relatively clean stream for analysis. It is already in use in a breast cancer clinical trial.

- [**New hope for people with fibromyalgia**](#) [周五, 22 9月 04:12]

A novel psychological therapy that encourages addressing emotional experiences related to trauma, conflict and relationship problems has been found helpful for people with the chronic pain condition fibromyalgia.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Into more thin air: Exploring the adaptation extremes of human high altitude sickness and fitness**](#) [周五, 22 9月 04:12]

Many research groups have explored human adaptation to high altitude living among three major far-flung global populations: Tibetans, Ethiopians and Peruvians. But few have simultaneously explored the other extreme---maladaptation---in the form of chronic mountain sickness (CMS). Now, in the largest whole genome study of its kind, an international research team led by University of California San Diego's Chairman of Pediatrics, Dr. Gabriel Haddad, has expanded on their recent study of understand...

- [**Synthetic molecule 'kicks and kills' some persistent HIV in mice**](#) [周五, 22 9月 02:13]

Scientists have designed a synthetic molecule that can reactivate dormant human immunodeficiency virus (HIV) in mice and lead to the death of some of the infected cells, according to a new study.

- [**Japanese encephalitis vaccine cuts disease rate in Nepal**](#) [周五, 22 9月 02:13]

From 2006 through 2011, Nepal conducted a mass immunization

campaign against Japanese encephalitis -- a mosquito-borne viral disease. Now, investigators have reported that the vaccination effort prevented thousands of cases of Japanese encephalitis (JE) and cut JE rates in Nepal by at least 78 percent.

• [**Your neurons register familiar faces, whether you notice them or not**](#) [周五, 22 9月 02:13]

When people see an image of a person they recognize particular cells light up in the brain. Now, researchers have found that those cells light up even when a person sees a familiar face or object but fails to notice it. The only difference is that the neural activity is weaker and delayed in comparison to what happens when an observer consciously registers and can recall having seen a particular image.

• [**A rapid alternative to standard safety tests for lentiviral vectors**](#) [周五, 22 9月 02:13]

A new, publicly available test to assess the safety of cell therapy products altered by lentivirus generates results within a few hours, potentially hastening the pace at which viral immunotherapies move into clinical trial. Current assays required by the US Food and Drug Administration take about six weeks to complete. The rapid test, which does not have a significant risk of false positives, is also a fraction of the cost of the standard approach.

• [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

• [**Neuron types in brain are defined by gene activity shaping their communication patterns**](#) [周五, 22 9月 02:12]

Neurons are the basic building blocks that wire up brain circuits supporting mental activities and behavior. In a major step forward,

scientists have described a discovery about the molecular-genetic basis of neuronal cell types. The study, which involves sophisticated computational analysis of the messages transcribed from genes that are active in a neuron, points to patterns of cell-to-cell communication as the core feature that makes possible rigorous distinctions among neuron types across the...

- [**Rapid hepatitis C testing may help better screen young adults**](#) [周五, 22 9月 02:12]

Routine and rapid hepatitis C virus testing among young adults who use injection drugs improves life expectancy and may provide a good use of limited resources, according to new research.

- [**Exosomes are the missing link to insulin resistance in diabetes**](#) [周五, 22 9月 02:11]

Chronic tissue inflammation resulting from obesity is an underlying cause of insulin resistance and type 2 diabetes. But the mechanism by which this occurs has remained cloaked, until now. In a new paper, researchers identified exosomes -- extremely small vesicles or sacs secreted from most cell types -- as the missing link.

- [**Locking down the big bang of immune cells**](#) [周五, 22 9月 01:44]

Ignored pieces of DNA play a critical role in the development of immune cells (T cells), scientists have found. These areas activate a change in the structure of DNA that brings together crucial elements necessary for T cell formation. This “big bang” discovery may aid in combating diseases.

- [**How staph cells dodge the body's immune system**](#) [周五, 22 9月 00:58]

For years, medical investigators have tried and failed to develop vaccines for a type of staph bacteria associated with the deadly superbug MRSA. But a new study shows how staph cells evade the body's immune system, offering a clearer picture of how a successful vaccine would work.

• [**Blood metal ion levels can identify hip replacement patients at low risk of ARMD**](#) [周五, 22 9月 00:58]

Patients with 'metal on metal' artificial hips are at risk of complications caused by adverse reactions to metal debris (ARMD). A study confirms that blood metal ion levels specific to the type of hip implant used can help predict patients who are at low risk of ARMD.

• [**Flu vaccine used in elderly may benefit middle-aged adults with chronic conditions**](#) [周五, 22 9月 00:11]

Expanding the high-dose influenza vaccine recommendation to include middle-aged adults with chronic health conditions may make economic sense and save lives. The findings may justify for clinical trials of the high-dose and new recombinant trivalent influenza vaccines in 50- to 64-year-old adults with chronic illnesses, such as heart or lung disease, diabetes, or cancer, to determine if they do provide considerably better protection than the currently recommended standard dose quadrivalent vaccin...

• [**One in four girls is depressed at age 14**](#) [周四, 21 9月 23:07]

New research shows a quarter of girls (24%) and one in 10 boys (9%) are depressed at age 14.

• [**Mitochondria drive cell survival in times of need**](#) [周四, 21 9月 23:07]

Researchers have discovered a mechanism through which mitochondria, the energy factory of our body's cells, play a role in preventing cells from dying when the cells are deprived of nutrients -- a finding that points to a potential target for next-generation cancer drugs.

• [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

• [Brain inflammation linked to suicidal thinking in depression](#) [周四, 21 9月 22:42]

Patients with major depressive disorder (MDD) have increased brain levels of a marker of microglial activation, a sign of inflammation, according to a new study. Scientists have found that the increase in the inflammatory marker was present specifically in patients with MDD who were experiencing suicidal thoughts, pinning the role of inflammation to suicidality rather than a diagnosis of MDD itself.

• [Production of key diabetes cells can be improved](#)

[周四, 21 9月 22:17]

In the future diabetics might benefit from getting insulin-regulating beta cells transplanted into their body because their own beta cells are destroyed or less functional. However, according to new stem cell research, the current way of producing beta cells from stem cells has significant shortfalls. The beta cells produced have some features resembling alpha cells.

• [Whole food diet may help prevent colon cancer, other chronic conditions](#) [周四, 21 9月 22:17]

A diet that includes plenty of colorful vegetables and fruits may contain compounds that can stop colon cancer and inflammatory bowel diseases in pigs, according to an international team of researchers. Understanding how these compounds work on a molecular level could be an initial step toward finding treatments for people with cancer, they added.

• [Treating asthma or COPD with steroid inhaler increases the risk of hard-to-treat infections](#) [周四, 21 9月 21:55]

[周四, 21 9月 21:55]

Older people who use steroid inhalers for asthma or chronic obstructive pulmonary disease (COPD) are more likely to suffer particular bacterial infections, according to a large study.

• [New genetic test for predicting cancer recurrence](#) [周四, 21 9月 21:50]

Researchers have discovered a new genetic test which could help predict cancer recurrence - paving the way for more precise, personalised

treatments.

• [**Cannabis, 'spice' – better think twice**](#) [周四, 21 9月 21:49]

Marijuana is the most commonly abused drug in the world, and the advent of synthetic cannabinoids creates additional challenges to the society because of their higher potency and ability to escape drug detection screenings. Scientists have a warning about a new danger coming from cannabinoid abuse.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**NASA'S OSIRIS-REx spacecraft slingshots past Earth**](#) [周六, 23 9月 04:25]

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

- [**Enhancing the sensing capabilities of diamonds with quantum properties**](#) [周六, 23 9月 00:29]

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Assembly of nanoparticles proceeds like a zipper**](#) [周五, 22 9月 21:40]

It has always been the Holy Grail of materials science to describe and control the material's structure-function relationship. Nanoparticles are an attractive class of components to be used in functional materials because they exhibit size-dependent properties, such as superparamagnetism and plasmonic absorption of light. Furthermore, controlling the arrangement of nanoparticles can result in unforeseen properties, but such studies are hard to carry out due to limited efficient approaches to prod...

- [**Smartphone apps can reduce depression**](#) [周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible interventions for the millions of people around the world diagnosed with this condition.

- [**Ultra-light aluminum: Chemist reports breakthrough in material design**](#) [周五, 22 9月 21:09]

Chemists report a new, metastable, ultra-light crystalline form of aluminum has been computationally designed using density functional calculations with imposing periodic boundary conditions.

- [**The math of doughnuts: 'Moonshine' sheds light on elliptic curves**](#) [周五, 22 9月 21:09]

Mathematicians have opened a new chapter in the theory of moonshine, one which begins to harness the power of the pariahs -- sporadic simple groups that previously had no known application.

- [**Positive, negative or neutral, it all matters: NASA explains space radiation**](#) [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- [**New technique accurately digitizes transparent objects**](#) [周五, 22 9月 04:12]

A new imaging technique makes it possible to precisely digitize clear objects and their surroundings, an achievement that has eluded current state-of-the-art 3-D rendering methods.

- [**'Labyrinth' chip could help monitor aggressive cancer stem cells**](#) [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to separate out rare circulating cancer cells into a relatively clean stream

for analysis. It is already in use in a breast cancer clinical trial.

- [**Dancing electrons lose the race**](#) [周五, 22 9月 02:13]

Ultrashort pulses of light were employed by physicists to start a race between electrons emitted from different initial states in a solid material. Timing this race revealed an unexpected result: the fastest electrons arrived in last place.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Breaking Coulomb's law: Scientists find a way around the rule that 'opposites attract'**](#) [周五, 22 9月 01:43]

Scientists have taken a big step towards creating the next generation of batteries, as well as more effective water treatment and better alternative energy after defying one of nature's most fundamental rules on an atomic scale.

- [**Quantum teleportation of patterns of light**](#) [周五, 22 9月 00:11]

Researchers have demonstrated entanglement swapping and teleportation of orbital angular momentum 'patterns' of light. This is a crucial step towards realizing a quantum repeater for high-dimensional entangled states.

- [**Rapid imaging of granular matter**](#) [周五, 22 9月 00:11]

Granular systems such as gravel or powders can be found everywhere, but studying them is not easy. Researchers have now developed a method by which pictures of the inside of granular systems can be taken 10,000 times faster than before.

- [**New analysis explains role of defects in metal oxides**](#) [周五, 22 9月 00:11]

Researchers have determined formulas to guide development of a promising new high-tech material, composed of insulating metal oxides

known as alkaline-earth-metal binary oxides, that could lead to better computer memory chips, refrigeration systems, and other devices.

• [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

• [**Better rechargeable batteries coming soon?**](#) [周四, 21 9月 22:17]

Novel lithium electrodes coated with indium could be the basis for more powerful, longer-lasting, rechargeable batteries. The coating hinders undesirable side-reactions between the electrode and electrolyte, provide a more uniform deposition of lithium when charging, and augments storage in the lithium anode via alloying reactions between lithium and indium. Their success stems from the good diffusion of lithium ions along the interfacial layer.

• [**Astonishing time limit for ultrafast perovskite solar cells set**](#) [周四, 21 9月 22:17]

Researchers have quantified the astonishingly high speeds at which future solar cells would have to operate in order to stretch what are presently seen as natural limits on their energy conversion efficiency.

• [**Diamonds show Earth still capable of 'superhot' surprises**](#) [周四, 21 9月 21:55]

Diamonds may be 'forever' but some may have formed more recently than geologists thought. A study of 26 diamonds, formed under extreme melting conditions in the Earth's mantle, found two populations, one of which has geologically 'young' ages. The results show that certain volcanic events on Earth may still be able to create super-heated conditions previously thought to have only existed early in the planet's history before it cooled. The findings may have implications for diamond prospecting.

- [**Solar eruption ‘photobombed’ Mars encounter with Comet Siding Spring**](#) [周四, 21 9月 21:50]

When Comet C/2013 A1 (Siding Spring) passed just 140,000 kilometers from Mars on 19th October 2014, depositing a large amount of debris in the Martian atmosphere, space agencies coordinated multiple spacecraft to witness the largest meteor shower in recorded history. It was a rare opportunity, as this kind of planetary event occurs only once every 100,000 years.

- [**Football helmet smartfoam signals potential concussions in real time, study suggests**](#) [周四, 21 9月 21:03]

While football-related concussions have been top of mind in recent years, people have struggled to create technology to accurately measure them in real time. Engineers have now developed and tested a nano composite smartfoam that can be placed inside a football helmet (and pads) to more accurately test the impact and power of hits.

- [**Precisely defined polymer chains now a reality**](#) [周四, 21 9月 21:03]

The materiality exhibited by humanmade polymers currently relies on simple chemical bonds and the sequence order taken by molecules in the polymer chain. We now no longer need to rely on fate to determine such materiality with this new technique for precisely defining polymer-chain order. This system uses highly specific 'grabber' ends on each molecule that bond with only one type of 'pin' end on another molecule.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**Bio-inspired approach to RNA delivery**](#) [周四, 21 9月 03:50]

A team of chemical engineers, inspired by the way that cells translate their own mRNA into proteins, has designed a synthetic delivery system

that is four times more effective than delivering mRNA on its own.

- [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

- [**New biomaterial could replace plastic laminates, greatly reduce pollution**](#) [周四, 21 9月 02:47]

An inexpensive biomaterial that can be used to sustainably replace plastic barrier coatings in packaging and many other applications has been developed by researchers, who predict its adoption would greatly reduce pollution.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

- [**Automatic code reuse: System automatically modifies code for transfer to other programs**](#) [周四, 21 9月 02:46]

Researchers have developed a new system that allows programmers to transplant code from one program into another. The programmer can select the code from one program and an insertion point in a second program, and the system will automatically make modifications necessary -- such as changing variable names -- to integrate the code into its new context.

- [**New concept of terrestrial planet formation**](#) [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- [**Unique property of critical methane-producing enzyme discovered**](#) [周三, 20 9月 23:53]

An unexpected discovery has given a group of scientists a greater understanding of an important methane-producing enzyme called methyl-coenzyme M reductase, or MCR. Their findings overturn what was previously believed to be true in the field: that a set of unique modifications present in MCR were essential to how the enzyme functions.

- [**Spinning a lighter, safer electrode**](#) [周三, 20 9月 23:35]

A fabric-like material electrode has been created that could help make energy storage devices -- batteries and supercapacitors -- faster and less susceptible to leaks or disastrous meltdowns. Their design for a new supercapacitor, which looks something like a furry sponge infused with gelatin, offers a unique alternative to the flammable electrolyte solution that is a common component in these devices.

- [**Straining the memory: Prototype strain engineered materials are the future of data storage**](#) [周三, 20 9月 23:34]

Researchers have strain-engineered a data storage material to store data by exploiting a process of avalanche atomic switching. Memory cells

using this material substantially outperform state-of-the-art phase change memory devices.

• [**Mathematicians ask: What's in a ripple?**](#) [周三, 20 9月 23:34]

When a fluid or a gas experiences a sudden disturbance, it often gives rise to a phenomenon known as an undular bore, which consists of a series of rapid oscillations that propagate and spread. But how to describe what transpires? New mathematics research brings us closer to finding an answer.

• [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• [**Real or fake? Creating fingers to protect identities**](#) [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

• [**Mathematical simulations shed new light on epilepsy surgery**](#) [周三, 20 9月 22:43]

Results from an unexpected quarter is could help neurologists to identify which brain region to remove to eliminate an epilepsy patient's symptoms. Mathematicians have shown that it is sensible to examine the interconnections between different brain regions closely, instead of searching for abnormal regions only.

• [**Naked molecules dancing in liquid become**](#)

[visible](#) [周三, 20 9月 22:42]

Moving, vibrating and leaping molecules make up our world. However, capturing their movement is not an easy task. Scientists were able to see the movement of molecules stored inside a graphene pocket without the need to stain them. This study paves the way for observing the dynamics of life building blocks, like proteins and DNA, as well as the self-assembly of other materials.

• [Gravity waves influence weather and climate](#) [周三, 20 9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

• [Halogen bonding-mediated metal-free controlled cationic polymerization](#) [周三, 20 9月 22:00]

Chemists report a metal-free method to control cationic polymerization that provides a new framework for higher quality industrial polymers. The reaction depends on weak halogen bonding and the addition of a small amount of ammonium salt to produce long, homogeneous polymers.

• [Getting to the heart of the matter: Nanogels for heart attack patients](#) [周三, 20 9月 22:00]

Heart disease and heart-related illnesses are a leading cause of death around the world, but treatment options are limited. Now, one group reports that encapsulating stem cells in a nanogel could help repair damage to the heart.

• [Risks vary widely in drone-human impacts](#) [周三, 20 9月 04:03]

New research suggests there's wide variation in the risk that unmanned aircraft pose to people on the ground.

• [Tiny lasers from a gallery of whispers](#) [周三, 20 9月 04:03]

Whispering gallery mode resonators rely on a phenomenon similar to an effect observed in circular galleries, and the same phenomenon applies to light. When light is stored in ring-shaped or spherical active

resonators, the waves superimpose in such a way that it can result in laser light. Investigators now report a new type of dye-doped WGM micro-laser that produces light with tunable wavelengths.

- [**Security cameras vulnerable to attacks using infrared light**](#) [周三, 20 9月 04:02]

Researchers have demonstrated that security cameras infected with malware can receive covert signals and leak sensitive information from the very same surveillance devices used to protect facilities.

- [**Clear tactics, but few easy solutions, for hospitals combating ransomware**](#) [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

- [**Wikipedia used to give AI context clues**](#) [周三, 20 9月 02:04]

A team of computer scientists is teaching artificial intelligence agents how to interact with the world in a way that makes sense.

- [**Political polarization? Don't blame the web**](#) [周三, 20 9月 02:04]

Despite the popular narrative that the web is to blame for rising political polarization, a study by economists has found that recent growth in polarization is greatest for demographic groups in which individuals are least likely to use the internet and social media. This means that data does not support the claim that the internet is the most significant driver of partisanship.

- [**Mercury's poles may be icier than scientists thought**](#) [周三, 20 9月 00:31]

A new study identifies three large surface ice deposits near Mercury's north pole, and suggests there could be many additional small-scale deposits that would dramatically increase the planet's surface ice inventory.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**700 years old saint myth has been proven \(almost\) true**](#) [周五, 22 9月 23:17]

Scientists confirm that the age and content of an old sack is in accordance with a medieval myth about Saint Francis of Assisi.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Ancient textiles reveal differences in Mediterranean fabrics in the 1st millennium BC**](#)

[周五, 22 9月 21:40]

Analysis of Iron Age textiles indicates that during c. 1000-400 BC Italy shared the textile culture of Central Europe, while Greece was largely influenced by the traditions of ancient Near East.

- [**Crowning the 'king of the crops': Sequencing the white guinea yam genome**](#) [周五, 22 9月 21:40]

Scientists have, for the first time, provided a genome sequence for the white Guinea yam, a staple crop with huge economic and cultural significance on the African continent and a lifeline for millions of people.

- [**Winter cold extremes linked to high-altitude polar vortex weakening**](#) [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern

hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Rainbow colors reveal cell history**](#) [周五, 22 9月 21:14]

A system called "Beta-bow", which allows the history of beta-cells to be traced by genetic bar-coding and multicolor imaging, has been developed by researchers.

- [**Party discipline for jumping genes**](#) [周五, 22 9月 21:09]

Jumping genes, transposons, are part of the genome of most organisms, aggregated into families and can damage the genome by jumping. How hosts suppress the jumping is well investigated. Why they still can jump has hardly been understood so far. Researchers investigated for the first time in all transposons of the host organism, which properties and host environments facilitate jumping. They showed that family affiliation is more important than position.

- [**Artificial orchid cultivation kit**](#) [周五, 22 9月 21:09]

Orchids are loved by gardeners around the world but are notoriously difficult to cultivate. Researchers have developed a new orchid cultivation kit and have succeeded in complete artificial cultivation of an autonomous orchid. Since this kit can be made cheaply, it can broaden the opportunities for orchid cultivation in general households. It is also expected to be useful in preserving the genetic diversity of orchidaceous plants, many of which are in danger of extinction.

- [**Ozark grasslands experience major increase in**](#)

trees and shrubs [周五, 22 9月 04:12]

Woody vegetation, such as trees and shrubs, has increased dramatically in Ozark grasslands over the past 75 years, according to a study. If these ecosystems continue to favor woody vegetation, will it be possible to maintain open grasslands for the foreseeable future?

Into more thin air: Exploring the adaptation extremes of human high altitude sickness and fitness [周五, 22 9月 04:12]

Many research groups have explored human adaptation to high altitude living among three major far-flung global populations: Tibetans, Ethiopians and Peruvians. But few have simultaneously explored the other extreme---maladaptation----in the form of chronic mountain sickness (CMS). Now, in the largest whole genome study of its kind, an international research team led by University of California San Diego's Chairman of Pediatrics, Dr. Gabriel Haddad, has expanded on their recent study of understand...

Ancient DNA data fills in thousands of years of human prehistory in Africa [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

Scientists sequence asexual tiny worm whose lineage stretches back 18 million years [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

Green algae could hold clues for engineering

[**faster-growing crops**](#) [周五, 22 9月 02:13]

Two new studies provide a detailed look at an essential part of algae's growth machinery, with the eventual goal of applying this knowledge to improving the growth of crops.

• [**Jellyfish, with no brains, still seem to sleep**](#) [周五, 22 9月 02:12]

The discovery that primitive jellyfish sleep suggests that sleep is an ancient, evolutionarily conserved behavior.

• [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

• [**We must accelerate transitions for sustainability and climate change, experts say**](#) [周五, 22 9月 02:12]

We must move faster towards a low-carbon world if we are to limit global warming to 2 degrees C this century, experts have warned.

• [**Heat-loving Australian ants believe in diversity, hint 74 species new to science**](#) [周五, 22 9月 02:12]

A genus of Australian ants, many of whose members prefer to forage in blistering temperatures of up to 50°C (122°F), is revised to include 74 new species. The ants include seed-eaters, ant and termite raiders, 'honeypot ants' that store nectar and honeydew, and numerous others whose biology is not yet understood. Some are bizarre: one species has eyes like inverted ice-cream cones.

• [**Reconstructing how Neanderthals grew, based on an El Sidrón child**](#) [周五, 22 9月 02:12]

How did Neanderthals grow? Does modern man develop in the same way as Homo neanderthalensis did? How does the size of the brain affect the development of the body? Researchers have studied the fossil remains of a Neanderthal child's skeleton in order to establish whether

there are differences between the growth of Neanderthals and that of sapiens.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Wildlife rangers: What motivates them?**](#) [周五, 22 9月 00:11]

Wildlife rangers are on the front lines protecting our most iconic species -- tigers, elephants, gorillas and many others. But their challenges involve more than confrontations with wild animals and poachers.

- [**Dino-killing asteroid's impact on bird evolution**](#) [周五, 22 9月 00:11]

Human activities could change the pace of evolution, similar to what occurred 66 million years ago when a giant asteroid wiped out the dinosaurs, leaving modern birds as their only descendants.

- [**Surprising discovery: How the African tsetse fly really drinks your blood**](#) [周四, 21 9月 23:06]

Researchers have been taking a close-up look at the biting mouthparts of the African tsetse fly as part of ongoing work on the animal diseases it carries. Using a new high-powered scanning electron microscope, researchers were able to see the rows of sharp teeth and rasps that the fly uses to chew through the skin when it bites.

- [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

• [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

• [**New hermit crab uses live coral as its home**](#) [周四, 21 9月 22:42]

A new hermit crab species can live in a walking coral's cavity in a reciprocal relationship, replacing the usual marine worm partner, according to a new study.

• [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

• [**Recipe for forest restoration discovered**](#) [周四, 21 9月 22:17]

A new study has uncovered some valuable information on ways to maximize the success of replanting efforts, bringing new hope for restoring these threatened ecosystems.

• [**Changing of the guard: Research sheds light on how plants breathe**](#) [周四, 21 9月 22:17]

New research is set to change the textbook understanding of how plants breathe. Researchers have developed the first full 3D model of a guard cell.

• [**Scientists and farmers work together to wipe out African lovegrass**](#) [周四, 21 9月 22:17]

New research and collaboration could lead to the eventual eradication of the highly invasive African lovegrass threatening pastures and native grasslands Australia-wide. What they discovered is that local knowledge

is the key to a successful management approach.

• [**Obese dogs helped by 'effective' weight loss trials**](#) [周四, 21 9月 22:17]

On average overweight dogs lose an average of 11 percent of their body weight when enrolled on a weight loss trial according to researchers who have conducted the largest international multi-center weight study.

• [**Lightning-fast trappers: Biomechanics of suction traps in carnivorous bladderworts**](#) [周四, 21 9月 22:17]

New findings have been gained on the biomechanics and evolution of suction traps in carnivorous bladderworts.

• [**Whole food diet may help prevent colon cancer, other chronic conditions**](#) [周四, 21 9月 22:17]

A diet that includes plenty of colorful vegetables and fruits may contain compounds that can stop colon cancer and inflammatory bowel diseases in pigs, according to an international team of researchers. Understanding how these compounds work on a molecular level could be an initial step toward finding treatments for people with cancer, they added.

• [**Diamonds show Earth still capable of 'superhot' surprises**](#) [周四, 21 9月 21:55]

Diamonds may be 'forever' but some may have formed more recently than geologists thought. A study of 26 diamonds, formed under extreme melting conditions in the Earth's mantle, found two populations, one of which has geologically 'young' ages. The results show that certain volcanic events on Earth may still be able to create super-heated conditions previously thought to have only existed early in the planet's history before it cooled. The findings may have implications for diamond prospecting.

• [**In times of climate change: What a lake's color can tell about its condition**](#) [周四, 21 9月 21:50]

With the help of satellite observations from 188 lakes worldwide, scientists have shown that the warming of large lakes amplifies their

color. Lakes which are green due to their high phytoplankton content tend to become greener in warm years as phytoplankton content increases. Clear, blue lakes with little phytoplankton, on the other hand, tend to become even bluer in warm years caused by declines in phytoplankton. Thus, contrary to previous assumptions, the warming of lakes tends to amplify thei...

- [**Cannabis, 'spice' – better think twice**](#) [周四, 21 9月 21:49]

Marijuana is the most commonly abused drug in the world, and the advent of synthetic cannabinoids creates additional challenges to the society because of their higher potency and ability to escape drug detection screenings. Scientists have a warning about a new danger coming from cannabinoid abuse.

- [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

- [**An extraordinary cave animal found in Eastern Turkmenistan**](#) [周四, 21 9月 21:02]

A remote cave in Eastern Turkmenistan was found to shelter a marvelous cave-adapted inhabitant that turned out to represent a species and genus new to science. This new troglodyte is the first of its order from Central Asia and the first strictly subterranean terrestrial creature recorded in the country.

- [**Going diving in the tropics? Don't eat the reef fish!**](#) [周四, 21 9月 21:02]

Reducing tourist consumption of reef fish is critical for Palau's ocean sustainability, finds a new study that suggests other small island nations might also consider adopting this strategy.

- [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

• [**When residents take charge of their rainforests, fewer trees die**](#) [周四, 21 9月 06:21]

When the government gives citizens a personal stake in forested land, trees don't disappear as quickly and environmental harm slows down, research finds.

• [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

• [**3-D analysis of dog fossils sheds light on domestication debate**](#) [周四, 21 9月 06:20]

In an effort to settle the debate about the origin of dog domestication, a technique that uses 3-D scans of fossils is helping researchers determine the difference between dogs and wolves.

• [**Convergent evolution of mimetic butterflies confounds classification**](#) [周四, 21 9月 06:20]

A new paper on butterflies may revise the taxonomy of Asian palmflies in the genus *Elymnias* in light of a forthcoming study on the butterflies' evolutionary history.

• [**Protected waters foster resurgence of West Coast rockfish**](#) [周四, 21 9月 03:49]

West Coast rockfish species in deep collapse only 20 years ago have multiplied rapidly in large marine protected areas off Southern California, likely seeding surrounding waters with enough offspring to offer promise of renewed fishing, a new study has found.

- [**Immune system is critical to regeneration, study finds**](#) [周四, 21 9月 03:49]

The answer to the question of why some organisms can regenerate major body parts while others, such as humans, cannot may lie with the body's innate immune system, according to a new study of heart regeneration in the Mexican salamander.

- [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

- [**New biomaterial could replace plastic laminates, greatly reduce pollution**](#) [周四, 21 9月 02:47]

An inexpensive biomaterial that can be used to sustainably replace plastic barrier coatings in packaging and many other applications has been developed by researchers, who predict its adoption would greatly reduce pollution.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Strong alcohol policies help reduce alcohol-involved homicides**](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among homicide victims, according to a new study.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**We must accelerate transitions for sustainability and climate change, experts say**](#) [周五, 22 9月 02:12]

We must move faster towards a low-carbon world if we are to limit global warming to 2 degrees C this century, experts have warned.

- [**Rapid hepatitis C testing may help better screen young adults**](#) [周五, 22 9月 02:12]

Routine and rapid hepatitis C virus testing among young adults who use injection drugs improves life expectancy and may provide a good use of limited resources, according to new research.

- [**Wildlife rangers: What motivates them?**](#) [周五, 22 9月 00:11]

Wildlife rangers are on the front lines protecting our most iconic species -- tigers, elephants, gorillas and many others. But their challenges involve more than confrontations with wild animals and poachers.

- [**Recipe for forest restoration discovered**](#) [周四, 21 9月 22:17]

A new study has uncovered some valuable information on ways to maximize the success of replanting efforts, bringing new hope for restoring these threatened ecosystems.

- [**Premature births cost health plans \\$6 billion annually**](#) [周四, 21 9月 21:02]

A new study estimates employer-sponsored health plans spent at least \$6 billion extra on infants born prematurely in 2013 and a substantial portion of that sum was spent on infants with major birth defects.

- [**Pay more, smoke less: Possible effects of raising tobacco taxes across the EU**](#) [周四, 21 9月 11:22]

Raising tobacco taxes to increase cigarette prices could reduce cigarette consumption and smoking-associated deaths (SADs) in all 28 EU countries, according to a new study. In higher income countries, raising tobacco taxes could increase revenues that could be spend on prevention and control programs, while in lower income countries tax revenues may be negatively affected, researchers suggest.

- [**When residents take charge of their rainforests, fewer trees die**](#) [周四, 21 9月 06:21]

When the government gives citizens a personal stake in forested land, trees don't disappear as quickly and environmental harm slows down, research finds.

- [**Communication among health care facilities key to preventing spread of drug-resistant bacteria**](#) [周四, 21 9月 02:47]

Communication breakdowns between care facilities can pave the way for outbreaks of infection, according to research on the spread of an extensively drug-resistant bacterium.

- [**Hold the phone: An ambulance might lower your chances of surviving some injuries**](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

- [**Building social communication skills in shy children helps with peer likeability**](#) [周三, 20 9月 22:00]

A new study has discovered that shy children with low English vocabulary skills, can still be popular among their peers if they have high-functioning social communication skills that enable them to engage and interact well with their peers in social settings.

- [**New tool to assess individual's level of wisdom**](#) [周三, 20 9月 21:59]

Researchers have developed a new tool called the San Diego Wisdom Scale (SD-WISE) to assess an individual's level of wisdom, based upon a conceptualization of wisdom as a trait with a neurobiological as well as psychosocial basis.

- [**Clear tactics, but few easy solutions, for hospitals combating ransomware**](#) [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that

afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

• [**Management studies: Dishonesty shift**](#) [周三, 20 9月 02:04]

Lying comes more easily to people in teams: Behavioral scientists have shown in an experimental study why groups are more likely to behave unethically than individuals.

• [**Political polarization? Don't blame the web**](#) [周三, 20 9月 02:04]

Despite the popular narrative that the web is to blame for rising political polarization, a study by economists has found that recent growth in polarization is greatest for demographic groups in which individuals are least likely to use the internet and social media. This means that data does not support the claim that the internet is the most significant driver of partisanship.

• [**Changes in non-extreme precipitation may have not-so-subtle consequences**](#) [周三, 20 9月 00:31]

Extreme floods and droughts receive a lot of attention. But what happens when precipitation -- or lack thereof -- occurs in a more measured way?

• [**UK oil and gas reserves may last only a decade, study suggests**](#) [周三, 20 9月 00:31]

The UK has low oil and gas resources and limited prospects for fracking, according to a new analysis by scientists, who recommend a shift towards greater use of renewable, clean energy.

• [**Students' self-concepts of ability in math, reading predict later math, reading attainment**](#) [周二, 19 9月 21:10]

A new longitudinal study looked at how youths' self-concepts are linked to their actual academic achievement in math and reading from middle childhood to adolescence. The study found that students' self-concepts of their abilities in these two academic domains play an important role in motivating their achievements over time and across levels of

achievement.

- [**Catching a diversity of fish species — instead of specializing — means more stable income for fishers**](#) [周二, 19 9月 11:23]

A team of scientists analyzed nearly 30 years of revenue and permitting records for individuals fishing in Alaskan waters and tracked how their fishing choices, in terms of permits purchased and species caught, influenced their year-to-year income volatility.

- [**The sublime challenge of jet noise**](#) [周二, 19 9月 11:22]

A scientist is using ALCF resources to create high fidelity simulations of jet turbulence to determine how and where noise is produced. The results may lead to novel engineering designs that reduce noise over commercial flight paths and on aircraft carrier decks.

- [**Fake news more likely to thrive online due to lowered fact-checking**](#) [周二, 19 9月 04:34]

Fake news is more likely to thrive online due to lowered fact-checking, according to new American research.

- [**Enzyme's worth to biofuels shown in recent research**](#) [周二, 19 9月 04:34]

A newly discovered enzyme proves adept at breaking down cellulose fibers regardless of whether their crystalline structure is simple or highly complex. No other enzyme has shown that ability.

- [**Reliance on 'gut feelings' linked to belief in fake news**](#) [周二, 19 9月 02:21]

People who tend to trust their intuition or to believe that the facts they hear are politically biased are more likely to stand behind inaccurate beliefs, a new study suggests.

- [**People's love of the seas could be the key for plastic pollution solution**](#) [周二, 19 9月 01:27]

Tapping into the public's passion for the ocean could be the key to

reducing the threats to it posed by plastic pollution.

· [5,000 deaths annually from Diesel-gate in Europe](#) [周一, 18 9月 21:33]

Excess emissions from diesel cars cause about 5,000 premature deaths annually across Europe, a new study shows. Higher exposure to secondary particles and ozone can be traced back to excess NOx emissions from diesel cars, vans and light commercial vehicles. With the EU's vehicle emission limits achieved on the road about 5,000 premature deaths could be avoided annually. If diesel cars emitted as little NOx as petrol cars, about 7,500 premature deaths could be avoided annually.

· [Parents not confident schools can assist child with chronic disease, mental health](#) [周一, 18 9月 21:08]

Most parents are sure schools would be able to provide basic first aid but are less confident about a school's ability to respond to more complex health situations, such as an asthma attack or mental health problem.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

- [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

• [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

• [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

• [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

• [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called Beelzebufo that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus Ceratophrys, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

• [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

• [**Dinosaur evolution: Lumbering giants had agile**](#)

ancestors [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

• **Scientists make atoms-thick 'Post-It notes' for solar cells and circuits** [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

• **Hold the phone: An ambulance might lower your chances of surviving some injuries** [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

• **Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues** [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• **Real or fake? Creating fingers to protect identities** [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly

called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

- [**Gravity waves influence weather and climate**](#) [周三, 20

9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

- [**Solar wind impacts on giant 'space hurricanes' may affect satellite safety**](#) [周二, 19 9月 21:10]

Could the flapping of a butterfly's wings in Costa Rica set off a hurricane in California? For most people, this hypothetical scenario may be difficult to imagine on Earth -- particularly when a real disaster strikes. Yet, in space, similarly small fluctuations in the solar wind as it streams toward the Earth's magnetic shield actually can affect the speed and strength of 'space hurricanes,' a researcher explains.

- [**DNA triggers shape-shifting in hydrogels, opening a new way to make 'soft robots'**](#) [周二, 19 9月 10:22]

Biochemical engineers have used sequences of DNA molecules to induce shape-changing in water-based gels, demonstrating a new tactic to produce "soft" robots and "smart" medical devices that do not rely on cumbersome wires, batteries or tethers.

- [**Scientists show molecular basis for ants acting as 'bodyguards' for plants**](#) [周二, 19 9月 00:35]

Though you might not think of ants as formidable bodyguards, some do an impressive job protecting plants from enemies. Examining the relationship between the Amazon rainforest plant *Cordia nodosa* in Peru and the ant species *Allomerus octoarticulatus*, scientists found the degree to which the ants express two genes significantly impacts the amount of protection they provide to their hosts.

- [**When radio galaxies collide, supermassive black holes form tightly bound pairs**](#) [周二, 19 9月 00:35]

Supermassive black holes found in the centers of galaxies can form gravitationally bound pairs when galaxies merge, according to a new study.

• [**More evidence of water on Mars**](#) [周二, 19 9月 00:35]

River deposits exist across the surface of Mars and record a surface environment from over 3.5 billion years ago that was able to support liquid water at the surface. A region of Mars named Aeolis Dorsa contains some of the most spectacular and densely packed river deposits seen on Mars.

• [**A solar cell you can put in the wash**](#) [周一, 18 9月 23:18]

Scientists have developed a new type of ultra-thin photovoltaic device, coated on both sides with stretchable and waterproof films, which can continue to provide electricity from sunlight even after being soaked in water or being stretched and compressed.

• [**Developing roads that can generate power from passing traffic**](#) [周一, 18 9月 23:18]

Researchers are looking at advanced materials for roads and pavements that could generate electricity from passing traffic. Engineers are working on smart materials such as 'piezoelectric' ceramics that when embedded in road surfaces would be able to harvest and convert vehicle vibration into electrical energy.

• [**New evidence for small, short-lived drops of early universe quark-gluon plasma?**](#) [周一, 18 9月 21:30]

Particles emerging from even the lowest energy collisions of small deuterons with large heavy nuclei at the Relativistic Heavy Ion Collider exhibit behavior scientists associate with the formation of a soup of quarks and gluons, the fundamental building blocks of nearly all visible matter.

• [**World first: 'Storing lightning inside thunder'**](#) [周一, 18 9月 21:07]

In a world first, researchers have stored photonic information on a microchip as an acoustic wave. This allows precious extra time to store, process and then redistribute the data without relying on electronics,

which produce excess heat. Such a hybrid chip could have a huge impact in cloud computing and telecommunication centers, which are overheating as we churn through data on our phones.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Quitting daily aspirin therapy may increase second heart attack, stroke risk**](#) [周二, 26 9月 04:32]

Stopping long-term, low-dose aspirin therapy may increase your risk of suffering a cardiovascular event, research indicates. Risk increases shortly after stopping and does not appear to diminish over time.

- [**Penguin-mounted video captures gastronomic close encounters of the gelatinous kind**](#) [周二, 26 9月 04:32]

Footage from penguin-mounted mini video recorders shows four species of penguin eating jellyfish and other gelatinous animals of the open ocean, a food source penguins were not previously believed to partake of, scientists report.

- [**Snails bred in lab help species crawl back from brink of extinction**](#) [周二, 26 9月 04:06]

Work to restore the endangered Chittenango ovate amber snail, found only in one location inside a Central New York state park, continued this month with the release of tagged adult snails raised in a laboratory.

- [**Being in a good mood for your flu jab boosts its effectiveness**](#) [周二, 26 9月 03:47]

New research by a team of health experts has found evidence that being

in a positive mood on the day of your flu jab can increase its protective effect.

• [Brain's anterior cingulate cortex and its tie to human learning](#) [周二, 26 9月 03:14]

After four years of lab testing and complex neuro-decoding, a research team has struck a major breakthrough that could open the floodgates for research into the anterior cingulate cortex, or ACC, and how human brains learn.

• [Prostaglandin EI inhibits leukemia stem cells](#) [周二, 26 9月 03:14]

Two drugs, already approved for safe use in people, may be able to improve therapy for chronic myeloid leukemia (CML), a blood cancer that affects myeloid cells, according to new results.

• [Antarctica: The wind sublimates snowflakes](#) [周二, 26 9月 03:14]

A team of researchers has collected new data that shows a significant decrease in snow precipitation close to the ground in Antarctica, which has an impact on the ice sheet surface mass balance.

• [Mechanism of asexual reproduction in flatworms](#) [周二, 26 9月 03:14]

Scientists have nailed the biomechanics of a centuries-long puzzle on how freshwater flatworms known as planarians reproduce. The asexual freshwater worms, notoriously difficult to study, tear themselves into two pieces that go on to form two new worms. Researchers are now able to predict where planarian fission occurs based on its anatomy as well as explain how the process happens using a relatively simple mechanical model.

• [Creative use of noise brings bio-inspired electronic improvement](#) [周二, 26 9月 03:14]

Researchers are working to exploit stochastic resonance to enhance signal transmission for a new generation of devices, using single-walled carbon nanotubes. They created a summing network SR device that detects subthreshold signals, fabricated to include a self-noise

component.

- [**Holograms for molecules**](#) [周二, 26 9月 01:30]

Scientists have developed a completely new method for the analysis of molecules in liquids on a chip. The possible applications of this technology are immense. It has the potential, inter alia, to revolutionize medical diagnostics.

- [**Metabolism directly impacts the odds of developing malaria**](#) [周二, 26 9月 01:30]

Researchers have found that the host's susceptibility to develop malaria depends on his or her metabolic state, which can be easily manipulated through external stimuli such as dietary patterns.

- [**Ticks are even tougher and nastier than you thought**](#) [周二, 26 9月 01:30]

Studies are showing how ticks can survive drought and cold northern winters.

- [**Creating brain cells to detect Tourette's**](#) [周二, 26 9月 01:30]

Scientists have used a genetic engineering technique for the first time to create brain cells from the blood cells of individuals in a three-generation family with Tourette syndrome to help determine what causes the disease.

- [**Study examines legacies of rainforest burning in British Columbia**](#) [周二, 26 9月 01:30]

Analyses of temperate rain forests located on the central coast of British Columbia, Canada, suggest that for centuries, humans have intentionally used fire to manage plant life.

- [**Click beetles inspire design of self-righting robots**](#) [周二, 26 9月 01:30]

Robots perform many tasks that humans can't or don't want to perform, getting around on intricately designed wheels and limbs. If they tip over, however, they are rendered almost useless. Mechanical engineers and entomologists are looking to click beetles, who can right themselves

without the use of their legs, to solve this robotics challenge.

- [**Bone marrow concentrate improves joint transplants**](#) [周二, 26 9月 01:30]

Biologic joint restoration using donor tissue instead of traditional metal and plastic may be an option for active patients with joint defects. Researchers have found in a group of patients that treating donor grafts with bone marrow aspirate concentrate before surgery improves bone integration and speeds recovery.

- [**New non-contact, remote biometric tool could be next advance in computer security**](#) [周二, 26 9月 01:30]

Forget fingerprint computer identification or retinal scanning. Scientists have now developed a computer security system using the dimensions of your heart as your identifier. The system uses low-level Doppler radar to measure your heart, and then continually monitors your heart to make sure no one else has stepped in to run your computer.

- [**IceCube helps demystify strange radio bursts from deep space**](#) [周二, 26 9月 01:29]

Scientists are turning IceCube, the world's most sensitive neutrino telescope, to the task of helping demystify powerful pulses of radio energy generated up to billions of light-years from Earth.

- [**The material that obscures supermassive black holes**](#) [周二, 26 9月 01:29]

New research examines the material that obscures active galactic nuclei obtained from infrared and X-ray observations.

- [**Discovering what makes organelles connect could help explain neurodegenerative diseases**](#) [周二, 26 9月 01:29]

Organelles must exchange signals and materials to make the cell operate correctly. New technologies are allowing researchers to see and understand the networks that connect these organelles, allowing them to build maps of the trade routes that exist within a cell.

- **[Violent crime increases during warmer weather, no matter the season, study finds](#)** [周二, 26 9月 01:29]

A study analyzing crime data in Philadelphia for 10 years found that rates of violent crime and disorderly conduct are higher when the weather is warmer and more pleasant, even rising sharply during warmer-than-typical winter days.

- **[Streamlined process opens drug development to a new class of steroids](#)** [周二, 26 9月 01:29]

Researchers have developed a technique to produce synthetic steroids that could pave the way for a cascade of new drug discoveries, significantly reducing the expense and time needed to develop therapeutics from an underexplored collection of molecules.

- **[After 15 years in a vegetative state, nerve stimulation restores consciousness](#)** [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- **[Tension makes the heart grow stronger](#)** [周二, 26 9月 01:29]

By taking videos of a tiny beating zebrafish heart as it reconstructs its covering in a petri dish, scientists have captured unexpected dynamics of cells involved in tissue regeneration. They found that the depleted heart tissue regenerates in a wave, led by a front of fast-moving, supersized cells and trailed by smaller cells that multiply to produce others. The nature of this wavefront is determined by mechanical tension on the cells.

- **[Are children who see movie characters use guns more likely to use them?](#)** [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played

with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- [**Big brains in birds provides survival advantage**](#) [周二, 26 9月 01:29]

Scientists have discovered that brainier birds are better able to colonize inhospitable places.

- [**Antibody protects against Zika and dengue, mouse study shows**](#) [周二, 26 9月 01:29]

The same countries hard hit by Zika virus -- which can cause brain damage in babies infected before birth -- are also home to dengue virus. Researchers now report that they have found an antibody that protects against both viruses. These findings, in mice, could be a step towards an antibody-based preventative drug to protect fetuses from brain damage, while also protecting their mothers from both Zika and dengue disease.

- [**Physicists demonstrate using a laser to control a current in graphene within just one femtosecond**](#) [周二, 26 9月 01:28]

Controlling electronic current is essential to modern electronics, as data and signals are transferred by streams of electrons which are controlled at high speed. Demands on transmission speeds are also increasing as technology develops. Scientists have now succeeded in switching on a current with a desired direction in graphene using a single laser pulse within a femtosecond. This is more than a thousand times faster compared to the most efficient transistors today.

- [**Bacterial nanosized speargun works like a power drill**](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in only a few thousandths of a second and injects a cocktail of toxins.

- [**Adding radiation to chemotherapy may dramatically improve survival for advanced**](#)

NSCLC [周一, 25 9月 23:33]

Combining radiation therapy with chemotherapy for patients with limited metastatic non-small cell lung cancer (NSCLC) may curb disease progression dramatically when compared to NSCLC patients who only receive chemotherapy, according to a new randomized phase II clinical trial.

• **Study raises expectations for improved language skills in the deaf and hard-of-hearing** [周一, 25 9月 23:33]

Universal screening of newborns for hearing loss before they leave the hospital is not enough to improve language skills of children who are deaf and hard of hearing. At least 40 percent of children with a hearing loss have the capacity for higher language levels -- beyond what test scores indicate.

• **Climate insurance is rarely well thought out in agriculture** [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

• **Group project? Taking turns, working with friends may improve grades** [周一, 25 9月 23:33]

A new study with college students has found that the social dynamics of a group, such as whether one person dominates the conversation or whether students work with a friend, affect academic performance. Put simply, the more comfortable students are, the better they do, which yields benefits beyond the classroom.

• **Lava tubes: Hidden sites for future human habitats on the Moon and Mars** [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

• [**Diabetes medicine reduces Parkinson's risk**](#) [周一, 25 9月 23:16]

Taking diabetes medicine reduces the risk of getting Parkinson's disease, new research demonstrates. Researchers have discovered that medical treatment against diabetes reduces the risk of getting Parkinson's disease by 35 per cent.

• [**New treatment for chronic throat irritation and globus sensation in the gullet**](#) [周一, 25 9月 23:16]

Chronic throat irritation, a permanent globus sensation, a sore or dry sensation in the throat are common symptoms, which are often trivialized and wrongly attributed to gastro-oesophageal reflux disease. However, these are also the characteristic symptoms of patients suffering from displaced gastric mucosa in the oesophagus (ectopic mucosa). A recent study has now brought a break-through in the treatment of patients with this condition. For the first time in the world, the new radiofrequency abl...

• [**Climate change can goad volcanoes into life**](#) [周一, 25 9月 23:14]

Geologists have analyzed volcanic data from the Messinian salinity crisis in the Mediterranean Sea, when the Strait of Gibraltar was blocked and the Mediterranean temporarily isolated from the Atlantic. After testing various scenarios, the geologists concluded that the increase in magmatic activity could only be explained by the almost total drying out of the Mediterranean.

• [**Clarifying perspectives to promote action on loss and damage from climate change**](#) [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy,

negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

- [**Likely scenarios for global spread of devastating crop disease**](#) [周一, 25 9月 23:13]

New research reveals the most likely months and routes for the spread of new strains of airborne 'wheat stem rust' that could endanger global food security by ravaging wheat production across Africa, the Middle East, Asia and the wider world.

- [**Visual attention drawn to meaning, not what stands out**](#) [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- [**New technique uses light to separate mirrored molecules**](#) [周一, 25 9月 23:13]

Left- and right-handed versions of molecules can be hard to tell apart but can have devastatingly different effects. Researchers are developing an optical filter to sort these molecules, which could lead to purer and safer drugs and agrichemicals.

- [**Nanoparticle supersoap creates 'bijel' with potential as sculptable fluid**](#) [周一, 25 9月 23:13]

A new type of 'bijel' could one day lead to applications in soft robotics, liquid circuitry, and a host of other applications that could benefit from shape-shifting fluids.

- [**New type of supercomputer could be based on 'magic dust' combination of light and matter**](#) [周一, 25 9月 23:13]

Scientists have successfully demonstrated that a type of 'magic dust'

which combines light and matter can be used to solve complex problems and could eventually surpass the capabilities of even the most powerful supercomputers.

- **[Panda habitat shrinking, becoming more fragmented](#)** [周一, 25 9月 23:13]

Using remote sensing data, Chinese and US scientists have re-assessed the conservation status of the giant panda. Their analysis shows that while panda numbers are increasing, their habitat still covers less area and is more fragmented than it was in 1988, when the species was listed as endangered on the IUCN Red List.

- **[World's botanic gardens contain a third of all known plant species, and help protect the most threatened](#)** [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41 percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

- **[Diet, in addition to alcohol consumption, may play important role in liver problems](#)** [周一, 25 9月 23:13]

A new study finds that mice bred to consume high amounts of alcohol, but controlled by diet, did not necessarily develop the most severe liver injuries, suggesting that diet may play an important role in liver injury development.

- **[Child abuse affects brain wiring](#)** [周一, 25 9月 23:13]

For the first time, researchers have been able to see changes in the neural structures in specific areas of the brains of people who suffered severe abuse as children. The researchers believe that these changes may contribute to the emergence of depressive disorders and suicidal behavior.

· [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

· [**Scientists monitor Silicon Valley's underground water reserves -- from space**](#) [周一, 25 9月 22:57]

Scientists monitoring Silicon Valley's underground water reserves from space have found that water levels rebounded quickly after a severe drought that lasted from 2012-15. The research points to the success of aggressive conservation measures. It also helps to lay the groundwork for low-cost monitoring of subterranean water reserves in California and elsewhere in the world.

Quitting daily aspirin therapy may increase second heart attack, stroke risk -- ScienceDaily

Stopping long-term, low-dose aspirin therapy may increase your risk of suffering a cardiovascular event, according to new research in the American Heart Association's journal *Circulation*.

Aspirin, taken in low doses, is used to help reduce the risk for recurrent heart attack or stroke. Aspirin inhibits clotting, lowering the risk of cardiovascular events. Nearly 10 to 20 percent of heart attack survivors stop daily aspirin use within the first three years following their event. In broader patient settings, discontinuation rates of up to 30 percent and poor aspirin compliance in up to 50 percent of patients have been reported.

To study the health effects of stopping aspirin therapy, Swedish researchers examined the records of 601,527 people who took low-dose aspirin for heart attack and stroke prevention between 2005 and 2009. Participants were older than 40, cancer-free and had an adherence

rate of greater than 80 percent in the first year of treatment.

In three years of follow-up, there were 62,690 cardiovascular events. Researchers also found:

- one out of every 74 patients who stopped taking aspirin had an additional cardiovascular event per year;
- a 37 percent higher rate of cardiovascular events for those who stopped aspirin therapy compared to those who continued; and
- an elevated risk of cardiovascular events that increased shortly after discontinuation of therapy and did not appear to diminish over time.

"Low-dose aspirin therapy is a simple and inexpensive treatment," said Johan Sundstrom, M.D., Ph.D., lead author and professor of epidemiology at Uppsala University in Sweden. "As long as there's no bleeding or any major surgery scheduled, our research shows the significant public health benefits that can be gained when patients stay on aspirin therapy."

Studies have suggested patient's experience a "rebound effect" after stopping aspirin treatment, this is possibly

due to increased clotting levels from the loss of aspirin's blood-thinning effects. Because of the large number of patients on aspirin and the high number who stop treatment, the importance of a rebound effect may be significant, Sundstrom said.

"We hope our research may help physicians, healthcare providers and patients make informed decisions on whether or not to stop aspirin use," Sundstrom said.

The American Heart Association recommends that people at high risk of heart attack should take a daily low-dose of aspirin (if told to by their healthcare provider) and that heart attack survivors also take low-dose aspirin regularly.

Penguin-mounted video captures gastronomic close encounters of the gelatinous kind: Penguins caught on camera eating jellyfish -- ScienceDaily

Footage from penguin-mounted mini video recorders shows four species of penguin eating jellyfish and other gelatinous animals of the open ocean, a food source penguins were not previously believed to partake of, scientists report this month in the Ecological Society of America's peer-reviewed journal *Frontiers in Ecology and the Environment*. The article, part of the October issue of the journal, is available online ahead of print.

Video logs confirmed that penguins targeted gelatinous animals for meals; the birds did not merely ingest them accidentally, while aiming for fish or other prey. Connecting this link in the food web helps ecologists understand the ecological niche of "gelata," a group the authors have defined based on shared gelatinous physique and ocean habitat, though it includes organisms from very different branches of the tree of

life

Gelata may play an underrated role in the carbon cycle, say Jean-Baptiste Thiebot, a postdoctoral fellow at the National Institute of Polar Research in Tokyo, Japan, and 16 colleagues.

Though gelata pack a relatively low caloric punch, a diet of them can sustain large animals such as sea turtles and ocean sunfish. Penguins, warm-blooded animals with high energetic demands, can now be added to the list of confirmed "jellyvores."

Thiebot and teammates from 5 countries fitted thumbdrive-sized video data loggers to 106 penguins at seven breeding sites in the southern oceans (ocean waters south of 30 degrees South latitude) ranging in habitat from the polar regions to more temperate waters. Adélie penguins (*Pygoscelis adeliae*), yellow-eyed penguins (*Megadyptes antipodes*), Magellanic penguins (*Spheniscus magellanicus*), and little penguins (*Eudyptula minor*) starred in the live-action first-penguin hunter videos. Over 350 hours of footage documented nearly 200 penguin attacks on gelata.

The miniature video-loggers were in place for only one

sea outing per penguin, to minimize potential disturbance to the birds.

Thiebot and colleagues estimate that gelatinous organisms provide more than 1 percent the the daily energy needs for Adélie, Magellanic, and yellow-eyed penguins, and up to 2 percent for little penguins.

Penguins appeared to selectively target the carnivores among the gelata, which include species of "true" jellyfish (Cnidaria) and "comb jellies" (Ctenophora). All four penguin species enjoyed true jellyfish, consuming an observed 187 species. Magellanic and little penguins also ate 11 comb jelly species.

Vegetarian gelata species known as salps, filter feeders more closely related to humans than jellyfish they resemble, are also common gelatinous denizens of the southern oceans. These little jet-propelled jelly tubes feed on phytoplankton, the floating, green, single-celled organisms that get energy from light, like plants. In the congregational phase of their lives, they form great chains, tubes, and wheels, sometimes 60 feet long. Although salps appeared in video, penguins did not pursue them.

In the southern oceans, salp population explosions

sometimes absorb a big portion of the tiny plankton which would otherwise feed krill, and, in turn, penguins, whales, and seals. Carnivorous jellyfish populations also oscillate worldwide, blooming in cycles that have not been deeply researched in the southern oceans. Thiebot and colleagues' video evidence has shown that penguins can make use of the gelatinous biomass. But whether the penguins could subsist on a strict gelatum diet during massive blooms is currently unknown.

Snails bred in lab help species crawl back from brink of extinction -- ScienceDaily

Work to restore the endangered Chittenango ovate amber snail, found only in one location inside a Central New York state park, continued this month with the release of tagged adult snails raised in a laboratory at the College of Environmental Science and Forestry (ESF).

Called the "Chit" by those interested in its well being, the rare snail has been the subject of a conservation-focused collaboration with the U.S. Fish and Wildlife Service (USFWS), New York State Department of Environmental Conservation (NYSDEC), New York State Office of Parks, Recreation and Historic Preservation (Parks), Rosamond Gifford Zoo in Syracuse and Seneca Park Zoo in Rochester.

The snail survives exclusively alongside Chittenango Falls within Chittenango Falls State Park, about 22 miles southeast of Syracuse. Biologists have feared that

a single catastrophic event could wipe out the entire population.

To address this threat, Cody Gilbertson, an ESF graduate and lead research technician in the laboratory of Dr. Rebecca Rundell, has established a captive breeding population in an ESF laboratory. She is working in ESF's Center for Integrated Research and Teaching in Aquatic Science.

In 2015, 270 laboratory-raised hatchlings were released at the park. The difference this time is that the snails are adults and large enough to be tagged so researchers can follow their life in the field.

"The fact that they're tagged is special," said Rundell, "because when we conduct our surveys next summer we will hopefully be able to track them." She is also hoping the snails will overwinter and then begin reproducing in the summer of 2018. The snails are marked with tiny numbered tags, small and light enough to be glued to a shell.

"This backup population can supplement their wild population and prevent extinction in case of a destructive event such as a storm or rockslide," said

Gilbertson.

Gilbertson likens raising the snails in the lab to the Head Start program that prepares children for kindergarten. "Like a child, if you bring them to a certain stage we hope they [the snails] are more likely to succeed," said Gilbertson.

She has spent four years researching snail husbandry from their diet to their reproductive cycles. "Their diet is incredibly important," she said, since it affects their size, shell quality and reproductive health. She found the snails prefer decomposed leaves from oak, hickory, cherry and sugar maple trees (known to biologists as "leaf litter"), but the snails only like a certain degree of leaf decomposition and leaf thickness. The preferred leaves are collected in the late spring and stored in bins to be fed to the snails during the year. This work is labor-intensive and involves the help of many ESF undergraduate biology majors, volunteers from Syracuse and Rochester zoos, and other conservation partners.

When the terrariums are changed weekly, Gilbertson layers the leaves to create a "leaf lasagna" for the snails. "They like the thin, decomposed leaves the best

because they're easier to eat," she said, "and they eat around the veins of the leaves."

"Once we got that [the diet] figured out, we got high reproduction in the lab," Gilbertson said.

The USFWS is pleased with the progress Gilbertson and crew are making. "With the Chit found in just a single location in the wild, this work is critical," said Robyn Niver, endangered species biologist. "We're taking steps toward boosting the numbers of snails at Chittenango Falls, and growing the captive population. Thanks to an excellent partnership with ESF, DEC, Parks, and the zoos, the Chit is crawling its way back from the brink of extinction."

NYSDEC is also excited about the work on the Chittenango ovate amber snail. "DEC's habitat conservation efforts are a key component to protecting declining species and keeping them from becoming endangered," said DEC Commissioner Basil Seggos. "The demonstration that these captive-raised snails can be successfully released at Chittenango Falls is the ultimate success for managing a species that is only known from a single location. The maintenance of captive-raised populations will help ensure this rare

snail is part of New York's fauna for generations to come."

The goal for these efforts is to boost the population, which is of great interest for the conservation partners involved, as well as the local community. The species is named for its home and its opaque, egg-shaped, amber-colored shell.

Being in a good mood for your flu jab boosts its effectiveness -- ScienceDaily

New research by a team of health experts at the University of Nottingham has found evidence that being in a positive mood on the day of your flu jab can increase its protective effect.

Flu vaccination is estimated to only be effective in 17-53% of older adults compared to 70-90% of younger people. With the onset of winter and so-called 'flu season', the research is likely to be of interest to everyone having their autumn flu jab.

This new Nottingham-based study is the first to examine several psychological and behavioural factors that have been shown to affect how well vaccinations work. The researchers set out to understand which factor, or combination of factors has the greatest impact on the ability of vaccinations to protect against disease.

The team measured negative mood, positive mood, physical activity, diet and sleep three times a week

over a 6 week period in a group of 138 older people due to have their flu jab. Then they examined how well the jab was working by measuring the amount of influenza antibody in the blood at 4 weeks and 16 weeks after the vaccination.

The results showed that of all of the factors measured, only positive mood over the 6 week observational period predicted how well the jab worked – with good mood associated with higher levels of antibody. In fact, when the researchers looked at influences on the day of vaccination itself, they found an even greater effect on how well it worked, accounting for between 8 and 14% of the variability in antibody levels.

Professor Kavita Vedhara, from the University's Division of Primary Care, said: "Vaccinations are an incredibly effective way of reducing the likelihood of catching infectious diseases. But their Achilles heel is that their ability to protect against disease is affected by how well an individual's immune system works. So people with less effective immune systems, such as the elderly, may find vaccines don't work as well for them as they do in the young.

"We have known for many years that a number of

psychological and behavioural factors such as stress, physical activity and diet influence how well the immune system works and these factors have also been shown to influence how well vaccines protect against disease..”

The study, published in *Brain, Behavior and Immunity*, was unusual in that, by chance, the vaccination that participants received was identical to the one they had received in the previous year. This has happened only once before since the turn of the century. As a result, the researchers found that participants had very high levels of antibody – and therefore protection – for two out of three of the viruses present in the vaccination, even before they were vaccinated.

This so-called ‘ceiling effect’ meant that this study was unlikely to see further large increases in antibody levels for these two viruses and therefore was unlikely to reveal an effect of psychological and behavioural factors. As a result the team focused its analyses on the one strain which was the least ‘immunogenic’ i.e. the strain with low levels of antibody prior to vaccination.

The researchers say the approach of focusing on individual viral strains is not uncommon, but

recommend that future research is best conducted in the context of a vaccination with more novel viral strains to further confirm the positive mood effect on vaccination.

The project was funded by National Institute for Health Research School for Primary Care Research (NIHR SPCR) and the Medical Research Council (MRC).

Brain's anterior cingulate cortex and its tie to human learning: New research advances understanding of the function of the brain's anterior cingulate cortex and its tie to human learning -- ScienceDaily

After four years of lab testing and complex neuro-decoding, a research team led by UNLV psychology professor James Hyman has struck a major breakthrough that could open the floodgates for research into the anterior cingulate cortex, or ACC, and how human brains learn.

The research, published this summer in the neuroscience journal *Neuron*, offers new insight into the ACC's role in guiding the brain's response and adaptation to unexpected outcomes. The study also showed the first cellular correlates of the extensively studied human phenomena known as feedback negativity. Hyman had previously found in 2015 conclusive evidence that the ACC in rodent brains

reacts in the same manner as in humans to reward probability and outcome expectancy.

The study garnered a special preview article in the journal from Bruno Averbeck, a leading expert in the field from the National Institutes of Health.

The function of the brain's ACC is heavily studied, but many scientists believe it contributes to behavioral adaptation, detection of conflict and responding to and managing emotional reactions.

According to Hyman, the ACC essentially creates expectations about what's going to happen. Then, when the result of our actions leads to an outcome, our brain assesses whether that outcome was the same as what we expected. The ACC is integrally involved in this process. If the outcome is not what we expected, the ACC reacts with a larger electrical charge -- known as feedback negativity -- than if the outcome was expected.

The research team showed that when an expected outcome was not delivered, a neural signal in the brain's ACC was detected. This signal offers clues to the cellular origin of feedback negativity, and that the

phenomenon may be generated as the neurons in the ACC shift from encoding expected to actual outcomes.

Our brains are constantly doing this, Hyman said.

"Generally, the ACC always has a negative electrical change to outcomes, it's just the size of this change varies by whether the outcome was the expected one or not and whether it was better or worse than expected," said Hyman. "Every single thing we do involves making predictions about what's going to happen next. Usually facile little things, such as opening an unlocked door," Hyman said.

For instance, if you go to open what you believe to be an unlocked door by its handle, your ACC is predicting the outcome that the door will open and you will walk in. If the door handle is locked and it does not open as predicted, an electrical reaction occurs that is readable. The ACC will then learn from the unexpected outcome of its initial prediction.

Now imagine you were playing a slot machine with a 75 percent chance of winning (we're pretending here). If the percentage was changed without you knowing to 25 percent, your ACC would still predict a positive

outcome. When you start losing, the ACC would react to the unexpected outcome. And, most importantly, you would realize something's not right, learn from the outcome, and potentially adjust your behavior.

Through the course of the study, Hyman also discovered a correlation between feedback-related negativity in in both human and rodent models.

"It took as few as two consecutive unexpected events for cells to change and start making the opposite prediction," Hyman said. The testing mirrored what has been done in humans and opens the possibility that findings from rodent models can contribute to our understanding of the ACC function in humans.

Additional research on the ACC could lead to new solutions to assist in the cognitive control problems that are associated with a host of psychiatric disorders such as depression, schizophrenia, and drug addiction.

According to Hyman, this discovery will help in further understanding our ability to detect the situations where we have the most learning. "Understanding those mechanics could make us learn faster," he said.

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different

parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

- [**Scientists sequence asexual tiny worm whose lineage stretches back 18 million years**](#) [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Jellyfish, with no brains, still seem to sleep**](#) [周五, 22 9月 02:12]

The discovery that primitive jellyfish sleep suggests that sleep is an ancient, evolutionarily conserved behavior.

- [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

- [**Reconstructing how Neanderthals grew, based on an El Sidrón child**](#) [周五, 22 9月 02:12]

How did Neanderthals grow? Does modern man develop in the same way as Homo neanderthalensis did? How does the size of the brain affect the development of the body? Researchers have studied the fossil remains of a Neanderthal child's skeleton in order to establish whether

there are differences between the growth of Neanderthals and that of sapiens.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Dino-killing asteroid's impact on bird evolution**](#) [周五, 22 9月 00:11]

Human activities could change the pace of evolution, similar to what occurred 66 million years ago when a giant asteroid wiped out the dinosaurs, leaving modern birds as their only descendants.

- [**One in four girls is depressed at age 14**](#) [周四, 21 9月 23:07]

New research shows a quarter of girls (24%) and one in 10 boys (9%) are depressed at age 14.

- [**Surprising discovery: How the African tsetse fly really drinks your blood**](#) [周四, 21 9月 23:06]

Researchers have been taking a close-up look at the biting mouthparts of the African tsetse fly as part of ongoing work on the animal diseases it carries. Using a new high-powered scanning electron microscope, researchers were able to see the rows of sharp teeth and rasps that the fly uses to chew through the skin when it bites.

- [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

- [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

- [**Changing of the guard: Research sheds light on how plants breathe**](#) [周四, 21 9月 22:17]

New research is set to change the textbook understanding of how plants breathe. Researchers have developed the first full 3D model of a guard cell.

- [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

- [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**Immune system is critical to regeneration, study finds**](#) [周四, 21 9月 03:49]

The answer to the question of why some organisms can regenerate major

body parts while others, such as humans, cannot may lie with the body's innate immune system, according to a new study of heart regeneration in the Mexican salamander.

• [Unique type of object discovered in our solar system](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

• [Fly away home? Ice age may have clipped bird migration](#) [周四, 21 9月 02:46]

The onset of the last ice age may have forced some bird species to abandon their northerly migrations for thousands of years, says new research led by an ornithologist. The study challenges a long-held presumption that birds merely shortened their migratory flights when glaciers advanced south to cover much of North America and northern Europe about 21,000 years ago.

• [Species abundance: Winter restricts innovation](#) [周四, 21 9月 01:17]

Why are there so many more species in the tropics? The 'storage effect' is stronger there than in temperate forests.

• [Bite force research reveals dinosaur-eating frog](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called *Beelzebufo* that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

• [Animal acoustic activity decline shows forest fire pollution wreaks havoc on wildlife](#) [周四, 21 9月 01:17]

Forest fires in Southeast Asia during the El Niño droughts of 2015

caused considerable disruption to the biodiversity of the region due to the smoke-induced 'haze' they created, according to new research.

- [**New concept of terrestrial planet formation**](#) [周四, 21 9月 01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- [**Dinosaur evolution: Lumbering giants had agile ancestors**](#) [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

- [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- [**Brain cancer growth halted by absence of protein**](#) [周四, 21 9月 01:16]

The growth of certain aggressive brain tumors can be halted by cutting off their access to a signaling molecule produced by the brain's nerve cells, according to a new study.

- [**Millions of new genes in human microbiome**](#) [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of

previously unknown genes from microbial communities in the human gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

- [**Genome editing reveals role of gene important for human embryo development**](#) [周四, 21 9月 01:16]

Researchers have used genome editing technology to reveal the role of a key gene in human embryos in the first few days of development. This is the first time that genome editing has been used to study gene function in human embryos, which could help scientists to better understand the biology of our early development.

- [**Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues**](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

- [**How Teotihuacan's urban design was lost and found**](#) [周三, 20 9月 23:33]

A new article outlines how the urban design of the city of Teotihuacan differed from past and subsequent cities, only to be rediscovered and partially modeled on many centuries later by the Aztecs.

- [**10,000 year-old DNA proves when fish colonized our lakes**](#) [周三, 20 9月 22:45]

DNA in lake sediment forms a natural archive displaying when various fish species colonized lakes after the glacial period. Scientists' analyses of the prevalence of whitefish DNA in sediment reveal that the whitefish came to Lake Stora Lögdsjön in Västerbotten already 10,000 years ago, whereas Lake Hotagen in Jämtland had its whitefish only 2,200 years ago.

• [**Solving the Easter Island population puzzle**](#) [周三, 20 9月 22:01]

The nearly nine hundred giant stone statues discovered by the first Europeans to land on Easter Island seemed at odds with the small population found living there. It is believed a once thriving community witnessed sweeping ecological change and suffered internal conflict, resulting in a population crash. A new detailed study of the farming potential of the Island suggests it could have sustained 17,500 people at its peak.

• [**Emerging disease further jeopardizes North American frogs**](#) [周三, 20 9月 04:02]

A deadly amphibian disease called severe Perkinsea infections, or SPI, is the cause of many large-scale frog die-offs in the United States, according to a new study.

• [**End-of-summer Arctic sea ice extent is eighth lowest on record**](#) [周三, 20 9月 04:01]

Arctic sea ice appeared to have reached its yearly lowest extent on Sept. 13, scientists have reported. Analysis of satellite data showed that at 1.79 million square miles (4.64 million square kilometers), this year's Arctic sea ice minimum extent is the eighth lowest in the consistent long-term satellite record, which began in 1978.

• [**North Atlantic right whales decline confirmed: 458 remaining**](#) [周三, 20 9月 02:04]

Marine biologists have developed a new model to improve estimates of abundance and population trends of endangered North Atlantic right whales, which have declined in numbers and productivity in recent years. Between 1990 and 2010 abundance increased to 482 animals, but since 2010 the numbers have declined to 458 in 2015, with 14 known deaths this year.

• [**Sleep deprivation is an effective anti-depressant for nearly half of depressed patients, study suggests**](#) [周三, 20 9月 02:04]

Sleep deprivation - typically administered in controlled, inpatient settings - rapidly reduces symptoms of depression in roughly half of depression patients, according the first meta-analysis on the subject in nearly 30 years.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Quitting daily aspirin therapy may increase second heart attack, stroke risk**](#) [周二, 26 9月 04:32]

Stopping long-term, low-dose aspirin therapy may increase your risk of suffering a cardiovascular event, research indicates. Risk increases shortly after stopping and does not appear to diminish over time.

- [**Being in a good mood for your flu jab boosts its effectiveness**](#) [周二, 26 9月 03:47]

New research by a team of health experts has found evidence that being in a positive mood on the day of your flu jab can increase its protective effect.

- [**Brain's anterior cingulate cortex and its tie to human learning**](#) [周二, 26 9月 03:14]

After four years of lab testing and complex neuro-decoding, a research team has struck a major breakthrough that could open the floodgates for research into the anterior cingulate cortex, or ACC, and how human brains learn.

- [**Prostaglandin EI inhibits leukemia stem cells**](#) [周二, 26 9月 03:14]

Two drugs, already approved for safe use in people, may be able to improve therapy for chronic myeloid leukemia (CML), a blood cancer that affects myeloid cells, according to new results.

- [**Metabolism directly impacts the odds of developing malaria**](#) [周二, 26 9月 01:30]

Researchers have found that the host's susceptibility to develop malaria depends on his or her metabolic state, which can be easily manipulated through external stimuli such as dietary patterns.

- [**Creating brain cells to detect Tourette's**](#) [周二, 26 9月 01:30]

Scientists have used a genetic engineering technique for the first time to create brain cells from the blood cells of individuals in a three-generation family with Tourette syndrome to help determine what causes the disease.

- [**Bone marrow concentrate improves joint transplants**](#) [周二, 26 9月 01:30]

Biologic joint restoration using donor tissue instead of traditional metal and plastic may be an option for active patients with joint defects. Researchers have found in a group of patients that treating donor grafts with bone marrow aspirate concentrate before surgery improves bone integration and speeds recovery.

- [**Discovering what makes organelles connect could help explain neurodegenerative diseases**](#) [周二, 26 9月 01:29]

Organelles must exchange signals and materials to make the cell operate correctly. New technologies are allowing researchers to see and understand the networks that connect these organelles, allowing them to build maps of the trade routes that exist within a cell.

- [**Violent crime increases during warmer weather, no matter the season, study finds**](#) [周二, 26 9月 01:29]

A study analyzing crime data in Philadelphia for 10 years found that rates of violent crime and disorderly conduct are higher when the weather is warmer and more pleasant, even rising sharply during warmer-than-typical winter days.

- [**Streamlined process opens drug development to a new class of steroids**](#) [周二, 26 9月 01:29]

Researchers have developed a technique to produce synthetic steroids that could pave the way for a cascade of new drug discoveries,

significantly reducing the expense and time needed to develop therapeutics from an underexplored collection of molecules.

• [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

• [**Tension makes the heart grow stronger**](#) [周二, 26 9月 01:29]

By taking videos of a tiny beating zebrafish heart as it reconstructs its covering in a petri dish, scientists have captured unexpected dynamics of cells involved in tissue regeneration. They found that the depleted heart tissue regenerates in a wave, led by a front of fast-moving, supersized cells and trailed by smaller cells that multiply to produce others. The nature of this wavefront is determined by mechanical tension on the cells.

• [**Are children who see movie characters use guns more likely to use them?**](#) [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

• [**Antibody protects against Zika and dengue, mouse study shows**](#) [周二, 26 9月 01:29]

The same countries hard hit by Zika virus -- which can cause brain damage in babies infected before birth -- are also home to dengue virus. Researchers now report that they have found an antibody that protects against both viruses. These findings, in mice, could be a step towards an antibody-based preventative drug to protect fetuses from brain damage, while also protecting their mothers from both Zika and dengue disease.

• [**Adding radiation to chemotherapy may**](#)

[**dramatically improve survival for advanced NSCLC**](#) [周一, 25 9月 23:33]

Combining radiation therapy with chemotherapy for patients with limited metastatic non-small cell lung cancer (NSCLC) may curb disease progression dramatically when compared to NSCLC patients who only receive chemotherapy, according to a new randomized phase II clinical trial.

[**Study raises expectations for improved language skills in the deaf and hard-of-hearing**](#) [周一, 25 9月 23:33]

Universal screening of newborns for hearing loss before they leave the hospital is not enough to improve language skills of children who are deaf and hard of hearing. At least 40 percent of children with a hearing loss have the capacity for higher language levels -- beyond what test scores indicate.

[**Group project? Taking turns, working with friends may improve grades**](#) [周一, 25 9月 23:33]

A new study with college students has found that the social dynamics of a group, such as whether one person dominates the conversation or whether students work with a friend, affect academic performance. Put simply, the more comfortable students are, the better they do, which yields benefits beyond the classroom.

[**Diabetes medicine reduces Parkinson's risk**](#) [周一, 25 9月 23:16]

Taking diabetes medicine reduces the risk of getting Parkinson's disease, new research demonstrates. Researchers have discovered that medical treatment against diabetes reduces the risk of getting Parkinson's disease by 35 per cent.

[**New treatment for chronic throat irritation and globus sensation in the gullet**](#) [周一, 25 9月 23:16]

Chronic throat irritation, a permanent globus sensation, a sore or dry sensation in the throat are common symptoms, which are often trivialized and wrongly attributed to gastro-oesophageal reflux disease.

However, these are also the characteristic symptoms of patients suffering from displaced gastric mucosa in the oesophagus (ectopic mucosa). A recent study has now brought a break-through in the treatment of patients with this condition. For the first time in the world, the new radiofrequency abl...

- [**Visual attention drawn to meaning, not what stands out**](#) [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- [**Diet, in addition to alcohol consumption, may play important role in liver problems**](#) [周一, 25 9月 23:13]

A new study finds that mice bred to consume high amounts of alcohol, but controlled by diet, did not necessarily develop the most severe liver injuries, suggesting that diet may play an important role in liver injury development.

- [**Child abuse affects brain wiring**](#) [周一, 25 9月 23:13]

For the first time, researchers have been able to see changes in the neural structures in specific areas of the brains of people who suffered severe abuse as children. The researchers believe that these changes may contribute to the emergence of depressive disorders and suicidal behavior.

- [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

- [**The rat race is over: New livestock model for stroke could speed discovery**](#) [周一, 25 9月 22:57]

Researchers have developed the first US pig model for stroke

treatments.

- [**Minority public managers prefer integrating social equity, traditional public values**](#) [周一, 25 9月 22:57]

Minority public managers place more emphasis on both traditional values, like efficiency and effectiveness, and social equity when compared with their white counterparts, according to a new study.

- [**Open-ended laboratory tests for cyclists could help athletes train better**](#) [周一, 25 9月 22:47]

Scientists have discovered that cyclists can perform better when they do not have to pace their efforts. Using 17 experienced male cyclists in a series of tests, they compared open-ended Time-To-Exhaustion (TTE) trials that are often used in laboratories with race-like Time-Trials to measure endurance performance. All of the cyclists were blinded to elapsed time, power output, cadence and heart rate.

- [**A 'social control' system guarantees embryonic stem cell purity**](#) [周一, 25 9月 22:47]

A sophisticated system of 'social control' operating between neighboring cells allows embryos to protect the purity of their pluripotent cell population, which is able to generate all body tissues.

- [**Drug targeting technique could aid therapies for immune diseases**](#) [周一, 25 9月 22:47]

A new technique that targets drugs to specific cells could lead to improved therapies for diseases caused by an overactive immune response. The research could help people affected by conditions such as arthritis and inflammatory bowel diseases, where the body's own immune system mistakenly attacks healthy tissues.

- [**Maternal diet could affect kids' brain reward circuitry**](#) [周一, 25 9月 22:47]

Researchers have found that rats who ate junk food during pregnancy had heavier pups that strongly preferred fat straight after weaning. However, a balanced diet in childhood seemed to reduce the pups' desire

for fat. The pups also showed altered brain reward circuitry into adulthood. The findings could have implications for childhood nutrition and obesity in Western countries.

- [**Electronic triage tool improves patient care in emergency departments**](#) [周一, 25 9月 22:47]

When a patient arrives in any emergency department, one of the first steps in their care process is triage, an opportunity for a care team member to identify critically ill patients and assign priority treatment levels.

- [**Gene associated with schizophrenia risk regulates early brain development**](#) [周一, 25 9月 22:47]

A gene associated with the risk of schizophrenia regulates critical components of early brain development, according to a new study. The gene is involved in the translation of proteins from RNA and in the proliferation and migration of neurons in the brain. Understanding the function of this gene could lead to more effective treatments for schizophrenia.

- [**Thinking 'out-of-the-box' may build a better brain and prevent dementia**](#) [周一, 25 9月 21:55]

With disease-modifying treatment trials for Alzheimer's disease (AD) currently unsuccessful and only medications to treat symptoms available, what now? A leading neuroscientist has developed the

- [**Fresh blood for damaged tissues via alginate hydrogels**](#) [周一, 25 9月 21:55]

A team of researchers has engineered an alginate hydrogel infused with VEGF and IGF in order to promote vascularization in the ischemic hind limbs of aged mice and young rabbits and increase perfusion, or blood flow in the damaged tissue.

- [**Regenerating tissues with gene-targeting molecules**](#) [周一, 25 9月 21:55]

Researchers have constructed a synthetic molecule that can recognize

and bind with a specific DNA sequence and promotes differentiation of hiPSCs into heart muscle cells.

- **Wound care: Patch could improve healing and reduce scarring** [周一, 25 9月 21:54]

Scientists have developed a new gel patch prototype that could speed up the healing of a skin wound while minimizing the formation of scars.

- **Newly revealed autism-related genes include genes involved in cancer** [周一, 25 9月 21:54]

Researchers have applied a computational technique that accounts for how genes interact, to find new networks of related genes that may be involved in autism spectrum disorder. Some of the genes have not been previously linked to the disorder, and could help scientists to better understand it and develop new treatments.

- **Brain guides body much sooner than previously believed** [周一, 25 9月 21:54]

The brain plays an active role much earlier than previously thought. Long before movement or other behaviors occur, the nascent brain of an embryonic frog instructs normal muscle and nerve patterning and protects the embryo from agents that cause developmental defects. In addition to identifying these essential functions for the first time, researchers successfully rescued defects caused by lack of a brain by using widely available, human-approved drugs.

- **Up to one-quarter of cancer patients use marijuana** [周一, 25 9月 21:54]

A new study conducted in a cancer center in a state with legalized medicinal and recreational marijuana found that approximately one-quarter of surveyed patients used marijuana in the past year, mostly for physical and psychological symptoms.

- **For a better 'I,' there needs to be a supportive 'we'** [周一, 25 9月 21:54]

If you're one of those lucky individuals with high motivation and who

actively pursues personal growth goals, thank your family and friends who support you.

- [**MRI contrast agent locates and distinguishes aggressive from slow-growing breast cancer**](#) [周一, 25 9月 21:54]

A new magnetic resonance imaging contrast agent being tested by researchers not only pinpoints breast cancers at early stages but differentiates between aggressive and slow-growing types.

- [**A brain-system that builds confidence in what we see, hear and touch**](#) [周一, 25 9月 21:53]

A series of experiments provide conclusive evidence that the brain uses a single mechanism (supramodality) to estimate confidence in different senses such as audition, touch, or vision.

- [**Chronic migraine cases are amplified by jawbone disorder**](#) [周日, 24 9月 22:37]

A new study shows patients with chronic migraine are three times as likely to suffer from severe temporomandibular disorder. Though not a primary cause, the disorder is thought to accentuate and perpetuate sensitivity to pain; therefore, researchers recommend in chronic migraine clinical practice the assessment of the disorder's symptoms.

- [**First large scale study of cocaine users leads to breakthrough in drug testing**](#) [周六, 23 9月 07:31]

A rapid and highly sensitive fingerprint test has been developed that can take just seconds to confirm whether someone has used cocaine.

- [**Antibiotics, biocidal cleaners may spread multidrug resistance in MRSA**](#) [周六, 23 9月 03:05]

Antibiotic use on people or pets, and use of biocidal cleaning products such as bleach, are associated with multidrug resistance in methicillin-resistant *Staphylococcus aureus* (MRSA) in the home. This contamination of the home environment may contribute to reinfection of both humans and animals with MRSA, and to subsequent failure of treatment.

• [**Mechanism that underlies age-associated bone loss**](#) [周六, 23 9月 03:05]

A major health problem in older people is age-associated osteoporosis -- the thinning of bone and the loss of bone density that increases the risk of fractures. Researchers have now detailed an underlying mechanism leading to that osteoporosis. When this mechanism malfunctions, progenitor cells stop creating bone-producing cells, and instead create fat cells. Knowledge of this mechanism can provide targets in the search for novel bone-loss.

• [**Two Group A Streptococcus genes linked to 'flesh-eating' bacterial infections**](#) [周六, 23 9月 03:05]

Group A Streptococcus bacteria cause illnesses ranging from mild nuisances like strep throat to life-threatening conditions such as flesh-eating disease, also known as necrotizing fasciitis. Life-threatening infections occur when the bacteria spread underneath the surface of the skin or throat and invade the underlying soft tissue. Researchers have found two group A Streptococcus genes involved in invasive infections, which may be potential targets for therapeutics.

• [**Emergency contraception not as accessible as it should be, say researchers**](#) [周六, 23 9月 00:53]

Efforts to remove barriers to accessing emergency contraception (EC) scored victories in 2013, when the US Food and Drug Administration removed age restrictions on over-the-counter sales of the levonogestrel drug Plan B.

• [**Dentistry study pinpoints role of proteins that produce pearls**](#) [周六, 23 9月 00:29]

While it is known that pearls are made of calcium carbonate with an organic matrix core, the role of the proteins modulating the organization of these crystals has, until recently, been unclear. Researchers report the role of two such proteins that regulate the processes leading up to the formation of pearl.

. [Our weight tells how we assess food](#) [周五, 22 9月 23:17]

A new study demonstrated that people of normal weight tend to associate natural foods such as apples with their sensory characteristics. On the other hand, processed foods such as pizzas are generally associated with their function or the context in which they are eaten. But that's not all. The research also highlighted the ways in which underweight people pay greater attention to natural foods and overweight people to processed foods.

. [Residents: Frontline defenders against antibiotic resistance?](#) [周五, 22 9月 23:17]

Residents often decide which antibiotics to start a patient on so they could become the first line of defense against antibiotic resistance.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Creative use of noise brings bio-inspired electronic improvement**](#) [周二, 26 9月 03:14]

Researchers are working to exploit stochastic resonance to enhance signal transmission for a new generation of devices, using single-walled carbon nanotubes. They created a summing network SR device that detects subthreshold signals, fabricated to include a self-noise component.

- [**Holograms for molecules**](#) [周二, 26 9月 01:30]

Scientists have developed a completely new method for the analysis of molecules in liquids on a chip. The possible applications of this technology are immense. It has the potential, inter alia, to revolutionize medical diagnostics.

- [**Click beetles inspire design of self-righting robots**](#) [周二, 26 9月 01:30]

Robots perform many tasks that humans can't or don't want to perform, getting around on intricately designed wheels and limbs. If they tip over, however, they are rendered almost useless. Mechanical engineers and entomologists are looking to click beetles, who can right themselves without the use of their legs, to solve this robotics challenge.

- [**New non-contact, remote biometric tool could be next advance in computer security**](#) [周二, 26 9月 01:30]

Forget fingerprint computer identification or retinal scanning. Scientists have now developed a computer security system using the dimensions of your heart as your identifier. The system uses low-level Doppler radar to

measure your heart, and then continually monitors your heart to make sure no one else has stepped in to run your computer.

- **[IceCube helps demystify strange radio bursts from deep space](#)** [周二, 26 9月 01:29]

Scientists are turning IceCube, the world's most sensitive neutrino telescope, to the task of helping demystify powerful pulses of radio energy generated up to billions of light-years from Earth.

- **[The material that obscures supermassive black holes](#)** [周二, 26 9月 01:29]

New research examines the material that obscures active galactic nuclei obtained from infrared and X-ray observations.

- **[Are children who see movie characters use guns more likely to use them?](#)** [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- **[Physicists demonstrate using a laser to control a current in graphene within just one femtosecond](#)** [周二, 26 9月 01:28]

Controlling electronic current is essential to modern electronics, as data and signals are transferred by streams of electrons which are controlled at high speed. Demands on transmission speeds are also increasing as technology develops. Scientists have now succeeded in switching on a current with a desired direction in graphene using a single laser pulse within a femtosecond. This is more than a thousand times faster compared to the most efficient transistors today.

- **[Climate insurance is rarely well thought out in agriculture](#)** [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains

recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

- [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

- [**New technique uses light to separate mirrored molecules**](#) [周一, 25 9月 23:13]

Left- and right-handed versions of molecules can be hard to tell apart but can have devastatingly different effects. Researchers are developing an optical filter to sort these molecules, which could lead to purer and safer drugs and agrichemicals.

- [**Nanoparticle supersoap creates 'bijel' with potential as sculptable fluid**](#) [周一, 25 9月 23:13]

A new type of 'bijel' could one day lead to applications in soft robotics, liquid circuitry, and a host of other applications that could benefit from shape-shifting fluids.

- [**New type of supercomputer could be based on 'magic dust' combination of light and matter**](#) [周一, 25 9月 23:13]

Scientists have successfully demonstrated that a type of 'magic dust' which combines light and matter can be used to solve complex problems and could eventually surpass the capabilities of even the most powerful supercomputers.

- [**Scientists monitor Silicon Valley's underground water reserves -- from space**](#) [周一, 25 9月 22:57]

Scientists monitoring Silicon Valley's underground water reserves from space have found that water levels rebounded quickly after a severe

drought that lasted from 2012-15. The research points to the success of aggressive conservation measures. It also helps to lay the groundwork for low-cost monitoring of subterranean water reserves in California and elsewhere in the world.

• [**Filter may be a match for fracking water**](#) [周一, 25 9月 22:47]

A superhydrophilic filter has proven able to remove more than 90 percent of contaminants from water used in hydraulic fracturing operations at shale oil and gas wells.

• [**With extra sugar, leaves get fat too**](#) [周一, 25 9月 22:47]

Eat too much without exercising and you'll probably put on a few pounds. As it turns out, plant leaves do something similar. A new study shows that retaining sugars in plant leaves can make them get fat too. In plants, this extra fat accumulation could be a good thing. It could help turn plants into factories for making biofuels and other useful chemicals.

• [**Semitransparent and flexible: Solar cells made from atomically thin sheet**](#) [周一, 25 9月 21:55]

A new method for fabricating semitransparent, flexible solar cells has greatly improved power conversion efficiency.

• [**New synthesis method for click chemistry**](#) [周一, 25 9月 21:55]

Scientists have developed a new way to advance click chemistry.

• [**Wound care: Patch could improve healing and reduce scarring**](#) [周一, 25 9月 21:54]

Scientists have developed a new gel patch prototype that could speed up the healing of a skin wound while minimizing the formation of scars.

• [**A preparative-scale reaction using platinum clusters with a single-digit atomicity realized**](#) [周一, 25 9月 21:54]

Scientists have recently developed a fully scalable method for the synthesis of atom-precise platinum clusters for potential use in catalytic applications. This method could provide a new pathway for large-scale production of atom-precise clusters. To demonstrate this, the

hydrogenation of styrene was performed.

- [**How aerial thermal imagery is revolutionizing archaeology**](#) [周日, 24 9月 22:37]

A new study has demonstrated how the latest aerial thermal imagery is transforming archaeology due to advancements in technology. Today's thermal cameras, commercial drones and photogrammetric software has introduced a new realm of possibilities for collecting site data-- field survey data across a much larger area can now be obtained in much less time. The findings serve as a manual on how to use aerial thermography.

- [**NASA'S OSIRIS-REx spacecraft slingshots past Earth**](#) [周六, 23 9月 04:25]

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

- [**Twitter bots for good: Study reveals how information spreads on social media**](#) [周六, 23 9月 03:05]

Twitter bots have earned a bad reputation. But not all bots are bad, suggests a new study.

- [**Enhancing the sensing capabilities of diamonds with quantum properties**](#) [周六, 23 9月 00:29]

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Assembly of nanoparticles proceeds like a zipper**](#) [周五, 22 9月 21:40]

It has always been the Holy Grail of materials science to describe and

control the material's structure-function relationship. Nanoparticles are an attractive class of components to be used in functional materials because they exhibit size-dependent properties, such as superparamagnetism and plasmonic absorption of light. Furthermore, controlling the arrangement of nanoparticles can result in unforeseen properties, but such studies are hard to carry out due to limited efficient approaches to prod...

- [**Smartphone apps can reduce depression**](#) [周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible interventions for the millions of people around the world diagnosed with this condition.

- [**Ultra-light aluminum: Chemist reports breakthrough in material design**](#) [周五, 22 9月 21:09]

Chemists report a new, metastable, ultra-light crystalline form of aluminum has been computationally designed using density functional calculations with imposing periodic boundary conditions.

- [**The math of doughnuts: 'Moonshine' sheds light on elliptic curves**](#) [周五, 22 9月 21:09]

Mathematicians have opened a new chapter in the theory of moonshine, one which begins to harness the power of the pariahs -- sporadic simple groups that previously had no known application.

- [**Positive, negative or neutral, it all matters: NASA explains space radiation**](#) [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- [**New technique accurately digitizes transparent objects**](#) [周五, 22 9月 04:12]

A new imaging technique makes it possible to precisely digitize clear

objects and their surroundings, an achievement that has eluded current state-of-the-art 3-D rendering methods.

- [**'Labyrinth' chip could help monitor aggressive cancer stem cells**](#) [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to separate out rare circulating cancer cells into a relatively clean stream for analysis. It is already in use in a breast cancer clinical trial.

- [**Dancing electrons lose the race**](#) [周五, 22 9月 02:13]

Ultrashort pulses of light were employed by physicists to start a race between electrons emitted from different initial states in a solid material. Timing this race revealed an unexpected result: the fastest electrons arrived in last place.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Breaking Coulomb's law: Scientists find a way around the rule that 'opposites attract'**](#) [周五, 22 9月 01:43]

Scientists have taken a big step towards creating the next generation of batteries, as well as more effective water treatment and better alternative energy after defying one of nature's most fundamental rules on an atomic scale.

- [**Quantum teleportation of patterns of light**](#) [周五, 22 9月 00:11]

Researchers have demonstrated entanglement swapping and teleportation of orbital angular momentum 'patterns' of light. This is a crucial step towards realizing a quantum repeater for high-dimensional entangled states.

- [**Rapid imaging of granular matter**](#) [周五, 22 9月 00:11]

Granular systems such as gravel or powders can be found everywhere,

but studying them is not easy. Researchers have now developed a method by which pictures of the inside of granular systems can be taken 10,000 times faster than before.

- [**New analysis explains role of defects in metal oxides**](#) [周五, 22 9月 00:11]

Researchers have determined formulas to guide development of a promising new high-tech material, composed of insulating metal oxides known as alkaline-earth-metal binary oxides, that could lead to better computer memory chips, refrigeration systems, and other devices.

- [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

- [**Better rechargeable batteries coming soon?**](#) [周四, 21 9月 22:17]

Novel lithium electrodes coated with indium could be the basis for more powerful, longer-lasting, rechargeable batteries. The coating hinders undesirable side-reactions between the electrode and electrolyte, provide a more uniform deposition of lithium when charging, and augments storage in the lithium anode via alloying reactions between lithium and indium. Their success stems from the good diffusion of lithium ions along the interfacial layer.

- [**Astonishing time limit for ultrafast perovskite solar cells set**](#) [周四, 21 9月 22:17]

Researchers have quantified the astonishingly high speeds at which future solar cells would have to operate in order to stretch what are presently seen as natural limits on their energy conversion efficiency.

- [**Diamonds show Earth still capable of 'superhot' surprises**](#) [周四, 21 9月 21:55]

Diamonds may be 'forever' but some may have formed more recently

than geologists thought. A study of 26 diamonds, formed under extreme melting conditions in the Earth's mantle, found two populations, one of which has geologically 'young' ages. The results show that certain volcanic events on Earth may still be able to create super-heated conditions previously thought to have only existed early in the planet's history before it cooled. The findings may have implications for diamond prospecting.

- [**Solar eruption 'photobombed' Mars encounter with Comet Siding Spring**](#) [周四, 21 9月 21:50]

When Comet C/2013 A1 (Siding Spring) passed just 140,000 kilometers from Mars on 19th October 2014, depositing a large amount of debris in the Martian atmosphere, space agencies coordinated multiple spacecraft to witness the largest meteor shower in recorded history. It was a rare opportunity, as this kind of planetary event occurs only once every 100,000 years.

- [**Football helmet smartfoam signals potential concussions in real time, study suggests**](#) [周四, 21 9月 21:03]

While football-related concussions have been top of mind in recent years, people have struggled to create technology to accurately measure them in real time. Engineers have now developed and tested a nano composite smartfoam that can be placed inside a football helmet (and pads) to more accurately test the impact and power of hits.

- [**Precisely defined polymer chains now a reality**](#) [周四, 21 9月 21:03]

The materiality exhibited by humanmade polymers currently relies on simple chemical bonds and the sequence order taken by molecules in the polymer chain. We now no longer need to rely on fate to determine such materiality with this new technique for precisely defining polymer-chain order. This system uses highly specific 'grabber' ends on each molecule that bond with only one type of 'pin' end on another molecule.

- [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They

have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

- [**Bio-inspired approach to RNA delivery**](#) [周四, 21 9月 03:50]

A team of chemical engineers, inspired by the way that cells translate their own mRNA into proteins, has designed a synthetic delivery system that is four times more effective than delivering mRNA on its own.

- [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

- [**New biomaterial could replace plastic laminates, greatly reduce pollution**](#) [周四, 21 9月 02:47]

An inexpensive biomaterial that can be used to sustainably replace plastic barrier coatings in packaging and many other applications has been developed by researchers, who predict its adoption would greatly reduce pollution.

- [**Wave Glider surfs across stormy Drake Passage in Antarctica**](#) [周四, 21 9月 02:46]

A hardy ocean drone made a first-ever attempt to surf across Antarctica's stormy Drake Passage gathering data about ocean mixing.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Penguin-mounted video captures gastronomic close encounters of the gelatinous kind**](#) [周二, 26 9月 04:32]

Footage from penguin-mounted mini video recorders shows four species of penguin eating jellyfish and other gelatinous animals of the open ocean, a food source penguins were not previously believed to partake of, scientists report.

- [**Snails bred in lab help species crawl back from brink of extinction**](#) [周二, 26 9月 04:06]

Work to restore the endangered Chittenango ovate amber snail, found only in one location inside a Central New York state park, continued this month with the release of tagged adult snails raised in a laboratory.

- [**Antarctica: The wind sublimates snowflakes**](#) [周二, 26 9月 03:14]

A team of researchers has collected new data that shows a significant decrease in snow precipitation close to the ground in Antarctica, which has an impact on the ice sheet surface mass balance.

- [**Mechanism of asexual reproduction in flatworms**](#) [周二, 26 9月 03:14]

Scientists have nailed the biomechanics of a centuries-long puzzle on how freshwater flatworms known as planarians reproduce. The asexual freshwater worms, notoriously difficult to study, tear themselves into two pieces that go on to form two new worms. Researchers are now able to predict where planarian fission occurs based on its anatomy as well as explain how the process happens using a relatively simple mechanical

model.

- [**Metabolism directly impacts the odds of developing malaria**](#) [周二, 26 9月 01:30]

Researchers have found that the host's susceptibility to develop malaria depends on his or her metabolic state, which can be easily manipulated through external stimuli such as dietary patterns.

- [**Ticks are even tougher and nastier than you thought**](#) [周二, 26 9月 01:30]

Studies are showing how ticks can survive drought and cold northern winters.

- [**Study examines legacies of rainforest burning in British Columbia**](#) [周二, 26 9月 01:30]

Analyses of temperate rain forests located on the central coast of British Columbia, Canada, suggest that for centuries, humans have intentionally used fire to manage plant life.

- [**Discovering what makes organelles connect could help explain neurodegenerative diseases**](#) [周二, 26 9月 01:29]

Organelles must exchange signals and materials to make the cell operate correctly. New technologies are allowing researchers to see and understand the networks that connect these organelles, allowing them to build maps of the trade routes that exist within a cell.

- [**Tension makes the heart grow stronger**](#) [周二, 26 9月 01:29]

By taking videos of a tiny beating zebrafish heart as it reconstructs its covering in a petri dish, scientists have captured unexpected dynamics of cells involved in tissue regeneration. They found that the depleted heart tissue regenerates in a wave, led by a front of fast-moving, supersized cells and trailed by smaller cells that multiply to produce others. The nature of this wavefront is determined by mechanical tension on the cells.

- [**Big brains in birds provides survival advantage**](#) [周二, 26 9月 01:29]

Scientists have discovered that brainier birds are better able to colonize inhospitable places.

- [**Bacterial nanosized speargun works like a power drill**](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in only a few thousandths of a second and injects a cocktail of toxins.

- [**Climate insurance is rarely well thought out in agriculture**](#) [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

- [**Climate change can goad volcanoes into life**](#) [周一, 25 9月 23:14]

Geologists have analyzed volcanic data from the Messinian salinity crisis in the Mediterranean Sea, when the Strait of Gibraltar was blocked and the Mediterranean temporarily isolated from the Atlantic. After testing various scenarios, the geologists concluded that the increase in magmatic activity could only be explained by the almost total drying out of the Mediterranean.

- [**Clarifying perspectives to promote action on loss and damage from climate change**](#) [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy, negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations

Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

- [**Likely scenarios for global spread of devastating crop disease**](#) [周一, 25 9月 23:13]

New research reveals the most likely months and routes for the spread of new strains of airborne 'wheat stem rust' that could endanger global food security by ravaging wheat production across Africa, the Middle East, Asia and the wider world.

- [**Panda habitat shrinking, becoming more fragmented**](#) [周一, 25 9月 23:13]

Using remote sensing data, Chinese and US scientists have re-assessed the conservation status of the giant panda. Their analysis shows that while panda numbers are increasing, their habitat still covers less area and is more fragmented than it was in 1988, when the species was listed as endangered on the IUCN Red List.

- [**World's botanic gardens contain a third of all known plant species, and help protect the most threatened**](#) [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41 percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

- [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

- [**The rat race is over: New livestock model for**](#)

[stroke could speed discovery](#) [周一, 25 9月 22:57]

Researchers have developed the first US pig model for stroke treatments.

• [Scientists monitor Silicon Valley's underground water reserves -- from space](#) [周一, 25 9月 22:57]

Scientists monitoring Silicon Valley's underground water reserves from space have found that water levels rebounded quickly after a severe drought that lasted from 2012-15. The research points to the success of aggressive conservation measures. It also helps to lay the groundwork for low-cost monitoring of subterranean water reserves in California and elsewhere in the world.

• [Scientists call for more research on how human activities affect the seabed](#) [周一, 25 9月 22:47]

Extensive research has been released into how industry and environmental change are affecting our seafloors. Researchers say more work is needed to help safeguard these complex ecosystems and the benefits they provide to people for the future.

• [Getting the measure of mud](#) [周一, 25 9月 22:47]

For the first time, researchers have been able to use mud deposited on the depths of the ocean floor to measure changes in the speed of deep-sea currents. Using mud as a current meter could help scientists to identify fluctuating patterns in ocean current speeds stretching back into prehistory, enabling climate change researchers to get a better sense of how currents behave over time.

• [Brain damage in fish from plastic nanoparticles in water](#) [周一, 25 9月 22:47]

A new study shows that plastic particles in water may end up inside fish brains. The plastic can cause brain damage, which is the likely cause of behavioral disorders observed in the fish.

• [Filter may be a match for fracking water](#) [周一, 25 9月 22:47]

A superhydrophilic filter has proven able to remove more than 90

percent of contaminants from water used in hydraulic fracturing operations at shale oil and gas wells.

- **[With extra sugar, leaves get fat too](#)** [周一, 25 9月 22:47]

Eat too much without exercising and you'll probably put on a few pounds. As it turns out, plant leaves do something similar. A new study shows that retaining sugars in plant leaves can make them get fat too. In plants, this extra fat accumulation could be a good thing. It could help turn plants into factories for making biofuels and other useful chemicals.

- **[Semitransparent and flexible: Solar cells made from atomically thin sheet](#)** [周一, 25 9月 21:55]

A new method for fabricating semitransparent, flexible solar cells has greatly improved power conversion efficiency.

- **[Regenerating tissues with gene-targeting molecules](#)** [周一, 25 9月 21:55]

Researchers have constructed a synthetic molecule that can recognize and bind with a specific DNA sequence and promotes differentiation of hiPSCs into heart muscle cells.

- **[Organic consumers mean business](#)** [周一, 25 9月 21:54]

Organic consumers are standing fast and are buying more and more organic products following an increasingly predictable pattern.

- **[Discovery of a new group of sponges could help measure impact of deep-sea mining](#)** [周一, 25 9月 21:54]

A completely new group of sponges has been discovered, which scientists believe could be a key indicator species in measuring future mining impact in a region targeted for deep-sea mining of polymetallic (metal-rich) nodules. They are likely to be the most abundant nodule-dwelling animal in the area.

- **[Fish have surprisingly complex personalities](#)** [周一, 25 9月 21:54]

Tiny fish called Trinidadian guppies have individual 'personalities', new research shows.

• [**Brain guides body much sooner than previously believed**](#) [周一, 25 9月 21:54]

The brain plays an active role much earlier than previously thought. Long before movement or other behaviors occur, the nascent brain of an embryonic frog instructs normal muscle and nerve patterning and protects the embryo from agents that cause developmental defects. In addition to identifying these essential functions for the first time, researchers successfully rescued defects caused by lack of a brain by using widely available, human-approved drugs.

• [**Up to one-quarter of cancer patients use marijuana**](#) [周一, 25 9月 21:54]

A new study conducted in a cancer center in a state with legalized medicinal and recreational marijuana found that approximately one-quarter of surveyed patients used marijuana in the past year, mostly for physical and psychological symptoms.

• [**New technique spots warning signs of extreme events**](#) [周日, 24 9月 22:38]

Engineers have devised a framework for identifying key patterns that precede an extreme event. The framework can be applied to a wide range of complicated, multidimensional systems to pick out the warning signs that are most likely to occur in the real world.

• [**How aerial thermal imagery is revolutionizing archaeology**](#) [周日, 24 9月 22:37]

A new study has demonstrated how the latest aerial thermal imagery is transforming archaeology due to advancements in technology. Today's thermal cameras, commercial drones and photogrammetric software has introduced a new realm of possibilities for collecting site data-- field survey data across a much larger area can now be obtained in much less time. The findings serve as a manual on how to use aerial thermography.

• [**Study finds no-tillage not sufficient alone to prevent water pollution from nitrate**](#) [周六, 23 9月 04:25]

A new study answers a long-debated agricultural question: whether no-tillage alone is sufficient to prevent water pollution from nitrate. The answer is no.

- [**Antibiotics, biocidal cleaners may spread multidrug resistance in MRSA**](#) [周六, 23 9月 03:05]

Antibiotic use on people or pets, and use of biocidal cleaning products such as bleach, are associated with multidrug resistance in methicillin-resistant *Staphylococcus aureus* (MRSA) in the home. This contamination of the home environment may contribute to reinfection of both humans and animals with MRSA, and to subsequent failure of treatment.

- [**Dentistry study pinpoints role of proteins that produce pearls**](#) [周六, 23 9月 00:29]

While it is known that pearls are made of calcium carbonate with an organic matrix core, the role of the proteins modulating the organization of these crystals has, until recently, been unclear. Researchers report the role of two such proteins that regulate the processes leading up to the formation of pearl.

- [**700 years old saint myth has been proven \(almost\) true**](#) [周五, 22 9月 23:17]

Scientists confirm that the age and content of an old sack is in accordance with a medieval myth about Saint Francis of Assisi.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Ancient textiles reveal differences in Mediterranean fabrics in the 1st millennium BC**](#) [周五, 22 9月 21:40]

Analysis of Iron Age textiles indicates that during c. 1000-400 BC Italy shared the textile culture of Central Europe, while Greece was largely influenced by the traditions of ancient Near East.

- [**Crowning the 'king of the crops': Sequencing the white guinea yam genome**](#) [周五, 22 9月 21:40]

Scientists have, for the first time, provided a genome sequence for the white Guinea yam, a staple crop with huge economic and cultural significance on the African continent and a lifeline for millions of people.

- [**Winter cold extremes linked to high-altitude polar vortex weakening**](#) [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Rainbow colors reveal cell history**](#) [周五, 22 9月 21:14]

A system called "Beta-bow", which allows the history of beta-cells to be traced by genetic bar-coding and multicolor imaging, has been developed by researchers.

- [**Party discipline for jumping genes**](#) [周五, 22 9月 21:09]

Jumping genes, transposons, are part of the genome of most organisms, aggregated into families and can damage the genome by jumping. How hosts suppress the jumping is well investigated. Why they still can jump has hardly been understood so far. Researchers investigated for the first time in all transposons of the host organism, which properties and host

environments facilitate jumping. They showed that family affiliation is more important than position.

• [**Artificial orchid cultivation kit**](#) [周五, 22 9月 21:09]

Orchids are loved by gardeners around the world but are notoriously difficult to cultivate. Researchers have developed a new orchid cultivation kit and have succeeded in complete artificial cultivation of an autonomous orchid. Since this kit can be made cheaply, it can broaden the opportunities for orchid cultivation in general households. It is also expected to be useful in preserving the genetic diversity of orchidaceous plants, many of which are in danger of extinction.

• [**Ozark grasslands experience major increase in trees and shrubs**](#) [周五, 22 9月 04:12]

Woody vegetation, such as trees and shrubs, has increased dramatically in Ozark grasslands over the past 75 years, according to a study. If these ecosystems continue to favor woody vegetation, will it be possible to maintain open grasslands for the foreseeable future?

• [**Into more thin air: Exploring the adaptation extremes of human high altitude sickness and fitness**](#) [周五, 22 9月 04:12]

Many research groups have explored human adaptation to high altitude living among three major far-flung global populations: Tibetans, Ethiopians and Peruvians. But few have simultaneously explored the other extreme---maladaptation---in the form of chronic mountain sickness (CMS). Now, in the largest whole genome study of its kind, an international research team led by University of California San Diego's Chairman of Pediatrics, Dr. Gabriel Haddad, has expanded on their recent study of understand...

• [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back

thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

[Scientists sequence asexual tiny worm whose lineage stretches back 18 million years](#) [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Are children who see movie characters use guns more likely to use them?**](#) [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- [**Climate insurance is rarely well thought out in agriculture**](#) [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

- [**Group project? Taking turns, working with friends may improve grades**](#) [周一, 25 9月 23:33]

A new study with college students has found that the social dynamics of a group, such as whether one person dominates the conversation or whether students work with a friend, affect academic performance. Put simply, the more comfortable students are, the better they do, which yields benefits beyond the classroom.

- [**Clarifying perspectives to promote action on loss and damage from climate change**](#) [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy, negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

- **[Visual attention drawn to meaning, not what stands out](#)** [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- **[World's botanic gardens contain a third of all known plant species, and help protect the most threatened](#)** [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41 percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

- **[Minority public managers prefer integrating social equity, traditional public values](#)** [周一, 25 9月 22:57]

Minority public managers place more emphasis on both traditional values, like efficiency and effectiveness, and social equity when compared with their white counterparts, according to a new study.

- **[Scientists call for more research on how human activities affect the seabed](#)** [周一, 25 9月 22:47]

Extensive research has been released into how industry and

environmental change are affecting our seafloors. Researchers say more work is needed to help safeguard these complex ecosystems and the benefits they provide to people for the future.

- [**New technique spots warning signs of extreme events**](#) [周日, 24 9月 22:38]

Engineers have devised a framework for identifying key patterns that precede an extreme event. The framework can be applied to a wide range of complicated, multidimensional systems to pick out the warning signs that are most likely to occur in the real world.

- [**Study finds no-tillage not sufficient alone to prevent water pollution from nitrate**](#) [周六, 23 9月 04:25]

A new study answers a long-debated agricultural question: whether no-tillage alone is sufficient to prevent water pollution from nitrate. The answer is no.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Strong alcohol policies help reduce alcohol-involved homicides**](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have

been shown to reduce the likelihood of alcohol involvement among homicide victims, according to a new study.

- **[Babies can learn that hard work pays off](#)** [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- **[We must accelerate transitions for sustainability and climate change, experts say](#)** [周五, 22 9月 02:12]

We must move faster towards a low-carbon world if we are to limit global warming to 2 degrees C this century, experts have warned.

- **[Rapid hepatitis C testing may help better screen young adults](#)** [周五, 22 9月 02:12]

Routine and rapid hepatitis C virus testing among young adults who use injection drugs improves life expectancy and may provide a good use of limited resources, according to new research.

- **[Wildlife rangers: What motivates them?](#)** [周五, 22 9月 00:11]

Wildlife rangers are on the front lines protecting our most iconic species -- tigers, elephants, gorillas and many others. But their challenges involve more than confrontations with wild animals and poachers.

- **[Recipe for forest restoration discovered](#)** [周四, 21 9月 22:17]

A new study has uncovered some valuable information on ways to maximize the success of replanting efforts, bringing new hope for restoring these threatened ecosystems.

- **[Premature births cost health plans \\$6 billion annually](#)** [周四, 21 9月 21:02]

A new study estimates employer-sponsored health plans spent at least \$6 billion extra on infants born prematurely in 2013 and a substantial portion of that sum was spent on infants with major birth defects.

- **[Pay more, smoke less: Possible effects of raising](#)**

[tobacco taxes across the EU](#) [周四, 21 9月 11:22]

Raising tobacco taxes to increase cigarette prices could reduce cigarette consumption and smoking-associated deaths (SADs) in all 28 EU countries, according to a new study. In higher income countries, raising tobacco taxes could increase revenues that could be spend on prevention and control programs, while in lower income countries tax revenues may be negatively affected, researchers suggest.

• [When residents take charge of their rainforests, fewer trees die](#) [周四, 21 9月 06:21]

When the government gives citizens a personal stake in forested land, trees don't disappear as quickly and environmental harm slows down, research finds.

• [Communication among health care facilities key to preventing spread of drug-resistant bacteria](#) [周四, 21 9月 02:47]

Communication breakdowns between care facilities can pave the way for outbreaks of infection, according to research on the spread of an extensively drug-resistant bacterium.

• [Hold the phone: An ambulance might lower your chances of surviving some injuries](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

• [Building social communication skills in shy children helps with peer likeability](#) [周三, 20 9月 22:00]

A new study has discovered that shy children with low English vocabulary skills, can still be popular among their peers if they have high-functioning social communication skills that enable them to engage and interact well with their peers in social settings.

• [New tool to assess individual's level of wisdom](#) [周三, 20 9月 21:59]

Researchers have developed a new tool called the San Diego Wisdom Scale (SD-WISE) to assess an individual's level of wisdom, based upon a conceptualization of wisdom as a trait with a neurobiological as well as psychosocial basis.

- [**Clear tactics, but few easy solutions, for hospitals combating ransomware**](#) [周三, 20 9月 02:48]

Hospitals facing the prospect of ransomware attacks like the one that afflicted British hospitals in May can take many concrete steps to better protect themselves, but some of the most important measures -- such as a national policy not to pay ransoms -- may be tougher to formulate.

- [**Management studies: Dishonesty shift**](#) [周三, 20 9月 02:04]

Lying comes more easily to people in teams: Behavioral scientists have shown in an experimental study why groups are more likely to behave unethically than individuals.

- [**Political polarization? Don't blame the web**](#) [周三, 20 9月 02:04]

Despite the popular narrative that the web is to blame for rising political polarization, a study by economists has found that recent growth in polarization is greatest for demographic groups in which individuals are least likely to use the internet and social media. This means that data does not support the claim that the internet is the most significant driver of partisanship.

- [**Changes in non-extreme precipitation may have not-so-subtle consequences**](#) [周三, 20 9月 00:31]

Extreme floods and droughts receive a lot of attention. But what happens when precipitation -- or lack thereof -- occurs in a more measured way?

- [**UK oil and gas reserves may last only a decade, study suggests**](#) [周三, 20 9月 00:31]

The UK has low oil and gas resources and limited prospects for fracking, according to a new analysis by scientists, who recommend a shift towards greater use of renewable, clean energy.

[Students' self-concepts of ability in math, reading predict later math, reading attainment](#) [周二, 19 9月 21:10]

A new longitudinal study looked at how youths' self-concepts are linked to their actual academic achievement in math and reading from middle childhood to adolescence. The study found that students' self-concepts of their abilities in these two academic domains play an important role in motivating their achievements over time and across levels of achievement.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Bacterial nanosized speargun works like a power drill**](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in only a few thousandths of a second and injects a cocktail of toxins.

- [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

- [**Genes are controlled by 'Nano footballs,'**](#)

[scientists discover](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

• [Fish have surprisingly complex personalities](#) [周一, 25 9月 21:54]

Tiny fish called Trinidadian guppies have individual 'personalities', new research shows.

• [Detecting cosmic rays from a galaxy far, far away](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

• [Early trilobites had stomachs, new fossil study finds](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

• [Hope to discover sure signs of life on Mars? New research says look for the element vanadium](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

• [Big herbivorous dinosaurs ate crustaceans as a side dish](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

• [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

• [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

• [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

• [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called Beelzebufo that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus Ceratophrys, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

• [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

• [**Dinosaur evolution: Lumbering giants had agile**](#)

ancestors [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

• **Scientists make atoms-thick 'Post-It notes' for solar cells and circuits** [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

• **Hold the phone: An ambulance might lower your chances of surviving some injuries** [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

• **Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues** [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• **Real or fake? Creating fingers to protect identities** [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly

called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

• [**Gravity waves influence weather and climate**](#) [周三, 20

9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

• [**Solar wind impacts on giant 'space hurricanes' may affect satellite safety**](#) [周二, 19 9月 21:10]

Could the flapping of a butterfly's wings in Costa Rica set off a hurricane in California? For most people, this hypothetical scenario may be difficult to imagine on Earth -- particularly when a real disaster strikes. Yet, in space, similarly small fluctuations in the solar wind as it streams toward the Earth's magnetic shield actually can affect the speed and strength of 'space hurricanes,' a researcher explains.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [Near-Earth asteroid CubeSat goes full sail](#) [周三, 27 9月 01:39]

NASA's Near-Earth Asteroid Scout, a small satellite the size of a shoebox, designed to study asteroids close to Earth, recently performed a full-scale solar sail deployment test. The test was performed in an indoor clean room to ensure the deployment mechanism's functionality after recent environmental testing.

- [Innovative control system paves the way for large scale universal quantum computing](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

- [Energy harvested from evaporation could power much of US](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

• [**Quantum communications bend to our needs**](#) [周三, 27 9月 00:51]

The potential for photon entanglement in quantum computing and communications has been known for decades. One issue impeding immediate application is that many photon entanglement platforms don't operate within the range used by most forms of telecommunication. Researchers have started to unravel the mysteries of entangled photons, demonstrating a technique that uses semiconductor quantum dots to bend photons to the wavelengths used by today's popular C-band standards.

• [**Some marine species more vulnerable to climate change than others**](#) [周三, 27 9月 00:51]

Certain marine species will fare much worse than others as they become more vulnerable to the effects of climate change, a new study has found.

• [**Antibiotics warranted for kids with minor staph infections**](#) [周三, 27 9月 00:51]

The overuse of antibiotics has left some doctors questioning whether to give such drugs to children diagnosed with uncomplicated *Staphylococcus aureus* (staph) infections. Now, research indicates that prescribing antibiotics -- in addition to lancing and draining staph-infected areas -- reduces the risk of recurrent infections.

• [**Amount of water in stem cells can determine its fate as fat or bone**](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

• [**Scientists unlock mysteries of how Ebola uses people's immune defenses to cause infection**](#) [周三, 27 9月 00:51]

Scientists have gained new insight into how the Ebola virus uses the body's natural defenses to speed the rate of infection and unleash its lethal disease, according to a new report.

- [**Fisheries sustainability linked to gender roles among traders**](#) [周二, 26 9月 23:59]

A new study of fish traders in coastal Kenya shows that women largely occupied fisheries with the lowest profits and are not saving money while working in these fisheries.

- [**Two Caribbean bird-catcher trees named after two women with overlooked botanical works**](#) [周二, 26 9月 23:59]

Known for their biodiversity richness, the Caribbean Islands are now adding two new species of bird-catcher trees to their list of botanical treasures. The new species were named after two women who self-engaged for decades on educational projects in botany, but whose remarkable work was never properly made known and accredited.

- [**Injection alternative: Model predicts performance of glucose-responsive insulin**](#) [周二, 26 9月 23:59]

Researchers have created a computer model that can predict how glucose-responsive insulin will affect patients' blood sugar based on chemical traits such as how quickly it becomes activated in the presence of glucose. This could help scientists design insulin that lingers in a patient's bloodstream and becomes active only when needed, such as right after a meal.

- [**Warm Northwest waters draw spawning fish north**](#) [周二, 26 9月 23:59]

Unusually warm ocean conditions off the Pacific Northwest in the last few years led anchovies, sardines and hake to begin spawning in Northwest waters much earlier in the year and, for anchovy, longer than biologists have ever recorded before, new research has found.

- [**A fresh set of eyes: Rotating plant inspectors reduces risk of medical device recalls**](#) [周二, 26 9月 23:59]

More frequent rotation of plant inspectors at medical device manufacturing facilities could benefit consumers and lead to fewer

product recalls, finds new research.

- [**One in 5 teens report having had a concussion in their lifetime**](#) [周二, 26 9月 23:20]

A new study confirms what many hospital emergency rooms nationwide are seeing: teens playing contact sports suffer from concussions.

- [**Does your back feel stiff? Well, it may not actually be stiff, study finds**](#) [周二, 26 9月 23:20]

The feeling of stiffness in your back may mean something else is going, warns a new report.

- [**Biochemists discover mechanism that helps flu viruses evolve**](#) [周二, 26 9月 23:20]

Flu viruses' rapid evolution relies in part on hijacking some of the cellular machinery of the infected host cell -- a group of proteins called chaperones, which help other proteins fold into the correct shape. When viruses are unable to get help from these proteins, they do not evolve as rapidly, research shows.

- [**Wearable solar thermoelectric generator created**](#) [周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

- [**Lactation hormone also helps a mother's brain**](#) [周二, 26 9月 22:55]

The same hormone that stimulates milk production for lactation, also acts in a particular part of the brain to help establish the nurturing link between mother and baby, researchers have revealed.

- [**Researchers identify novel way to target Ebola**](#) [周二, 26 9月 22:55]

Researchers have identified a potential new way to attack Ebola. Scientists have discovered that a protein called Tim-1 (T-cell immunoglobulin and mucin domain-containing protein 1) plays a key role in the development of the cytokine storm seen in the last stages of Ebola infection.

- [**Predatory bacteria found in study of cystic fibrosis patients' lung microbiome**](#) [周二, 26 9月 22:55]

Cystic fibrosis patients have a wide variety of bacteria in their lungs, including two 'predators' not detected before, according to a new study.

- [**Artificial intelligence for obtaining chemical fingerprints**](#) [周二, 26 9月 22:54]

Researchers have succeeded in developing a method for predicting molecular infrared spectra based on artificial intelligence. These chemical 'fingerprints' could only be simulated by common prediction techniques for small molecules in high quality. The team was able to carry out simulations that were previously not possible.

- [**Understanding football violence could help the fight against terror**](#) [周二, 26 9月 22:54]

Football has long been tarnished by outbreaks of fan violence. Although media headlines often link the behavior to 'hooliganism,' the activity could stem from potentially more positive motivations, such as passionate commitment to the group and the desire to belong. Understanding the root cause of the behavior may therefore help in tackling the violence and channeling it into something more positive, scientists suggest.

- [**Interventions for reducing hepatitis C infection in people who inject drugs**](#) [周二, 26 9月 22:54]

The first global review to quantify the impact of needle syringe programs (NSP) and opioid substitution treatment (OST) in reducing the risk of becoming infected with the hepatitis C virus has now been published. The study has implications for millions of people who are 'at risk' from infection.

- [**Older drivers adapt their thinking to improve road hazard detection**](#) [周二, 26 9月 22:54]

A recent study finds older drivers adapt their responses in heavy traffic to better identify road hazards.

• [**Household chores: Women still do more**](#) [周二, 26 9月 22:54]

Women of all ages still tend to do more household chores than their male partners, no matter how much they work or earn in a job outside the home. New findings demonstrate the persistent gendered nature of how housework is divided.

• [**The drying of peatlands is reducing bird diversity**](#) [周二, 26 9月 22:54]

The populations of peatland birds in Finland, Sweden, Norway, Estonia and Latvia have decreased by a third during the past three decades, a recent international study indicates. The situation in Finland is the most dire, and the species in most trouble is the Finnish ruff, as the population has fallen to approximately 3 percent of what it was at the beginning of the study period.

• [**Preschool teachers need better training in science**](#) [周二, 26 9月 22:54]

Preschool instructors appear to lack the knowledge, skills and confidence to effectively teach their young students science -- a problem that is likely contributing to America's poor global performance in this crucially important subject.

• [**No evidence of hidden hearing loss from common recreational noise**](#) [周二, 26 9月 22:54]

The first study to look for a causal relationship between recreational noise exposure and auditory function in humans finds that while hearing is temporarily affected in young adults after attending a loud recreational event, there is no evidence of auditory nerve injury or permanent hearing difficulties.

• [**Nerves control the body's bacterial community**](#) [周二, 26 9月 22:54]

Using the freshwater polyp Hydra as a model organism, researchers have investigated how the simple nervous system of these animals interacts with the microbiome. They were able to demonstrate, for the first time, that small molecules secreted by nerve cells help to regulate

the composition and colonization of specific types of beneficial bacteria along the Hydra's body column.

- [**Doctors gain a greater understanding of skin cancer using tattoos**](#) [周二, 26 9月 22:54]

Cancer is on the rise and the need to be empathetic when giving a patient their diagnosis and throughout treatment is imperative. Now, a collaborative study, with a Huddersfield professor, has enabled future doctors to experience some of the challenges patients living with skin cancer can face to develop a greater empathy for their patients.

- [**'Hypermotators' drive pathogenic fungi to evolve more rapidly**](#) [周二, 26 9月 22:54]

For nearly two decades, a rare but potentially deadly fungus called *Cryptococcus deuterogattii* has gained a foothold in the Pacific Northwest and Vancouver Island. Researchers recently showed that lineages of the fungal pathogen *Cryptococcus deuterogattii* house a specific mutation in their DNA that increases their mutation rate. These hypermutators, as they are called, rapidly develop resistance to the antifungal drugs FK506 and rapamycin.

- [**Chronic wasting disease**](#) [周二, 26 9月 22:54]

New research summarizes the efforts in disease surveillance and risk management of chronic wasting disease (CWD) in deer and shows that past management strategies such as selective culling, herd reduction, and hunter surveillance have had only limited effectiveness. The summary points towards new advice for optimal, cost-effective strategies in aggressive disease control.

- [**Cartography of the Cosmos**](#) [周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime. This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

- **[Milk-alternative drinks do not replace the iodine in cows' milk](#)** [周二, 26 9月 21:14]

Consumers of milk-alternative drinks may be at risk of iodine deficiency, according to the findings of a new study.

- **[Agent Orange still linked to hormone imbalances in babies in Vietnam](#)** [周二, 26 9月 21:14]

Could herbicides that were sprayed during the Vietnam War still be causing health problems?

- **[The motor protein dancing in all our cells](#)** [周二, 26 9月 21:14]

Biologists have invented optical tweezers to follow the motions of molecular machines measured in nanometers.

- **[Higher risk of heart failure in cold weather](#)** [周二, 26 9月 21:14]

Could decreases in temperature cause heart failure and death?

- **[New 'bioactive' glass puts minerals back into damaged teeth](#)** [周二, 26 9月 21:12]

Dental researchers have now developed a very fast dissolving 'bioactive' glass which they are putting in toothpaste to repair decayed teeth.

- **[Even open-label placebos work, if they are explained](#)** [周二, 26 9月 21:05]

For some medical complaints, open-label placebos work just as well as deceptive ones. As psychologists report, the accompanying rationale plays an important role when administering a placebo.

- **[Drought: A cause of riots](#)** [周二, 26 9月 21:05]

The scientific community has been working on the possibility of a relationship between periods of drought and rioting for several years. Now a team has formally verified this hypothesis by studying almost 1,800 riots that occurred over a 20-year period in sub-Saharan Africa. The researchers observed a systematic link between the sudden depletion of water resources and the outbreak of unrest. They also

succeeded in quantifying the impact of geographic and social factors on the same link.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**Physicists achieve rapid magnetic switching with lasers**](#) [周二, 26 9月 21:00]

New research shows control over composition of ferrimagnetic materials offers new ways of switching their magnetism.

- [**People are reluctant to use public defibrillators to treat cardiac arrests**](#) [周二, 26 9月 20:59]

A new study suggests that people are reluctant to use public-access defibrillators to treat cardiac arrests.

- [**Larger-dose opioid prescriptions not coming from emergency departments, study shows**](#) [周二, 26 9月 20:59]

Opioid prescriptions from the emergency department (ED) are written for a shorter duration and smaller dose than those written elsewhere, shows new research. The study also demonstrates that patients who receive an opioid prescription in the ED are less likely to progress to long-term use.

- [**Discovering potential therapeutic protein inhibitors for Chagas disease**](#) [周二, 26 9月 20:59]

Scientists have identified four potential protein inhibitors and unlocked drug discovery strategies for the treatment of Chagas disease by using advanced three-dimensional computer simulation by supercomputer TSUBAME in combination with in vitro experiments and X-ray crystallography.

- [**Weight loss for adults at any age leads to cost savings, study suggests**](#) [周二, 26 9月 20:59]

Helping an adult lose weight leads to significant cost savings at any age, with those savings peaking at age 50, suggests a new study.

- [**Quitting daily aspirin therapy may increase second heart attack, stroke risk**](#) [周二, 26 9月 04:32]

Stopping long-term, low-dose aspirin therapy may increase your risk of suffering a cardiovascular event, research indicates. Risk increases shortly after stopping and does not appear to diminish over time.

- [**Psychological impacts of natural disasters on youth**](#) [周二, 26 9月 04:32]

A researcher is fully aware of children's reaction to trauma. Her research focuses on the impact of disasters on youth since Hurricane Andrew in 1992. La Greca has been evaluating how best to define post-traumatic stress disorder (PTSD) in children. This line of research will help to quickly identify the children who need support services post-disaster and identify key aspects of the post-disaster environment that facilitate their recovery.

- [**Penguin-mounted video captures gastronomic close encounters of the gelatinous kind**](#) [周二, 26 9月 04:32]

Footage from penguin-mounted mini video recorders shows four species of penguin eating jellyfish and other gelatinous animals of the open ocean, a food source penguins were not previously believed to partake of, scientists report.

- [**Snails bred in lab help species crawl back from brink of extinction**](#) [周二, 26 9月 04:06]

Work to restore the endangered Chittenango ovate amber snail, found only in one location inside a Central New York state park, continued this month with the release of tagged adult snails raised in a laboratory.

Near-Earth asteroid CubeSat goes full sail -- ScienceDaily

NASA's Near-Earth Asteroid Scout, a small satellite the size of a shoebox, designed to study asteroids close to Earth, performed a full-scale solar sail deployment test at ManTech NeXolve's facility in Huntsville, Alabama, Sept. 13. The test was performed in an indoor clean room to ensure the deployment mechanism's functionality after recent environmental testing.

NEA Scout is a six-unit CubeSat that relies on an innovative solar sail for propulsion. It is one of 13 secondary science payloads NASA selected to fly on the initial launch of NASA's Space Launch System rocket. When deployed, the sail is square in shape with each side about the length of a school bus, and harnesses solar energy to use as propulsion to move through space. Instead of wind, solar sails reflect sunlight for thrust, minimizing the need for fuel. This method results in cost savings due to the reduced weight and size of the payload with reduced fuel and

provides the satellite with the ability to travel through space. The NEA Scout solar sail will deploy from the spacecraft using four arms -- called booms -- to hold the sail, much like a sail on a ship.

"Last year, we did a deployment test on a half-scale prototype of the solar sail. We used the findings to make several improvements to the spacecraft's sail deployment mechanism," said Tiffany Lockett, a NEA Scout sail systems engineer at NASA's Marshall Space Flight Center in Huntsville, Alabama. "We incorporated a larger motor to help retract the booms after deployment and upgraded the software to perform the test. Also, we improved the sail restraint tab that holds the sail in place prior to deployment for easier sail deployment, upgraded the connection between the sail and the booms, and included a pin puller to help lock the sail spool during transportation."

To minimize the amount of human intervention needed to deploy the sail in a gravity environment, the team had to come up with a way to reduce friction where possible. Engineers used improved sliders to allow the booms to glide easily across the surface of the table with less friction.

"We learned a lot from the results of today's test. The motor performed as anticipated and three of the four sail restraint tabs released on time. The new improved booms operated much better under less friction," said Alex Few, NEA Scout sail systems mechanical designer at Marshall. "We look forward to analyzing the results further in the coming weeks."

The team will use these findings to make final adjustments to the testing of the solar sail that will be used in flight, scheduled for testing later this year.

"NEA Scout will perform a reconnaissance fly-by and take pictures of an asteroid to learn more about the risks and challenges they may pose to future human exploration missions," said Les Johnson, NEA Scout's solar sail principal investigator at Marshall. "It will deploy from the rocket after the Orion spacecraft is separated from the upper stage."

Innovative control system paves the way for large scale universal quantum computing -- ScienceDaily

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has been engineered by Richard Versluis, principal scientist at TNO, Leo DiCarlo, associate professor at TU Delft and postdoc Stefano Poletto with support of colleagues from TNO and TU Delft at QuTech and Intel. They invented a control methodology for fault-tolerant quantum computing based on a basic building block of eight qubits with a fixed set of control hardware. This basic building block can be reproduced to large arrays of qubits, without any increase or changes to the control hardware.

With this new method, qubit error correction and logical operations, needed to execute complex algorithms on large scale quantum computers, are now

made possible on any number of qubits.

Plenty of room at the bottom

Nobel-prize winning physicist Richard Feynman famous quote 'there is plenty of room at the bottom' indicated that there is a whole world to explore at the quantum scale. He was one of the first to note that the complexity to model quantum mechanical systems could also be turned into a powerful resource: since it takes many parameters to adequately model coupled quantum-mechanical systems, one can look at coupled quantum-mechanical systems as systems that can store and manipulate huge amounts of data. Since that time, people have come up with clever algorithms for quantum computers that will outperform regular supercomputers on various problems, such as code cracking, data finding and data analysis and determining properties of chemical substances. Such algorithms require millions of qubits, and the quest to scale the number of controllable qubits is challenging.

Large-scale quantum computers require smart hardware

A major challenge for quantum computers, which now

consist of a handful of qubits, is their scalability. In order to execute quantum algorithms with a reasonable success rate, you need millions of qubits in order to overcome the inherent instability of qubits and correct errors in the system. Up to now, qubit control systems typically got bigger and more complex with the growing number of qubits. This is not a major problem in experimental quantum chips with a small number of qubits, but no concepts were available to control the thousands to millions of qubits, while at the same time performing error correction on the qubits.

Any number of qubits controlled by a single set of hardware

The researchers from QuTech, a collaboration founded by TU Delft and TNO, established a solution to this scaling challenge for superconducting qubits. The solution uses control hardware with the size of a small bookcase, to control a basic set of eight qubits. By copying and pasting the eight qubits on the chip, the same single control system can control any number of qubits individually, from 8 to 8 million or more, and execute the gates required for quantum error correction. This enables quantum computer programmers to execute quantum algorithms on any

number of qubits. The next goal at QuTech is to apply this method to realize a 17-qubit quantum processor with error correction in an ongoing project. This would constitute a world-record number of qubits with both individual control and error correction.

Energy harvested from evaporation could power much of US: Other potential benefits include reliability and water savings -- ScienceDaily

In the first evaluation of evaporation as a renewable energy source, researchers at Columbia University find that U.S. lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

Though still limited to experiments in the lab, evaporation-harvested power could in principle be made on demand, day or night, overcoming the intermittency problems plaguing solar and wind energy. The researchers' calculations are outlined in the Sept. issue of *Nature Communications*.

"We have the technology to harness energy from wind, water and the sun, but evaporation is just as powerful," says the study's senior author Ozgur Sahin, a biophysicist at Columbia. "We can now put a number on its potential."

Evaporation is nature's way of cycling water between land and air. Sahin has previously shown how this basic process can be exploited to do work. One machine developed in his lab, the so-called Evaporation Engine, controls humidity with a shutter that opens and closes, prompting bacterial spores to expand and contract. The spores' contractions are transferred to a generator that makes electricity. The current study was designed to test how much power this process could theoretically produce.

One benefit of evaporation is that it can be generated only when needed. Solar and wind power, by contrast, require batteries to supply power when the sun isn't shining and wind isn't blowing. Batteries are also expensive and require toxic materials to manufacture.

"Evaporation comes with a natural battery," said study lead author, Ahmet-Hamdi Cavusoglu, a graduate student at Columbia. "You can make it your main source of power and draw on solar and wind when they're available." Evaporation technology can also save water. In the study, researchers estimate that half of the water that evaporates naturally from lakes and reservoirs into the atmosphere could be saved during the energy-harvesting process. In their model, that

came to 25 trillion gallons a year, or about a fifth of the water Americans consume.

States with growing populations and sunnier weather can best capitalize on evaporation's capacity to generate power and reduce water waste, in part because evaporation packs more energy in warm and dry conditions, the researchers say. Drought-prone California, Nevada and Arizona could benefit most.

The researchers simplified their model in several ways to test evaporation's potential. They limited their calculations to the United States, where weather station data are readily accessible, and excluded prime locations such as farmland, rivers, the Great Lakes, and coastlines, to limit errors associated with modeling more complex interactions. They also made the assumption that technology to harvest energy from evaporation efficiently is fully developed.

Klaus Lackner, a physicist at Arizona State University who was not involved in the study, expressed support for the team's findings. Lackner is developing artificial trees that draw carbon dioxide from the air, in part, by harnessing the power of evaporation.

"Evaporation has the potential to do a lot of work," he said. "It's nice to see that drying and wetting cycles can also be used to collect mechanical energy."

The researchers are working to improve the energy efficiency of their spore-studded materials and hope to eventually test their concept on a lake, reservoir, or even a greenhouse, where the technology could be used to simultaneously make power and limit water loss.

Quantum communications bend to our needs: By changing the wavelengths of entangled photons to those used in telecommunications, researchers see quantum technology take a major leap forward -- ScienceDaily

The potential for photon entanglement in quantum computing and communications has been known for decades. One of the issues impeding its immediate application is the fact that many photon entanglement platforms do not operate within the range used by most forms of telecommunication.

An international team of researchers has started to unravel the mysteries of entangled photons, demonstrating a new nanoscale technique that uses semiconductor quantum dots to bend photons to the wavelengths used by today's popular C-band standards. They report their work this week in *Applied Physics Letters*, from AIP Publishing.

"We have demonstrated the emission of polarization-entangled photons from a quantum dot at 1550 nanometers for the first time ever," said Simone Luca Portalupi, one of the work's authors and a senior scientist at the Institute of Semiconductor Optics and Functional Interfaces at the University of Stuttgart.

"We are now on the wavelength that can actually carry quantum communication over long distances with existing telecommunication technology."

The researchers used quantum dots created from an indium arsenide and gallium arsenide platform, producing pure single photons and entangled photons. Unlike parametric down-conversion techniques, quantum dots allow for photons to be emitted only one at a time and on demand, crucial properties for quantum computing. A distributed Bragg reflector, which is made from multiple layered materials and reflects over a wide spectrum, then directed the photons to a microscope objective, allowing them to be collected and measured.

Researchers and industry leaders have found that the C-band -- a specific range of infrared wavelengths -- has become an electromagnetic sweet spot in telecommunications. Photons traveling through both

optical fibers and the atmosphere within this range experience significantly less absorption, making them perfect for relaying signals across long distances.

"The telecom C-band window has the absolute minimum absorption we can achieve for signal transmission," said Fabian Olbrich, another of the paper's authors. "As scientists have made discoveries, industry has improved technology, which has let scientists make more discoveries, and so now we have a standard that works very well and has low dispersion."

Most entangled photons originating from quantum dots, however, operate near 900 nanometers, closer to wavelengths we can see with the naked eye.

The researchers were impressed by the quality of the signal, Olbrich said. Other efforts to shift the emission wavelength of polarization-entangled photons of quantum dots toward the C-band tended to increase the exciton fine-structure splitting (FSS), a quantity that should be close to zero for entanglement generation. Olbrich's team reports their experiment experienced less than one-fifth as much FSS as other studies in the literature.

"The chance to find a quantum dot that is able to emit polarization-entangled photons with high fidelity is quite high for our specific study," Olbrich said.

With each successful experiment, the quantum communications community is seeing its field bend toward greater applicability in today's telecommunications industry. Researchers hope that one day, entangled photons will impact cryptography and secure satellite communications.

"The hard part now is to combine all the advantages of the system and fulfill prerequisites such as high photon indistinguishability, high temperature operation, increased photon flux and out coupling efficiency that would make them work," Olbrich said.

Some marine species more vulnerable to climate change than others -- ScienceDaily

Certain marine species will fare much worse than others as they become more vulnerable to the effects of climate change, a new UBC study has found.

After analyzing the biological characteristics of 1,074 marine fish and shellfish, the study identified 294 species that are most at-risk due to climate change by 2050. Species most at-risk include the Eastern Australian salmon, yellowbar angelfish, toli shad, sohal surgeonfish and spotted grouper.

"We hope that this study will highlight the marine species that are most in need of management and conservation actions under climate change," said William Cheung, associate professor in the Institute for the Oceans and Fisheries and director of science for the Nippon Foundation -- UBC Nereus Program.

As part of the study, UBC researchers created a

database that examines the long-term vulnerability of marine species that are important to fisheries around the world. The database was developed with an approach that uses "fuzzy logic" to combine information about the biological sensitivity of these species to environmental changes as well as their projected exposure to changes in the ocean including temperature and oxygen and acidity levels.

"How susceptible are Atlantic cod to climate change compared to skipjack tuna? How about smaller fishes such as anchovy and pilchard?" asked Cheung. "We know that some characteristics of the species make them more sensitive and less resilient to climate change."

The factors that restrict whether fish or shellfish can adapt to climate change include their preferred temperature range, restrictions on their geographic range, how long it takes to reproduce, and specific habitat requirements such as needing kelp or coral reef to survive.

"Eastern Australian salmon is highly vulnerable because their distribution is limited to shallow coastal and estuarine waters in southern Australia and New

Zealand," said Miranda Jones, the study's lead author, who was a postdoctoral fellow in the Institute for the Oceans and Fisheries when the study was underway. "The species lives in habitats that are exposed to large changes in ocean conditions and have limited scope to avoid these changes."

In Canada, sockeye salmon, along with the alewife, Pacific bonito, and sharks such as the porbeagle and thresher, are identified as at risk to climate change impacts. In contrast, some species such as the Pacific sanddab, blue crab and Pacific sandlance have less vulnerable biological characteristics and live in areas that are relatively less affected by climate change.

- [**Energy harvested from evaporation could power much of US**](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

- [**Amount of water in stem cells can determine its fate as fat or bone**](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

- [**Wearable solar thermoelectric generator created**](#) [周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

- [**Cartography of the Cosmos**](#) [周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime. This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as

humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Antibody protects against Zika and dengue, mouse study shows**](#) [周二, 26 9月 01:29]

The same countries hard hit by Zika virus -- which can cause brain damage in babies infected before birth -- are also home to dengue virus. Researchers now report that they have found an antibody that protects against both viruses. These findings, in mice, could be a step towards an antibody-based preventative drug to protect fetuses from brain damage, while also protecting their mothers from both Zika and dengue disease.

- [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

- [**Visual attention drawn to meaning, not what stands out**](#) [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new

research. The findings overturn the widely held model of visual attention.

- [**Panda habitat shrinking, becoming more fragmented**](#) [周一, 25 9月 23:13]

Using remote sensing data, Chinese and US scientists have re-assessed the conservation status of the giant panda. Their analysis shows that while panda numbers are increasing, their habitat still covers less area and is more fragmented than it was in 1988, when the species was listed as endangered on the IUCN Red List.

- [**Child abuse affects brain wiring**](#) [周一, 25 9月 23:13]

For the first time, researchers have been able to see changes in the neural structures in specific areas of the brains of people who suffered severe abuse as children. The researchers believe that these changes may contribute to the emergence of depressive disorders and suicidal behavior.

- [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

- [**Brain damage in fish from plastic nanoparticles in water**](#) [周一, 25 9月 22:47]

A new study shows that plastic particles in water may end up inside fish brains. The plastic can cause brain damage, which is the likely cause of behavioral disorders observed in the fish.

- [**Brain guides body much sooner than previously believed**](#) [周一, 25 9月 21:54]

The brain plays an active role much earlier than previously thought. Long before movement or other behaviors occur, the nascent brain of an embryonic frog instructs normal muscle and nerve patterning and protects the embryo from agents that cause developmental defects. In

addition to identifying these essential functions for the first time, researchers successfully rescued defects caused by lack of a brain by using widely available, human-approved drugs.

- [**Winter cold extremes linked to high-altitude polar vortex weakening**](#) [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations

lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

- [**Scientists sequence asexual tiny worm whose lineage stretches back 18 million years**](#) [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Jellyfish, with no brains, still seem to sleep**](#) [周五, 22 9月 02:12]

The discovery that primitive jellyfish sleep suggests that sleep is an ancient, evolutionarily conserved behavior.

- [**Why poison frogs don't poison themselves**](#) [周五, 22 9月 02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

- [**Reconstructing how Neanderthals grew, based on an El Sidrón child**](#) [周五, 22 9月 02:12]

How did Neanderthals grow? Does modern man develop in the same way as Homo neanderthalensis did? How does the size of the brain affect the development of the body? Researchers have studied the fossil remains of a Neanderthal child's skeleton in order to establish whether there are differences between the growth of Neanderthals and that of sapiens.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Dino-killing asteroid's impact on bird evolution**](#)

[周五, 22 9月 00:11]

Human activities could change the pace of evolution, similar to what occurred 66 million years ago when a giant asteroid wiped out the dinosaurs, leaving modern birds as their only descendants.

- [**One in four girls is depressed at age 14**](#) [周四, 21 9月 23:07]

New research shows a quarter of girls (24%) and one in 10 boys (9%) are depressed at age 14.

- [**Surprising discovery: How the African tsetse fly really drinks your blood**](#) [周四, 21 9月 23:06]

Researchers have been taking a close-up look at the biting mouthparts of the African tsetse fly as part of ongoing work on the animal diseases it carries. Using a new high-powered scanning electron microscope, researchers were able to see the rows of sharp teeth and rasps that the fly uses to chew through the skin when it bites.

- [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

- [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

• [**Changing of the guard: Research sheds light on how plants breathe**](#) [周四, 21 9月 22:17]

New research is set to change the textbook understanding of how plants breathe. Researchers have developed the first full 3D model of a guard cell.

• [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

• [**Efforts to save sea turtles are a 'global conservation success story'**](#) [周四, 21 9月 06:21]

A new study of the world's seven sea turtle species provides evidence that their numbers are growing overall (unlike many endangered vertebrates), thanks to years of conservation efforts that have played a key role in sea turtle recovery -- even for small sea turtle populations.

• [**Mathematics predicts a sixth mass extinction**](#) [周四, 21 9月 06:21]

Scientists have analyzed significant changes in the carbon cycle over the last 540 million years, including the five mass extinction events. They have identified 'thresholds of catastrophe' in the carbon cycle that, if exceeded, would lead to an unstable environment, and ultimately, mass extinction.

• [**Immune system is critical to regeneration, study finds**](#) [周四, 21 9月 03:49]

The answer to the question of why some organisms can regenerate major body parts while others, such as humans, cannot may lie with the body's innate immune system, according to a new study of heart regeneration in the Mexican salamander.

- [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

- [**Fly away home? Ice age may have clipped bird migration**](#) [周四, 21 9月 02:46]

The onset of the last ice age may have forced some bird species to abandon their northerly migrations for thousands of years, says new research led by an ornithologist. The study challenges a long-held presumption that birds merely shortened their migratory flights when glaciers advanced south to cover much of North America and northern Europe about 21,000 years ago.

- [**Species abundance: Winter restricts innovation**](#) [周四, 21 9月 01:17]

Why are there so many more species in the tropics? The 'storage effect' is stronger there than in temperate forests.

- [**Bite force research reveals dinosaur-eating frog**](#) [周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called Beelzebufo that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

- [**Animal acoustic activity decline shows forest fire pollution wreaks havoc on wildlife**](#) [周四, 21 9月 01:17]

Forest fires in Southeast Asia during the El Niño droughts of 2015 caused considerable disruption to the biodiversity of the region due to the smoke-induced 'haze' they created, according to new research.

- [**New concept of terrestrial planet formation**](#) [周四, 21 9月]

01:17]

Scientists are proposing a new way of understanding the cooling and transfer of heat from terrestrial planetary interiors and how that affects the generation of the volcanic terrains that dominate the rocky planets.

- [**World's first 'molecular robot' capable of building molecules**](#) [周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- [**Dinosaur evolution: Lumbering giants had agile ancestors**](#) [周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

- [**Scientists make atoms-thick 'Post-It notes' for solar cells and circuits**](#) [周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- [**Brain cancer growth halted by absence of protein**](#) [周四, 21 9月 01:16]

The growth of certain aggressive brain tumors can be halted by cutting off their access to a signaling molecule produced by the brain's nerve cells, according to a new study.

- [**Millions of new genes in human microbiome**](#) [周四, 21 9月 01:16]

A new study of the human microbiome has uncovered millions of previously unknown genes from microbial communities in the human gut, skin, mouth, and vaginal microbiome, allowing for new insights into the role these microbes play in human health and disease.

• [Genome editing reveals role of gene important for human embryo development](#) [周四, 21 9月 01:16]

Researchers have used genome editing technology to reveal the role of a key gene in human embryos in the first few days of development. This is the first time that genome editing has been used to study gene function in human embryos, which could help scientists to better understand the biology of our early development.

• [Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• [How Teotihuacan's urban design was lost and found](#) [周三, 20 9月 23:33]

A new article outlines how the urban design of the city of Teotihuacan differed from past and subsequent cities, only to be rediscovered and partially modeled on many centuries later by the Aztecs.

• [10,000 year-old DNA proves when fish colonized our lakes](#) [周三, 20 9月 22:45]

DNA in lake sediment forms a natural archive displaying when various fish species colonized lakes after the glacial period. Scientists' analyses of the prevalence of whitefish DNA in sediment reveal that the whitefish came to Lake Stora Lögdasjön in Västerbotten already 10,000 years ago, whereas Lake Hotagen in Jämtland had its whitefish only 2,200 years ago.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Antibiotics warranted for kids with minor staph infections**](#) [周三, 27 9月 00:51]

The overuse of antibiotics has left some doctors questioning whether to give such drugs to children diagnosed with uncomplicated Staphylococcus aureus (staph) infections. Now, research indicates that prescribing antibiotics -- in addition to lancing and draining staph-infected areas -- reduces the risk of recurrent infections.

- [**Amount of water in stem cells can determine its fate as fat or bone**](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

- [**Scientists unlock mysteries of how Ebola uses people's immune defenses to cause infection**](#) [周三, 27 9月 00:51]

Scientists have gained new insight into how the Ebola virus uses the body's natural defenses to speed the rate of infection and unleash its lethal disease, according to a new report.

- [**Injection alternative: Model predicts performance of glucose-responsive insulin**](#) [周二, 26 9月 23:59]

Researchers have created a computer model that can predict how glucose-responsive insulin will affect patients' blood sugar based on chemical traits such as how quickly it becomes activated in the presence of glucose. This could help scientists design insulin that lingers in a

patient's bloodstream and becomes active only when needed, such as right after a meal.

- [**A fresh set of eyes: Rotating plant inspectors reduces risk of medical device recalls**](#) [周二, 26 9月 23:59]

More frequent rotation of plant inspectors at medical device manufacturing facilities could benefit consumers and lead to fewer product recalls, finds new research.

- [**One in 5 teens report having had a concussion in their lifetime**](#) [周二, 26 9月 23:20]

A new study confirms what many hospital emergency rooms nationwide are seeing: teens playing contact sports suffer from concussions.

- [**Does your back feel stiff? Well, it may not actually be stiff, study finds**](#) [周二, 26 9月 23:20]

The feeling of stiffness in your back may mean something else is going, warns a new report.

- [**Biochemists discover mechanism that helps flu viruses evolve**](#) [周二, 26 9月 23:20]

Flu viruses' rapid evolution relies in part on hijacking some of the cellular machinery of the infected host cell -- a group of proteins called chaperones, which help other proteins fold into the correct shape. When viruses are unable to get help from these proteins, they do not evolve as rapidly, research shows.

- [**Lactation hormone also helps a mother's brain**](#) [周二, 26 9月 22:55]

The same hormone that stimulates milk production for lactation, also acts in a particular part of the brain to help establish the nurturing link between mother and baby, researchers have revealed.

- [**Researchers identify novel way to target Ebola**](#) [周二, 26 9月 22:55]

Researchers have identified a potential new way to attack Ebola. Scientists have discovered that a protein called Tim-1 (T-cell immunoglobulin and mucin domain-containing protein 1) plays a key

role in the development of the cytokine storm seen in the last stages of Ebola infection.

- [**Predatory bacteria found in study of cystic fibrosis patients' lung microbiome**](#) [周二, 26 9月 22:55]

Cystic fibrosis patients have a wide variety of bacteria in their lungs, including two 'predators' not detected before, according to a new study.

- [**Understanding football violence could help the fight against terror**](#) [周二, 26 9月 22:54]

Football has long been tarnished by outbreaks of fan violence. Although media headlines often link the behavior to 'hooliganism,' the activity could stem from potentially more positive motivations, such as passionate commitment to the group and the desire to belong.

Understanding the root cause of the behavior may therefore help in tackling the violence and channeling it into something more positive, scientists suggest.

- [**Interventions for reducing hepatitis C infection in people who inject drugs**](#) [周二, 26 9月 22:54]

The first global review to quantify the impact of needle syringe programs (NSP) and opioid substitution treatment (OST) in reducing the risk of becoming infected with the hepatitis C virus has now been published. The study has implications for millions of people who are 'at risk' from infection.

- [**Older drivers adapt their thinking to improve road hazard detection**](#) [周二, 26 9月 22:54]

A recent study finds older drivers adapt their responses in heavy traffic to better identify road hazards.

- [**Household chores: Women still do more**](#) [周二, 26 9月 22:54]

Women of all ages still tend to do more household chores than their male partners, no matter how much they work or earn in a job outside the home. New findings demonstrate the persistent gendered nature of how housework is divided.

• [Preschool teachers need better training in science](#) [周二, 26 9月 22:54]

Preschool instructors appear to lack the knowledge, skills and confidence to effectively teach their young students science -- a problem that is likely contributing to America's poor global performance in this crucially important subject.

• [No evidence of hidden hearing loss from common recreational noise](#) [周二, 26 9月 22:54]

The first study to look for a causal relationship between recreational noise exposure and auditory function in humans finds that while hearing is temporarily affected in young adults after attending a loud recreational event, there is no evidence of auditory nerve injury or permanent hearing difficulties.

• [Nerves control the body's bacterial community](#) [周二, 26 9月 22:54]

Using the freshwater polyp Hydra as a model organism, researchers have investigated how the simple nervous system of these animals interacts with the microbiome. They were able to demonstrate, for the first time, that small molecules secreted by nerve cells help to regulate the composition and colonization of specific types of beneficial bacteria along the Hydra's body column.

• [Doctors gain a greater understanding of skin cancer using tattoos](#) [周二, 26 9月 22:54]

Cancer is on the rise and the need to be empathetic when giving a patient their diagnosis and throughout treatment is imperative. Now, a collaborative study, with a Huddersfield professor, has enabled future doctors to experience some of the challenges patients living with skin cancer can face to develop a greater empathy for their patients.

• [Chronic wasting disease](#) [周二, 26 9月 22:54]

New research summarizes the efforts in disease surveillance and risk management of chronic wasting disease (CWD) in deer and shows that past management strategies such as selective culling, herd reduction, and

hunter surveillance have had only limited effectiveness. The summary points towards new advice for optimal, cost-effective strategies in aggressive disease control.

- [**Milk-alternative drinks do not replace the iodine in cows' milk**](#) [周二, 26 9月 21:14]

Consumers of milk-alternative drinks may be at of risk iodine deficiency, according to the findings of a new study.

- [**Agent Orange still linked to hormone imbalances in babies in Vietnam**](#) [周二, 26 9月 21:14]

Could herbicides that were sprayed during the Vietnam War still be causing health problems?

- [**The motor protein dancing in all our cells**](#) [周二, 26 9月 21:14]

Biologists have invented optical tweezers to follow the motions of molecular machines measured in nanometers.

- [**Higher risk of heart failure in cold weather**](#) [周二, 26 9月 21:14]

Could decreases in temperature cause heart failure and death?

- [**New 'bioactive' glass puts minerals back into damaged teeth**](#) [周二, 26 9月 21:12]

Dental researchers have now developed a very fast dissolving 'bioactive' glass which they are putting in toothpaste to repair decayed teeth.

- [**Even open-label placebos work, if they are explained**](#) [周二, 26 9月 21:05]

For some medical complaints, open-label placebos work just as well as deceptive ones. As psychologists report, the accompanying rationale plays an important role when administering a placebo.

- [**People are reluctant to use public defibrillators to treat cardiac arrests**](#) [周二, 26 9月 20:59]

A new study suggests that people are reluctant to use public-access

defibrillators to treat cardiac arrests.

- [**Larger-dose opioid prescriptions not coming from emergency departments, study shows**](#) [周二, 26 9月 20:59]

Opioid prescriptions from the emergency department (ED) are written for a shorter duration and smaller dose than those written elsewhere, shows new research. The study also demonstrates that patients who receive an opioid prescription in the ED are less likely to progress to long-term use.

- [**Discovering potential therapeutic protein inhibitors for Chagas disease**](#) [周二, 26 9月 20:59]

Scientists have identified four potential protein inhibitors and unlocked drug discovery strategies for the treatment of Chagas disease by using advanced three-dimensional computer simulation by supercomputer TSUBAME in combination with in vitro experiments and X-ray crystallography.

- [**Weight loss for adults at any age leads to cost savings, study suggests**](#) [周二, 26 9月 20:59]

Helping an adult lose weight leads to significant cost savings at any age, with those savings peaking at age 50, suggests a new study.

- [**Quitting daily aspirin therapy may increase second heart attack, stroke risk**](#) [周二, 26 9月 04:32]

Stopping long-term, low-dose aspirin therapy may increase your risk of suffering a cardiovascular event, research indicates. Risk increases shortly after stopping and does not appear to diminish over time.

- [**Psychological impacts of natural disasters on youth**](#) [周二, 26 9月 04:32]

A researcher is fully aware of children's reaction to trauma. Her research focuses on the impact of disasters on youth since Hurricane Andrew in 1992. La Greca has been evaluating how best to define post-traumatic stress disorder (PTSD) in children. This line of research will help to quickly identify the children who need support services post-disaster and

identify key aspects of the post-disaster environment that facilitate their recovery.

- [**Three or more cups of coffee daily halves mortality risk in patients with both HIV, HCV**](#) [周二, 26 9月 03:47]

A novel five-year study highlights importance of behaviors such as coffee drinking and not smoking on health and survival of HIV-infected patients, report investigators.

- [**Being in a good mood for your flu jab boosts its effectiveness**](#) [周二, 26 9月 03:47]

New research by a team of health experts has found evidence that being in a positive mood on the day of your flu jab can increase its protective effect.

- [**Brain's anterior cingulate cortex and its tie to human learning**](#) [周二, 26 9月 03:14]

After four years of lab testing and complex neuro-decoding, a research team has struck a major breakthrough that could open the floodgates for research into the anterior cingulate cortex, or ACC, and how human brains learn.

- [**Prostaglandin E1 inhibits leukemia stem cells**](#) [周二, 26 9月 03:14]

Two drugs, already approved for safe use in people, may be able to improve therapy for chronic myeloid leukemia (CML), a blood cancer that affects myeloid cells, according to new results.

- [**Metabolism directly impacts the odds of developing malaria**](#) [周二, 26 9月 01:30]

Researchers have found that the host's susceptibility to develop malaria depends on his or her metabolic state, which can be easily manipulated through external stimuli such as dietary patterns.

- [**Creating brain cells to detect Tourette's**](#) [周二, 26 9月 01:30]

Scientists have used a genetic engineering technique for the first time to create brain cells from the blood cells of individuals in a three-

generation family with Tourette syndrome to help determine what causes the disease.

- [**Bone marrow concentrate improves joint transplants**](#) [周二, 26 9月 01:30]

Biologic joint restoration using donor tissue instead of traditional metal and plastic may be an option for active patients with joint defects. Researchers have found in a group of patients that treating donor grafts with bone marrow aspirate concentrate before surgery improves bone integration and speeds recovery.

- [**Discovering what makes organelles connect could help explain neurodegenerative diseases**](#) [周二, 26 9月 01:29]

Organelles must exchange signals and materials to make the cell operate correctly. New technologies are allowing researchers to see and understand the networks that connect these organelles, allowing them to build maps of the trade routes that exist within a cell.

- [**Violent crime increases during warmer weather, no matter the season, study finds**](#) [周二, 26 9月 01:29]

A study analyzing crime data in Philadelphia for 10 years found that rates of violent crime and disorderly conduct are higher when the weather is warmer and more pleasant, even rising sharply during warmer-than-typical winter days.

- [**Streamlined process opens drug development to a new class of steroids**](#) [周二, 26 9月 01:29]

Researchers have developed a technique to produce synthetic steroids that could pave the way for a cascade of new drug discoveries, significantly reducing the expense and time needed to develop therapeutics from an underexplored collection of molecules.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons

implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Are children who see movie characters use guns more likely to use them?**](#) [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- [**Antibody protects against Zika and dengue, mouse study shows**](#) [周二, 26 9月 01:29]

The same countries hard hit by Zika virus -- which can cause brain damage in babies infected before birth -- are also home to dengue virus. Researchers now report that they have found an antibody that protects against both viruses. These findings, in mice, could be a step towards an antibody-based preventative drug to protect fetuses from brain damage, while also protecting their mothers from both Zika and dengue disease.

- [**Autism's gender patterns**](#) [周二, 26 9月 01:29]

Having one child with autism is a well-known risk factor for having another one with the same disorder, but whether and how a sibling's gender influences this risk has remained largely unknown. Now new research has, for the first time, successfully quantified the likelihood that a family who has one child with autism would have another one with the same disorder based on the siblings' gender.

- [**High-fidelity recording of molecular geometry with DNA 'nanoscopy'**](#) [周一, 25 9月 23:33]

A research team has now developed a DNA nanotechnology-based method that allows for repeated, non-destructive recording of uniquely barcoded molecular pairings, rendering a detailed view of their components and geometries. In the future, the approach could help researchers understand how changes in molecular complexes control biological processes in living cells.

[Adding radiation to chemotherapy may dramatically improve survival for advanced NSCLC](#) [周一, 25 9月 23:33]

Combining radiation therapy with chemotherapy for patients with limited metastatic non-small cell lung cancer (NSCLC) may curb disease progression dramatically when compared to NSCLC patients who only receive chemotherapy, according to a new randomized phase II clinical trial.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [Near-Earth asteroid CubeSat goes full sail](#) [周三, 27 9月 01:39]

NASA's Near-Earth Asteroid Scout, a small satellite the size of a shoebox, designed to study asteroids close to Earth, recently performed a full-scale solar sail deployment test. The test was performed in an indoor clean room to ensure the deployment mechanism's functionality after recent environmental testing.

- [Innovative control system paves the way for large scale universal quantum computing](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

- [Energy harvested from evaporation could power much of US](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

- [Quantum communications bend to our needs](#) [周三, 27 9月 00:51]

The potential for photon entanglement in quantum computing and communications has been known for decades. One issue impeding immediate application is that many photon entanglement platforms don't

operate within the range used by most forms of telecommunication. Researchers have started to unravel the mysteries of entangled photons, demonstrating a technique that uses semiconductor quantum dots to bend photons to the wavelengths used by today's popular C-band standards.

- [**A fresh set of eyes: Rotating plant inspectors reduces risk of medical device recalls**](#) [周二, 26 9月 23:59]

More frequent rotation of plant inspectors at medical device manufacturing facilities could benefit consumers and lead to fewer product recalls, finds new research.

- [**Wearable solar thermoelectric generator created**](#) [周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

- [**Artificial intelligence for obtaining chemical fingerprints**](#) [周二, 26 9月 22:54]

Researchers have succeeded in developing a method for predicting molecular infrared spectra based on artificial intelligence. These chemical 'fingerprints' could only be simulated by common prediction techniques for small molecules in high quality. The team was able to carry out simulations that were previously not possible.

- [**Understanding football violence could help the fight against terror**](#) [周二, 26 9月 22:54]

Football has long been tarnished by outbreaks of fan violence. Although media headlines often link the behavior to 'hooliganism,' the activity could stem from potentially more positive motivations, such as passionate commitment to the group and the desire to belong. Understanding the root cause of the behavior may therefore help in tackling the violence and channeling it into something more positive, scientists suggest.

- [**Cartography of the Cosmos**](#) [周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime. This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

- [**The motor protein dancing in all our cells**](#) [周二, 26 9月 21:14]

Biologists have invented optical tweezers to follow the motions of molecular machines measured in nanometers.

- [**Physicists achieve rapid magnetic switching with lasers**](#) [周二, 26 9月 21:00]

New research shows control over composition of ferrimagnetic materials offers new ways of switching their magnetism.

- [**Creative use of noise brings bio-inspired electronic improvement**](#) [周二, 26 9月 03:14]

Researchers are working to exploit stochastic resonance to enhance signal transmission for a new generation of devices, using single-walled carbon nanotubes. They created a summing network SR device that detects subthreshold signals, fabricated to include a self-noise component.

- [**Holograms for molecules**](#) [周二, 26 9月 01:30]

Scientists have developed a completely new method for the analysis of molecules in liquids on a chip. The possible applications of this technology are immense. It has the potential, inter alia, to revolutionize medical diagnostics.

- [**Click beetles inspire design of self-righting robots**](#) [周二, 26 9月 01:30]

Robots perform many tasks that humans can't or don't want to perform, getting around on intricately designed wheels and limbs. If they tip over, however, they are rendered almost useless. Mechanical engineers and entomologists are looking to click beetles, who can right themselves

without the use of their legs, to solve this robotics challenge.

- [**New non-contact, remote biometric tool could be next advance in computer security**](#) [周二, 26 9月 01:30]

Forget fingerprint computer identification or retinal scanning. Scientists have now developed a computer security system using the dimensions of your heart as your identifier. The system uses low-level Doppler radar to measure your heart, and then continually monitors your heart to make sure no one else has stepped in to run your computer.

- [**IceCube helps demystify strange radio bursts from deep space**](#) [周二, 26 9月 01:29]

Scientists are turning IceCube, the world's most sensitive neutrino telescope, to the task of helping demystify powerful pulses of radio energy generated up to billions of light-years from Earth.

- [**The material that obscures supermassive black holes**](#) [周二, 26 9月 01:29]

New research examines the material that obscures active galactic nuclei obtained from infrared and X-ray observations.

- [**Are children who see movie characters use guns more likely to use them?**](#) [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- [**Physicists demonstrate using a laser to control a current in graphene within just one femtosecond**](#) [周二, 26 9月 01:28]

Controlling electronic current is essential to modern electronics, as data and signals are transferred by streams of electrons which are controlled at high speed. Demands on transmission speeds are also increasing as technology develops. Scientists have now succeeded in switching on a current with a desired direction in graphene using a single laser pulse within a femtosecond. This is more than a thousand times faster compared to the most efficient transistors today.

- [**High-fidelity recording of molecular geometry with DNA 'nanoscopy'**](#) [周一, 25 9月 23:33]

A research team has now developed a DNA nanotechnology-based method that allows for repeated, non-destructive recording of uniquely barcoded molecular pairings, rendering a detailed view of their components and geometries. In the future, the approach could help researchers understand how changes in molecular complexes control biological processes in living cells.

- [**Climate insurance is rarely well thought out in agriculture**](#) [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

- [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

- [**Fully renewable India in 2050 can take a shortcut to emission-free future**](#) [周一, 25 9月 23:16]

India can function on a fully renewable electricity system in 2050, research indicates. The study shows that developing countries that have an abundance of renewable resources do not need to take the path of the western countries where increasing living standards have been coupled with heavy emissions from electricity generation and other industry. They can move straight to renewable systems and do it cheaply.

- [**New technique uses light to separate mirrored molecules**](#) [周一, 25 9月 23:13]

Left- and right-handed versions of molecules can be hard to tell apart but can have devastatingly different effects. Researchers are developing an optical filter to sort these molecules, which could lead to purer and safer drugs and agrichemicals.

- [**Nanoparticle supersoap creates 'bijel' with potential as sculptable fluid**](#) [周一, 25 9月 23:13]

A new type of 'bijel' could one day lead to applications in soft robotics, liquid circuitry, and a host of other applications that could benefit from shape-shifting fluids.

- [**New type of supercomputer could be based on 'magic dust' combination of light and matter**](#) [周一, 25 9月 23:13]

Scientists have successfully demonstrated that a type of 'magic dust' which combines light and matter can be used to solve complex problems and could eventually surpass the capabilities of even the most powerful supercomputers.

- [**Scientists monitor Silicon Valley's underground water reserves -- from space**](#) [周一, 25 9月 22:57]

Scientists monitoring Silicon Valley's underground water reserves from space have found that water levels rebounded quickly after a severe drought that lasted from 2012-15. The research points to the success of aggressive conservation measures. It also helps to lay the groundwork for low-cost monitoring of subterranean water reserves in California and elsewhere in the world.

- [**Filter may be a match for fracking water**](#) [周一, 25 9月 22:47]

A superhydrophilic filter has proven able to remove more than 90 percent of contaminants from water used in hydraulic fracturing operations at shale oil and gas wells.

- [**With extra sugar, leaves get fat too**](#) [周一, 25 9月 22:47]

Eat too much without exercising and you'll probably put on a few pounds. As it turns out, plant leaves do something similar. A new study shows that retaining sugars in plant leaves can make them get fat too. In plants, this extra fat accumulation could be a good thing. It could help turn plants into factories for making biofuels and other useful chemicals.

- [**Semitransparent and flexible: Solar cells made from atomically thin sheet**](#) [周一, 25 9月 21:55]

A new method for fabricating semitransparent, flexible solar cells has greatly improved power conversion efficiency.

- [**New synthesis method for click chemistry**](#) [周一, 25 9月 21:55]

Scientists have developed a new way to advance click chemistry.

- [**Wound care: Patch could improve healing and reduce scarring**](#) [周一, 25 9月 21:54]

Scientists have developed a new gel patch prototype that could speed up the healing of a skin wound while minimizing the formation of scars.

- [**A preparative-scale reaction using platinum clusters with a single-digit atomicity realized**](#) [周一, 25 9月 21:54]

Scientists have recently developed a fully scalable method for the synthesis of atom-precise platinum clusters for potential use in catalytic applications. This method could provide a new pathway for large-scale production of atom-precise clusters. To demonstrate this, the hydrogenation of styrene was performed.

- [**How aerial thermal imagery is revolutionizing archaeology**](#) [周日, 24 9月 22:37]

A new study has demonstrated how the latest aerial thermal imagery is transforming archaeology due to advancements in technology. Today's thermal cameras, commercial drones and photogrammetric software has introduced a new realm of possibilities for collecting site data-- field survey data across a much larger area can now be obtained in much less time. The findings serve as a manual on how to use aerial thermography.

- [**NASA'S OSIRIS-REx spacecraft slingshots past Earth**](#) [周六, 23 9月 04:25]

NASA's asteroid sample return spacecraft successfully used Earth's gravity on Friday to slingshot itself on a path toward the asteroid Bennu, for a rendezvous next August.

- [**Twitter bots for good: Study reveals how information spreads on social media**](#) [周六, 23 9月 03:05]

Twitter bots have earned a bad reputation. But not all bots are bad, suggests a new study.

- [**Enhancing the sensing capabilities of diamonds with quantum properties**](#) [周六, 23 9月 00:29]

When a nitrogen atom is next to the space vacated by a carbon atom, it forms what is called a nitrogen-vacancy center. Now, researchers have shown how they can create more NV centers, which makes sensing magnetic fields easier, using a relatively simple method that can be done in many labs.

- [**A sustainable future powered by sea**](#) [周五, 22 9月 21:40]

Researchers develop turbines to convert the power of ocean waves into clean, renewable energy.

- [**Assembly of nanoparticles proceeds like a zipper**](#) [周五, 22 9月 21:40]

It has always been the Holy Grail of materials science to describe and control the material's structure-function relationship. Nanoparticles are an attractive class of components to be used in functional materials because they exhibit size-dependent properties, such as superparamagnetism and plasmonic absorption of light. Furthermore, controlling the arrangement of nanoparticles can result in unforeseen properties, but such studies are hard to carry out due to limited efficient approaches to prod...

- [**Smartphone apps can reduce depression**](#) [周五, 22 9月 21:09]

New research has confirmed that smartphone apps are an effective treatment option for depression, paving the way for safe and accessible

interventions for the millions of people around the world diagnosed with this condition.

- [**Ultra-light aluminum: Chemist reports breakthrough in material design**](#) [周五, 22 9月 21:09]

Chemists report a new, metastable, ultra-light crystalline form of aluminum has been computationally designed using density functional calculations with imposing periodic boundary conditions.

- [**The math of doughnuts: 'Moonshine' sheds light on elliptic curves**](#) [周五, 22 9月 21:09]

Mathematicians have opened a new chapter in the theory of moonshine, one which begins to harness the power of the pariahs -- sporadic simple groups that previously had no known application.

- [**Positive, negative or neutral, it all matters: NASA explains space radiation**](#) [周五, 22 9月 21:09]

Charged particles may be small, but they matter to astronauts. NASA's Human Research Program (HRP) is investigating these particles to solve one of its biggest challenges for a human journey to Mars: space radiation and its effects on the human body.

- [**New technique accurately digitizes transparent objects**](#) [周五, 22 9月 04:12]

A new imaging technique makes it possible to precisely digitize clear objects and their surroundings, an achievement that has eluded current state-of-the-art 3-D rendering methods.

- [**'Labyrinth' chip could help monitor aggressive cancer stem cells**](#) [周五, 22 9月 04:12]

Inspired by the Labyrinth of Greek mythology, a new chip etched with fluid channels sends blood samples through a hydrodynamic maze to separate out rare circulating cancer cells into a relatively clean stream for analysis. It is already in use in a breast cancer clinical trial.

- [**Dancing electrons lose the race**](#) [周五, 22 9月 02:13]

Ultrashort pulses of light were employed by physicists to start a race between electrons emitted from different initial states in a solid material. Timing this race revealed an unexpected result: the fastest electrons arrived in last place.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Breaking Coulomb's law: Scientists find a way around the rule that 'opposites attract'**](#) [周五, 22 9月 01:43]

Scientists have taken a big step towards creating the next generation of batteries, as well as more effective water treatment and better alternative energy after defying one of nature's most fundamental rules on an atomic scale.

- [**Quantum teleportation of patterns of light**](#) [周五, 22 9月 00:11]

Researchers have demonstrated entanglement swapping and teleportation of orbital angular momentum 'patterns' of light. This is a crucial step towards realizing a quantum repeater for high-dimensional entangled states.

- [**Rapid imaging of granular matter**](#) [周五, 22 9月 00:11]

Granular systems such as gravel or powders can be found everywhere, but studying them is not easy. Researchers have now developed a method by which pictures of the inside of granular systems can be taken 10,000 times faster than before.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Energy harvested from evaporation could power much of US**](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

- [**Some marine species more vulnerable to climate change than others**](#) [周三, 27 9月 00:51]

Certain marine species will fare much worse than others as they become more vulnerable to the effects of climate change, a new study has found.

- [**Amount of water in stem cells can determine its fate as fat or bone**](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

- [**Scientists unlock mysteries of how Ebola uses people's immune defenses to cause infection**](#) [周三, 27 9月 00:51]

Scientists have gained new insight into how the Ebola virus uses the body's natural defenses to speed the rate of infection and unleash its lethal disease, according to a new report.

- [**Fisheries sustainability linked to gender roles among traders**](#) [周二, 26 9月 23:59]

A new study of fish traders in coastal Kenya shows that women largely occupied fisheries with the lowest profits and are not saving money while working in these fisheries.

• [**Two Caribbean bird-catcher trees named after two women with overlooked botanical works**](#) [周二, 26 9月 23:59]

Known for their biodiversity richness, the Caribbean Islands are now adding two new species of bird-catcher trees to their list of botanical treasures. The new species were named after two women who self-engaged for decades on educational projects in botany, but whose remarkable work was never properly made known and accredited.

• [**Warm Northwest waters draw spawning fish north**](#) [周二, 26 9月 23:59]

Unusually warm ocean conditions off the Pacific Northwest in the last few years led anchovies, sardines and hake to begin spawning in Northwest waters much earlier in the year and, for anchovy, longer than biologists have ever recorded before, new research has found.

• [**Biochemists discover mechanism that helps flu viruses evolve**](#) [周二, 26 9月 23:20]

Flu viruses' rapid evolution relies in part on hijacking some of the cellular machinery of the infected host cell -- a group of proteins called chaperones, which help other proteins fold into the correct shape. When viruses are unable to get help from these proteins, they do not evolve as rapidly, research shows.

• [**Wearable solar thermoelectric generator created**](#) [周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

• [**Researchers identify novel way to target Ebola**](#) [周二, 26 9月 22:55]

Researchers have identified a potential new way to attack Ebola. Scientists have discovered that a protein called Tim-1 (T-cell immunoglobulin and mucin domain-containing protein 1) plays a key

role in the development of the cytokine storm seen in the last stages of Ebola infection.

- [**Predatory bacteria found in study of cystic fibrosis patients' lung microbiome**](#) [周二, 26 9月 22:55]

Cystic fibrosis patients have a wide variety of bacteria in their lungs, including two 'predators' not detected before, according to a new study.

- [**The drying of peatlands is reducing bird diversity**](#) [周二, 26 9月 22:54]

The populations of peatland birds in Finland, Sweden, Norway, Estonia and Latvia have decreased by a third during the past three decades, a recent international study indicates. The situation in Finland is the most dire, and the species in most trouble is the Finnish ruff, as the population has fallen to approximately 3 percent of what it was at the beginning of the study period.

- [**Nerves control the body's bacterial community**](#) [周二, 26 9月 22:54]

Using the freshwater polyp Hydra as a model organism, researchers have investigated how the simple nervous system of these animals interacts with the microbiome. They were able to demonstrate, for the first time, that small molecules secreted by nerve cells help to regulate the composition and colonization of specific types of beneficial bacteria along the Hydra's body column.

- [**'Hypermutators' drive pathogenic fungi to evolve more rapidly**](#) [周二, 26 9月 22:54]

For nearly two decades, a rare but potentially deadly fungus called *Cryptococcus deuterogattii* has gained a foothold in the Pacific Northwest and Vancouver Island. Researchers recently showed that lineages of the fungal pathogen *Cryptococcus deuterogattii* house a specific mutation in their DNA that increases their mutation rate. These hypermutators, as they are called, rapidly develop resistance to the antifungal drugs FK506 and rapamycin.

- [**Chronic wasting disease**](#) [周二, 26 9月 22:54]

New research summarizes the efforts in disease surveillance and risk management of chronic wasting disease (CWD) in deer and shows that past management strategies such as selective culling, herd reduction, and hunter surveillance have had only limited effectiveness. The summary points towards new advice for optimal, cost-effective strategies in aggressive disease control.

- [**Milk-alternative drinks do not replace the iodine in cows' milk**](#) [周二, 26 9月 21:14]

Consumers of milk-alternative drinks may be at risk of iodine deficiency, according to the findings of a new study.

- [**Agent Orange still linked to hormone imbalances in babies in Vietnam**](#) [周二, 26 9月 21:14]

Could herbicides that were sprayed during the Vietnam War still be causing health problems?

- [**The motor protein dancing in all our cells**](#) [周二, 26 9月 21:14]

Biologists have invented optical tweezers to follow the motions of molecular machines measured in nanometers.

- [**Higher risk of heart failure in cold weather**](#) [周二, 26 9月 21:14]

Could decreases in temperature cause heart failure and death?

- [**New 'bioactive' glass puts minerals back into damaged teeth**](#) [周二, 26 9月 21:12]

Dental researchers have now developed a very fast dissolving 'bioactive' glass which they are putting in toothpaste to repair decayed teeth.

- [**Drought: A cause of riots**](#) [周二, 26 9月 21:05]

The scientific community has been working on the possibility of a relationship between periods of drought and rioting for several years. Now a team has formally verified this hypothesis by studying almost 1,800 riots that occurred over a 20-year period in sub-Saharan Africa. The researchers observed a systematic link between the sudden

depletion of water resources and the outbreak of unrest. They also succeeded in quantifying the impact of geographic and social factors on the same link.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**Penguin-mounted video captures gastronomic close encounters of the gelatinous kind**](#) [周二, 26 9月 04:32]

Footage from penguin-mounted mini video recorders shows four species of penguin eating jellyfish and other gelatinous animals of the open ocean, a food source penguins were not previously believed to partake of, scientists report.

- [**Snails bred in lab help species crawl back from brink of extinction**](#) [周二, 26 9月 04:06]

Work to restore the endangered Chittenango ovate amber snail, found only in one location inside a Central New York state park, continued this month with the release of tagged adult snails raised in a laboratory.

- [**Antarctica: The wind sublimates snowflakes**](#) [周二, 26 9月 03:14]

A team of researchers has collected new data that shows a significant decrease in snow precipitation close to the ground in Antarctica, which has an impact on the ice sheet surface mass balance.

- [**Mechanism of asexual reproduction in flatworms**](#) [周二, 26 9月 03:14]

Scientists have nailed the biomechanics of a centuries-long puzzle on how freshwater flatworms known as planarians reproduce. The asexual freshwater worms, notoriously difficult to study, tear themselves into two pieces that go on to form two new worms. Researchers are now able

to predict where planarian fission occurs based on its anatomy as well as explain how the process happens using a relatively simple mechanical model.

- [**Metabolism directly impacts the odds of developing malaria**](#) [周二, 26 9月 01:30]

Researchers have found that the host's susceptibility to develop malaria depends on his or her metabolic state, which can be easily manipulated through external stimuli such as dietary patterns.

- [**Ticks are even tougher and nastier than you thought**](#) [周二, 26 9月 01:30]

Studies are showing how ticks can survive drought and cold northern winters.

- [**Study examines legacies of rainforest burning in British Columbia**](#) [周二, 26 9月 01:30]

Analyses of temperate rain forests located on the central coast of British Columbia, Canada, suggest that for centuries, humans have intentionally used fire to manage plant life.

- [**Discovering what makes organelles connect could help explain neurodegenerative diseases**](#) [周二, 26 9月 01:29]

Organelles must exchange signals and materials to make the cell operate correctly. New technologies are allowing researchers to see and understand the networks that connect these organelles, allowing them to build maps of the trade routes that exist within a cell.

- [**Big brains in birds provides survival advantage**](#) [周二, 26 9月 01:29]

Scientists have discovered that brainier birds are better able to colonize inhospitable places.

- [**Bacterial nanosized speargun works like a power drill**](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now

gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in only a few thousandths of a second and injects a cocktail of toxins.

• [**High-fidelity recording of molecular geometry with DNA 'nanoscopy'**](#) [周一, 25 9月 23:33]

A research team has now developed a DNA nanotechnology-based method that allows for repeated, non-destructive recording of uniquely barcoded molecular pairings, rendering a detailed view of their components and geometries. In the future, the approach could help researchers understand how changes in molecular complexes control biological processes in living cells.

• [**Climate insurance is rarely well thought out in agriculture**](#) [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

• [**Fully renewable India in 2050 can take a shortcut to emission-free future**](#) [周一, 25 9月 23:16]

India can function on a fully renewable electricity system in 2050, research indicates. The study shows that developing countries that have an abundance of renewable resources do not need to take the path of the western countries where increasing living standards have been coupled with heavy emissions from electricity generation and other industry. They can move straight to renewable systems and do it cheaply.

• [**Climate change can goad volcanoes into life**](#) [周一, 25 9月 23:14]

Geologists have analyzed volcanic data from the Messinian salinity crisis in the Mediterranean Sea, when the Strait of Gibraltar was blocked and the Mediterranean temporarily isolated from the Atlantic. After

testing various scenarios, the geologists concluded that the increase in magmatic activity could only be explained by the almost total drying out of the Mediterranean.

- [**Clarifying perspectives to promote action on loss and damage from climate change**](#) [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy, negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

- [**Likely scenarios for global spread of devastating crop disease**](#) [周一, 25 9月 23:13]

New research reveals the most likely months and routes for the spread of new strains of airborne 'wheat stem rust' that could endanger global food security by ravaging wheat production across Africa, the Middle East, Asia and the wider world.

- [**Panda habitat shrinking, becoming more fragmented**](#) [周一, 25 9月 23:13]

Using remote sensing data, Chinese and US scientists have re-assessed the conservation status of the giant panda. Their analysis shows that while panda numbers are increasing, their habitat still covers less area and is more fragmented than it was in 1988, when the species was listed as endangered on the IUCN Red List.

- [**World's botanic gardens contain a third of all known plant species, and help protect the most threatened**](#) [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41

percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

- [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

- [**The rat race is over: New livestock model for stroke could speed discovery**](#) [周一, 25 9月 22:57]

Researchers have developed the first US pig model for stroke treatments.

- [**Scientists monitor Silicon Valley's underground water reserves -- from space**](#) [周一, 25 9月 22:57]

Scientists monitoring Silicon Valley's underground water reserves from space have found that water levels rebounded quickly after a severe drought that lasted from 2012-15. The research points to the success of aggressive conservation measures. It also helps to lay the groundwork for low-cost monitoring of subterranean water reserves in California and elsewhere in the world.

- [**Scientists call for more research on how human activities affect the seabed**](#) [周一, 25 9月 22:47]

Extensive research has been released into how industry and environmental change are affecting our seafloors. Researchers say more work is needed to help safeguard these complex ecosystems and the benefits they provide to people for the future.

- [**Getting the measure of mud**](#) [周一, 25 9月 22:47]

For the first time, researchers have been able to use mud deposited on the depths of the ocean floor to measure changes in the speed of deep-sea currents. Using mud as a current meter could help scientists to

identify fluctuating patterns in ocean current speeds stretching back into prehistory, enabling climate change researchers to get a better sense of how currents behave over time.

• [**Brain damage in fish from plastic nanoparticles in water**](#) [周一, 25 9月 22:47]

A new study shows that plastic particles in water may end up inside fish brains. The plastic can cause brain damage, which is the likely cause of behavioral disorders observed in the fish.

• [**Filter may be a match for fracking water**](#) [周一, 25 9月 22:47]

A superhydrophilic filter has proven able to remove more than 90 percent of contaminants from water used in hydraulic fracturing operations at shale oil and gas wells.

• [**With extra sugar, leaves get fat too**](#) [周一, 25 9月 22:47]

Eat too much without exercising and you'll probably put on a few pounds. As it turns out, plant leaves do something similar. A new study shows that retaining sugars in plant leaves can make them get fat too. In plants, this extra fat accumulation could be a good thing. It could help turn plants into factories for making biofuels and other useful chemicals.

• [**Semitransparent and flexible: Solar cells made from atomically thin sheet**](#) [周一, 25 9月 21:55]

A new method for fabricating semitransparent, flexible solar cells has greatly improved power conversion efficiency.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Interventions for reducing hepatitis C infection in people who inject drugs**](#) [周二, 26 9月 22:54]

The first global review to quantify the impact of needle syringe programs (NSP) and opioid substitution treatment (OST) in reducing the risk of becoming infected with the hepatitis C virus has now been published. The study has implications for millions of people who are 'at risk' from infection.

- [**Household chores: Women still do more**](#) [周二, 26 9月 22:54]

Women of all ages still tend to do more household chores than their male partners, no matter how much they work or earn in a job outside the home. New findings demonstrate the persistent gendered nature of how housework is divided.

- [**Preschool teachers need better training in science**](#) [周二, 26 9月 22:54]

Preschool instructors appear to lack the knowledge, skills and confidence to effectively teach their young students science -- a problem that is likely contributing to America's poor global performance in this crucially important subject.

- [**Drought: A cause of riots**](#) [周二, 26 9月 21:05]

The scientific community has been working on the possibility of a relationship between periods of drought and rioting for several years. Now a team has formally verified this hypothesis by studying almost 1,800 riots that occurred over a 20-year period in sub-Saharan Africa. The researchers observed a systematic link between the sudden

depletion of water resources and the outbreak of unrest. They also succeeded in quantifying the impact of geographic and social factors on the same link.

- [**People are reluctant to use public defibrillators to treat cardiac arrests**](#) [周二, 26 9月 20:59]

A new study suggests that people are reluctant to use public-access defibrillators to treat cardiac arrests.

- [**Psychological impacts of natural disasters on youth**](#) [周二, 26 9月 04:32]

A researcher is fully aware of children's reaction to trauma. Her research focuses on the impact of disasters on youth since Hurricane Andrew in 1992. La Greca has been evaluating how best to define post-traumatic stress disorder (PTSD) in children. This line of research will help to quickly identify the children who need support services post-disaster and identify key aspects of the post-disaster environment that facilitate their recovery.

- [**Are children who see movie characters use guns more likely to use them?**](#) [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- [**Climate insurance is rarely well thought out in agriculture**](#) [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

- [**Group project? Taking turns, working with**](#)

friends may improve grades [周一, 25 9月 23:33]

A new study with college students has found that the social dynamics of a group, such as whether one person dominates the conversation or whether students work with a friend, affect academic performance. Put simply, the more comfortable students are, the better they do, which yields benefits beyond the classroom.

Fully renewable India in 2050 can take a shortcut to emission-free future [周一, 25 9月 23:16]

India can function on a fully renewable electricity system in 2050, research indicates. The study shows that developing countries that have an abundance of renewable resources do not need to take the path of the western countries where increasing living standards have been coupled with heavy emissions from electricity generation and other industry. They can move straight to renewable systems and do it cheaply.

Clarifying perspectives to promote action on loss and damage from climate change [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy, negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

Visual attention drawn to meaning, not what stands out [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

World's botanic gardens contain a third of all

known plant species, and help protect the most threatened [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41 percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

• **Minority public managers prefer integrating social equity, traditional public values** [周一, 25 9月 22:57]

Minority public managers place more emphasis on both traditional values, like efficiency and effectiveness, and social equity when compared with their white counterparts, according to a new study.

• **Scientists call for more research on how human activities affect the seabed** [周一, 25 9月 22:47]

Extensive research has been released into how industry and environmental change are affecting our seafloors. Researchers say more work is needed to help safeguard these complex ecosystems and the benefits they provide to people for the future.

• **New technique spots warning signs of extreme events** [周日, 24 9月 22:38]

Engineers have devised a framework for identifying key patterns that precede an extreme event. The framework can be applied to a wide range of complicated, multidimensional systems to pick out the warning signs that are most likely to occur in the real world.

• **Study finds no-tillage not sufficient alone to prevent water pollution from nitrate** [周六, 23 9月 04:25]

A new study answers a long-debated agricultural question: whether no-tillage alone is sufficient to prevent water pollution from nitrate. The answer is no.

• **Flint's water crisis led to fewer babies and**

[higher fetal death rates, researchers find](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

• [Breathing dirty air may harm kidneys](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

• [Strong alcohol policies help reduce alcohol-involved homicides](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among homicide victims, according to a new study.

• [Babies can learn that hard work pays off](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

• [We must accelerate transitions for sustainability and climate change, experts say](#) [周五, 22 9月 02:12]

We must move faster towards a low-carbon world if we are to limit global warming to 2 degrees C this century, experts have warned.

• [Rapid hepatitis C testing may help better screen young adults](#) [周五, 22 9月 02:12]

Routine and rapid hepatitis C virus testing among young adults who use injection drugs improves life expectancy and may provide a good use of

limited resources, according to new research.

- [**Wildlife rangers: What motivates them?**](#) [周五, 22 9月 00:11]

Wildlife rangers are on the front lines protecting our most iconic species -- tigers, elephants, gorillas and many others. But their challenges involve more than confrontations with wild animals and poachers.

- [**Recipe for forest restoration discovered**](#) [周四, 21 9月 22:17]

A new study has uncovered some valuable information on ways to maximize the success of replanting efforts, bringing new hope for restoring these threatened ecosystems.

- [**Premature births cost health plans \\$6 billion annually**](#) [周四, 21 9月 21:02]

A new study estimates employer-sponsored health plans spent at least \$6 billion extra on infants born prematurely in 2013 and a substantial portion of that sum was spent on infants with major birth defects.

- [**Pay more, smoke less: Possible effects of raising tobacco taxes across the EU**](#) [周四, 21 9月 11:22]

Raising tobacco taxes to increase cigarette prices could reduce cigarette consumption and smoking-associated deaths (SADs) in all 28 EU countries, according to a new study. In higher income countries, raising tobacco taxes could increase revenues that could be spend on prevention and control programs, while in lower income countries tax revenues may be negatively affected, researchers suggest.

- [**When residents take charge of their rainforests, fewer trees die**](#) [周四, 21 9月 06:21]

When the government gives citizens a personal stake in forested land, trees don't disappear as quickly and environmental harm slows down, research finds.

- [**Communication among health care facilities key to preventing spread of drug-resistant bacteria**](#) [周

四, 21 9月 02:47]

Communication breakdowns between care facilities can pave the way

for outbreaks of infection, according to research on the spread of an extensively drug-resistant bacterium.

• [**Hold the phone: An ambulance might lower your chances of surviving some injuries**](#) [周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

• [**Building social communication skills in shy children helps with peer likeability**](#) [周三, 20 9月 22:00]

A new study has discovered that shy children with low English vocabulary skills, can still be popular among their peers if they have high-functioning social communication skills that enable them to engage and interact well with their peers in social settings.

• [**New tool to assess individual's level of wisdom**](#) [周三, 20 9月 21:59]

Researchers have developed a new tool called the San Diego Wisdom Scale (SD-WISE) to assess an individual's level of wisdom, based upon a conceptualization of wisdom as a trait with a neurobiological as well as psychosocial basis.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Innovative control system paves the way for large scale universal quantum computing**](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Bacterial nanosized speargun works like a**](#)

[power drill](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in only a few thousandths of a second and injects a cocktail of toxins.

[Lava tubes: Hidden sites for future human habitats on the Moon and Mars](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

[Genes are controlled by 'Nano footballs,' scientists discover](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

[Fish have surprisingly complex personalities](#) [周一, 25 9月 21:54]

Tiny fish called Trinidadian guppies have individual 'personalities', new research shows.

[Detecting cosmic rays from a galaxy far, far away](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

[Early trilobites had stomachs, new fossil study finds](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at

least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

• [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

• [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

• [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

• [**Unique type of object discovered in our solar system**](#) [周四, 21 9月 02:47]

Astronomers have observed the intriguing characteristics of an unusual type of object in the asteroid belt between Mars and Jupiter: two asteroids orbiting each other and exhibiting comet-like features, including a bright coma and a long tail. This is the first known binary asteroid also classified as a comet.

• [**Plants combine color and fragrance to procure pollinators**](#) [周四, 21 9月 02:47]

Who knew that it's possible to predict the fragrance of a flower by looking at its color? This is true for many of the 41 insect-pollinated plant species growing in a Phrygana scrubland habitat on the Greek island of Lesbos.

- **[Bite force research reveals dinosaur-eating frog](#)**

[周四, 21 9月 01:17]

Scientists say that a large, now extinct, frog called *Beelzebufo* that lived about 68 million years ago in Madagascar would have been capable of eating small dinosaurs. The conclusion comes from a study of the bite force of South American horned frogs from the living genus *Ceratophrys*, known as Pacman frogs for their characteristic round shape and large mouth, similar to the video game character Pac-Man.

- **[World's first 'molecular robot' capable of building molecules](#)**

[周四, 21 9月 01:17]

Scientists have created the world's first 'molecular robot' that is capable of performing basic tasks including building other molecules.

- **[Dinosaur evolution: Lumbering giants had agile ancestors](#)**

[周四, 21 9月 01:17]

The best known sauropod dinosaurs were huge herbivorous creatures, whose brain structures were markedly different from those of their evolutionary predecessors, for the earliest representatives of the group were small, lithe carnivores.

- **[Scientists make atoms-thick 'Post-It notes' for solar cells and circuits](#)**

[周四, 21 9月 01:17]

A new study describes an innovative method to make stacks of semiconductors just a few atoms thick. The technique offers scientists and engineers a simple, cost-effective method to make thin, uniform layers of these materials, which could expand capabilities for devices from solar cells to cell phones.

- **[Hold the phone: An ambulance might lower your chances of surviving some injuries](#)**

[周四, 21 9月 01:16]

Victims of gunshots and stabbings are significantly less likely to die if they're taken to the trauma center by a private vehicle than ground emergency medical services (EMS), according to results of a new analysis.

• [Is the Milky Way an 'outlier' galaxy? Studying its 'siblings' for clues](#) [周三, 20 9月 23:33]

The most-studied galaxy in the universe -- the Milky Way -- might not be as 'typical' as previously thought, according to a new study. Early results from the Satellites Around Galactic Analogs (SAGA) Survey indicate that the Milky Way's satellites are much more tranquil than other systems of comparable luminosity and environment. Many satellites of those 'sibling' galaxies are actively pumping out new stars, but the Milky Way's satellites are mostly inert.

• [Real or fake? Creating fingers to protect identities](#) [周三, 20 9月 23:33]

Biometric experts for the first time have designed and created a fake finger containing multiple key properties of human skin. Commonly called a spoof, this fake finger has been used to test two of the predominant types of fingerprint readers to help determine their resilience to spoof attacks.

• [Gravity waves influence weather and climate](#) [周三, 20 9月 22:00]

Gravity waves form in the atmosphere as a result of destabilizing processes. The effects of gravity waves can only be taken into consideration by including additional special components in the models.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**No evidence to support claims that telephone consultations reduce GP workload or hospital referrals**](#) [周四, 28 9月 06:44]

Telephone consultations to determine whether a patient needs to see their GP face-to-face can deal with many problems, but a new study found no evidence to support claims by companies offering to manage these services or by NHS England that the approach saves money or reduces the number of hospital referrals.

- [**The hormone that could be making your dog aggressive discovered**](#) [周四, 28 9月 04:20]

Thousands of people are hospitalized every year for dog bites, and aggressive behavior is a major reason dogs end up in shelters. Biologists have studied the biology behind canine aggression, specifically the role of the hormones vasopressin and oxytocin.

- [**Nontraffic injuries and fatalities in young children**](#) [周四, 28 9月 04:20]

From 1990-2014, researchers found more than 11,750 distinct incidents in a variety of venues and vehicles affecting 14,568 children 14 years and younger, resulting in nearly 3,400 deaths.

- [**How cells recover from the verge of programmed death**](#) [周四, 28 9月 04:20]

Biologists explore the molecular underpinnings of cells that recover from the verge of programmed death.

- [**Earliest evidence for a native African cultigen discovered in Eastern Sudan**](#) [周四, 28 9月 04:20]

Archaeologists examining plant impressions within broken pottery have discovered the earliest evidence for domesticated sorghum in Africa.

- [**New class of molecules may protect brain from stroke, neurodegenerative diseases**](#) [周四, 28 9月 04:20]

Scientists have discovered a new class of molecules in the brain that synchronize cell-to-cell communication and neuroinflammation/immune activity in response to injury or diseases. Elovonoids (ELVs) are bioactive chemical messengers made from omega-3 very long chain polyunsaturated fatty acids (VLC-PUFAs,n-3). They are released on demand when cells are damaged or stressed.

- [**Mini-protein rapid design method opens way to create a new class of drugs**](#) [周四, 28 9月 04:20]

A high-speed method has been developed to generate many different, small, stable proteins from scratch, custom-designed to bind to specific therapeutic targets. Protection against infectious diseases, like flu, and antidotes to nerve toxins are but two research goals of this approach. The method rapidly originates thousands of new drug candidates. These computer-designed proteins, which did not previously exist in nature, combine the stability and bioavailability of small molecule drugs with the sp...

- [**Beer can lift your spirits due to malted barley ingredient**](#) [周四, 28 9月 03:28]

Visitors to the Oktoberfest have always known it and now it has been scientifically -- beer can lift your spirits. Scientists examined 13,000 food components to find out whether they stimulate the reward center in

the brain and make people feel good. Hordenine which is found in malted barley and beer seems to do the job quite well.

- **[Haplobank: A biobank of reversible mutant embryonic stem cells](#)** [周四, 28 9月 01:38]

Scientists have developed a biobank of revertible, mutant embryonic stem cells – called Haplobank - which contains over 100,000 mutated, conditional mouse embryonic stem cell lines, targeting about 70% of the protein-coding genome.

- **[Melanoma cells rewired to resist drug treatment](#)** [周四, 28 9月 01:36]

Scientists reveal why relapses after treatment for metastatic melanoma occur. While combination therapies block off the principal pathway that cancer cells use to fuel their growth, the cells come to bypass this blockade and, like vehicles on a detour route, make use of additional pathways to continue growing and spreading.

- **[Black holes with ravenous appetites define Type I active galaxies](#)** [周四, 28 9月 01:36]

Type I and Type II active galaxies do not just appear different -- they are, in fact, very different from each other, both structurally and energetically, new research shows. According to the results of a new study, the key factor that distinguishes Type I and Type II galaxies is the rate at which their central black holes -- or active galactic nuclei -- consume matter and spit out energy.

- **[New light shed on how Earth and Mars were created](#)** [周四, 28 9月 01:36]

Analysing a mixture of earth samples and meteorites, scientists have shed new light on the sequence of events that led to the creation of the planets Earth and Mars.

- **[The volatile processes that shaped Earth](#)** [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of

these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

• [**Turbocharging engine design**](#) [周四, 28 9月 00:51]

Researchers have moved the development process into the passing lane. For the first time, scientists and engineers have pinpointed engine designs for a given fuel using the Mira supercomputer at the heart of the Argonne Leadership Computing Facility (ALCF), a DOE Office of Science User Facility.

• [**Teen first in Virginia to receive cancer gene therapy in clinical trial**](#) [周四, 28 9月 00:51]

UVA has administered its first dose of an experimental gene therapy for a deadly form of treatment-resistant pediatric leukemia.

• [**Breakthrough in understanding the origin of the aging process**](#) [周四, 28 9月 00:50]

Researchers have unveiled the mystery of why we age in a new study. They have identified that genes belonging to a process called autophagy, which is one of the cells most critical survival processes, promote health and fitness in young worms but drive the process of aging later in life.

• [**Our brain's filing system for storing experiences uncovered**](#) [周四, 28 9月 00:36]

A team of neuroscientists has uncovered how our brains organize, over time, our experiences: that is, according to their similarities.

• [**LIGO and Virgo observatories jointly detect black hole collision**](#) [周四, 28 9月 00:36]

The first observation of gravitational waves has been discovered by by three different detectors, marking a new era of greater insights and improved localization of cosmic events now available through globally networked gravitational-wave observatories.

• [**Citizen science can predict butterfly population**](#)

trends [周四, 28 9月 00:36]

New research shows that citizen scientists can play a role in gathering meaningful information to inform long-term monitoring of biodiversity trends such as butterfly population change.

- **Iron supplements have long-term benefits for low birth-weight babies** [周四, 28 9月 00:36]

Babies classified as low birth weight (under 2,500 grams) are at risk of iron deficiency, which is linked to impaired neurological development. A long-term randomized study now shows that providing such babies with iron supplements can prevent behavioral problems at school age.

- **Increased arterial stiffness linked to restrictive spirometry pattern and reduced forced vital capacity** [周四, 28 9月 00:35]

Increased arterial stiffness is a known predictor of cardiovascular diseases in different populations, including healthy subjects and patients with hypertension, diabetes, or renal disease. A new study examining arterial stiffness in a large population determined that both restrictive spirometry pattern and reduced forced vital capacity (FVC) were associated with a higher risk of arterial stiffness not only in men but also in women. The investigators found that arterial stiffness increased fourfo...

- **Total solar eclipse viewed from space** [周四, 28 9月 00:35]

While people across the nation gazed at August's total solar eclipse from Earth, a bread loaf-sized NASA satellite had a front row seat for the astronomical event.

- **Teens' online friendships just as meaningful as face-to-face ones** [周三, 27 9月 22:54]

Many parents worry about how much time teenagers spend texting, sharing selfies and engaging in other online activities with their friends. However, according to a recent research synthesis, many of these digital behaviors serve the same purpose and encompass the same core qualities

as face-to-face relationships.

• [**New iceberg calved from Pine Island Glacier**](#) [周三, 27 9月 22:45]

A new iceberg calved from Pine Island Glacier -- one of the main outlets where ice from the interior of the West Antarctic Ice Sheet flows into the ocean.

• [**Drug slows stomach emptying, may individualize obesity treatment, study shows**](#) [周三, 27 9月 22:25]

Liraglutide injection, a prescription medication used to treat type 2 diabetes and obesity is associated with marked slowing of stomach emptying and is an effective weight loss therapy, finds a randomized, double-blind, placebo-controlled study.

• [**On a collision course with game theory**](#) [周三, 27 9月 22:23]

How do pedestrians behave in a large crowd? How do they avoid collisions? How can their paths be modeled? A new approach developed by mathematicians provides answers to these questions.

• [**How old does your computer think you are?**](#) [周三, 27 9月 22:23]

Computerized face recognition is an important part of initiatives to develop security systems, in building social networks, in curating photographs, and many other applications. Systems can allow a computer to estimate with precision a person's age based on an analysis of their face.

• [**Preservation of floodplains is flood protection**](#) [周三, 27 9月 22:23]

The silting of rivers and streams leads to problems for fish, mussels, and other aquatic organisms because their habitats disappear. However, not only intensive agriculture and erosion are destroying these habitats. Now a study refutes this widespread view. In order to save the species living in the river basin -- and protect people from the threat of floods -- rivers need more space, diversity, and freedom.

• [**Two new crustacean species discovered on Galician seabed**](#) [周三, 27 9月 22:23]

The fauna of deep seabed tends to be relatively unknown due to the difficulty of collecting samples at great depths. A research team undertook four oceanographic expeditions in the waters off the northwest coast of the Iberian Peninsula that have led to the discovery of several new species that inhabit the abyssal plains. Now they describe two eyeless species of millimetric proportions.

• [**Anxious moms may give clues about how anxiety develops**](#) [周三, 27 9月 22:23]

Moms may be notorious worriers, but babies of anxious mothers may also spend more time focusing on threats in their environment, according to a team of researchers.

• [**Emerging infectious disease threatens Darwin's frog with extinction**](#) [周三, 27 9月 22:09]

Iconic species likely to be wiped-out by amphibian fungus, despite lack of obvious short-term evidence.

• [**Middle age fattens you up if you do not increase your physical activity**](#) [周三, 27 9月 22:09]

New research has examined how changes in the daily step count are related to changes in the body mass index (BMI).

• [**More than a 38 % of the Neotropical parrot population in the American continent is threatened by human activity**](#) [周三, 27 9月 22:09]

More than a 38% of the Neotropical parrot population of the American continent (Neotropic) is endangered due the impact of human activity, according to a scientific study.

• [**Seeking feedback not always sufficient for stimulating creativity**](#) [周三, 27 9月 22:09]

It is widely believed that seeking feedback from colleagues, managers, friends and family enhances employees' creativity. But is this always the case? No, a positive effect depends on the work environment.

- [**Moths: A different weapon against each enemy**](#) [周三, 27 9月 21:56]

It's a dangerous world out there, especially if you are a small insect. Insects have thrived on our planet for hundreds of millions of years, so they must be doing something right despite all the threats to their survival. With so many predators out to get them many animals have evolved chemical defences, making themselves distasteful or even toxic. Wood tiger moths protect themselves from multiple predators using different chemical defences. Choosing the right defence can be tricky as predators ...

- [**Coping with stressful organizational change**](#) [周三, 27 9月 21:51]

Stress is not a recent phenomenon, but the modern work environment seems to highlight its detrimental effects on employees. This is no more obvious than during times of organizational change. New research considers the impact of such changes on workers in a healthcare authority in New Zealand, highlighting the problems that any organization might face under such circumstances and pointing to possible methods to cope and remediate employee stress.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**How to grow a spine**](#) [周三, 27 9月 21:33]

A genetics professor -- whose lab discovered the segmentation clock 20 years ago -- and colleagues report that they used mouse cells to reconstitute a stable version of this clockwork for the first time in a petri dish, leading to several new discoveries about where the clock is located, what makes it tick and how the vertebral column takes shape.

- [**New twist on asymmetric catalysis**](#) [周三, 27 9月 21:33]

Researchers have developed an efficient and simple chemical synthesis of a new kind of twisted helicene molecule containing a sulfur group, thiophene. The unusual screw-like asymmetry of the molecules could be

useful for making drugs and other types of chemicals in their pure single-enantiomer forms.

- [**Brain disconnections may contribute to Parkinson's hallucinations**](#) [周三, 27 9月 21:33]

Disconnections of brain areas involved in attention and visual processing may contribute to visual hallucinations in individuals with Parkinson's disease, according to a new study. The disconnected brain areas seen on functional MRI may be valuable in predicting the development of visual hallucinations in patients with Parkinson's disease.

- [**Geographic variation in Gentoo penguin calls**](#) [周三, 27 9月 21:33]

Vocal communication is central to the lives of many birds, which use sound to attract mates and defend territories. Penguins are no exception, but we know little about how or why penguin vocalizations vary between isolated populations. A new study takes a broad look at vocalizations across the range of Gentoo penguins and concludes that while their calls do vary from place to place, we still have lots to learn about the processes at work.

- [**Songbird populations may indicate trouble in northwestern forests**](#) [周三, 27 9月 21:33]

Populations of many North American songbirds are declining, and in many cases we don't understand why. Conservation efforts need this information to be effective, and bird banding stations can help fill in the gaps, providing insights into how demographics vary across space and time. A new study presents ten years of data from banding stations across northern California and southern Oregon and offers new hints on what's driving changes in the region's songbird populations.

- [**Tree-dwelling, coconut-cracking giant rat discovered in Solomon Islands**](#) [周三, 27 9月 21:33]

Scientists have discovered a new species of giant rat. It's more than four times the size of the black rats that live in the US, it lives in trees, and it's rumored to crack open coconuts with its teeth. And it's actually

pretty cute.

- [**Red blood cells for transfusion like a good red: A little older, a little better**](#) [周三, 27 9月 21:33]

The transfusion of older stored red blood cells is safe and surprisingly, associated with fewer side effects, a landmark research trial has found.

- [**The strange structures of the Saturn nebula**](#) [周三, 27 9月 21:33]

The spectacular planetary nebula NGC 7009, or the Saturn Nebula, emerges from the darkness like a series of oddly-shaped bubbles, lit up in glorious pinks and blues. This colourful image was captured by the MUSE instrument on ESO's Very Large Telescope (VLT). The map -- which reveals a wealth of intricate structures in the dust, including shells, a halo and a curious wave-like feature -- will help astronomers understand how planetary nebulae develop their strange shapes and symmetries.

- [**Cellular 'message in a bottle' may provide path to new way of treating disease**](#) [周三, 27 9月 21:33]

A newly discovered cellular messaging mechanism could lead to a new way to deliver therapeutics to tissues affected by disease, according to a new study. Researchers found a type of extracellular vesicle -- a sac secreted by cells that contains proteins and RNA molecules -- carries receptors that allow signaling without direct contact between cells.

- [**Removing nitrate for healthier ecosystems**](#) [周三, 27 9月 21:33]

In a new study, researchers have identified nitrate removal hotspots in landscapes around agricultural streams.

- [**Purple plant is on the defensive**](#) [周三, 27 9月 21:33]

While lavender has long been known for its strong scent and soothing oils, a researcher is exploring the plant's ability to create natural pesticides.

- [**Computer scientists address gap in messaging privacy**](#) [周三, 27 9月 21:33]

Researchers have developed a solution to a longstanding problem in the field of end-to-end encryption, a technique that ensures that only sender and recipient can read a message.

• [Plant substance inhibits cancer stem cells](#) [周三, 27 9月

21:33]

Lab experiments show that the chemical compound damsine found in the plant *Ambrosia arborescens* inhibits the growth and spread of cancer stem cells. The similar but synthetically produced ambrosin has the same positive effect.

No evidence to support claims that telephone consultations reduce GP workload or hospital referrals -- ScienceDaily

Telephone consultations to determine whether a patient needs to see their GP face-to-face can deal with many problems, but a study led by researchers at the Cambridge Centre for Health Services Research (University of Cambridge and RAND Europe), found no evidence to support claims by companies offering to manage these services or by NHS England that the approach saves money or reduces the number of hospital referrals.

As UK general practices struggle with rising demand from patients, more work being transferred from secondary to primary care, and increasing difficulty in recruiting general practitioners, one proposed potential solution is a 'telephone first' approach, in which every patient asking to see a GP is initially phoned back by their doctor on the same day. At the end of this phone call the GP and the patient decide whether the problem

needs a face-to-face consultation, or whether it has been satisfactorily resolved on the phone.

Two commercial companies provide similar types of management support for practices adopting the new approach, with claims that the approach dramatically reduces the need for face-to-face consultations, reduces workload stress for GPs and practice staff, increases continuity of care, reduces A&E; attendance and emergency hospital admissions, and increases patient satisfaction.

Some of these claims are repeated in NHS England literature, including the assertion based on claims from one of the companies that practices using the approach have a 20% lower A&E; usage and that "the model has demonstrated a cost saving of approximately £100k per practice through prevention of avoidable attendance and admissions to hospital." Several Clinical Commissioning Groups have subsequently paid for the management support required for the approach to be adopted by practices in their area.

The NIHR acknowledged the need for robust and independent evaluation of current services and therefore commissioned the team led by Martin

Roland, Emeritus Professor of Health Services Research at the University of Cambridge. The results of the evaluation, which looked at data sources including GP and hospital records, patient surveys and economic analyses, are published today in *The BMJ*.

The study found that adoption of the 'telephone first' approach had a major effect on patterns of consultation: the number of telephone consultations increased 12-fold, and the number of face-to-face consultations fell by 38%.

However, the study found that the 'telephone first' approach was on average associated with increased overall GP workload; there was an overall increase of 8% in the mean time spent consulting by GPs, but this figure masks a wide variation between practices, with some practices experiencing a substantial reduction in workload and others a large increase.

Dr Jennifer Newbould from RAND Europe, part of the Cambridge Centre for Health Services Research, the study's first author, says: "There are some positives to a 'telephone first approach'; for example, we found clear evidence that a significant part of patient workload can be addressed through phone consultations. But we need

to be careful about seeing this as a panacea: while this may increase a GP practice's control over day-to-day workload, it does not necessarily decrease the amount of time GPs spend consulting and may, in some cases, increase it."

The researchers found no evidence that the approach substantially reduced overall attendance at A&E; departments or emergency hospital admissions: introduction of the 'telephone first' approach was followed by a small (2%) increase in hospital admissions, no initial change in A&E; attendance, but a small (2% per year) decrease in the subsequent rate of rise of A&E; attendance. However, far from reducing secondary care costs, they found overall secondary care costs increased slightly by £11,776 per 10,000 patients.

Professor Roland adds: "Importantly, we found no evidence to support claims made by one of the companies that support such services -- claims that have been repeated by NHS England -- that the approach would be substantially cost-saving or reduce hospital referrals. This has resulted in some Clinical Commissioning Groups across England buying their consultancy services based on unsubstantiated claims. The NHS must be careful to ensure that it bases its

information and recommendation on robust evidence."

The study was funded by the National Institute for Health Research.

The hormone that could be making your dog aggressive discovered -- ScienceDaily

For some dog owners, a leisurely walk can turn stressful the moment their canine companion sees another pup walking by. Dogs with what is known as "leash aggression" may bark, growl or lunge at other dogs during walks, setting the scene for a tense and potentially dangerous interaction.

So why do some dogs lash out on the leash while others don't? Hormones may be to partly to blame, according to new research led by the University of Arizona's Evan MacLean.

Although a number of studies have looked at the role of testosterone and serotonin in aggression in dogs and other mammals, those hormones may be only part of the story, according to MacLean's findings, which are published in a special issue of the journal *Frontiers in Psychology*.

MacLean and his collaborators looked specifically at oxytocin and vasopressin -- hormones that are also found in humans -- and found that they may play an important role in shaping dogs' social behavior.

Better understanding the biology behind canine aggression could help with the development of interventions, said MacLean, an assistant professor of anthropology and director of the Arizona Canine Cognition Center in the UA School of Anthropology.

"Dog aggression is a huge problem. Thousands of people are hospitalized every year for dog bites, especially kids, and aggression is one of the main reasons that dogs get relinquished to shelters," MacLean said. "If there are ways to intervene and affect biological processes that produce aggression, that could have a huge benefit both for people and dogs."

MacLean was interested in oxytocin and vasopressin -- sometimes thought of as "yin and yang" hormones -- because of the growing research on their role in the biology of social behavior.

Oxytocin, which is significant in childbirth and

nursing, is sometimes called the "love hormone," as its levels in humans have been shown to increase when we hug or kiss a loved one. Vasopressin is a closely related hormone involved in water retention in the body. In contrast to oxytocin, it has been linked to aggression in humans, with previous research suggesting that people with chronic aggression problems have high levels of vasopressin.

For the current study, MacLean and his collaborators recruited pet dogs of varying ages, breeds and sexes, whose owners reported struggles with leash aggression. For each aggressive dog recruited, the researchers found a non-aggressive dog of the same sex, age and breed to serve as a comparison.

During the experiment, each dog was held on a leash by its owner. Across the room, an experimenter played audio of a dog barking behind a curtain, before pulling back the curtain to reveal a lifelike dog model with a human handler.

The dogs in the study were presented in the same way with everyday noises and three common objects -- a cardboard box, trash bag and an inflated yoga ball.

The dogs' responses and hormone levels were measured before and after the interaction.

While none of the dogs in the study reacted aggressively toward the box, bag or ball, many of the dogs in the leash aggression group had aggressive responses to the model dog, including barking, growling and lunging.

The dogs that reacted aggressively showed higher levels of total vasopressin in their systems, suggesting a link between vasopressin and aggression.

The researchers did not observe differences in oxytocin levels between the two groups of dogs. However, when they compared the oxytocin levels of the pet dogs in the study to a group of assistance dogs, which are specifically bred to have non-aggressive temperaments, they found that the assistance dogs had higher levels of oxytocin and higher oxytocin-to-vasopressin ratios. This supports the idea that oxytocin may help inhibit aggression in dogs.

"Seeing high oxytocin levels in assistance dogs is completely consistent with their behavioral phenotype - - that they're very, very friendly dogs that are not

aggressive toward people or other dogs," MacLean said.

Existing interventions for dogs' behavioral problems often target testosterone and serotonin -- the other two most commonly studied hormones in the context of canine aggression. Pet owners commonly neuter male dogs to help manage levels of testosterone, which has been linked to aggression. And to manage levels of serotonin, which is believed to reduce aggression, some dogs are prescribed SSRIs, or selective serotonin reuptake inhibitors, the most common type of antidepressants.

Future research might consider new interventions focused on vasopressin and oxytocin, MacLean said.

"It would be reasonable to think that if vasopressin facilitates aggression, you could develop pharmaceuticals that could target the vasopressin system to help in cases where dogs are really aggressive," he said. "Oxytocin and vasopressin are being used extensively as therapeutics in humans right now. Regulation of the oxytocin system has been implicated in things ranging from autism to schizophrenia to post-traumatic stress disorder, and

there are clinical trials looking at administering oxytocin as a drug to create some kind of behavioral response. It's interesting to think that maybe some of these same therapies we're trying with people could be useful in dogs."

As to why some dogs have higher levels of vasopressin, life experience may be a factor, MacLean said.

"There's a lot of work showing that experiences in your lifetime can change the way hormones function," MacLean said. "For a lot of dogs that have aggression problems, the owners report that the onset of the aggressive symptoms happened after some sort of traumatic experience. Often it was that the dog was attacked by some other dog and is in a hypervigilant state after that event -- almost like a post-traumatic reaction."

A piece of good news for pet owners and their pups: One way to boost dogs' oxytocin levels and decrease vasopressin is through friendly dog-human interactions. And the effect extends to people as well.

"Previous work shows dog-human friendly interactions

can create a release in oxytocin in dogs, and when dogs interact with people, we see that their vasopressin levels go down over time," MacLean said. "These are bidirectional effects. It's not just that when we're petting a dog, the dog is having this hormonal response -- we're having it, too."

Nontraffic injuries and fatalities in young children: First of its kind study focuses on hidden threats to children in and around motor vehicles -- ScienceDaily

Over the last couple of decades, significant reductions in vehicle crash-related child fatalities have been attributed to advances in legislation, public safety campaigns and engineering. However, less is known about nontraffic injuries and fatalities (occurring primarily in driveways and parking lots) to children in and around motor vehicles.

A new *Traffic Injury Prevention* journal study, *Unintentional Nontraffic Injury and Fatal Events: Threats to Children In and Around Motor Vehicles*, describes the frequency of various nontraffic incidents, injuries, and fatalities to children using a unique surveillance system and database. The database was developed and is maintained by KidsAndCars.org, a national nonprofit organization dedicated to keeping

children safe in and around motor vehicles. Examples of nontraffic events include backovers, children left in hot vehicles, frontovers, children inadvertently knocking vehicles into gear, and others.

The new study describes the national incidence of various nontraffic incidents, injuries, and fatalities to children in the United States using a comprehensive, longstanding surveillance system and database. Prior studies have focused on certain types of nontraffic mechanisms such as backovers, heatstroke, power window strangulation, trunk entrapment, etc. In addition to focusing on just a single mechanism, many of these studies have also been limited by institutional or regional estimates, or a narrow time period. The National Highway Traffic Safety Administration (NHTSA) has published recent periodic nontraffic incident summaries, including those with child-specific data. The significance of this study is that it is the first detailed analysis that includes all types of nontraffic vehicular dangers to young children.

Instances of nontraffic injuries and fatalities in the United States to children 0-14 years were tracked from 1990-2014 using a compilation of sources including media reports, individual accounts from victims and

their families, medical examiner reports, police reports, child death review teams, coroner reports, medical professionals, lawyers and various modes of publications. There were over 11,750 distinct incidents in a variety of venues and vehicles affecting 14,568 children 14 years and younger, resulting in nearly 3,400 deaths of which 47 percent of whom were male, and with an average age of 42 months.

"While we have made great progress in reducing injuries to children in motor vehicle crashes, this study describes the burden of nontraffic incidents and deaths to children 14 years old and younger over a 25-year period, including: children left in hot vehicles, backovers, frontovers, and other mechanisms," said Dr. Mark Zonfrillo, a pediatric emergency medicine physician and injury researcher from Hasbro Children's Hospital and Alpert Medical School of Brown University, and lead author of the study. "These nontraffic incidents present an important and often underreported threat to the safety and lives of young children, and are completely preventable" he added.

"These issues have been masked for decades by the age-old problem of, no data; no problem. Once thought of and referred to as 'freak accidents,' this study reveals

just how common nontraffic incidents really are," said Janette Fennell, president and founder of KidsAndCars.org. "Continued education, engineering modifications, advocacy, and legislation can help continue to prevent these incidents and must be incorporated into overall child vehicle safety initiatives."

How cells recover from the verge of programmed death -- ScienceDaily

A new collaboration between two UC Santa Barbara labs explores the underlying molecular mechanism of a remarkable process called anastasis, a Greek word meaning "rising to life." Building on earlier work showing that cells can recover from the brink of death, the new study demonstrates that anastasis is an active process composed of two distinguishable stages. The team's findings appear in the *Journal of Cell Biology*.

"We knew already that cells need to transcribe new genes in order to recover," explained corresponding author Denise Montell, UCSB's Duggan Professor of Molecular, Cellular, and Developmental Biology. "So we profiled every molecule of mRNA in the cells as they started to die and then as they recovered."

First, the biologists added a toxin to the growth medium to induce apoptosis -- a form of programmed cell suicide that is an integral part of almost every disease -- and took the cells to brink of death. Then they exchanged the medium to remove the inducer and

allowed the cells to recover for one, two, three, four, eight or 12 hours. At every step along the way, the researchers collected millions of cells and sequenced their RNAs to discover how their genetic profile changed during this process. Montell's lab worked with UCSB's Kosik Molecular and Cellular Neurobiology Lab, which conducted the RNA analysis.

The data from the RNA profiles not only demonstrated the active nature of the anastasis process but also showed its two distinct phases. During the first four hours, the cells undergo massive changes in gene expression compared to untreated cells. Yet cells one hour into recovery are much more similar to each other than they are to cells at eight hours, which look similar to those at the 12-hour mark.

"We also found that even when cells are at the brink of death, they are secretly enriching survival RNAs," Montell said. "The cells don't know if things are going to get better or worse, so they hold on to some survival molecules just in case. So the cells are poised to recover even while they're dying."

The team focused on one particular pro-survival RNA called snail that is enriched at the brink of death. The

cells don't make protein out of the RNA or degrade it; rather, they hold on to it. When the scientists prevented the expression of snail, the cells were unable to survive.

They also discovered that RNAs induced in the early phase of anastasis promote transcription of other genes, which allows cells to recover and start dividing. In the later phase, RNAs change what they make and acquire the ability to migrate.

"Some things are expressed during the whole recovery process, including angiogenesis inducers that make new blood vessels," Montell noted. "This looks a lot like wound healing: cell proliferation or migration to fill in the gap and the creation of new blood vessels to nourish the recovery.

"That's all well and good in a beneficial normal process," Montell added. "For example, during a heart attack, when heart cells are deprived of oxygen, if they can recover, that's good news. But when cancer cells do the same thing, it's bad news. Chemotherapy drugs and radiation are known to induce cancer cells to undergo apoptosis. But anastasis may give them a way to bounce back after treatment."

Now that the researchers have described this molecular mechanism, they are particularly interested in the earliest phases of recovery before cells begin transcribing new genes. They also would like to better understand the long-term cellular effects of anastasis.

"We want to know whether a cell recovering from the brink of death retains a permanent epigenetic memory of the experience," Montell said. "We also want to find out whether cells that have experienced one round of anastasis are more or less resilient to a subsequent round. And most importantly, does the mechanism we describe in this paper underlie relapse after chemo and radiation therapy?"

Earliest evidence for a native African cultigen discovered in Eastern Sudan -- ScienceDaily

Archaeologists examining plant impressions within broken pottery have discovered the earliest evidence for domesticated sorghum in Africa. The evidence comes from an archaeological site (known as KG23) in eastern Sudan, dating from 3500 to 3000 BC, and is associated with an ancient archaeological culture known as the Butana Group.

Sorghum is a native African grass that was utilized for thousands of years by prehistoric peoples, and emerged as one of the world's five most important cereal crops, along with rice, wheat, barley, and maize. For a half century scholars have hypothesized that native African groups were domesticating sorghum outside the winter rainfall zone of the ancient Egyptian Nile Valley (where wheat and barley cereals were predominant) in the semi-arid tropics of Africa, but no archaeological evidence existed. This new discovery in eastern Sudan reveals that during the 4th millennium BC, peoples of

the Butana Group were intensively cultivating wild stands of sorghum until they began to change the plant genetically into domesticated morphotypes.

Along with the recent discovery of domesticated pearl millet in eastern Mali around 2500 BC, this latest discovery in eastern Sudan pushes back the process for domesticating summer rainfall cereals another thousand years in the Sahel, with sorghum, providing new evidence for the earliest known native African cultigen.

Top science stories featured on ScienceDaily's home page.

- [**The hormone that could be making your dog aggressive discovered**](#) [周四, 28 9月 04:20]

Thousands of people are hospitalized every year for dog bites, and aggressive behavior is a major reason dogs end up in shelters. Biologists have studied the biology behind canine aggression, specifically the role of the hormones vasopressin and oxytocin.

- [**Black holes with ravenous appetites define Type I active galaxies**](#) [周四, 28 9月 01:36]

Type I and Type II active galaxies do not just appear different -- they are, in fact, very different from each other, both structurally and energetically, new research shows. According to the results of a new study, the key factor that distinguishes Type I and Type II galaxies is the rate at which their central black holes -- or active galactic nuclei -- consume matter and spit out energy.

- [**New light shed on how Earth and Mars were created**](#) [周四, 28 9月 01:36]

Analysing a mixture of earth samples and meteorites, scientists have shed new light on the sequence of events that led to the creation of the planets Earth and Mars.

- [**The volatile processes that shaped Earth**](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address

another scientific conundrum: Earth's depletion in many economically important chemical elements.

- [**LIGO and Virgo observatories jointly detect black hole collision**](#) [周四, 28 9月 00:36]

The first observation of gravitational waves has been discovered by by three different detectors, marking a new era of greater insights and improved localization of cosmic events now available through globally networked gravitational-wave observatories.

- [**Emerging infectious disease threatens Darwin's frog with extinction**](#) [周三, 27 9月 22:09]

Iconic species likely to be wiped-out by amphibian fungus, despite lack of obvious short-term evidence.

- [**Geographic variation in Gentoo penguin calls**](#) [周三, 27 9月 21:33]

Vocal communication is central to the lives of many birds, which use sound to attract mates and defend territories. Penguins are no exception, but we know little about how or why penguin vocalizations vary between isolated populations. A new study takes a broad look at vocalizations across the range of Gentoo penguins and concludes that while their calls do vary from place to place, we still have lots to learn about the processes at work.

- [**Songbird populations may indicate trouble in northwestern forests**](#) [周三, 27 9月 21:33]

Populations of many North American songbirds are declining, and in many cases we don't understand why. Conservation efforts need this information to be effective, and bird banding stations can help fill in the gaps, providing insights into how demographics vary across space and time. A new study presents ten years of data from banding stations across northern California and southern Oregon and offers new hints on what's driving changes in the region's songbird populations.

- [**Tree-dwelling, coconut-cracking giant rat discovered in Solomon Islands**](#) [周三, 27 9月 21:33]

Scientists have discovered a new species of giant rat. It's more than four times the size of the black rats that live in the US, it lives in trees, and it's rumored to crack open coconuts with its teeth. And it's actually pretty cute.

- [**Lost continent of Zealandia: Scientists return from expedition to sunken land**](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

- [**Caribbean praying mantises have ancient African origin**](#) [周三, 27 9月 11:59]

Three seemingly unrelated praying mantis groups inhabiting Cuba and the rest of the Greater Antilles actually share an ancient African ancestor and possibly form the oldest endemic animal lineage on the Caribbean islands, researchers have determined.

- [**Umbilical cord stem cells show promise as heart failure treatment**](#) [周三, 27 9月 04:23]

Intravenous stem cell infusion derived from umbilical cords appears to boost heart muscle function in patients with heart failure, according to a small study. In this first-of-its-kind study, patients had 'significant' improvement in their hearts' ability to pump blood and experienced no adverse side effects related to the therapy. The results suggest IV-infused umbilical cord-derived stem cells are a promising avenue to treat heart failure.

- [**Energy harvested from evaporation could power much of US**](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

- [**Amount of water in stem cells can determine its**](#)

[fate as fat or bone](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

[Wearable solar thermoelectric generator created](#)

[周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

[Cartography of the Cosmos](#) [周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime. This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

[Pigeons better at multitasking than humans](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

[After 15 years in a vegetative state, nerve stimulation restores consciousness](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

[Antibody protects against Zika and dengue,](#)

[**mouse study shows**](#) [周二, 26 9月 01:29]

The same countries hard hit by Zika virus -- which can cause brain damage in babies infected before birth -- are also home to dengue virus. Researchers now report that they have found an antibody that protects against both viruses. These findings, in mice, could be a step towards an antibody-based preventative drug to protect fetuses from brain damage, while also protecting their mothers from both Zika and dengue disease.

• [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

• [**Visual attention drawn to meaning, not what stands out**](#) [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

• [**Panda habitat shrinking, becoming more fragmented**](#) [周一, 25 9月 23:13]

Using remote sensing data, Chinese and US scientists have re-assessed the conservation status of the giant panda. Their analysis shows that while panda numbers are increasing, their habitat still covers less area and is more fragmented than it was in 1988, when the species was listed as endangered on the IUCN Red List.

• [**Child abuse affects brain wiring**](#) [周一, 25 9月 23:13]

For the first time, researchers have been able to see changes in the neural structures in specific areas of the brains of people who suffered severe abuse as children. The researchers believe that these changes may contribute to the emergence of depressive disorders and suicidal

behavior.

- [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

- [**Brain damage in fish from plastic nanoparticles in water**](#) [周一, 25 9月 22:47]

A new study shows that plastic particles in water may end up inside fish brains. The plastic can cause brain damage, which is the likely cause of behavioral disorders observed in the fish.

- [**Brain guides body much sooner than previously believed**](#) [周一, 25 9月 21:54]

The brain plays an active role much earlier than previously thought. Long before movement or other behaviors occur, the nascent brain of an embryonic frog instructs normal muscle and nerve patterning and protects the embryo from agents that cause developmental defects. In addition to identifying these essential functions for the first time, researchers successfully rescued defects caused by lack of a brain by using widely available, human-approved drugs.

- [**Winter cold extremes linked to high-altitude polar vortex weakening**](#) [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according

to new research findings.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**Unique gene therapy prevents, reverses multiple sclerosis in animal model**](#) [周五, 22 9月 04:12]

Multiple sclerosis can be inhibited or reversed using a novel gene therapy technique that stops the disease's immune response in mouse models, researchers have found.

- [**Ancient DNA data fills in thousands of years of human prehistory in Africa**](#) [周五, 22 9月 02:13]

By sequencing the ancient genomes of 15 individuals from different parts of Africa, researchers reporting in the journal Cell on Sept. 21 have reconstructed the prehistory of humans on the continent, going back thousands of years. The findings shed light on which human populations lived in eastern and southern Africa between 8,000 and 1,000 years ago, the researchers say.

- [**Scientists sequence asexual tiny worm whose lineage stretches back 18 million years**](#) [周五, 22 9月 02:13]

A team of scientists has sequenced, for the first time, a tiny worm that belongs to a group of exclusively asexual species that originated approximately 18 million years ago -- making it one of the oldest living lineages of asexual animals known.

- [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Jellyfish, with no brains, still seem to sleep**](#) [周五, 22 9月]

02:12]

The discovery that primitive jellyfish sleep suggests that sleep is an ancient, evolutionarily conserved behavior.

• [**Why poison frogs don't poison themselves**](#) [周五, 22 9月

02:12]

Poison frogs harbor some of the most potent neurotoxins we know, yet scientists have long wondered -- how do these frogs keep from poisoning themselves? Scientists are now a step closer to resolving that head-scratcher. And the answer has potential consequences for the fight against pain and addiction.

• [**Reconstructing how Neanderthals grew, based on an El Sidrón child**](#) [周五, 22 9月 02:12]

How did Neanderthals grow? Does modern man develop in the same way as Homo neanderthalensis did? How does the size of the brain affect the development of the body? Researchers have studied the fossil remains of a Neanderthal child's skeleton in order to establish whether there are differences between the growth of Neanderthals and that of sapiens.

• [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

• [**Dino-killing asteroid's impact on bird evolution**](#)

[周五, 22 9月 00:11]

Human activities could change the pace of evolution, similar to what occurred 66 million years ago when a giant asteroid wiped out the dinosaurs, leaving modern birds as their only descendants.

• [**One in four girls is depressed at age 14**](#) [周四, 21 9月 23:07]

New research shows a quarter of girls (24%) and one in 10 boys (9%) are depressed at age 14.

- [**Surprising discovery: How the African tsetse fly really drinks your blood**](#) [周四, 21 9月 23:06]

Researchers have been taking a close-up look at the biting mouthparts of the African tsetse fly as part of ongoing work on the animal diseases it carries. Using a new high-powered scanning electron microscope, researchers were able to see the rows of sharp teeth and rasps that the fly uses to chew through the skin when it bites.

- [**Broad swath of US deemed environmentally suitable for mosquitoes that transmit disease**](#) [周四, 21 9月 22:42]

Three-quarters of counties in the contiguous United States present suitable environmental conditions for at least part of the year for either *Aedes aegypti* or *Aedes albopictus* mosquitoes to survive if introduced, according to researchers. The two mosquito species can transmit viruses that cause Zika, dengue, chikungunya, and yellow fever.

- [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

- [**Changing of the guard: Research sheds light on how plants breathe**](#) [周四, 21 9月 22:17]

New research is set to change the textbook understanding of how plants breathe. Researchers have developed the first full 3D model of a guard cell.

- [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**No evidence to support claims that telephone consultations reduce GP workload or hospital referrals**](#) [周四, 28 9月 06:44]

Telephone consultations to determine whether a patient needs to see their GP face-to-face can deal with many problems, but a new study found no evidence to support claims by companies offering to manage these services or by NHS England that the approach saves money or reduces the number of hospital referrals.

- [**Nontraffic injuries and fatalities in young children**](#) [周四, 28 9月 04:20]

From 1990-2014, researchers found more than 11,750 distinct incidents in a variety of venues and vehicles affecting 14,568 children 14 years and younger, resulting in nearly 3,400 deaths.

- [**New class of molecules may protect brain from stroke, neurodegenerative diseases**](#) [周四, 28 9月 04:20]

Scientists have discovered a new class of molecules in the brain that synchronize cell-to-cell communication and neuroinflammation/immune activity in response to injury or diseases. Elovonoids (ELVs) are bioactive chemical messengers made from omega-3 very long chain polyunsaturated fatty acids (VLC-PUFAs,n-3). They are released on demand when cells are damaged or stressed.

- [**Mini-protein rapid design method opens way to create a new class of drugs**](#) [周四, 28 9月 04:20]

A high-speed method has been developed to generate many different, small, stable proteins from scratch, custom-designed to bind to specific therapeutic targets. Protection against infectious diseases, like flu, and antidotes to nerve toxins are but two research goals of this approach. The method rapidly originates thousands of new drug candidates. These computer-designed proteins, which did not previously exist in nature, combine the stability and bioavailability of small molecule drugs with the sp...

• [**Beer can lift your spirits due to malted barley ingredient**](#) [周四, 28 9月 03:28]

Visitors to the Oktoberfest have always known it and now it has been scientifically -- beer can lift your spirits. Scientists examined 13,000 food components to find out whether they stimulate the reward center in the brain and make people feel good. Hordenine which is found in malted barley and beer seems to do the job quite well.

• [**Haplobank: A biobank of reversible mutant embryonic stem cells**](#) [周四, 28 9月 01:38]

Scientists have developed a biobank of revertible, mutant embryonic stem cells – called Haplobank - which contains over 100,000 mutated, conditional mouse embryonic stem cell lines, targeting about 70% of the protein-coding genome.

• [**Melanoma cells rewire to resist drug treatment**](#) [周四, 28 9月 01:36]

Scientists reveal why relapses after treatment for metastatic melanoma occur. While combination therapies block off the principal pathway that cancer cells use to fuel their growth, the cells come to bypass this blockade and, like vehicles on a detour route, make use of additional pathways to continue growing and spreading.

• [**Teen first in Virginia to receive cancer gene therapy in clinical trial**](#) [周四, 28 9月 00:51]

UVA has administered its first dose of an experimental gene therapy for a deadly form of treatment-resistant pediatric leukemia.

- [**Breakthrough in understanding the origin of the aging process**](#) [周四, 28 9月 00:50]

Researchers have unveiled the mystery of why we age in a new study. They have identified that genes belonging to a process called autophagy, which is one of the cells most critical survival processes, promote health and fitness in young worms but drive the process of aging later in life.

- [**Our brain's filing system for storing experiences uncovered**](#) [周四, 28 9月 00:36]

A team of neuroscientists has uncovered how our brains organize, over time, our experiences: that is, according to their similarities.

- [**Iron supplements have long-term benefits for low birth-weight babies**](#) [周四, 28 9月 00:36]

Babies classified as low birth weight (under 2,500 grams) are at risk of iron deficiency, which is linked to impaired neurological development. A long-term randomized study now shows that providing such babies with iron supplements can prevent behavioral problems at school age.

- [**Increased arterial stiffness linked to restrictive spirometry pattern and reduced forced vital capacity**](#) [周四, 28 9月 00:35]

Increased arterial stiffness is a known predictor of cardiovascular diseases in different populations, including healthy subjects and patients with hypertension, diabetes, or renal disease. A new study examining arterial stiffness in a large population determined that both restrictive spirometry pattern and reduced forced vital capacity (FVC) were associated with a higher risk of arterial stiffness not only in men but also in women. The investigators found that arterial stiffness increased fourfo...

- [**Teens' online friendships just as meaningful as face-to-face ones**](#) [周三, 27 9月 22:54]

Many parents worry about how much time teenagers spend texting, sharing selfies and engaging in other online activities with their friends.

However, according to a recent research synthesis, many of these digital behaviors serve the same purpose and encompass the same core qualities as face-to-face relationships.

- [**Drug slows stomach emptying, may individualize obesity treatment, study shows**](#) [周三, 27 9月 22:25]

Liraglutide injection, a prescription medication used to treat type 2 diabetes and obesity is associated with marked slowing of stomach emptying and is an effective weight loss therapy, finds a randomized, double-blind, placebo-controlled study.

- [**On a collision course with game theory**](#) [周三, 27 9月 22:23]

How do pedestrians behave in a large crowd? How do they avoid collisions? How can their paths be modeled? A new approach developed by mathematicians provides answers to these questions.

- [**How old does your computer think you are?**](#) [周三, 27 9月 22:23]

Computerized face recognition is an important part of initiatives to develop security systems, in building social networks, in curating photographs, and many other applications. Systems can allow a computer to estimate with precision a person's age based on an analysis of their face.

- [**Anxious moms may give clues about how anxiety develops**](#) [周三, 27 9月 22:23]

Moms may be notorious worriers, but babies of anxious mothers may also spend more time focusing on threats in their environment, according to a team of researchers.

- [**Middle age fattens you up if you do not increase your physical activity**](#) [周三, 27 9月 22:09]

New research has examined how changes in the daily step count are related to changes in the body mass index (BMI).

- [**Seeking feedback not always sufficient for stimulating creativity**](#) [周三, 27 9月 22:09]

It is widely believed that seeking feedback from colleagues, managers, friends and family enhances employees' creativity. But is this always the case? No, a positive effect depends on the work environment.

• [**Coping with stressful organizational change**](#) [周三, 27 9月 21:51]

Stress is not a recent phenomenon, but the modern work environment seems to highlight its detrimental effects on employees. This is no more obvious than during times of organizational change. New research considers the impact of such changes on workers in a healthcare authority in New Zealand, highlighting the problems that any organization might face under such circumstances and pointing to possible methods to cope and remediate employee stress.

• [**How to grow a spine**](#) [周三, 27 9月 21:33]

A genetics professor -- whose lab discovered the segmentation clock 20 years ago -- and colleagues report that they used mouse cells to reconstitute a stable version of this clockwork for the first time in a petri dish, leading to several new discoveries about where the clock is located, what makes it tick and how the vertebral column takes shape.

• [**Red blood cells for transfusion like a good red: A little older, a little better**](#) [周三, 27 9月 21:33]

The transfusion of older stored red blood cells is safe and surprisingly, associated with fewer side effects, a landmark research trial has found.

• [**Cellular 'message in a bottle' may provide path to new way of treating disease**](#) [周三, 27 9月 21:33]

A newly discovered cellular messaging mechanism could lead to a new way to deliver therapeutics to tissues affected by disease, according to a new study. Researchers found a type of extracellular vesicle -- a sac secreted by cells that contains proteins and RNA molecules -- carries receptors that allow signaling without direct contact between cells.

• [**Plant substance inhibits cancer stem cells**](#) [周三, 27 9月 21:33]

Lab experiments show that the chemical compound damsin found in the plant *Ambrosia arborescens* inhibits the growth and spread of cancer

stem cells. The similar but synthetically produced ambrosin has the same positive effect.

- [**What happens when nerve cells stop working?**](#) [周三, 27 9月 21:33]

Micro-failures in brain functioning occur in conditions such as depression and dementia. In most cases, the lost capacity will return after a while. However, consequential damage will often remain so that the functional capability can only be restored through lengthy treatment -- if at all. For this reason, researchers have been investigating what happens during such breakdown phases and looking at possible ways of preventing damage and speeding up the healing processes.

- [**Brain cells that control appetite identified for first time**](#) [周三, 27 9月 21:32]

Dieting could be revolutionized, thanks to the groundbreaking discovery of the key brain cells which control our appetite.

- [**Woman develops rare life-threatening condition after liposuction**](#) [周三, 27 9月 11:59]

A 45-year-old woman developed a serious life-threatening condition after having liposuction, reveal doctors in a new report.

- [**Genetic fault that reduces the effectiveness of leukemia treatment, clinical trial reveals**](#) [周三, 27 9月 11:59]

A genetic fault has been identified in people with an aggressive type of leukemia that can significantly affect how they respond to treatment, report investigators.

- [**Restoring breathing capacity in Duchenne muscular dystrophy by activating the brain**](#) [周三, 27 9月 11:59]

New research suggests that enhancing breathing via the brain may limit deficiencies in respiratory capacity in Duchenne muscular dystrophy patients.

- [**Umbilical cord stem cells show promise as heart failure treatment**](#) [周三, 27 9月 04:23]

Intravenous stem cell infusion derived from umbilical cords appears to boost heart muscle function in patients with heart failure, according to a small study. In this first-of-its-kind study, patients had 'significant' improvement in their hearts' ability to pump blood and experienced no adverse side effects related to the therapy. The results suggest IV-infused umbilical cord-derived stem cells are a promising avenue to treat heart failure.

• [**Cancerous toxins linked to cannabis extract**](#) [周三, 27 9月 04:23]

Researchers have found benzene and other potentially cancer-causing chemicals in the vapor produced by butane hash oil, a cannabis extract.

• [**Gene circuit design strategy to advance synthetic biology**](#) [周三, 27 9月 04:23]

Scientists and engineers have developed synthetic gene circuits that program the functionality, performance, and behavior of living cells. These gene circuits hold great promise in medical and biotechnological applications, but to date, most circuits are constructed through a manner, which relies on a designer's intuition and is often inefficient.

• [**In plain sight: Researchers compare the performance of human subjects versus deep neural networks in visual searches**](#) [周三, 27 9月 04:18]

Researchers have compared the performance of human subjects versus deep neural networks in visual searches.

• [**Researchers identify possible biomarker for diagnosing CTE during life**](#) [周三, 27 9月 02:36]

A new biomarker (CCL11) for chronic traumatic encephalopathy (CTE) has been discovered that may allow the disease to be diagnosed during life for the first time. The findings might also help distinguish CTE from Alzheimer's disease, which often presents with symptoms similar to CTE and also can only be diagnosed post-mortem. The ability to diagnose CTE in living individuals will allow for research into prevention and treatment of the disease.

[Postpartum depression risk, duration and recurrence](#) [周三, 27 9月 02:35]

Postpartum affective disorder (AD), including postpartum depression (PPD), affects more than one in two hundred women with no history of prior psychiatric episodes, and raises the risk of later affective disorder for those women, according to a new study.

[Warming climate could increase bacterial impacts on Chesapeake Bay shellfish, recreation](#) [周三, 27 9月 02:35]

Researchers have found that three common species of Vibrio bacteria in Chesapeake Bay could increase with changing climate conditions by the end of this century, resulting in significant economic and healthcare costs from illnesses caused by exposure to contaminated water and consumption of contaminated shellfish. The study is among the first to apply a new way of downscaling global climate models to the Chesapeake Bay.

[Post heart attack: How can scar tissue be turned back into healthy heart muscle?](#) [周三, 27 9月 01:55]

Scientists are exploring ways to reprogram scar tissue cells into healthy heart muscle cells, and now researchers have published the first scientific paper to compare in great detail the two leading reprogramming techniques.

[Potential Zika vaccine protects against pregnancy transmission and testicular damage](#) [周三, 27 9月 00:51]

For the first time, a research team led has shown that a potential Zika vaccine quickly can protect fetuses against infection as well as protect males against testicular infection and injury. It also prevents a lowered sperm count after one vaccination.

[Antibiotics warranted for kids with minor staph infections](#) [周三, 27 9月 00:51]

The overuse of antibiotics has left some doctors questioning whether to

give such drugs to children diagnosed with uncomplicated Staphylococcus aureus (staph) infections. Now, research indicates that prescribing antibiotics -- in addition to lancing and draining staph-infected areas -- reduces the risk of recurrent infections.

• [**Amount of water in stem cells can determine its fate as fat or bone**](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

• [**Scientists unlock mysteries of how Ebola uses people's immune defenses to cause infection**](#) [周三, 27 9月 00:51]

Scientists have gained new insight into how the Ebola virus uses the body's natural defenses to speed the rate of infection and unleash its lethal disease, according to a new report.

• [**Drug combo gangs up to take on triple-negative breast cancer**](#) [周二, 26 9月 23:59]

In the hunt for novel treatments against an aggressive form of breast cancer, researchers combined a new protein inhibitor with a chemotherapy drug to create a powerful combination that resulted in cancer cell death.

• [**Injection alternative: Model predicts performance of glucose-responsive insulin**](#) [周二, 26 9月 23:59]

Researchers have created a computer model that can predict how glucose-responsive insulin will affect patients' blood sugar based on chemical traits such as how quickly it becomes activated in the presence of glucose. This could help scientists design insulin that lingers in a patient's bloodstream and becomes active only when needed, such as right after a meal.

• [**A fresh set of eyes: Rotating plant inspectors reduces risk of medical device recalls**](#) [周二, 26 9月 23:59]

More frequent rotation of plant inspectors at medical device manufacturing facilities could benefit consumers and lead to fewer product recalls, finds new research.

• [**One in 5 teens report having had a concussion in their lifetime**](#) [周二, 26 9月 23:20]

A new study confirms what many hospital emergency rooms nationwide are seeing: teens playing contact sports suffer from concussions.

• [**Does your back feel stiff? Well, it may not actually be stiff, study finds**](#) [周二, 26 9月 23:20]

The feeling of stiffness in your back may mean something else is going, warns a new report.

• [**Biochemists discover mechanism that helps flu viruses evolve**](#) [周二, 26 9月 23:20]

Flu viruses' rapid evolution relies in part on hijacking some of the cellular machinery of the infected host cell -- a group of proteins called chaperones, which help other proteins fold into the correct shape. When viruses are unable to get help from these proteins, they do not evolve as rapidly, research shows.

• [**Lactation hormone also helps a mother's brain**](#) [周二, 26 9月 22:55]

The same hormone that stimulates milk production for lactation, also acts in a particular part of the brain to help establish the nurturing link between mother and baby, researchers have revealed.

• [**Theory of Parkinson's disease overturned**](#) [周二, 26 9月 22:55]

A research team has identified a new mechanism that causes the hallmark symptoms of Parkinson's disease, namely tremors, rigidity, and loss of voluntary movement. The discovery presents a new perspective to three decades of conventional wisdom in Parkinson's disease research. It also opens up new avenues that can help alleviate the motor problems suffered by patients of the disease.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Black holes with ravenous appetites define Type I active galaxies**](#) [周四, 28 9月 01:36]

Type I and Type II active galaxies do not just appear different -- they are, in fact, very different from each other, both structurally and energetically, new research shows. According to the results of a new study, the key factor that distinguishes Type I and Type II galaxies is the rate at which their central black holes -- or active galactic nuclei -- consume matter and spit out energy.

- [**New light shed on how Earth and Mars were created**](#) [周四, 28 9月 01:36]

Analysing a mixture of earth samples and meteorites, scientists have shed new light on the sequence of events that led to the creation of the planets Earth and Mars.

- [**The volatile processes that shaped Earth**](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

- [**Turbocharging engine design**](#) [周四, 28 9月 00:51]

Researchers have moved the development process into the passing lane. For the first time, scientists and engineers have pinpointed engine

designs for a given fuel using the Mira supercomputer at the heart of the Argonne Leadership Computing Facility (ALCF), a DOE Office of Science User Facility.

- [**LIGO and Virgo observatories jointly detect black hole collision**](#) [周四, 28 9月 00:36]

The first observation of gravitational waves has been discovered by by three different detectors, marking a new era of greater insights and improved localization of cosmic events now available through globally networked gravitational-wave observatories.

- [**Total solar eclipse viewed from space**](#) [周四, 28 9月 00:35]

While people across the nation gazed at August's total solar eclipse from Earth, a bread loaf-sized NASA satellite had a front row seat for the astronomical event.

- [**On a collision course with game theory**](#) [周三, 27 9月 22:23]

How do pedestrians behave in a large crowd? How do they avoid collisions? How can their paths be modeled? A new approach developed by mathematicians provides answers to these questions.

- [**How old does your computer think you are?**](#) [周三, 27 9月 22:23]

Computerized face recognition is an important part of initiatives to develop security systems, in building social networks, in curating photographs, and many other applications. Systems can allow a computer to estimate with precision a person's age based on an analysis of their face.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**New twist on asymmetric catalysis**](#) [周三, 27 9月 21:33]

Researchers have developed an efficient and simple chemical synthesis of a new kind of twisted helicene molecule containing a sulfur group,

thiophene. The unusual screw-like asymmetry of the molecules could be useful for making drugs and other types of chemicals in their pure single-enantiomer forms.

- [**The strange structures of the Saturn nebula**](#) [周三, 27 9月 21:33]

The spectacular planetary nebula NGC 7009, or the Saturn Nebula, emerges from the darkness like a series of oddly-shaped bubbles, lit up in glorious pinks and blues. This colourful image was captured by the MUSE instrument on ESO's Very Large Telescope (VLT). The map -- which reveals a wealth of intricate structures in the dust, including shells, a halo and a curious wave-like feature -- will help astronomers understand how planetary nebulae develop their strange shapes and symmetries.

- [**Computer scientists address gap in messaging privacy**](#) [周三, 27 9月 21:33]

Researchers have developed a solution to a longstanding problem in the field of end-to-end encryption, a technique that ensures that only sender and recipient can read a message.

- [**A beautiful wing design solution inspired by owl feathers**](#) [周三, 27 9月 11:59]

Researchers have formulated a mathematical solution that could help minimize noise, maximize aerodynamics in design of porous airfoils (2-D wings) to improve wind turbines and air vehicles.

- [**Innovative control system paves the way for large scale universal quantum computing**](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

- [**Energy harvested from evaporation could power much of US**](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

• [Quantum communications bend to our needs](#) [周三, 27 9月 00:51]

The potential for photon entanglement in quantum computing and communications has been known for decades. One issue impeding immediate application is that many photon entanglement platforms don't operate within the range used by most forms of telecommunication. Researchers have started to unravel the mysteries of entangled photons, demonstrating a technique that uses semiconductor quantum dots to bend photons to the wavelengths used by today's popular C-band standards.

• [The 3-D selfie has arrived](#) [周三, 27 9月 00:51]

Computer scientists have solved a complex problem that has, until now, defeated experts in vision and graphics research. They have developed technology capable of producing 3-D facial reconstruction from a single 2-D image -- the 3-D selfie. People are queuing up to try it and so far, more than 400,000 users have had a go.

• [New reassurance that heat flux will be manageable in ITER](#) [周三, 27 9月 00:51]

A major issue facing ITER, the international tokamak under construction in France that will be the first magnetic fusion device to produce net energy, is whether the crucial divertor plates that will exhaust waste heat from the device can withstand the high heat flux, or load, that will strike them. Alarming projections extrapolated from existing tokamaks suggest that the heat flux could be so narrow and concentrated as to damage the tungsten divertor plates in the seven-story, 23,000 ton tokamak...

• [A fresh set of eyes: Rotating plant inspectors reduces risk of medical device recalls](#) [周二, 26 9月 23:59]

More frequent rotation of plant inspectors at medical device

manufacturing facilities could benefit consumers and lead to fewer product recalls, finds new research.

- [**Wearable solar thermoelectric generator created**](#)

[周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

- [**Artificial intelligence for obtaining chemical fingerprints**](#)

[周二, 26 9月 22:54]

Researchers have succeeded in developing a method for predicting molecular infrared spectra based on artificial intelligence. These chemical 'fingerprints' could only be simulated by common prediction techniques for small molecules in high quality. The team was able to carry out simulations that were previously not possible.

- [**Understanding football violence could help the fight against terror**](#)

[周二, 26 9月 22:54]

Football has long been tarnished by outbreaks of fan violence. Although media headlines often link the behavior to 'hooliganism,' the activity could stem from potentially more positive motivations, such as passionate commitment to the group and the desire to belong.

Understanding the root cause of the behavior may therefore help in tackling the violence and channeling it into something more positive, scientists suggest.

- [**Cartography of the Cosmos**](#)

[周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime.

This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

- [**Graphene forged into three-dimensional shapes**](#)

[周二, 26 9月 21:14]

Researchers have discovered how graphene, a single-atom-thin layer of

carbon, can be forged into three-dimensional objects by using laser light. A striking illustration was provided when the researchers fabricated a pyramid with a height of 60 nm, which is about 200 times larger than the thickness of a graphene sheet. The pyramid was so small that it would easily fit on a single strand of hair.

- [**The motor protein dancing in all our cells**](#) [周二, 26 9月 21:14]

Biologists have invented optical tweezers to follow the motions of molecular machines measured in nanometers.

- [**Physicists achieve rapid magnetic switching with lasers**](#) [周二, 26 9月 21:00]

New research shows control over composition of ferrimagnetic materials offers new ways of switching their magnetism.

- [**The principle Feynman and Einstein could not find was discovered**](#) [周二, 26 9月 20:59]

The Faraday's induction formula (flux rule) of electromagnetism says that the electromotive force (emf) created in a conducting circuit is equal to the rate at which the magnetic flux through the conducting circuit changes as it is written on a high school text in physics. This emf can be calculated in two ways: either by using the Lorentz force formula and calculating the force acting on electrons in the moving conductor of the circuit; or via one of Maxwell's equations (Faraday's law) and calcu...

- [**Creative use of noise brings bio-inspired electronic improvement**](#) [周二, 26 9月 03:14]

Researchers are working to exploit stochastic resonance to enhance signal transmission for a new generation of devices, using single-walled carbon nanotubes. They created a summing network SR device that detects subthreshold signals, fabricated to include a self-noise component.

- [**Holograms for molecules**](#) [周二, 26 9月 01:30]

Scientists have developed a completely new method for the analysis of molecules in liquids on a chip. The possible applications of this

technology are immense. It has the potential, inter alia, to revolutionize medical diagnostics.

- [**Click beetles inspire design of self-righting robots**](#) [周二, 26 9月 01:30]

Robots perform many tasks that humans can't or don't want to perform, getting around on intricately designed wheels and limbs. If they tip over, however, they are rendered almost useless. Mechanical engineers and entomologists are looking to click beetles, who can right themselves without the use of their legs, to solve this robotics challenge.

- [**New non-contact, remote biometric tool could be next advance in computer security**](#) [周二, 26 9月 01:30]

Forget fingerprint computer identification or retinal scanning. Scientists have now developed a computer security system using the dimensions of your heart as your identifier. The system uses low-level Doppler radar to measure your heart, and then continually monitors your heart to make sure no one else has stepped in to run your computer.

- [**The material that obscures supermassive black holes**](#) [周二, 26 9月 01:29]

New research examines the material that obscures active galactic nuclei obtained from infrared and X-ray observations.

- [**Are children who see movie characters use guns more likely to use them?**](#) [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- [**Physicists demonstrate using a laser to control a current in graphene within just one femtosecond**](#) [周二, 26 9月 01:28]

Controlling electronic current is essential to modern electronics, as data and signals are transferred by streams of electrons which are controlled at high speed. Demands on transmission speeds are also increasing as technology develops. Scientists have now succeeded in switching on a

current with a desired direction in graphene using a single laser pulse within a femtosecond. This is more than a thousand times faster compared to the most efficient transistors today.

• [**High-fidelity recording of molecular geometry with DNA 'nanoscopy'**](#) [周一, 25 9月 23:33]

A research team has now developed a DNA nanotechnology-based method that allows for repeated, non-destructive recording of uniquely barcoded molecular pairings, rendering a detailed view of their components and geometries. In the future, the approach could help researchers understand how changes in molecular complexes control biological processes in living cells.

• [**Climate insurance is rarely well thought out in agriculture**](#) [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

• [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

• [**Fully renewable India in 2050 can take a shortcut to emission-free future**](#) [周一, 25 9月 23:16]

India can function on a fully renewable electricity system in 2050, research indicates. The study shows that developing countries that have an abundance of renewable resources do not need to take the path of the

western countries where increasing living standards have been coupled with heavy emissions from electricity generation and other industry. They can move straight to renewable systems and do it cheaply.

- [**New technique uses light to separate mirrored molecules**](#) [周一, 25 9月 23:13]

Left- and right-handed versions of molecules can be hard to tell apart but can have devastatingly different effects. Researchers are developing an optical filter to sort these molecules, which could lead to purer and safer drugs and agrichemicals.

- [**Nanoparticle supersoap creates 'bijel' with potential as sculptable fluid**](#) [周一, 25 9月 23:13]

A new type of 'bijel' could one day lead to applications in soft robotics, liquid circuitry, and a host of other applications that could benefit from shape-shifting fluids.

- [**New type of supercomputer could be based on 'magic dust' combination of light and matter**](#) [周一, 25 9月 23:13]

Scientists have successfully demonstrated that a type of 'magic dust' which combines light and matter can be used to solve complex problems and could eventually surpass the capabilities of even the most powerful supercomputers.

- [**Scientists monitor Silicon Valley's underground water reserves -- from space**](#) [周一, 25 9月 22:57]

Scientists monitoring Silicon Valley's underground water reserves from space have found that water levels rebounded quickly after a severe drought that lasted from 2012-15. The research points to the success of aggressive conservation measures. It also helps to lay the groundwork for low-cost monitoring of subterranean water reserves in California and elsewhere in the world.

- [**Filter may be a match for fracking water**](#) [周一, 25 9月 22:47]

A superhydrophilic filter has proven able to remove more than 90 percent of contaminants from water used in hydraulic fracturing

operations at shale oil and gas wells.

- [**With extra sugar, leaves get fat too**](#) [周一, 25 9月 22:47]

Eat too much without exercising and you'll probably put on a few pounds. As it turns out, plant leaves do something similar. A new study shows that retaining sugars in plant leaves can make them get fat too. In plants, this extra fat accumulation could be a good thing. It could help turn plants into factories for making biofuels and other useful chemicals.

- [**Semitransparent and flexible: Solar cells made from atomically thin sheet**](#) [周一, 25 9月 21:55]

A new method for fabricating semitransparent, flexible solar cells has greatly improved power conversion efficiency.

- [**New synthesis method for click chemistry**](#) [周一, 25 9月 21:55]

Scientists have developed a new way to advance click chemistry.

- [**Wound care: Patch could improve healing and reduce scarring**](#) [周一, 25 9月 21:54]

Scientists have developed a new gel patch prototype that could speed up the healing of a skin wound while minimizing the formation of scars.

- [**A preparative-scale reaction using platinum clusters with a single-digit atomicity realized**](#) [周一, 25 9月 21:54]

Scientists have recently developed a fully scalable method for the synthesis of atom-precise platinum clusters for potential use in catalytic applications. This method could provide a new pathway for large-scale production of atom-precise clusters. To demonstrate this, the hydrogenation of styrene was performed.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**The hormone that could be making your dog aggressive discovered**](#) [周四, 28 9月 04:20]

Thousands of people are hospitalized every year for dog bites, and aggressive behavior is a major reason dogs end up in shelters. Biologists have studied the biology behind canine aggression, specifically the role of the hormones vasopressin and oxytocin.

- [**How cells recover from the verge of programmed death**](#) [周四, 28 9月 04:20]

Biologists explore the molecular underpinnings of cells that recover from the verge of programmed death.

- [**Earliest evidence for a native African cultigen discovered in Eastern Sudan**](#) [周四, 28 9月 04:20]

Archaeologists examining plant impressions within broken pottery have discovered the earliest evidence for domesticated sorghum in Africa.

- [**Beer can lift your spirits due to malted barley ingredient**](#) [周四, 28 9月 03:28]

Visitors to the Oktoberfest have always known it and now it has been scientifically -- beer can lift your spirits. Scientists examined 13,000 food components to find out whether they stimulate the reward center in the brain and make people feel good. Hordenine which is found in malted barley and beer seems to do the job quite well.

- [**Haplobank: A biobank of reversible mutant**](#)

[embryonic stem cells](#) [周四, 28 9月 01:38]

Scientists have developed a biobank of revertible, mutant embryonic stem cells – called Haplobank - which contains over 100,000 mutated, conditional mouse embryonic stem cell lines, targeting about 70% of the protein-coding genome.

• [The volatile processes that shaped Earth](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

• [Citizen science can predict butterfly population trends](#) [周四, 28 9月 00:36]

New research shows that citizen scientists can play a role in gathering meaningful information to inform long-term monitoring of biodiversity trends such as butterfly population change.

• [New iceberg calved from Pine Island Glacier](#) [周三, 27 9月 22:45]

A new iceberg calved from Pine Island Glacier -- one of the main outlets where ice from the interior of the West Antarctic Ice Sheet flows into the ocean.

• [Preservation of floodplains is flood protection](#) [周三, 27 9月 22:23]

The silting of rivers and streams leads to problems for fish, mussels, and other aquatic organisms because their habitats disappear. However, not only intensive agriculture and erosion are destroying these habitats. Now a study refutes this widespread view. In order to save the species living in the river basin -- and protect people from the threat of floods -- rivers need more space, diversity, and freedom.

• [Two new crustacean species discovered on Galician seabed](#) [周三, 27 9月 22:23]

The fauna of deep seabed tends to be relatively unknown due to the difficulty of collecting samples at great depths. A research team undertook four oceanographic expeditions in the waters off the northwest coast of the Iberian Peninsula that have led to the discovery of several new species that inhabit the abyssal plains. Now they describe two eyeless species of millimetric proportions.

• [**Emerging infectious disease threatens Darwin's frog with extinction**](#) [周三, 27 9月 22:09]

Iconic species likely to be wiped-out by amphibian fungus, despite lack of obvious short-term evidence.

• [**More than a 38 % of the Neotropical parrot population in the American continent is threatened by human activity**](#) [周三, 27 9月 22:09]

More than a 38% of the Neotropical parrot population of the American continent (Neotropic) is endangered due the impact of human activity, according to a scientific study.

• [**Moths: A different weapon against each enemy**](#) [周三, 27 9月 21:56]

It's a dangerous world out there, especially if you are a small insect. Insects have thrived on our planet for hundreds of millions of years, so they must be doing something right despite all the threats to their survival. With so many predators out to get them many animals have evolved chemical defences, making themselves distasteful or even toxic. Wood tiger moths protect themselves from multiple predators using different chemical defences. Choosing the right defence can be tricky as predators ...

• [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

• [**How to grow a spine**](#) [周三, 27 9月 21:33]

A genetics professor -- whose lab discovered the segmentation clock 20 years ago -- and colleagues report that they used mouse cells to reconstitute a stable version of this clockwork for the first time in a petri dish, leading to several new discoveries about where the clock is located, what makes it tick and how the vertebral column takes shape.

- [**Geographic variation in Gentoo penguin calls**](#) [周三, 27 9月 21:33]

Vocal communication is central to the lives of many birds, which use sound to attract mates and defend territories. Penguins are no exception, but we know little about how or why penguin vocalizations vary between isolated populations. A new study takes a broad look at vocalizations across the range of Gentoo penguins and concludes that while their calls do vary from place to place, we still have lots to learn about the processes at work.

- [**Songbird populations may indicate trouble in northwestern forests**](#) [周三, 27 9月 21:33]

Populations of many North American songbirds are declining, and in many cases we don't understand why. Conservation efforts need this information to be effective, and bird banding stations can help fill in the gaps, providing insights into how demographics vary across space and time. A new study presents ten years of data from banding stations across northern California and southern Oregon and offers new hints on what's driving changes in the region's songbird populations.

- [**Tree-dwelling, coconut-cracking giant rat discovered in Solomon Islands**](#) [周三, 27 9月 21:33]

Scientists have discovered a new species of giant rat. It's more than four times the size of the black rats that live in the US, it lives in trees, and it's rumored to crack open coconuts with its teeth. And it's actually pretty cute.

- [**Cellular 'message in a bottle' may provide path to new way of treating disease**](#) [周三, 27 9月 21:33]

A newly discovered cellular messaging mechanism could lead to a new way to deliver therapeutics to tissues affected by disease, according to a

new study. Researchers found a type of extracellular vesicle -- a sac secreted by cells that contains proteins and RNA molecules -- carries receptors that allow signaling without direct contact between cells.

- [**Removing nitrate for healthier ecosystems**](#) [周三, 27 9月 21:33]

In a new study, researchers have identified nitrate removal hotspots in landscapes around agricultural streams.

- [**Purple plant is on the defensive**](#) [周三, 27 9月 21:33]

While lavender has long been known for its strong scent and soothing oils, a researcher is exploring the plant's ability to create natural pesticides.

- [**Plant substance inhibits cancer stem cells**](#) [周三, 27 9月 21:33]

Lab experiments show that the chemical compound damsin found in the plant *Ambrosia arborescens* inhibits the growth and spread of cancer stem cells. The similar but synthetically produced ambrosin has the same positive effect.

- [**A beautiful wing design solution inspired by owl feathers**](#) [周三, 27 9月 11:59]

Researchers have formulated a mathematical solution that could help minimize noise, maximize aerodynamics in design of porous airfoils (2-D wings) to improve wind turbines and air vehicles.

- [**Noise pollution found to be disruptive for schooling fish**](#) [周三, 27 9月 11:59]

Noise from human construction projects can disrupt the schools that are so impressive in marine fish, new research has found.

- [**How has society adapted to hurricanes? A look at New Orleans over 300 years**](#) [周三, 27 9月 11:59]

In the midst of an intense hurricane season, a historical perspective looks at adaptation to hurricanes in New Orleans over nearly three centuries, from its foundation in 1718 to Hurricane Katrina in 2005.

- [**Lost continent of Zealandia: Scientists return**](#)

[from expedition to sunken land](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

[Caribbean praying mantises have ancient African origin](#) [周三, 27 9月 11:59]

Three seemingly unrelated praying mantis groups inhabiting Cuba and the rest of the Greater Antilles actually share an ancient African ancestor and possibly form the oldest endemic animal lineage on the Caribbean islands, researchers have determined.

[Cancerous toxins linked to cannabis extract](#) [周三, 27 9月 04:23]

Researchers have found benzene and other potentially cancer-causing chemicals in the vapor produced by butane hash oil, a cannabis extract.

[Gene circuit design strategy to advance synthetic biology](#) [周三, 27 9月 04:23]

Scientists and engineers have developed synthetic gene circuits that program the functionality, performance, and behavior of living cells. These gene circuits hold great promise in medical and biotechnological applications, but to date, most circuits are constructed through a manner, which relies on a designer's intuition and is often inefficient.

[Warming climate could increase bacterial impacts on Chesapeake Bay shellfish, recreation](#) [周三, 27 9月 02:35]

Researchers have found that three common species of Vibrio bacteria in Chesapeake Bay could increase with changing climate conditions by the end of this century, resulting in significant economic and healthcare costs from illnesses caused by exposure to contaminated water and consumption of contaminated shellfish. The study is among the first to apply a new way of downscaling global climate models to the Chesapeake Bay.

[Energy harvested from evaporation could power](#)

[**much of US**](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

• [**Some marine species more vulnerable to climate change than others**](#) [周三, 27 9月 00:51]

Certain marine species will fare much worse than others as they become more vulnerable to the effects of climate change, a new study has found.

• [**Amount of water in stem cells can determine its fate as fat or bone**](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

• [**Scientists unlock mysteries of how Ebola uses people's immune defenses to cause infection**](#) [周三, 27 9月 00:51]

Scientists have gained new insight into how the Ebola virus uses the body's natural defenses to speed the rate of infection and unleash its lethal disease, according to a new report.

• [**Fisheries sustainability linked to gender roles among traders**](#) [周二, 26 9月 23:59]

A new study of fish traders in coastal Kenya shows that women largely occupied fisheries with the lowest profits and are not saving money while working in these fisheries.

• [**Two Caribbean bird-catcher trees named after two women with overlooked botanical works**](#) [周二, 26 9月 23:59]

Known for their biodiversity richness, the Caribbean Islands are now adding two new species of bird-catcher trees to their list of botanical treasures. The new species were named after two women who self-engaged for decades on educational projects in botany, but whose

remarkable work was never properly made known and accredited.

- [**Warm Northwest waters draw spawning fish north**](#) [周二, 26 9月 23:59]

Unusually warm ocean conditions off the Pacific Northwest in the last few years led anchovies, sardines and hake to begin spawning in Northwest waters much earlier in the year and, for anchovy, longer than biologists have ever recorded before, new research has found.

- [**Biochemists discover mechanism that helps flu viruses evolve**](#) [周二, 26 9月 23:20]

Flu viruses' rapid evolution relies in part on hijacking some of the cellular machinery of the infected host cell -- a group of proteins called chaperones, which help other proteins fold into the correct shape. When viruses are unable to get help from these proteins, they do not evolve as rapidly, research shows.

- [**Wearable solar thermoelectric generator created**](#) [周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

- [**Researchers identify novel way to target Ebola**](#) [周二, 26 9月 22:55]

Researchers have identified a potential new way to attack Ebola. Scientists have discovered that a protein called Tim-1 (T-cell immunoglobulin and mucin domain-containing protein 1) plays a key role in the development of the cytokine storm seen in the last stages of Ebola infection.

- [**Predatory bacteria found in study of cystic fibrosis patients' lung microbiome**](#) [周二, 26 9月 22:55]

Cystic fibrosis patients have a wide variety of bacteria in their lungs, including two 'predators' not detected before, according to a new study.

- [**The drying of peatlands is reducing bird diversity**](#) [周二, 26 9月 22:54]

The populations of peatland birds in Finland, Sweden, Norway, Estonia and Latvia have decreased by a third during the past three decades, a recent international study indicates. The situation in Finland is the most dire, and the species in most trouble is the Finnish ruff, as the population has fallen to approximately 3 percent of what it was at the beginning of the study period.

- [**Nerves control the body's bacterial community**](#) [周二, 26 9月 22:54]

Using the freshwater polyp Hydra as a model organism, researchers have investigated how the simple nervous system of these animals interacts with the microbiome. They were able to demonstrate, for the first time, that small molecules secreted by nerve cells help to regulate the composition and colonization of specific types of beneficial bacteria along the Hydra's body column.

- [**'Hypermotators' drive pathogenic fungi to evolve more rapidly**](#) [周二, 26 9月 22:54]

For nearly two decades, a rare but potentially deadly fungus called *Cryptococcus deuterogattii* has gained a foothold in the Pacific Northwest and Vancouver Island. Researchers recently showed that lineages of the fungal pathogen *Cryptococcus deuterogattii* house a specific mutation in their DNA that increases their mutation rate. These hypermutators, as they are called, rapidly develop resistance to the antifungal drugs FK506 and rapamycin.

- [**Chronic wasting disease**](#) [周二, 26 9月 22:54]

New research summarizes the efforts in disease surveillance and risk management of chronic wasting disease (CWD) in deer and shows that past management strategies such as selective culling, herd reduction, and hunter surveillance have had only limited effectiveness. The summary points towards new advice for optimal, cost-effective strategies in aggressive disease control.

- [**Milk-alternative drinks do not replace the iodine in cows' milk**](#) [周二, 26 9月 21:14]

Consumers of milk-alternative drinks may be at risk of iodine

deficiency, according to the findings of a new study.

- [**Agent Orange still linked to hormone imbalances in babies in Vietnam**](#) [周二, 26 9月 21:14]

Could herbicides that were sprayed during the Vietnam War still be causing health problems?

- [**The motor protein dancing in all our cells**](#) [周二, 26 9月 21:14]

Biologists have invented optical tweezers to follow the motions of molecular machines measured in nanometers.

- [**Higher risk of heart failure in cold weather**](#) [周二, 26 9月 21:14]

Could decreases in temperature cause heart failure and death?

- [**New 'bioactive' glass puts minerals back into damaged teeth**](#) [周二, 26 9月 21:12]

Dental researchers have now developed a very fast dissolving 'bioactive' glass which they are putting in toothpaste to repair decayed teeth.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**No evidence to support claims that telephone consultations reduce GP workload or hospital referrals**](#) [周四, 28 9月 06:44]

Telephone consultations to determine whether a patient needs to see their GP face-to-face can deal with many problems, but a new study found no evidence to support claims by companies offering to manage these services or by NHS England that the approach saves money or reduces the number of hospital referrals.

- [**Citizen science can predict butterfly population trends**](#) [周四, 28 9月 00:36]

New research shows that citizen scientists can play a role in gathering meaningful information to inform long-term monitoring of biodiversity trends such as butterfly population change.

- [**Iron supplements have long-term benefits for low birth-weight babies**](#) [周四, 28 9月 00:36]

Babies classified as low birth weight (under 2,500 grams) are at risk of iron deficiency, which is linked to impaired neurological development. A long-term randomized study now shows that providing such babies with iron supplements can prevent behavioral problems at school age.

- [**Teens' online friendships just as meaningful as face-to-face ones**](#) [周三, 27 9月 22:54]

Many parents worry about how much time teenagers spend texting, sharing selfies and engaging in other online activities with their friends.

However, according to a recent research synthesis, many of these digital behaviors serve the same purpose and encompass the same core qualities as face-to-face relationships.

- [**Coping with stressful organizational change**](#) [周三, 27 9月 21:51]

Stress is not a recent phenomenon, but the modern work environment seems to highlight its detrimental effects on employees. This is no more obvious than during times of organizational change. New research considers the impact of such changes on workers in a healthcare authority in New Zealand, highlighting the problems that any organization might face under such circumstances and pointing to possible methods to cope and remediate employee stress.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**Interventions for reducing hepatitis C infection in people who inject drugs**](#) [周二, 26 9月 22:54]

The first global review to quantify the impact of needle syringe programs (NSP) and opioid substitution treatment (OST) in reducing the risk of becoming infected with the hepatitis C virus has now been published. The study has implications for millions of people who are 'at risk' from infection.

- [**Household chores: Women still do more**](#) [周二, 26 9月 22:54]

Women of all ages still tend to do more household chores than their male partners, no matter how much they work or earn in a job outside the home. New findings demonstrate the persistent gendered nature of how housework is divided.

- [**Preschool teachers need better training in science**](#) [周二, 26 9月 22:54]

Preschool instructors appear to lack the knowledge, skills and

confidence to effectively teach their young students science -- a problem that is likely contributing to America's poor global performance in this crucially important subject.

- [**Teachers report weaker relationships with students of color, children of immigrants**](#) [周二, 26 9月 22:54]

The relationship between teachers and students is a critical factor for academic success. However, a new study finds that teachers report weaker relationships with children of immigrants and adolescents of color.

- [**Drought: A cause of riots**](#) [周二, 26 9月 21:05]

The scientific community has been working on the possibility of a relationship between periods of drought and rioting for several years. Now a team has formally verified this hypothesis by studying almost 1,800 riots that occurred over a 20-year period in sub-Saharan Africa. The researchers observed a systematic link between the sudden depletion of water resources and the outbreak of unrest. They also succeeded in quantifying the impact of geographic and social factors on the same link.

- [**People are reluctant to use public defibrillators to treat cardiac arrests**](#) [周二, 26 9月 20:59]

A new study suggests that people are reluctant to use public-access defibrillators to treat cardiac arrests.

- [**Psychological impacts of natural disasters on youth**](#) [周二, 26 9月 04:32]

A researcher is fully aware of children's reaction to trauma. Her research focuses on the impact of disasters on youth since Hurricane Andrew in 1992. La Greca has been evaluating how best to define post-traumatic stress disorder (PTSD) in children. This line of research will help to quickly identify the children who need support services post-disaster and identify key aspects of the post-disaster environment that facilitate their recovery.

- [**Are children who see movie characters use guns**](#)

more likely to use them? [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

Climate insurance is rarely well thought out in agriculture [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

Group project? Taking turns, working with friends may improve grades [周一, 25 9月 23:33]

A new study with college students has found that the social dynamics of a group, such as whether one person dominates the conversation or whether students work with a friend, affect academic performance. Put simply, the more comfortable students are, the better they do, which yields benefits beyond the classroom.

Fully renewable India in 2050 can take a shortcut to emission-free future [周一, 25 9月 23:16]

India can function on a fully renewable electricity system in 2050, research indicates. The study shows that developing countries that have an abundance of renewable resources do not need to take the path of the western countries where increasing living standards have been coupled with heavy emissions from electricity generation and other industry. They can move straight to renewable systems and do it cheaply.

Clarifying perspectives to promote action on loss and damage from climate change [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the

climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy, negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

- **[Visual attention drawn to meaning, not what stands out](#)** [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- **[World's botanic gardens contain a third of all known plant species, and help protect the most threatened](#)** [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41 percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

- **[Minority public managers prefer integrating social equity, traditional public values](#)** [周一, 25 9月 22:57]

Minority public managers place more emphasis on both traditional values, like efficiency and effectiveness, and social equity when compared with their white counterparts, according to a new study.

- **[Scientists call for more research on how human activities affect the seabed](#)** [周一, 25 9月 22:47]

Extensive research has been released into how industry and environmental change are affecting our seafloors. Researchers say more

work is needed to help safeguard these complex ecosystems and the benefits they provide to people for the future.

- [**New technique spots warning signs of extreme events**](#) [周日, 24 9月 22:38]

Engineers have devised a framework for identifying key patterns that precede an extreme event. The framework can be applied to a wide range of complicated, multidimensional systems to pick out the warning signs that are most likely to occur in the real world.

- [**Study finds no-tillage not sufficient alone to prevent water pollution from nitrate**](#) [周六, 23 9月 04:25]

A new study answers a long-debated agricultural question: whether no-tillage alone is sufficient to prevent water pollution from nitrate. The answer is no.

- [**Flint's water crisis led to fewer babies and higher fetal death rates, researchers find**](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

- [**Breathing dirty air may harm kidneys**](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

- [**Strong alcohol policies help reduce alcohol-involved homicides**](#) [周五, 22 9月 04:12]

Stronger alcohol policies, including taxes and sales restrictions, have been shown to reduce the likelihood of alcohol involvement among

homicide victims, according to a new study.

- [**Babies can learn that hard work pays off**](#) [周五, 22 9月 04:12]

A new study reveals babies as young as 15 months can learn the value of hard work. Researchers found babies who watched an adult struggle to reach two different goals before succeeding tried harder at their own difficult task than babies who saw an adult succeed effortlessly.

- [**We must accelerate transitions for sustainability and climate change, experts say**](#) [周五, 22 9月 02:12]

We must move faster towards a low-carbon world if we are to limit global warming to 2 degrees C this century, experts have warned.

- [**Rapid hepatitis C testing may help better screen young adults**](#) [周五, 22 9月 02:12]

Routine and rapid hepatitis C virus testing among young adults who use injection drugs improves life expectancy and may provide a good use of limited resources, according to new research.

- [**Wildlife rangers: What motivates them?**](#) [周五, 22 9月 00:11]

Wildlife rangers are on the front lines protecting our most iconic species -- tigers, elephants, gorillas and many others. But their challenges involve more than confrontations with wild animals and poachers.

- [**Recipe for forest restoration discovered**](#) [周四, 21 9月 22:17]

A new study has uncovered some valuable information on ways to maximize the success of replanting efforts, bringing new hope for restoring these threatened ecosystems.

- [**Premature births cost health plans \\$6 billion annually**](#) [周四, 21 9月 21:02]

A new study estimates employer-sponsored health plans spent at least \$6 billion extra on infants born prematurely in 2013 and a substantial portion of that sum was spent on infants with major birth defects.

- [**Pay more, smoke less: Possible effects of raising tobacco taxes across the EU**](#) [周四, 21 9月 11:22]

Raising tobacco taxes to increase cigarette prices could reduce cigarette consumption and smoking-associated deaths (SADs) in all 28 EU countries, according to a new study. In higher income countries, raising tobacco taxes could increase revenues that could be spend on prevention and control programs, while in lower income countries tax revenues may be negatively affected, researchers suggest.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Lost continent of Zealandia: Scientists return from expedition to sunken land**](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

- [**Innovative control system paves the way for large scale universal quantum computing**](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons

implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

• [**Bacterial nanosized speargun works like a power drill**](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in only a few thousandths of a second and injects a cocktail of toxins.

• [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

• [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

• [**Fish have surprisingly complex personalities**](#) [周一, 25 9月 21:54]

Tiny fish called Trinidadian guppies have individual 'personalities', new research shows.

• [**Detecting cosmic rays from a galaxy far, far away**](#) [周五, 22 9月 02:12]

Where do cosmic rays come from? Solving a 50-year-old mystery, a collaboration of researchers has discovered it's much farther than the Milky Way.

- [**Early trilobites had stomachs, new fossil study finds**](#) [周五, 22 9月 02:12]

Exceptionally preserved trilobite fossils from China, dating back to more than 500 million years ago, have revealed new insights into the extinct marine animal's digestive system. The new study shows that at least two trilobite species evolved a stomach structure 20 million years earlier than previously thought.

- [**Hope to discover sure signs of life on Mars? New research says look for the element vanadium**](#) [周四, 21 9月 23:06]

A new article suggests NASA and others hunting for proof of Martian biology in the form of 'microfossils' could use the element vanadium in combination with Raman spectroscopy to confirm traces of extraterrestrial life.

- [**Big herbivorous dinosaurs ate crustaceans as a side dish**](#) [周四, 21 9月 22:17]

Some big plant-eating dinosaurs roaming present-day Utah some 75 million years ago were slurping up crustaceans on the side, a behavior that may have been tied to reproductive activities, says a new study.

- [**Tiny Brazilian frogs are deaf to their own calls**](#) [周四, 21 9月 21:03]

Pumpkin toadlets, found on the leaf litter of Brazil's Atlantic forest, are among the smallest frogs in the world. Scientists have now discovered that two species of these tiny orange frogs cannot hear the sound of their own calls.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Solving the mystery of Pluto's giant blades of ice**](#)

[周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

- [**Farthest active inbound comet yet seen**](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

- [**Understanding connection between HIV transmission, racial/ethnic/geographical differences**](#) [周五, 29 9月 02:54]

The health effects of where people live, work, and interact are well documented, as are the value of neighborhood-level structural interventions designed to improve health. But place-based characteristics that contribute to disparities in HIV transmission and disease burden are poorly understood, possibly resulting in less-effective HIV risk reduction interventions and programming.

- [**Continental controls needed to maintain fightback against tree diseases**](#) [周五, 29 9月 02:21]

Tighter controls on timber and plant movements into Europe are necessary to prevent further disastrous effects of plant diseases, a new study of the ash-dieback pathogen advises.

- [**How molecular scissors cut in the right place**](#) [周五, 29 9月 02:21]

A research group has found out how CRISPR-Cas9 -- also known as 'molecular scissors' -- can search the genome for a specific DNA sequence. Cas9 already has many applications in biotechnology and is also expected to revolutionize medicine. The new research findings show how Cas9 can be improved to make the molecular scissors faster and more reliable.

- [**Protecting 'self-reactive' immune cells so they can fight melanoma**](#) [周五, 29 9月 02:21]

Researchers report on a potential new way to fight melanoma by blocking one of the immune system's checks and balances.

- [**Flexible new platform for high-performance electronics**](#) [周五, 29 9月 02:21]

A team of engineers has created the most functional flexible transistor in the world -- and with it, a fast, simple and inexpensive fabrication process that's easily scalable to the commercial level. It's an advance that could open the door to an increasingly interconnected world, enabling manufacturers to add 'smart,' wireless capabilities to any number of large or small products or objects -- like wearable sensors and computers for people and animals -- that curve, bend, stretch and move.

- [**Generating terahertz radiation from water makes 'the impossible, possible'**](#) [周五, 29 9月 02:21]

For nearly a decade, researchers have worked to solve a scientific puzzle that many in the research community believed to be impossible: producing terahertz waves -- a form of electromagnetic radiation in the far infrared frequency range -- from liquid water.

- [**Tsunami enabled hundreds of aquatic species to raft across Pacific**](#) [周五, 29 9月 02:21]

The 2011 Japanese tsunami set the stage for something unprecedented. For the first time in recorded history, scientists have detected entire communities of coastal species crossing the ocean by floating on makeshift rafts. Nearly 300 species have appeared on the shores of Hawaii and the US West Coast attached to tsunami debris, marine biologists discovered.

- [**Bed bugs attracted to dirty laundry**](#) [周五, 29 9月 02:20]

Bed bugs are attracted to dirty laundry, according to new research.

- [**Modern humans emerged more than 300,000 years ago new study suggests**](#) [周五, 29 9月 02:20]

A genomic analysis of ancient human remains from KwaZulu-Natal revealed that southern Africa has an important role to play in writing the history of humankind.

- [**Supersonic gas streams left over from the Big Bang drive massive black hole formation**](#) [周五, 29 9月 02:20]

A super-computer simulation by an international team of researchers has shown the formation of a rapidly growing star from supersonic gas streams in the early universe left over from the Big Bang. The star ends its life with catastrophic collapse to leave a black hole with a mass of 34,000 times that of the Sun.

- [**Perovskite solar cells reach record long-term stability, efficiency over 20 percent**](#) [周五, 29 9月 02:20]

Scientists have greatly improved the operational stability of perovskite

solar cells by introducing cuprous thiocyanate protected by a thin layer of reduced graphene oxide. Devices lost less than 5 percent performance when subjected to a crucial accelerated aging test during which they were exposed for more than 1,000 hours to full sunlight at 60°C.

- [**Summer could be one long heatwave if planet hits 2 degrees Celsius**](#) [周五, 29 9月 00:18]

New paper highlighting how heatwaves will change with every degree of global warming up to 5 degrees C. It finds tropical summers may be one continuous heatwave at 2 degrees C.

- [**Saber-toothed kittens may have been born with thicker bones than other contemporary cats**](#) [周五, 29 9月 00:17]

Saber-toothed kittens may have been born with thicker bones compared to other contemporary cats, but they have a similar pattern of bone development, according to a new study.

- [**Speedy urine test for amphetamines sends results via app**](#) [周五, 29 9月 00:17]

Researchers have developed a wireless sensor and a smartphone app that can detect the presence of speed in a drop of human urine in seconds. The prototype device is also portable enough to be worn as a bracelet, has unprecedented sensitivity for amphetamines with low risk for false-positive results, and costs about \$50 to produce.

- [**For boys at risk of psychopathy, laughter isn't so contagious**](#) [周五, 29 9月 00:17]

For most people, laughter is highly contagious. It's nearly impossible to hear or see someone laughing and not feel the urge to join in. But researchers have new evidence to show that boys at risk of developing psychopathy when they become adults don't have that same urge.

- [**Incurable childhood brain tumors split into 10 new diseases**](#) [周五, 29 9月 00:17]

Scientists have found that deadly childhood brain tumors are actually 10 different diseases that should each be diagnosed and treated based on

their specific genetic faults. The major new study has important implications for treatment, since personalizing care for each type of brain tumor is likely to be much more effective than grouping them all together as one.

- [**How brain develops before birth is tightly controlled by RNA modification**](#) [周五, 29 9月 00:17]

A chemical tag added to RNA during embryonic development regulates how the early brain grows. When this development goes awry, problems happen and may cause psychiatric disorders in people.

- [**How do we sense moonlight? Daylight? There's a cell for that**](#) [周五, 29 9月 00:17]

Neuroscientists describe an unexpected way that we sense the overall degree of illumination in our environment. They found that neurons in the retina of the eye divvy up the job, with particular neurons tuned to different ranges of light intensity.

- [**Uncovering why psoriasis recurs**](#) [周五, 29 9月 00:17]

New research helps address a longstanding question about the inflammatory skin condition psoriasis: Why do skin lesions that have resolved with therapy recur in the same locations after a patient stops using topical steroids?

- [**Necessity is indeed mother of invention, regardless of resources, study shows**](#) [周五, 29 9月 00:16]

People who live in extremely resource poor environments can also be highly innovative in a different way and provide benefits to a range of people through creative problem solving, research shows.

- [**Zinc can halt the growth of cancer cells, study says**](#) [周五, 29 9月 00:16]

Zinc supplements can significantly inhibit the proliferation of esophageal cancer cells, according to a new study.

- [**Fluorine-containing molecules from cell cultures**](#) [周五, 29 9月 00:16]

Natural organic compounds that contain fluorine are rare because living organisms -- with a few exceptions -- do not produce them. Scientists have now genetically engineered a microbial host for organofluorine metabolism, allowing it to produce a fluorinated intermediate known as a diketide. As reported, the diketide could then be used as a monomer for the in vivo production of fluorinated bioplastics.

- [**Nearly one in six new HIV diagnoses in Europe are among people over 50**](#) [周五, 29 9月 00:16]

A new study showed that while the rate of newly reported HIV cases in Europe remained steady in younger people between 2004 and 2015, it increased by 2 percent each year overall in older people. With around 30,000 newly diagnosed HIV infections reported each year over the last decade, the HIV epidemic remains a significant public health problem in the 31 countries of the European Union and European Economic Area.

- [**Highly virulent bacterium causes rampant caries in some children**](#) [周五, 29 9月 00:16]

Researchers have made a novel discovery connecting highly variant types of the caries bacterium *Streptococcus mutans* and their adhesive function to children with rampant caries and increased risk of dental caries.

- [**Popping bubbles: Surfactants have surprising effect on nanobubble stability**](#) [周五, 29 9月 00:16]

The stability of nanobubbles is well understood, but the mechanisms causing their eventual destabilization are still in question. Using molecular dynamics simulations, researchers explored the effect of surfactants -- components that lower surface tension -- on the stabilization of nanobubbles.

- [**Study provides first estimate of total US population with felony convictions**](#) [周五, 29 9月 00:16]

New research on the growth in the scope and scale of felony convictions finds that, as of 2010, 3 percent of the total US population and 15 percent of the African-American male population have served time in

prison. People with felony convictions more broadly account for 8 percent of the overall population and 33 percent of the African-American male population.

- [**In people with OCD, actions are at odds with beliefs**](#) [周五, 29 9月 00:16]

The repeated behaviors that characterize obsessive-compulsive disorder are a manifestation of an underlying brain dysfunction that is not yet well understood. Now, scientists report the use of a mathematical model that they say will help them get at the root of what causes OCD. They find that people with OCD develop an internal, accurate sense of how things work but do not use it to guide behavior.

- [**Tracking the body's mini-shuttles**](#) [周四, 28 9月 23:30]

The development of a new technique for labelling the body's own transporters -- exosomes -- could have long term benefits in the treatment of life-threatening medical conditions, including cancer.

Scientists discover the anatomical link for the loss of smell in Parkinson's disease.

- [**How do zebrafish develop their stripes?**](#) [周四, 28 9月 22:31]

A mathematician has thrown new light on the longstanding mystery of how zebrafish develop the distinctive striped patterns on their skin.

[Driving speed affected when a driver's mind 'wanders'](#) [周四, 28 9月 22:30]

Research finds that driving speed fluctuates more when a driver's mind wanders from focusing on the act of driving - and that the outside environment influences how often a driver's mind wanders.

[Bursting with starbirth](#) [周四, 28 9月 22:12]

This oddly shaped galactic spectacle is bursting with brand new stars. The pink fireworks in this image taken with the NASA/ESA Hubble Space Telescope are regions of intense star formation, triggered by a cosmic-scale collision. The huge galaxy in this image, NGC 4490, has a smaller galaxy in its gravitational grip and is feeling the strain.

[Scientists create endocytosis on demand by 'hotwiring' cells](#) [周四, 28 9月 22:12]

A solution to the problem of creating endocytosis on demand is being compared to 'hotwiring' a car. A team has managed to trigger clathrin-mediated endocytosis in the lab.

[Small scale energy harvesters show large scale impact](#) [周四, 28 9月 22:12]

The production of nano-scale devices has drastically increased with the rise in technological applications, yet a major drawback to the functionality of nano-sized systems is the need for an equally small energy resource. To address this, researchers have been modeling new piezoelectric energy harvester technology at the nano-scale level.

[Abusive bosses experience short-lived benefits](#) [周四, 28 9月 22:12]

Being a jerk to your employees may actually improve your well-being, but only for a short while, suggests new research on abusive bosses.

[Medication that treats parasite infection also has anti-cancer effect](#) [周四, 28 9月 21:42]

Scientists report a new gene target, KPNB1, for treatment against epithelial ovarian cancer (EOC). EOC is the fifth leading cause of cancer-related deaths in women and has a particularly grim outlook

upon diagnosis. They also find that ivermectin exerts an anti-tumor effect on EOC cells by interacting with the KPNB1 gene. Because ivermectin is already approved to treat parasitic infections in patients, experiments for its effectiveness in an anti-cancer regimen is expected to significantly lower ...

- [**Mapping the Tasmanian tiger's mysterious loss from mainland**](#) [周四, 28 9月 21:42]

Ancient DNA extracted from fossil bones and museum specimens has shed new light on the mysterious loss of the Tasmanian tiger (thylacine) from Australia's mainland.

- [**Did rapid sea-level rise drown fossil coral reefs around Hawaii?**](#) [周四, 28 9月 21:42]

Investigations to predict changes in sea levels and their impacts on coastal systems are a step closer, as a result of a new international collaboration.

- [**Women with suspected HPV adverse effects more often suffered from psychiatric disorders**](#) [周四, 28 9月 21:42]

New research shows that women who are referred to an HPV center more often have had psychiatric medicine prescribed or been hospitalized for psychiatric conditions up to five years before they received the vaccine.

- [**Biodegradable microsensors for food monitoring**](#) [周四, 28 9月 21:42]

A new generation of microsensors could provide the vital link between food products and the Internet of Things. Researchers have developed an ultra-thin temperature sensor that is both biocompatible and biodegradable.

- [**Chimpanzees can learn how to use tools without observing others**](#) [周四, 28 9月 21:42]

New observations have led researchers to believe that chimpanzees can use tools spontaneously to solve a task, without needing to watch others first.

- [**Large earthquakes along Olympic Mountain faults, Washington State, USA**](#) [周四, 28 9月 21:42]

A comprehensive study of faults along the north side of the Olympic Mountains of Washington State emphasizes the substantial seismic hazard to the northern Puget Lowland region. The study examined the Lake Creek-Boundary Creek and Sadie Creek faults along the north flank the Olympic Mountains, and concludes that there were three to five large, surface-rupturing earthquakes along the faults within the last 13,000 years.

- [**Answer to young people's persistent sleep problems**](#) [周四, 28 9月 21:41]

A collaborative research project indicates high rates of sleep problems continuing through teenage years and into early adulthood -- but also suggests a natural remedy.

- [**Making surgical screws from bones**](#) [周四, 28 9月 20:51]

Biomechanics are developing surgical screws from donated human bone material for foot and jaw surgery together with an Austrian start-up.

- [**Non-toxic flame retardant enters market, study suggests**](#) [周四, 28 9月 20:51]

Chemists have developed and patented an environmentally friendly way to produce flame retardants for foams that can be used in mattresses and upholstery. Unlike previous flame retardants made of chemicals containing chlorine, the new material is non-toxic and effective, researchers say.

- [**Delayed diagnosis, not gender, affects women's treatment for heart disease**](#) [周四, 28 9月 20:51]

Women with heart disease typically receive less complete surgical revascularization with arterial grafts than men do, but not because of gender bias. Instead, factors such as delayed diagnosis of coronary artery disease (CAD) in women may contribute to the differences in treatment, according to a new study.

Solving the mystery of Pluto's giant blades of ice -- ScienceDaily

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery.

Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces, leaving dramatic crests and sharp divides.

These jagged geological ridges are found at the highest altitudes on Pluto's surface, near its equator, and can soar many hundreds of feet into the sky -- as high as a New York City skyscraper. They are one of the most puzzling feature types on Pluto, and it now appears the blades are related to Pluto's complex climate and geological history.

A team led by New Horizons team member Jeffrey

Moore, a research scientist at NASA's Ames Research Center in California's Silicon Valley, has determined that formation of the bladed terrain begins with methane freezing out of the atmosphere at extreme altitudes on Pluto, in the same way frost freezes on the ground on Earth, or even in your freezer.

"When we realized that bladed terrain consists of tall deposits of methane ice, we asked ourselves why it forms all of these ridges, as opposed to just being big blobs of ice on the ground," said Moore. "It turns out that Pluto undergoes climate variation and sometimes, when Pluto is a little warmer, the methane ice begins to basically 'evaporate' away."

Scientists use the term "sublimation" for this process where ice transforms directly into gas, skipping over the intermediate liquid form.

Similar structures can be found in high-altitude snowfields along Earth's equator, though on a very different scale than the blades on Pluto. The terrestrial structures, called penitentes, are snow formations just a few meters high, with striking similarities to the vastly larger bladed terrain on Pluto. Their spiky texture also forms through sublimation.

This erosion of Pluto's bladed terrain indicates that its climate has undergone changes over long periods of time -- on a scale of millions of years -- that cause this ongoing geological activity. Early climatic conditions allowed methane to freeze out onto high elevation surfaces, but, as time progressed, these conditions changed, causing the ice to "burn off" into a gas.

As a result of this discovery, we now know that the surface and air of Pluto are apparently far more dynamic than previously thought. The results have just been published in *Icarus*, an international journal of planetary science.

Mapping Pluto's Surface

Identifying the nature of the exotic bladed terrain also brings us a step closer to understanding the global topography of Pluto. The New Horizons spacecraft provided spectacular, high-resolution data about one side of Pluto, called the encounter hemisphere, and observed the other side of Pluto at lower resolution.

Since methane has now been linked to high elevations, researchers can use data that indicates where methane is present around Pluto's globe to infer which locations

are at higher altitudes. This provides an opportunity to map out altitudes of some parts of Pluto's surface not captured in high resolution, where bladed terrains also appear to exist.

Though the detailed coverage of Pluto's bladed terrain covers only a small area, NASA researchers and their collaborators have been able to conclude from several types of data that these sharp ridges may be a widespread feature on Pluto's so-called "far side," helping to develop a working understanding of Pluto's global geography, its present and its past.

Farthest active inbound comet yet seen -- ScienceDaily

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

The comet, called C/2017 K2 (PANSTARRS) or "K2," has been travelling for millions of years from its home in the frigid outer reaches of the solar system, where the temperature is about minus 440 degrees Fahrenheit. The comet's orbit indicates that it came from the Oort Cloud, a spherical region almost a light-year in diameter and thought to contain hundreds of billions of comets. Comets are the icy leftovers from the formation of the solar system 4.6 billion years ago and

therefore pristine in icy composition.

"K2 is so far from the Sun and so cold, we know for sure that the activity -- all the fuzzy stuff making it look like a comet -- is not produced, as in other comets, by the evaporation of water ice," said lead researcher David Jewitt of the University of California, Los Angeles. "Instead, we think the activity is due to the sublimation [a solid changing directly into a gas] of super-volatiles as K2 makes its maiden entry into the solar system's planetary zone. That's why it's special. This comet is so far away and so incredibly cold that water ice there is frozen like a rock."

Based on the Hubble observations of K2's coma, Jewitt suggests that sunlight is heating frozen volatile gases -- such as oxygen, nitrogen, carbon dioxide, and carbon monoxide -- that coat the comet's frigid surface. These icy volatiles lift off from the comet and release dust, forming the coma. Past studies of the composition of comets near the Sun have revealed the same mixture of volatile ices.

"I think these volatiles are spread all through K2, and in the beginning billions of years ago, they were probably all through every comet presently in the Oort

Cloud," Jewitt said. "But the volatiles on the surface are the ones that absorb the heat from the Sun, so, in a sense, the comet is shedding its outer skin. Most comets are discovered much closer to the Sun, near Jupiter's orbit, so by the time we see them, these surface volatiles have already been baked off. That's why I think K2 is the most primitive comet we've seen."

K2 was discovered in May 2017 by the Panoramic Survey Telescope and Rapid Response System (Pan-STARRS) in Hawaii, a survey project of NASA's Near-Earth Object Observations Program. Jewitt used Hubble's Wide Field Camera 3 at the end of June to take a closer look at the icy visitor.

Hubble's sharp "eye" revealed the extent of the coma and also helped Jewitt estimate the size of the nucleus - - less than 12 miles across -- though the tenuous coma is 10 Earth diameters across.

This vast coma must have formed when the comet was even farther away from the Sun. Digging through archival images, Jewitt's team uncovered views of K2 and its fuzzy coma taken in 2013 by the Canada-France-Hawaii Telescope (CFHT) in Hawaii. But the

object was then so faint that no one noticed it.

"We think the comet has been continuously active for at least four years," Jewitt said. "In the CFHT data, K2 had a coma already at 2 billion miles from the Sun, when it was between the orbits of Uranus and Neptune. It was already active, and I think it has been continuously active coming in. As it approaches the Sun, it's getting warmer and warmer, and the activity is ramping up."

But, curiously, the Hubble images do not show a tail flowing from K2, which is a signature of comets. The absence of such a feature indicates that particles lifting off the comet are too large for radiation pressure from the Sun to sweep them back into a tail.

Astronomers will have plenty of time to conduct detailed studies of K2. For the next five years, the comet will continue its journey into the inner solar system before it reaches its closest approach to the Sun in 2022 just beyond Mars' orbit. "We will be able to monitor for the first time the developing activity of a comet falling in from the Oort Cloud over an extraordinary range of distances," Jewitt said. "It should become more and more active as it nears the

Sun and presumably will form a tail."

Jewitt said that NASA's James Webb Space Telescope, an infrared observatory scheduled to launch in 2018, could measure the heat from the nucleus, which would give astronomers a more accurate estimate of its size.

The team's results will appear in the September 28 issue of *The Astrophysical Journal Letters*.

The Hubble Space Telescope is a project of international cooperation between NASA and ESA (European Space Agency). NASA's Goddard Space Flight Center in Greenbelt, Maryland, manages the telescope. The Space Telescope Science Institute (STScI) in Baltimore, Maryland, conducts Hubble science operations. STScI is operated for NASA by the Association of Universities for Research in Astronomy, Inc., in Washington, D.C.

Understanding connection between HIV transmission, racial/ethnic/geographical differences - - ScienceDaily

The health effects of where people live, work, and interact are well documented, as are the value of neighborhood-level structural interventions designed to improve health. But place-based characteristics that contribute to disparities in HIV transmission and disease burden are poorly understood, possibly resulting in less-effective HIV risk reduction interventions and programming.

A new study from the University of Pennsylvania School of Nursing (Penn Nursing) is helping to better understand the contextual social and structural factors that drive disparate HIV/AIDS rates and how place-based interventions can be more effective in fighting the HIV/AIDS pandemic.

The 22-month pilot study -- recently published in the *Journal of Urban Health* -- explored racial/ethnic and

geographic differences in mode of HIV transmission in Philadelphia, an urban HIV epicenter. Data indicated that certain geographic locations appear to have different modes of transmission profiles, with nuanced differences by gender and race/ethnicity.

"Underlying geographical factors that contribute to disparities in HIV transmission and disease burden are poorly understood," explains Bridgette M. Brawner, PhD, APRN, Assistant Professor of Nursing, and the lead author of the study. "'One size' does not fit all for individual-level interventions; the same is true in disproportionately affected neighborhoods, particularly when risk profiles differ by neighborhood characteristics and population demographics. The data generated from this research support a much needed paradigm shift to acknowledge the role negative social and structural factors like limited social cohesion, inadequate health-related resources and poverty have on the HIV/AIDS pandemic. The findings will also better inform the development of neighborhood-level structural interventions to address HIV/AIDS in overly burdened communities."

Continental controls needed to maintain fightback against tree diseases: New research calls for tighter controls to fight tree disease epidemics -- ScienceDaily

Tighter controls on timber and plant movements into Europe are necessary to prevent further disastrous effects of plant diseases, a new study of the ash-dieback pathogen advises.

The call to action follows detailed investigations carried out in British woodlands into the population makeup of the *Hymenoscyphus fraxineus* fungus that causes ash dieback.

While the findings bring some hope for the future of ash tree populations in Great Britain and continental Europe, the authors warn that further introductions of variants of the fungus from its native East Asia must be prevented.

Professor James Brown from the John Innes Centre,

one of the authors of the peer review paper in the journal *Plant Pathology*, said: "What this study shows is that once the ash dieback fungus arrived in Europe, it spread to Britain both by wind-borne spores and by trade in plants. Other alien diseases could spread in the same way. Because of this, disease control must operate on a European scale. Above all, we should prevent diseased plants getting into Europe."

The research team from the John Innes Centre and Forest Research carried out genetic tests on fungal samples found on ash leaves and stems collected from infected woodlands in England and Wales.

Three of the woodland study sites in Norfolk, Suffolk and Kent in the east of England contained ash populations believed to have been infected by windborne fungal spores that travelled from diseased woodlands in continental Europe.

Two further English sites, in Devon, Derbyshire and one in Carmarthenshire, Wales, were selected because they were presumed be infected from ash trees planted in the last 10-20 years from nursery stock from continental Europe.

The aim of the research was to determine if the mode of arrival of the fungus had an impact on the genetic diversity of fungal populations and how they were adapting to local population of ash.

A range of lab and field techniques revealed that numerous infections had established many strains of the pathogenic fungus at each location. There was considerable genetic diversity within pathogen populations in all the sites, regardless of mode of arrival.

The genetic diversity found in European populations of the fungus had been transferred to all the British woodlands, whether they had been introduced as windborne spores or on imported nursery stock. This genetic diversity is, surprisingly, a positive sign for the future of ash because it allows natural selection to operate within populations of the fungus. The pathogen is expected to gradually evolve over successive life cycles to adapt to the tree rather than killing it.

"What we expect in the long run is that the ash and the fungi will reach equilibrium -- a kind of armed stand-off, and the fungus will merge into the background as a parasite of only moderate importance," said Professor

Brown.

But the study warns that this prospect is based upon the present make-up of the population in Britain and continental Europe. The danger is that new arrivals from East Asia of more genetically diverse strains of the pathogen could be disastrous for European ash.

"It's strongly suspected that ash dieback disease was imported by timber movements from East Asia. Transport of plant material between countries carries a real risk of spreading disease," said Professor Brown.

This study has implications for timber and plant trade within Europe, "We have to be more rigorous about trade between European countries once it is known that a disease is in the source country. It would not stop spread of the disease but it would certainly slow it down," says Professor Brown,

Dr Elizabeth Orton, a post-doctoral scientist at the John Innes Centre and lead author on the paper, recommends the creation of nurseries containing trees with diverse resistance to the ash dieback pathogen. Nurseries like these would allow the trees to breed together to produce seed that can be distributed to

bolster resistance throughout the UK.

How molecular scissors cut in the right place -- ScienceDaily

A research group at Uppsala University has found out how CRISPR-Cas9 -- also known as 'molecular scissors' -- can search the genome for a specific DNA sequence. Cas9 already has many applications in biotechnology and is also expected to revolutionise medicine. The new research findings show how Cas9 can be improved to make the molecular scissors faster and more reliable. The study is being published in *Science*.

In less than a decade, CRISPR-Cas9 has revolutionised biological research. Cas9 makes it possible, for specific purposes, to correct or modify ('edit') essentially any DNA sequence. The hope is that the genetic scissors will also enable genetic diseases to be cured and prevented.

The exciting aspect of Cas9 is that the molecule can be programmed with a piece of artificial genetic code, which can then be made to seek out the corresponding sequence in the genome. A research group at Uppsala

University has now discovered how Cas9 finds the right sequence.

'Most proteins that search DNA code can recognise one specific sequence merely by sensing the outside of the DNA double helix. Cas9 can search for an arbitrary code, but to determine whether it is in the right place the molecule has to open the double DNA helix and compare the sequence with the programmed code. The incredible thing is that it can still search the entire genome without using any energy,' says Johan Elf, who is in charge of the study.

The researchers have developed two new methods to measure how long Cas9 takes to find its target sequence. The first method showed that it takes as long as six hours for Cas9 to search a bacterium, i.e. through four million base pairs. This somewhat unlikely result was also verifiable by means of the second, independent technique. The time found also tallies with the number of milliseconds Cas9 has available for testing every position, which the researchers were able to measure by following labelled Cas9 molecules in real time.

'The results show that the price Cas9 pays for its

flexibility is time. To find the target faster, more Cas9 molecules searching for the same DNA sequence are needed,' says Johan Elf.

The very high concentrations of Cas9 that are necessary for finding the right sequence within a reasonable time frame can pose severe problems for the cells that scientists try to alternate. But since the nature of the search process is now understood, an important clue as to how the system can be improved has been found. By sacrificing a portion of Cas9's flexibility, it would be possible to design genetic scissors that are still sufficiently versatile to edit various genes but simultaneously fast enough to be medically usable.

'The results have given us clues on how we might achieve that kind of solution,' Elf says. 'The key is in what are known as the "PAM sequences," which determine where and how often Cas9 opens up the DNA double helix. Molecular scissors that do not need to open the helix as many times to find their target are not only faster but would also reduce the risk of side-effects.'

- [**Solving the mystery of Pluto's giant blades of ice**](#)

[周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

- [**Farthest active inbound comet yet seen**](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

- [**Tsunami enabled hundreds of aquatic species to raft across Pacific**](#) [周五, 29 9月 02:21]

The 2011 Japanese tsunami set the stage for something unprecedented. For the first time in recorded history, scientists have detected entire communities of coastal species crossing the ocean by floating on makeshift rafts. Nearly 300 species have appeared on the shores of Hawaii and the US West Coast attached to tsunami debris, marine biologists discovered.

- [**Modern humans emerged more than 300,000 years ago new study suggests**](#) [周五, 29 9月 02:20]

A genomic analysis of ancient human remains from KwaZulu-Natal revealed that southern Africa has an important role to play in writing the history of humankind.

- [**Supersonic gas streams left over from the Big Bang drive massive black hole formation**](#) [周五, 29 9月 02:20]

A super-computer simulation by an international team of researchers has shown the formation of a rapidly growing star from supersonic gas streams in the early universe left over from the Big Bang. The star ends its life with catastrophic collapse to leave a black hole with a mass of 34,000 times that of the Sun.

- [**Perovskite solar cells reach record long-term stability, efficiency over 20 percent**](#) [周五, 29 9月 02:20]

Scientists have greatly improved the operational stability of perovskite solar cells by introducing cuprous thiocyanate protected by a thin layer of reduced graphene oxide. Devices lost less than 5 percent performance when subjected to a crucial accelerated aging test during which they were exposed for more than 1,000 hours to full sunlight at 60°C.

- [**Summer could be one long heatwave if planet hits 2 degrees Celsius**](#) [周五, 29 9月 00:18]

New paper highlighting how heatwaves will change with every degree of global warming up to 5 degrees C. It finds tropical summers may be one continuous heatwave at 2 degrees C.

- [**Saber-toothed kittens may have been born with thicker bones than other contemporary cats**](#) [周五, 29 9月 00:17]

Saber-toothed kittens may have been born with thicker bones compared to other contemporary cats, but they have a similar pattern of bone development, according to a new study.

- [**Chimpanzees can learn how to use tools without**](#)

[observing others](#) [周四, 28 9月 21:42]

New observations have led researchers to believe that chimpanzees can use tools spontaneously to solve a task, without needing to watch others first.

• [The hormone that could be making your dog aggressive discovered](#) [周四, 28 9月 04:20]

Thousands of people are hospitalized every year for dog bites, and aggressive behavior is a major reason dogs end up in shelters. Biologists have studied the biology behind canine aggression, specifically the role of the hormones vasopressin and oxytocin.

• [Black holes with ravenous appetites define Type I active galaxies](#) [周四, 28 9月 01:36]

Type I and Type II active galaxies do not just appear different -- they are, in fact, very different from each other, both structurally and energetically, new research shows. According to the results of a new study, the key factor that distinguishes Type I and Type II galaxies is the rate at which their central black holes -- or active galactic nuclei -- consume matter and spit out energy.

• [New light shed on how Earth and Mars were created](#) [周四, 28 9月 01:36]

Analysing a mixture of earth samples and meteorites, scientists have shed new light on the sequence of events that led to the creation of the planets Earth and Mars.

• [The volatile processes that shaped Earth](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

- [**LIGO and Virgo observatories jointly detect black hole collision**](#) [周四, 28 9月 00:36]

The first observation of gravitational waves has been discovered by by three different detectors, marking a new era of greater insights and improved localization of cosmic events now available through globally networked gravitational-wave observatories.

- [**Emerging infectious disease threatens Darwin's frog with extinction**](#) [周三, 27 9月 22:09]

Iconic species likely to be wiped-out by amphibian fungus, despite lack of obvious short-term evidence.

- [**Geographic variation in Gentoo penguin calls**](#) [周三, 27 9月 21:33]

Vocal communication is central to the lives of many birds, which use sound to attract mates and defend territories. Penguins are no exception, but we know little about how or why penguin vocalizations vary between isolated populations. A new study takes a broad look at vocalizations across the range of Gentoo penguins and concludes that while their calls do vary from place to place, we still have lots to learn about the processes at work.

- [**Songbird populations may indicate trouble in northwestern forests**](#) [周三, 27 9月 21:33]

Populations of many North American songbirds are declining, and in many cases we don't understand why. Conservation efforts need this information to be effective, and bird banding stations can help fill in the gaps, providing insights into how demographics vary across space and time. A new study presents ten years of data from banding stations across northern California and southern Oregon and offers new hints on what's driving changes in the region's songbird populations.

- [**Tree-dwelling, coconut-cracking giant rat discovered in Solomon Islands**](#) [周三, 27 9月 21:33]

Scientists have discovered a new species of giant rat. It's more than four times the size of the black rats that live in the US, it lives in trees, and

it's rumored to crack open coconuts with its teeth. And it's actually pretty cute.

- [**Lost continent of Zealandia: Scientists return from expedition to sunken land**](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

- [**Caribbean praying mantises have ancient African origin**](#) [周三, 27 9月 11:59]

Three seemingly unrelated praying mantis groups inhabiting Cuba and the rest of the Greater Antilles actually share an ancient African ancestor and possibly form the oldest endemic animal lineage on the Caribbean islands, researchers have determined.

- [**Umbilical cord stem cells show promise as heart failure treatment**](#) [周三, 27 9月 04:23]

Intravenous stem cell infusion derived from umbilical cords appears to boost heart muscle function in patients with heart failure, according to a small study. In this first-of-its-kind study, patients had 'significant' improvement in their hearts' ability to pump blood and experienced no adverse side effects related to the therapy. The results suggest IV-infused umbilical cord-derived stem cells are a promising avenue to treat heart failure.

- [**Energy harvested from evaporation could power much of US**](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

- [**Amount of water in stem cells can determine its fate as fat or bone**](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of

the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

- [**Wearable solar thermoelectric generator created**](#)

[周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

- [**Cartography of the Cosmos**](#) [周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime. This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Antibody protects against Zika and dengue, mouse study shows**](#) [周二, 26 9月 01:29]

The same countries hard hit by Zika virus -- which can cause brain

damage in babies infected before birth -- are also home to dengue virus. Researchers now report that they have found an antibody that protects against both viruses. These findings, in mice, could be a step towards an antibody-based preventative drug to protect fetuses from brain damage, while also protecting their mothers from both Zika and dengue disease.

- [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

- [**Visual attention drawn to meaning, not what stands out**](#) [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- [**Panda habitat shrinking, becoming more fragmented**](#) [周一, 25 9月 23:13]

Using remote sensing data, Chinese and US scientists have re-assessed the conservation status of the giant panda. Their analysis shows that while panda numbers are increasing, their habitat still covers less area and is more fragmented than it was in 1988, when the species was listed as endangered on the IUCN Red List.

- [**Child abuse affects brain wiring**](#) [周一, 25 9月 23:13]

For the first time, researchers have been able to see changes in the neural structures in specific areas of the brains of people who suffered severe abuse as children. The researchers believe that these changes may contribute to the emergence of depressive disorders and suicidal behavior.

- [**Genes are controlled by 'Nano footballs,'**](#)

scientists discover [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

Brain damage in fish from plastic nanoparticles in water [周一, 25 9月 22:47]

A new study shows that plastic particles in water may end up inside fish brains. The plastic can cause brain damage, which is the likely cause of behavioral disorders observed in the fish.

Brain guides body much sooner than previously believed [周一, 25 9月 21:54]

The brain plays an active role much earlier than previously thought. Long before movement or other behaviors occur, the nascent brain of an embryonic frog instructs normal muscle and nerve patterning and protects the embryo from agents that cause developmental defects. In addition to identifying these essential functions for the first time, researchers successfully rescued defects caused by lack of a brain by using widely available, human-approved drugs.

Winter cold extremes linked to high-altitude polar vortex weakening [周五, 22 9月 21:40]

When the strong winds that circle the Arctic slacken, cold polar air can escape and cause extreme winter chills in parts of the Northern hemisphere. A new study finds that these weak states have become more persistent over the past four decades and can be linked to cold winters in Russia and Europe.

Flint's water crisis led to fewer babies and higher fetal death rates, researchers find [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Understanding connection between HIV transmission, racial/ethnic/geographical differences**](#) [周五, 29 9月 02:54]

The health effects of where people live, work, and interact are well documented, as are the value of neighborhood-level structural interventions designed to improve health. But place-based characteristics that contribute to disparities in HIV transmission and disease burden are poorly understood, possibly resulting in less-effective HIV risk reduction interventions and programming.

- [**How molecular scissors cut in the right place**](#) [周五, 29 9月 02:21]

A research group has found out how CRISPR-Cas9 -- also known as 'molecular scissors' -- can search the genome for a specific DNA sequence. Cas9 already has many applications in biotechnology and is also expected to revolutionize medicine. The new research findings show how Cas9 can be improved to make the molecular scissors faster and more reliable.

- [**Protecting 'self-reactive' immune cells so they can fight melanoma**](#) [周五, 29 9月 02:21]

Researchers report on a potential new way to fight melanoma by blocking one of the immune system's checks and balances.

- [**Bed bugs attracted to dirty laundry**](#) [周五, 29 9月 02:20]

Bed bugs are attracted to dirty laundry, according to new research.

- [**Speedy urine test for amphetamines sends**](#)

[results via app](#) [周五, 29 9月 00:17]

Researchers have developed a wireless sensor and a smartphone app that can detect the presence of speed in a drop of human urine in seconds. The prototype device is also portable enough to be worn as a bracelet, has unprecedented sensitivity for amphetamines with low risk for false-positive results, and costs about \$50 to produce.

[For boys at risk of psychopathy, laughter isn't so contagious](#) [周五, 29 9月 00:17]

For most people, laughter is highly contagious. It's nearly impossible to hear or see someone laughing and not feel the urge to join in. But researchers have new evidence to show that boys at risk of developing psychopathy when they become adults don't have that same urge.

[Incurable childhood brain tumors split into 10 new diseases](#) [周五, 29 9月 00:17]

Scientists have found that deadly childhood brain tumors are actually 10 different diseases that should each be diagnosed and treated based on their specific genetic faults. The major new study has important implications for treatment, since personalizing care for each type of brain tumor is likely to be much more effective than grouping them all together as one.

[How brain develops before birth is tightly controlled by RNA modification](#) [周五, 29 9月 00:17]

A chemical tag added to RNA during embryonic development regulates how the early brain grows. When this development goes awry, problems happen and may cause psychiatric disorders in people.

[How do we sense moonlight? Daylight? There's a cell for that](#) [周五, 29 9月 00:17]

Neuroscientists describe an unexpected way that we sense the overall degree of illumination in our environment. They found that neurons in the retina of the eye divvy up the job, with particular neurons tuned to different ranges of light intensity.

- [**Uncovering why psoriasis recurs**](#) [周五, 29 9月 00:17]

New research helps address a longstanding question about the inflammatory skin condition psoriasis: Why do skin lesions that have resolved with therapy recur in the same locations after a patient stops using topical steroids?

- [**Necessity is indeed mother of invention, regardless of resources, study shows**](#) [周五, 29 9月 00:16]

People who live in extremely resource poor environments can also be highly innovative in a different way and provide benefits to a range of people through creative problem solving, research shows.

- [**Zinc can halt the growth of cancer cells, study says**](#) [周五, 29 9月 00:16]

Zinc supplements can significantly inhibit the proliferation of esophageal cancer cells, according to a new study.

- [**Nearly one in six new HIV diagnoses in Europe are among people over 50**](#) [周五, 29 9月 00:16]

A new study showed that while the rate of newly reported HIV cases in Europe remained steady in younger people between 2004 and 2015, it increased by 2 percent each year overall in older people. With around 30,000 newly diagnosed HIV infections reported each year over the last decade, the HIV epidemic remains a significant public health problem in the 31 countries of the European Union and European Economic Area.

- [**Highly virulent bacterium causes rampant caries in some children**](#) [周五, 29 9月 00:16]

Researchers have made a novel discovery connecting highly variant types of the caries bacterium *Streptococcus mutans* and their adhesive function to children with rampant caries and increased risk of dental caries.

- [**Study provides first estimate of total US population with felony convictions**](#) [周五, 29 9月 00:16]

New research on the growth in the scope and scale of felony convictions

finds that, as of 2010, 3 percent of the total US population and 15 percent of the African-American male population have served time in prison. People with felony convictions more broadly account for 8 percent of the overall population and 33 percent of the African-American male population.

- [**In people with OCD, actions are at odds with beliefs**](#) [周五, 29 9月 00:16]

The repeated behaviors that characterize obsessive-compulsive disorder are a manifestation of an underlying brain dysfunction that is not yet well understood. Now, scientists report the use of a mathematical model that they say will help them get at the root of what causes OCD. They find that people with OCD develop an internal, accurate sense of how things work but do not use it to guide behavior.

- [**Tracking the body's mini-shuttles**](#) [周四, 28 9月 23:30]

The development of a new technique for labelling the body's own transporters -- exosomes -- could have long term benefits in the treatment of life-threatening medical conditions, including cancer.

- [**Fever during labor may present risk to mother**](#) [周四, 28 9月 23:30]

A new study finds a link between the duration of fever during labor and maternal complications.

- [**Don't rely on mixed messages to change health behaviors**](#) [周四, 28 9月 23:30]

Self-improvement messages to lose weight, quit smoking or eat more fruits and vegetables can fall on deaf ears if the intervention message is mixed, says new research.

- [**Parkinson's disease involves degeneration of the olfactory system**](#) [周四, 28 9月 23:30]

Scientists discover the anatomical link for the loss of smell in Parkinson's disease.

- [**Driving speed affected when a driver's mind**](#)

'wanders' [周四, 28 9月 22:30]

Research finds that driving speed fluctuates more when a driver's mind wanders from focusing on the act of driving - and that the outside environment influences how often a driver's mind wanders.

Scientists create endocytosis on demand by 'hotwiring' cells [周四, 28 9月 22:12]

A solution to the problem of creating endocytosis on demand is being compared to 'hotwiring' a car. A team has managed to trigger clathrin-mediated endocytosis in the lab.

Abusive bosses experience short-lived benefits [周四, 28 9月 22:12]

Being a jerk to your employees may actually improve your well-being, but only for a short while, suggests new research on abusive bosses.

Medication that treats parasite infection also has anti-cancer effect [周四, 28 9月 21:42]

Scientists report a new gene target, KPNB1, for treatment against epithelial ovarian cancer (EOC). EOC is the fifth leading cause of cancer-related deaths in women and has a particularly grim outlook upon diagnosis. They also find that ivermectin exerts an anti-tumor effect on EOC cells by interacting with the KPNB1 gene. Because ivermectin is already approved to treat parasitic infections in patients, experiments for its effectiveness in an anti-cancer regimen is expected to significantly lower ...

Women with suspected HPV adverse effects more often suffered from psychiatric disorders [周四, 28 9月 21:42]

New research shows that women who are referred to an HPV center more often have had psychiatric medicine prescribed or been hospitalized for psychiatric conditions up to five years before they received the vaccine.

Answer to young people's persistent sleep problems [周四, 28 9月 21:41]

A collaborative research project indicates high rates of sleep problems continuing through teenage years and into early adulthood -- but also suggests a natural remedy.

- [**Making surgical screws from bones**](#) [周四, 28 9月 20:51]

Biomechanics are developing surgical screws from donated human bone material for foot and jaw surgery together with an Austrian start-up.

- [**Non-toxic flame retardant enters market, study suggests**](#) [周四, 28 9月 20:51]

Chemists have developed and patented an environmentally friendly way to produce flame retardants for foams that can be used in mattresses and upholstery. Unlike previous flame retardants made of chemicals containing chlorine, the new material is non-toxic and effective, researchers say.

- [**Delayed diagnosis, not gender, affects women's treatment for heart disease**](#) [周四, 28 9月 20:51]

Women with heart disease typically receive less complete surgical revascularization with arterial grafts than men do, but not because of gender bias. Instead, factors such as delayed diagnosis of coronary artery disease (CAD) in women may contribute to the differences in treatment, according to a new study.

- [**Self-esteem in kids: Lavish praise is not the answer, warmth is**](#) [周四, 28 9月 20:51]

How do children construct views of themselves and their place in the world? Children's social relationships turn out to be critical. For example, children develop higher self-esteem when their parents treat them warmly. But they develop lower self-esteem when their parents lavish them with inflated praise.

- [**Breakthrough in rapid, mass screening for the Ebola virus**](#) [周四, 28 9月 20:49]

A new, faster and safer way of diagnosing the Ebola virus has been developed.

- **[Intriguing link between sleep, cognition and schizophrenia identified](#)** [周四, 28 9月 20:47]

Many people with schizophrenia have trouble with learning and memory. A new study has found intriguing links between sleep, cognition and a compound called kynurenine. These links could illuminate the mechanism that causes cognitive problems among those with the disease, and could point the way to new treatments to reduce some of the disease's symptoms.

- **[Biology of mending a broken heart](#)** [周四, 28 9月 20:47]

Scientists might be on to a way to preserve heart function after heart attacks or for people with inherited heart defects called congenital cardiomyopathies. Researchers report that after simulating heart injury in laboratory mouse models, they stopped or slowed cardiac fibrosis, organ enlargement and preserved heart function by blocking a well-known molecular pathway.

- **[Secrets from inside the womb that could provide clues to miscarriage](#)** [周四, 28 9月 20:47]

The major structures of a baby's heart form in just four days, according to new research using the latest imaging techniques.

- **[Expectant mother's elevated blood pressure raises child's risk of obesity](#)** [周四, 28 9月 06:47]

When expectant mothers have elevated blood pressure during pregnancy, it may raise their children's risk of developing childhood obesity.

- **[No evidence to support claims that telephone consultations reduce GP workload or hospital referrals](#)** [周四, 28 9月 06:44]

Telephone consultations to determine whether a patient needs to see their GP face-to-face can deal with many problems, but a new study found no evidence to support claims by companies offering to manage these services or by NHS England that the approach saves money or

reduces the number of hospital referrals.

- [**Health and social care changes 'paving way for fewer services' warn experts**](#) [周四, 28 9月 06:44]

Current reforms to health and social care services, and radical redesign of the local government finance system, may signal the end of the NHS and local government in England as we know them, warn experts.

- [**Strong family ties improve employment options for people with childhood-onset disabilities**](#) [周四, 28 9月 06:43]

Family and close friends play an integral role in helping people with childhood-onset disabilities attain quality employment as adults, a new study has found.

- [**Move towards 'holy grail' of computing by creation of brain-like photonic microchips**](#) [周四, 28 9月 04:20]

Scientists have made a crucial step towards unlocking the 'holy grail' of computing -- microchips that mimic the way the human brain works to store and process information.

- [**That cup of coffee may not relieve Parkinson's symptoms**](#) [周四, 28 9月 04:20]

Contrary to previous research, caffeine may not relieve movement symptoms for people with Parkinson's disease, according to a study.

- [**Early 'full-term' babies may have poorer respiratory fitness through adolescence and young adulthood**](#) [周四, 28 9月 04:20]

Though considered full-term, babies born at 37-38 gestational weeks may be more likely than those born later to have poor cardiorespiratory fitness into young adulthood. These findings suggest scheduled caesarean sections or induced labor at lower gestational ages are concerning.

- [**High cost of truckers not having enough places**](#)

[to park and rest](#) [周四, 28 9月 04:20]

A pilot study illustrates the high economic cost of having too few safe places for commercial truck drivers to park and rest.

• [Nontraffic injuries and fatalities in young children](#) [周四, 28 9月 04:20]

From 1990-2014, researchers found more than 11,750 distinct incidents in a variety of venues and vehicles affecting 14,568 children 14 years and younger, resulting in nearly 3,400 deaths.

• [New test rapidly diagnoses Zika](#) [周四, 28 9月 04:20]

Researchers have developed a paper-based test that can diagnose Zika infection within 20 minutes. Unlike existing tests, the new diagnostic does not cross-react with Dengue virus, a close relative of the Zika virus that can produce false positives on many Zika tests.

• [New class of molecules may protect brain from stroke, neurodegenerative diseases](#) [周四, 28 9月 04:20]

Scientists have discovered a new class of molecules in the brain that synchronize cell-to-cell communication and neuroinflammation/immune activity in response to injury or diseases. Elovans (ELVs) are bioactive chemical messengers made from omega-3 very long chain polyunsaturated fatty acids (VLC-PUFAs,n-3). They are released on demand when cells are damaged or stressed.

• [Mini-protein rapid design method opens way to create a new class of drugs](#) [周四, 28 9月 04:20]

A high-speed method has been developed to generate many different, small, stable proteins from scratch, custom-designed to bind to specific therapeutic targets. Protection against infectious diseases, like flu, and antidotes to nerve toxins are but two research goals of this approach. The method rapidly originates thousands of new drug candidates. These computer-designed proteins, which did not previously exist in nature, combine the stability and bioavailability of small molecule drugs with the sp...

- [**Beer can lift your spirits due to malted barley ingredient**](#) [周四, 28 9月 03:28]

Visitors to the Oktoberfest have always known it and now it has been scientifically -- beer can lift your spirits. Scientists examined 13,000 food components to find out whether they stimulate the reward center in the brain and make people feel good. Hordenine which is found in malted barley and beer seems to do the job quite well.

- [**Haplobank: A biobank of reversible mutant embryonic stem cells**](#) [周四, 28 9月 01:38]

Scientists have developed a biobank of revertible, mutant embryonic stem cells – called Haplobank - which contains over 100,000 mutated, conditional mouse embryonic stem cell lines, targeting about 70% of the protein-coding genome.

- [**Minimally invasive valve replacements hold up well after five years, study shows**](#) [周四, 28 9月 01:36]

A minimally invasive procedure used to replace heart valves without open heart surgery appears to provide a durable remedy for people with a life-threatening form of heart disease in which the aortic valve opening narrows, diminishing blood flow.

- [**Battling belly fat: Specialized immune cells impair metabolism in aging**](#) [周四, 28 9月 01:36]

Researchers have described how nervous systems and immune systems talk to each other to control metabolism and inflammation. Their finding furthers scientists' understanding of why older adults fail to burn stored belly fat, which raises the risk of chronic disease. The study also points to potential therapeutic approaches to target the problem, the researchers said.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**Solving the mystery of Pluto's giant blades of ice**](#)

[周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

- [**Farthest active inbound comet yet seen**](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

- [**Flexible new platform for high-performance electronics**](#) [周五, 29 9月 02:21]

A team of engineers has created the most functional flexible transistor in the world -- and with it, a fast, simple and inexpensive fabrication process that's easily scalable to the commercial level. It's an advance that could open the door to an increasingly interconnected world, enabling manufacturers to add 'smart,' wireless capabilities to any number of large or small products or objects -- like wearable sensors and computers for

people and animals -- that curve, bend, stretch and move.

- [**Generating terahertz radiation from water makes 'the impossible, possible'**](#) [周五, 29 9月 02:21]

For nearly a decade, researchers have worked to solve a scientific puzzle that many in the research community believed to be impossible: producing terahertz waves -- a form of electromagnetic radiation in the far infrared frequency range -- from liquid water.

- [**Supersonic gas streams left over from the Big Bang drive massive black hole formation**](#) [周五, 29 9月 02:20]

A super-computer simulation by an international team of researchers has shown the formation of a rapidly growing star from supersonic gas streams in the early universe left over from the Big Bang. The star ends its life with catastrophic collapse to leave a black hole with a mass of 34,000 times that of the Sun.

- [**Perovskite solar cells reach record long-term stability, efficiency over 20 percent**](#) [周五, 29 9月 02:20]

Scientists have greatly improved the operational stability of perovskite solar cells by introducing cuprous thiocyanate protected by a thin layer of reduced graphene oxide. Devices lost less than 5 percent performance when subjected to a crucial accelerated aging test during which they were exposed for more than 1,000 hours to full sunlight at 60°C.

- [**Speedy urine test for amphetamines sends results via app**](#) [周五, 29 9月 00:17]

Researchers have developed a wireless sensor and a smartphone app that can detect the presence of speed in a drop of human urine in seconds. The prototype device is also portable enough to be worn as a bracelet, has unprecedented sensitivity for amphetamines with low risk for false-positive results, and costs about \$50 to produce.

- [**Fluorine-containing molecules from cell cultures**](#) [周五, 29 9月 00:16]

Natural organic compounds that contain fluorine are rare because living organisms -- with a few exceptions -- do not produce them. Scientists

have now genetically engineered a microbial host for organofluorine metabolism, allowing it to produce a fluoridated intermediate known as a diketide. As reported, the diketide could then be used as a monomer for the in vivo production of fluorinated bioplastics.

- [**Popping bubbles: Surfactants have surprising effect on nanobubble stability**](#) [周五, 29 9月 00:16]

The stability of nanobubbles is well understood, but the mechanisms causing their eventual destabilization are still in question. Using molecular dynamics simulations, researchers explored the effect of surfactants -- components that lower surface tension -- on the stabilization of nanobubbles.

- [**How do zebrafish develop their stripes?**](#) [周四, 28 9月 22:31]

A mathematician has thrown new light on the longstanding mystery of how zebrafish develop the distinctive striped patterns on their skin.

- [**Bursting with starbirth**](#) [周四, 28 9月 22:12]

This oddly shaped galactic spectacle is bursting with brand new stars. The pink fireworks in this image taken with the NASA/ESA Hubble Space Telescope are regions of intense star formation, triggered by a cosmic-scale collision. The huge galaxy in this image, NGC 4490, has a smaller galaxy in its gravitational grip and is feeling the strain.

- [**Small scale energy harvesters show large scale impact**](#) [周四, 28 9月 22:12]

The production of nano-scale devices has drastically increased with the rise in technological applications, yet a major drawback to the functionality of nano-sized systems is the need for an equally small energy resource. To address this, researchers have been modeling new piezoelectric energy harvester technology at the nano-scale level.

- [**Biodegradable microsensors for food monitoring**](#) [周四, 28 9月 21:42]

A new generation of microsensors could provide the vital link between food products and the Internet of Things. Researchers have developed an ultra-thin temperature sensor that is both biocompatible and biodegradable.

- [**Making surgical screws from bones**](#) [周四, 28 9月 20:51]

Biomechanics are developing surgical screws from donated human bone material for foot and jaw surgery together with an Austrian start-up.

- [**Non-toxic flame retardant enters market, study suggests**](#) [周四, 28 9月 20:51]

Chemists have developed and patented an environmentally friendly way to produce flame retardants for foams that can be used in mattresses and upholstery. Unlike previous flame retardants made of chemicals containing chlorine, the new material is non-toxic and effective, researchers say.

- [**Move towards 'holy grail' of computing by creation of brain-like photonic microchips**](#) [周四, 28 9月 04:20]

Scientists have made a crucial step towards unlocking the 'holy grail' of computing -- microchips that mimic the way the human brain works to store and process information.

- [**High cost of truckers not having enough places to park and rest**](#) [周四, 28 9月 04:20]

A pilot study illustrates the high economic cost of having too few safe places for commercial truck drivers to park and rest.

- [**Band gaps, made to order**](#) [周四, 28 9月 04:20]

Engineers have created atomically thin superlattice materials with precision.

- [**Atomistic simulations go the distance on metal strength**](#) [周四, 28 9月 04:20]

Researchers have dived down to the atomic scale to resolve every 'jiggle and wiggle' of atomic motion that underlies metal strength.

- [**Minimally invasive valve replacements hold up well after five years, study shows**](#) [周四, 28 9月 01:36]

A minimally invasive procedure used to replace heart valves without open heart surgery appears to provide a durable remedy for people with

a life-threatening form of heart disease in which the aortic valve opening narrows, diminishing blood flow.

- [**Black holes with ravenous appetites define Type I active galaxies**](#) [周四, 28 9月 01:36]

Type I and Type II active galaxies do not just appear different -- they are, in fact, very different from each other, both structurally and energetically, new research shows. According to the results of a new study, the key factor that distinguishes Type I and Type II galaxies is the rate at which their central black holes -- or active galactic nuclei -- consume matter and spit out energy.

- [**New light shed on how Earth and Mars were created**](#) [周四, 28 9月 01:36]

Analysing a mixture of earth samples and meteorites, scientists have shed new light on the sequence of events that led to the creation of the planets Earth and Mars.

- [**The volatile processes that shaped Earth**](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

- [**Recipe for quantum-enhanced technologies refined**](#) [周四, 28 9月 00:57]

A breakthrough has been made in understanding the structure of entanglement in quantum systems with long-range interactions.

- [**Turbocharging engine design**](#) [周四, 28 9月 00:51]

Researchers have moved the development process into the passing lane. For the first time, scientists and engineers have pinpointed engine designs for a given fuel using the Mira supercomputer at the heart of the Argonne Leadership Computing Facility (ALCF), a DOE Office of

Science User Facility.

- [**Prototype UT equipment can detect rheumatoid arthritis**](#) [周四, 28 9月 00:50]

Researchers have designed a device that shows the difference between healthy fingers and arthritic fingers, according to a first clinical study published. The researchers responsible for the development of the compact device believe that it may in time help doctors to objectively diagnose the degree of inflammation in joints.

- [**LIGO and Virgo observatories jointly detect black hole collision**](#) [周四, 28 9月 00:36]

The first observation of gravitational waves has been discovered by by three different detectors, marking a new era of greater insights and improved localization of cosmic events now available through globally networked gravitational-wave observatories.

- [**Unlocking the mysteries of memory -- and potentially enhancing it**](#) [周四, 28 9月 00:36]

Memory acts like an anchor, reminding us of past experiences that have made us who we are today. Attempts to boost it, particularly as we age, have sprouted cottage industries of supplements and brain games. In parallel, researchers have been pursuing pharmaceutical interventions. In some of the latest work on this front, one team reports that they have identified a novel compound that enhances long-term memory in animal studies.

- [**Ancient ink for cancer treatment**](#) [周四, 28 9月 00:35]

For hundreds of years, Chinese calligraphers have used a plant-based ink to create beautiful messages and art. Now, one group reports that this ink could noninvasively and effectively treat cancer cells that spread, or metastasize, to lymph nodes.

- [**Total solar eclipse viewed from space**](#) [周四, 28 9月 00:35]

While people across the nation gazed at August's total solar eclipse from Earth, a bread loaf-sized NASA satellite had a front row seat for the astronomical event.

- [**On a collision course with game theory**](#) [周三, 27 9月 22:23]

How do pedestrians behave in a large crowd? How do they avoid collisions? How can their paths be modeled? A new approach developed by mathematicians provides answers to these questions.

- [**How old does your computer think you are?**](#) [周三, 27 9月 22:23]

Computerized face recognition is an important part of initiatives to develop security systems, in building social networks, in curating photographs, and many other applications. Systems can allow a computer to estimate with precision a person's age based on an analysis of their face.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**New twist on asymmetric catalysis**](#) [周三, 27 9月 21:33]

Researchers have developed an efficient and simple chemical synthesis of a new kind of twisted helicene molecule containing a sulfur group, thiophene. The unusual screw-like asymmetry of the molecules could be useful for making drugs and other types of chemicals in their pure single-enantiomer forms.

- [**The strange structures of the Saturn nebula**](#) [周三, 27 9月 21:33]

The spectacular planetary nebula NGC 7009, or the Saturn Nebula, emerges from the darkness like a series of oddly-shaped bubbles, lit up in glorious pinks and blues. This colourful image was captured by the MUSE instrument on ESO's Very Large Telescope (VLT). The map -- which reveals a wealth of intricate structures in the dust, including shells, a halo and a curious wave-like feature -- will help astronomers understand how planetary nebulae develop their strange shapes and symmetries.

- [**Computer scientists address gap in messaging**](#)

[privacy](#) [周三, 27 9月 21:33]

Researchers have developed a solution to a longstanding problem in the field of end-to-end encryption, a technique that ensures that only sender and recipient can read a message.

· [A beautiful wing design solution inspired by owl feathers](#) [周三, 27 9月 11:59]

Researchers have formulated a mathematical solution that could help minimize noise, maximize aerodynamics in design of porous airfoils (2-D wings) to improve wind turbines and air vehicles.

· [Engineers to pioneer unprecedented high speed wireless data coverage](#) [周三, 27 9月 01:52]

A major new international research program is responding to the overwhelming demand of internet traffic to develop ubiquitous wireless data coverage with unprecedented speed at millimetre waves.

· [Near-Earth asteroid CubeSat goes full sail](#) [周三, 27 9月 01:39]

NASA's Near-Earth Asteroid Scout, a small satellite the size of a shoebox, designed to study asteroids close to Earth, recently performed a full-scale solar sail deployment test. The test was performed in an indoor clean room to ensure the deployment mechanism's functionality after recent environmental testing.

· [Innovative control system paves the way for large scale universal quantum computing](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

· [Energy harvested from evaporation could power much of US](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source,

researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

• [Quantum communications bend to our needs](#) [周三, 27 9月 00:51]

The potential for photon entanglement in quantum computing and communications has been known for decades. One issue impeding immediate application is that many photon entanglement platforms don't operate within the range used by most forms of telecommunication. Researchers have started to unravel the mysteries of entangled photons, demonstrating a technique that uses semiconductor quantum dots to bend photons to the wavelengths used by today's popular C-band standards.

• [The 3-D selfie has arrived](#) [周三, 27 9月 00:51]

Computer scientists have solved a complex problem that has, until now, defeated experts in vision and graphics research. They have developed technology capable of producing 3-D facial reconstruction from a single 2-D image -- the 3-D selfie. People are queuing up to try it and so far, more than 400,000 users have had a go.

• [New reassurance that heat flux will be manageable in ITER](#) [周三, 27 9月 00:51]

A major issue facing ITER, the international tokamak under construction in France that will be the first magnetic fusion device to produce net energy, is whether the crucial divertor plates that will exhaust waste heat from the device can withstand the high heat flux, or load, that will strike them. Alarming projections extrapolated from existing tokamaks suggest that the heat flux could be so narrow and concentrated as to damage the tungsten divertor plates in the seven-story, 23,000 ton tokamak...

• [A fresh set of eyes: Rotating plant inspectors reduces risk of medical device recalls](#) [周二, 26 9月 23:59]

More frequent rotation of plant inspectors at medical device manufacturing facilities could benefit consumers and lead to fewer

product recalls, finds new research.

- [**Wearable solar thermoelectric generator created**](#)

[周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

- [**Artificial intelligence for obtaining chemical fingerprints**](#)

[周二, 26 9月 22:54]

Researchers have succeeded in developing a method for predicting molecular infrared spectra based on artificial intelligence. These chemical 'fingerprints' could only be simulated by common prediction techniques for small molecules in high quality. The team was able to carry out simulations that were previously not possible.

- [**Understanding football violence could help the fight against terror**](#)

[周二, 26 9月 22:54]

Football has long been tarnished by outbreaks of fan violence. Although media headlines often link the behavior to 'hooliganism,' the activity could stem from potentially more positive motivations, such as passionate commitment to the group and the desire to belong. Understanding the root cause of the behavior may therefore help in tackling the violence and channeling it into something more positive, scientists suggest.

- [**80 percent of activity tracker users stick with the devices for at least six months, study shows**](#)

[周二, 26 9月 21:17]

Use of activity trackers, such as wearable devices and smartphone apps, is on the rise, and a new study shows that 80 percent of users stuck with the device for at least six months. Though the gadgets may help motivate users to increase exercise, the populations that could benefit most may not be using the technologies.

- [**Cartography of the Cosmos**](#)

[周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime.

This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Continental controls needed to maintain fightback against tree diseases**](#) [周五, 29 9月 02:21]

Tighter controls on timber and plant movements into Europe are necessary to prevent further disastrous effects of plant diseases, a new study of the ash-dieback pathogen advises.

- [**Tsunami enabled hundreds of aquatic species to raft across Pacific**](#) [周五, 29 9月 02:21]

The 2011 Japanese tsunami set the stage for something unprecedented. For the first time in recorded history, scientists have detected entire communities of coastal species crossing the ocean by floating on makeshift rafts. Nearly 300 species have appeared on the shores of Hawaii and the US West Coast attached to tsunami debris, marine biologists discovered.

- [**Bed bugs attracted to dirty laundry**](#) [周五, 29 9月 02:20]

Bed bugs are attracted to dirty laundry, according to new research.

- [**Modern humans emerged more than 300,000 years ago new study suggests**](#) [周五, 29 9月 02:20]

A genomic analysis of ancient human remains from KwaZulu-Natal revealed that southern Africa has an important role to play in writing the history of humankind.

- [**Perovskite solar cells reach record long-term stability, efficiency over 20 percent**](#) [周五, 29 9月 02:20]

Scientists have greatly improved the operational stability of perovskite

solar cells by introducing cuprous thiocyanate protected by a thin layer of reduced graphene oxide. Devices lost less than 5 percent performance when subjected to a crucial accelerated aging test during which they were exposed for more than 1,000 hours to full sunlight at 60°C.

- [**Summer could be one long heatwave if planet hits 2 degrees Celsius**](#) [周五, 29 9月 00:18]

New paper highlighting how heatwaves will change with every degree of global warming up to 5 degrees C. It finds tropical summers may be one continuous heatwave at 2 degrees C.

- [**Saber-toothed kittens may have been born with thicker bones than other contemporary cats**](#) [周五, 29 9月 00:17]

Saber-toothed kittens may have been born with thicker bones compared to other contemporary cats, but they have a similar pattern of bone development, according to a new study.

- [**Fluorine-containing molecules from cell cultures**](#) [周五, 29 9月 00:16]

Natural organic compounds that contain fluorine are rare because living organisms -- with a few exceptions -- do not produce them. Scientists have now genetically engineered a microbial host for organofluorine metabolism, allowing it to produce a fluorinated intermediate known as a diketide. As reported, the diketide could then be used as a monomer for the in vivo production of fluorinated bioplastics.

- [**Highly virulent bacterium causes rampant caries in some children**](#) [周五, 29 9月 00:16]

Researchers have made a novel discovery connecting highly variant types of the caries bacterium *Streptococcus mutans* and their adhesive function to children with rampant caries and increased risk of dental caries.

- [**How do zebrafish develop their stripes?**](#) [周四, 28 9月 22:31]

A mathematician has thrown new light on the longstanding mystery of how zebrafish develop the distinctive striped patterns on their skin.

- [**Mapping the Tasmanian tiger's mysterious loss from mainland**](#) [周四, 28 9月 21:42]

Ancient DNA extracted from fossil bones and museum specimens has shed new light on the mysterious loss of the Tasmanian tiger (thylacine) from Australia's mainland.

- [**Did rapid sea-level rise drown fossil coral reefs around Hawaii?**](#) [周四, 28 9月 21:42]

Investigations to predict changes in sea levels and their impacts on coastal systems are a step closer, as a result of a new international collaboration.

- [**Chimpanzees can learn how to use tools without observing others**](#) [周四, 28 9月 21:42]

New observations have led researchers to believe that chimpanzees can use tools spontaneously to solve a task, without needing to watch others first.

- [**Large earthquakes along Olympic Mountain faults, Washington State, USA**](#) [周四, 28 9月 21:42]

A comprehensive study of faults along the north side of the Olympic Mountains of Washington State emphasizes the substantial seismic hazard to the northern Puget Lowland region. The study examined the Lake Creek-Boundary Creek and Sadie Creek faults along the north flank the Olympic Mountains, and concludes that there were three to five large, surface-rupturing earthquakes along the faults within the last 13,000 years.

- [**Breakthrough in rapid, mass screening for the Ebola virus**](#) [周四, 28 9月 20:49]

A new, faster and safer way of diagnosing the Ebola virus has been developed.

- [**Exploring an ancient event in pumpkin, gourd and melon evolution**](#) [周四, 28 9月 20:47]

Recently, scientists have making great strides in better understanding with the genomes sequenced of cucumber, watermelon, and melons. With these projects completed, a research team has performed the first large comparative genomics exploration of their genome structures and evolution. After reconstructing evolutionary trees and extensive comparisons of common genes between Cucurbitaceae plants, unexpectedly, the research team has found the first evidence of an ancient whole genome duplication ev...

- [**New mechanism points the way to breaking ribosome antibiotic resistance**](#) [周四, 28 9月 20:47]

Research groups reveal a novel mechanism of ribosome dimerization in the bacterium *Lactococcus lactis* using cryo-electron microscopy. As this dimerization renders ribosomes more resistant to antibiotics, this study provides the necessary structural basis to design new generations of antibiotics.

- [**Examining the lifestyles of microbes**](#) [周四, 28 9月 06:43]

Scientists are studying microbes called Parcubacteria that were found by James Cameron (director of 'Terminator') during a recent deep sea expedition. They want to study the microbes' lifestyle and see how similar they are to those found on land.

- [**That cup of coffee may not relieve Parkinson's symptoms**](#) [周四, 28 9月 04:20]

Contrary to previous research, caffeine may not relieve movement symptoms for people with Parkinson's disease, according to a study.

- [**The hormone that could be making your dog aggressive discovered**](#) [周四, 28 9月 04:20]

Thousands of people are hospitalized every year for dog bites, and aggressive behavior is a major reason dogs end up in shelters. Biologists have studied the biology behind canine aggression, specifically the role of the hormones vasopressin and oxytocin.

- [**How cells recover from the verge of**](#)

[programmed death](#) [周四, 28 9月 04:20]

Biologists explore the molecular underpinnings of cells that recover from the verge of programmed death.

• [Earliest evidence for a native African cultigen discovered in Eastern Sudan](#) [周四, 28 9月 04:20]

Archaeologists examining plant impressions within broken pottery have discovered the earliest evidence for domesticated sorghum in Africa.

• [Beer can lift your spirits due to malted barley ingredient](#) [周四, 28 9月 03:28]

Visitors to the Oktoberfest have always known it and now it has been scientifically -- beer can lift your spirits. Scientists examined 13,000 food components to find out whether they stimulate the reward center in the brain and make people feel good. Hordenine which is found in malted barley and beer seems to do the job quite well.

• [Haplobank: A biobank of reversible mutant embryonic stem cells](#) [周四, 28 9月 01:38]

Scientists have developed a biobank of revertible, mutant embryonic stem cells – called Haplobank - which contains over 100,000 mutated, conditional mouse embryonic stem cell lines, targeting about 70% of the protein-coding genome.

• [The volatile processes that shaped Earth](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

• [Citizen science can predict butterfly population trends](#) [周四, 28 9月 00:36]

New research shows that citizen scientists can play a role in gathering

meaningful information to inform long-term monitoring of biodiversity trends such as butterfly population change.

- **[Olive mill wastewater transformed: From pollutant to bio-fertilizer, biofuel](#)** [周四, 28 9月 00:36]

Olive oil has long been a popular kitchen staple. Yet producing the oil creates a vast stream of wastewater that can foul waterways, reduce soil fertility and trigger extensive damage to nearby ecosystems. Now scientists report on the development of an environmentally friendly process that could transform this pollutant into 'green' biofuel, bio-fertilizer and safe water for use in agricultural irrigation.

- **[Ancient ink for cancer treatment](#)** [周四, 28 9月 00:35]

For hundreds of years, Chinese calligraphers have used a plant-based ink to create beautiful messages and art. Now, one group reports that this ink could noninvasively and effectively treat cancer cells that spread, or metastasize, to lymph nodes.

- **[New iceberg calved from Pine Island Glacier](#)** [周三, 27 9月 22:45]

A new iceberg calved from Pine Island Glacier -- one of the main outlets where ice from the interior of the West Antarctic Ice Sheet flows into the ocean.

- **[Preservation of floodplains is flood protection](#)** [周三, 27 9月 22:23]

The silting of rivers and streams leads to problems for fish, mussels, and other aquatic organisms because their habitats disappear. However, not only intensive agriculture and erosion are destroying these habitats. Now a study refutes this widespread view. In order to save the species living in the river basin -- and protect people from the threat of floods -- rivers need more space, diversity, and freedom.

- **[Two new crustacean species discovered on Galician seabed](#)** [周三, 27 9月 22:23]

The fauna of deep seabed tends to be relatively unknown due to the difficulty of collecting samples at great depths. A research team undertook four oceanographic expeditions in the waters off the

northwest coast of the Iberian Peninsula that have led to the discovery of several new species that inhabit the abyssal plains. Now they describe two eyeless species of millimetric proportions.

• **[Emerging infectious disease threatens Darwin's frog with extinction](#)** [周三, 27 9月 22:09]

Iconic species likely to be wiped-out by amphibian fungus, despite lack of obvious short-term evidence.

• **[More than a 38 % of the Neotropical parrot population in the American continent is threatened by human activity](#)** [周三, 27 9月 22:09]

More than a 38% of the Neotropical parrot population of the American continent (Neotropic) is endangered due the impact of human activity, according to a scientific study.

• **[Moths: A different weapon against each enemy](#)** [周三, 27 9月 21:56]

It's a dangerous world out there, especially if you are a small insect. Insects have thrived on our planet for hundreds of millions of years, so they must be doing something right despite all the threats to their survival. With so many predators out to get them many animals have evolved chemical defences, making themselves distasteful or even toxic. Wood tiger moths protect themselves from multiple predators using different chemical defences. Choosing the right defence can be tricky as predators ...

• **[Genome of Fall Armyworm decoded: Moth pest is invading Africa](#)** [周三, 27 9月 21:51]

As part of an international consortium, researchers have sequenced one of the first genomes of a moth from the superfamily Noctuoidea: *Spodoptera frugiperda*, or armyworm. This crop pest -- until now only known on the American continent -- has become invasive in Africa since 2016. This study opens up perspectives for new methods of biological control and a better understanding of the mechanisms involved in the appearance of pesticide resistance.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**How to grow a spine**](#) [周三, 27 9月 21:33]

A genetics professor -- whose lab discovered the segmentation clock 20 years ago -- and colleagues report that they used mouse cells to reconstitute a stable version of this clockwork for the first time in a petri dish, leading to several new discoveries about where the clock is located, what makes it tick and how the vertebral column takes shape.

- [**Geographic variation in Gentoo penguin calls**](#) [周三, 27 9月 21:33]

Vocal communication is central to the lives of many birds, which use sound to attract mates and defend territories. Penguins are no exception, but we know little about how or why penguin vocalizations vary between isolated populations. A new study takes a broad look at vocalizations across the range of Gentoo penguins and concludes that while their calls do vary from place to place, we still have lots to learn about the processes at work.

- [**Songbird populations may indicate trouble in northwestern forests**](#) [周三, 27 9月 21:33]

Populations of many North American songbirds are declining, and in many cases we don't understand why. Conservation efforts need this information to be effective, and bird banding stations can help fill in the gaps, providing insights into how demographics vary across space and time. A new study presents ten years of data from banding stations across northern California and southern Oregon and offers new hints on what's driving changes in the region's songbird populations.

- [**Tree-dwelling, coconut-cracking giant rat discovered in Solomon Islands**](#) [周三, 27 9月 21:33]

Scientists have discovered a new species of giant rat. It's more than four

times the size of the black rats that live in the US, it lives in trees, and it's rumored to crack open coconuts with its teeth. And it's actually pretty cute.

- [**Cellular 'message in a bottle' may provide path to new way of treating disease**](#) [周三, 27 9月 21:33]

A newly discovered cellular messaging mechanism could lead to a new way to deliver therapeutics to tissues affected by disease, according to a new study. Researchers found a type of extracellular vesicle -- a sac secreted by cells that contains proteins and RNA molecules -- carries receptors that allow signaling without direct contact between cells.

- [**Removing nitrate for healthier ecosystems**](#) [周三, 27 9月 21:33]

In a new study, researchers have identified nitrate removal hotspots in landscapes around agricultural streams.

- [**Purple plant is on the defensive**](#) [周三, 27 9月 21:33]

While lavender has long been known for its strong scent and soothing oils, a researcher is exploring the plant's ability to create natural pesticides.

- [**Plant substance inhibits cancer stem cells**](#) [周三, 27 9月 21:33]

Lab experiments show that the chemical compound damsine found in the plant *Ambrosia arborescens* inhibits the growth and spread of cancer stem cells. The similar but synthetically produced ambrosin has the same positive effect.

- [**A beautiful wing design solution inspired by owl feathers**](#) [周三, 27 9月 11:59]

Researchers have formulated a mathematical solution that could help minimize noise, maximize aerodynamics in design of porous airfoils (2-D wings) to improve wind turbines and air vehicles.

- [**Noise pollution found to be disruptive for schooling fish**](#) [周三, 27 9月 11:59]

Noise from human construction projects can disrupt the schools that are

so impressive in marine fish, new research has found.

- [**How has society adapted to hurricanes? A look at New Orleans over 300 years**](#) [周三, 27 9月 11:59]

In the midst of an intense hurricane season, a historical perspective looks at adaptation to hurricanes in New Orleans over nearly three centuries, from its foundation in 1718 to Hurricane Katrina in 2005.

- [**Lost continent of Zealandia: Scientists return from expedition to sunken land**](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

- [**Caribbean praying mantises have ancient African origin**](#) [周三, 27 9月 11:59]

Three seemingly unrelated praying mantis groups inhabiting Cuba and the rest of the Greater Antilles actually share an ancient African ancestor and possibly form the oldest endemic animal lineage on the Caribbean islands, researchers have determined.

- [**Cancerous toxins linked to cannabis extract**](#) [周三, 27 9月 04:23]

Researchers have found benzene and other potentially cancer-causing chemicals in the vapor produced by butane hash oil, a cannabis extract.

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Understanding connection between HIV transmission, racial/ethnic/geographical differences**](#) [周五, 29 9月 02:54]

The health effects of where people live, work, and interact are well documented, as are the value of neighborhood-level structural interventions designed to improve health. But place-based characteristics that contribute to disparities in HIV transmission and disease burden are poorly understood, possibly resulting in less-effective HIV risk reduction interventions and programming.

- [**Nearly one in six new HIV diagnoses in Europe are among people over 50**](#) [周五, 29 9月 00:16]

A new study showed that while the rate of newly reported HIV cases in Europe remained steady in younger people between 2004 and 2015, it increased by 2 percent each year overall in older people. With around 30,000 newly diagnosed HIV infections reported each year over the last decade, the HIV epidemic remains a significant public health problem in the 31 countries of the European Union and European Economic Area.

- [**Study provides first estimate of total US population with felony convictions**](#) [周五, 29 9月 00:16]

New research on the growth in the scope and scale of felony convictions finds that, as of 2010, 3 percent of the total US population and 15 percent of the African-American male population have served time in prison. People with felony convictions more broadly account for 8 percent of the overall population and 33 percent of the African-

American male population.

- **[In people with OCD, actions are at odds with beliefs](#)** [周五, 29 9月 00:16]

The repeated behaviors that characterize obsessive-compulsive disorder are a manifestation of an underlying brain dysfunction that is not yet well understood. Now, scientists report the use of a mathematical model that they say will help them get at the root of what causes OCD. They find that people with OCD develop an internal, accurate sense of how things work but do not use it to guide behavior.

- **[Don't rely on mixed messages to change health behaviors](#)** [周四, 28 9月 23:30]

Self-improvement messages to lose weight, quit smoking or eat more fruits and vegetables can fall on deaf ears if the intervention message is mixed, says new research.

- **[Abusive bosses experience short-lived benefits](#)** [周四, 28 9月 22:12]

Being a jerk to your employees may actually improve your well-being, but only for a short while, suggests new research on abusive bosses.

- **[Self-esteem in kids: Lavish praise is not the answer, warmth is](#)** [周四, 28 9月 20:51]

How do children construct views of themselves and their place in the world? Children's social relationships turn out to be critical. For example, children develop higher self-esteem when their parents treat them warmly. But they develop lower self-esteem when their parents lavish them with inflated praise.

- **[No evidence to support claims that telephone consultations reduce GP workload or hospital referrals](#)** [周四, 28 9月 06:44]

Telephone consultations to determine whether a patient needs to see their GP face-to-face can deal with many problems, but a new study found no evidence to support claims by companies offering to manage these services or by NHS England that the approach saves money or

reduces the number of hospital referrals.

- [**Health and social care changes 'paving way for fewer services' warn experts**](#) [周四, 28 9月 06:44]

Current reforms to health and social care services, and radical redesign of the local government finance system, may signal the end of the NHS and local government in England as we know them, warn experts.

- [**Should we welcome plans to sell off wasted NHS land?**](#) [周四, 28 9月 06:44]

With the NHS under severe financial pressure, should we welcome plans to raise capital by selling off inefficiently used land and buildings owned by the health service? Experts debate the issue in a new article.

- [**High cost of truckers not having enough places to park and rest**](#) [周四, 28 9月 04:20]

A pilot study illustrates the high economic cost of having too few safe places for commercial truck drivers to park and rest.

- [**New test rapidly diagnoses Zika**](#) [周四, 28 9月 04:20]

Researchers have developed a paper-based test that can diagnose Zika infection within 20 minutes. Unlike existing tests, the new diagnostic does not cross-react with Dengue virus, a close relative of the Zika virus that can produce false positives on many Zika tests.

- [**Citizen science can predict butterfly population trends**](#) [周四, 28 9月 00:36]

New research shows that citizen scientists can play a role in gathering meaningful information to inform long-term monitoring of biodiversity trends such as butterfly population change.

- [**Iron supplements have long-term benefits for low birth-weight babies**](#) [周四, 28 9月 00:36]

Babies classified as low birth weight (under 2,500 grams) are at risk of iron deficiency, which is linked to impaired neurological development. A long-term randomized study now shows that providing such babies

with iron supplements can prevent behavioral problems at school age.

- [**Teens' online friendships just as meaningful as face-to-face ones**](#) [周三, 27 9月 22:54]

Many parents worry about how much time teenagers spend texting, sharing selfies and engaging in other online activities with their friends. However, according to a recent research synthesis, many of these digital behaviors serve the same purpose and encompass the same core qualities as face-to-face relationships.

- [**Coping with stressful organizational change**](#) [周三, 27 9月 21:51]

Stress is not a recent phenomenon, but the modern work environment seems to highlight its detrimental effects on employees. This is no more obvious than during times of organizational change. New research considers the impact of such changes on workers in a healthcare authority in New Zealand, highlighting the problems that any organization might face under such circumstances and pointing to possible methods to cope and remediate employee stress.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**Do deep promotional discounts work? New study sheds light on strategy**](#) [周三, 27 9月 01:53]

Promotional discounts increase store traffic and lead to higher overall profits, especially if the advertised products are staples – items such as meat and produce that are purchased frequently and by many customers.

- [**Potential Zika vaccine protects against pregnancy transmission and testicular damage**](#) [周三, 27 9月 00:51]

For the first time, a research team led has shown that a potential Zika vaccine quickly can protect fetuses against infection as well as protect males against testicular infection and injury. It also prevents a lowered

sperm count after one vaccination.

- [**Interventions for reducing hepatitis C infection in people who inject drugs**](#) [周二, 26 9月 22:54]

The first global review to quantify the impact of needle syringe programs (NSP) and opioid substitution treatment (OST) in reducing the risk of becoming infected with the hepatitis C virus has now been published. The study has implications for millions of people who are 'at risk' from infection.

- [**Household chores: Women still do more**](#) [周二, 26 9月 22:54]

Women of all ages still tend to do more household chores than their male partners, no matter how much they work or earn in a job outside the home. New findings demonstrate the persistent gendered nature of how housework is divided.

- [**Preschool teachers need better training in science**](#) [周二, 26 9月 22:54]

Preschool instructors appear to lack the knowledge, skills and confidence to effectively teach their young students science -- a problem that is likely contributing to America's poor global performance in this crucially important subject.

- [**Teachers report weaker relationships with students of color, children of immigrants**](#) [周二, 26 9月 22:54]

The relationship between teachers and students is a critical factor for academic success. However, a new study finds that teachers report weaker relationships with children of immigrants and adolescents of color.

- [**Escaping wildfires**](#) [周二, 26 9月 21:15]

A new study is the first attempt to map escape routes for wildland fire fighters from an aerial perspective. The researchers used LiDAR technology to analyze the terrain slope, ground surface roughness and vegetation density of a fire-prone region in central Utah, and assessed how each landscape condition impeded a person's ability to travel.

- **[Drought: A cause of riots](#)** [周二, 26 9月 21:05]

The scientific community has been working on the possibility of a relationship between periods of drought and rioting for several years. Now a team has formally verified this hypothesis by studying almost 1,800 riots that occurred over a 20-year period in sub-Saharan Africa. The researchers observed a systematic link between the sudden depletion of water resources and the outbreak of unrest. They also succeeded in quantifying the impact of geographic and social factors on the same link.

- **[People are reluctant to use public defibrillators to treat cardiac arrests](#)** [周二, 26 9月 20:59]

A new study suggests that people are reluctant to use public-access defibrillators to treat cardiac arrests.

- **[Psychological impacts of natural disasters on youth](#)** [周二, 26 9月 04:32]

A researcher is fully aware of children's reaction to trauma. Her research focuses on the impact of disasters on youth since Hurricane Andrew in 1992. La Greca has been evaluating how best to define post-traumatic stress disorder (PTSD) in children. This line of research will help to quickly identify the children who need support services post-disaster and identify key aspects of the post-disaster environment that facilitate their recovery.

- **[Are children who see movie characters use guns more likely to use them?](#)** [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

- **[Climate insurance is rarely well thought out in agriculture](#)** [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change.

However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

- **[Group project? Taking turns, working with friends may improve grades](#)** [周一, 25 9月 23:33]

A new study with college students has found that the social dynamics of a group, such as whether one person dominates the conversation or whether students work with a friend, affect academic performance. Put simply, the more comfortable students are, the better they do, which yields benefits beyond the classroom.

- **[Fully renewable India in 2050 can take a shortcut to emission-free future](#)** [周一, 25 9月 23:16]

India can function on a fully renewable electricity system in 2050, research indicates. The study shows that developing countries that have an abundance of renewable resources do not need to take the path of the western countries where increasing living standards have been coupled with heavy emissions from electricity generation and other industry. They can move straight to renewable systems and do it cheaply.

- **[Clarifying perspectives to promote action on loss and damage from climate change](#)** [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy, negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

- **[Visual attention drawn to meaning, not what stands out](#)** [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- [**World's botanic gardens contain a third of all known plant species, and help protect the most threatened**](#) [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41 percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

- [**Minority public managers prefer integrating social equity, traditional public values**](#) [周一, 25 9月 22:57]

Minority public managers place more emphasis on both traditional values, like efficiency and effectiveness, and social equity when compared with their white counterparts, according to a new study.

- [**Scientists call for more research on how human activities affect the seabed**](#) [周一, 25 9月 22:47]

Extensive research has been released into how industry and environmental change are affecting our seafloors. Researchers say more work is needed to help safeguard these complex ecosystems and the benefits they provide to people for the future.

- [**New technique spots warning signs of extreme events**](#) [周日, 24 9月 22:38]

Engineers have devised a framework for identifying key patterns that precede an extreme event. The framework can be applied to a wide range of complicated, multidimensional systems to pick out the warning signs that are most likely to occur in the real world.

- [**Study finds no-tillage not sufficient alone to**](#)

[prevent water pollution from nitrate](#) [周六, 23 9月 04:25]

A new study answers a long-debated agricultural question: whether no-tillage alone is sufficient to prevent water pollution from nitrate. The answer is no.

· [Flint's water crisis led to fewer babies and higher fetal death rates, researchers find](#) [周五, 22 9月 21:16]

An estimated 275 fewer children were born in Flint, Michigan, while the city was using lead-contaminated water from the Flint River, according to new research findings.

· [Breathing dirty air may harm kidneys](#) [周五, 22 9月 21:16]

Outdoor air pollution may increase the risk of chronic kidney disease and contribute to kidney failure, say researchers. Scientists culled national VA databases to evaluate the effects of air pollution and kidney disease on nearly 2.5 million people over a period of 8.5 years, beginning in 2004. The scientists compared VA data on kidney function to air-quality levels collected by the Environmental Protection Agency (EPA) as well as the National Aeronautics and Space Administration (NASA).

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Solving the mystery of Pluto's giant blades of ice**](#)

[周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

- [**Farthest active inbound comet yet seen**](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

- [**Chimpanzees can learn how to use tools without observing others**](#) [周四, 28 9月 21:42]

New observations have led researchers to believe that chimpanzees can use tools spontaneously to solve a task, without needing to watch others first.

- [**Lost continent of Zealandia: Scientists return from expedition to sunken land**](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

- [**Innovative control system paves the way for large scale universal quantum computing**](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Bacterial nanosized speargun works like a power drill**](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in

only a few thousandths of a second and injects a cocktail of toxins.

• [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

• [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

• [**Fish have surprisingly complex personalities**](#) [周一, 25 9月 21:54]

Tiny fish called Trinidadian guppies have individual 'personalities', new research shows.

Latest Science News

Breaking science news and articles on global warming, extrasolar planets, stem cells, bird flu, autism, nanotechnology, dinosaurs, evolution -- the latest discoveries in astronomy, anthropology, biology, chemistry, climate and environment, computers, engineering, health and medicine, math, physics, psychology, technology, and more -- from the world's leading universities and research organizations.

- [**Physical abuse and punishment impact children's academic performance**](#) [周六, 30 9月 03:22]

Scientists have found that physical abuse was associated with decreases in children's cognitive performance, while non-abusive forms of physical punishment were independently associated with reduced school engagement and increased peer isolation.

- [**UV-irradiated amorphous ice behaves like liquid at low temperatures**](#) [周六, 30 9月 03:21]

Ice analogs mimicking interstellar ice behave like liquids at temperatures between -210°C and -120°C according to researchers. This liquid-like ice may enhance the formation of organic compounds including prebiotic molecules and the accretion of dust to form planets.

- [**Snapchat users motivation, level of interest**](#) [周六, 30 9月 01:35]

The simplicity of the platform and brevity of posts are key factors in determining how students can become very regular users.

- [**Video gamers have an advantage in learning**](#) [周六, 30 9月 00:51]

Neuropsychologists let video gamers compete against non-gamers in a learning competition. During the test, the video gamers performed significantly better and showed an increased brain activity in the brain

areas that are relevant for learning.

- [**Raccoons solve an ancient puzzle, but do they really understand it?**](#) [周六, 30 9月 00:51]

Scientists have been using an ancient Greek fable written by Aesop as inspiration to test whether birds and small children understand cause and effect relationships. A group of scientists have now extended this body of work to study raccoon intelligence. Their research uses the Aesop's Fable paradigm to assess if mammalian carnivores understand the principles of water displacement.

- [**New mouse model replicates an underlying cause of intellectual disability**](#) [周六, 30 9月 00:50]

Researchers have developed the first mice that lack the Upf3b gene, providing a new model for studying its underlying role in intellectual disabilities and neurodevelopmental disorders.

- [**There are only 15 possible pentagonal tiles**](#) [周五, 29 9月 23:50]

Tiling the plane with a single pattern is a mathematical problem that has interested humans since Antiquity, notably for the aesthetic quality of tiles in mosaics or tiling. One of the unresolved problems in this field that has been puzzling the scientific community since 1918 has now been definitively resolved.

- [**New study changes our view on flying insects**](#) [周五, 29 9月 23:49]

For the first time, researchers are able to prove that there is an optimal speed for certain insects when they fly. At this speed, they are the most efficient and consume the least amount of energy. Corresponding phenomena have previously been demonstrated in birds, but never among insects.

- [**Erosion from ancient tsunami in Northern California**](#) [周五, 29 9月 23:30]

Geologists use ground-penetrating radar to determine the breadth and depth of erosion from an ancient tsunami in Northern California.

- [**Scandinavia's earliest farmers exchanged terminology with Indo-Europeans**](#) [周五, 29 9月 23:29]

5,000 years ago, the Yamnaya culture migrated into Europe from the Caspian steppe. In addition to innovations such as the wagon and dairy production, they brought a new language -- Indo-European -- that replaced most local languages the following millennia. But local cultures also influenced the new language, particularly in southern Scandinavia, where Neolithic farmers made lasting contributions to Indo-European vocabulary before their own language went extinct, new research shows.

- [**Algae with light switch**](#) [周五, 29 9月 23:29]

The adhesion of Chlamydomonas, a unicellular alga, to surfaces is light-dependent.

- [**Bioreactors on a chip renew promises for algal biofuels**](#) [周五, 29 9月 23:29]

Researchers report exciting new technology that may revolutionize the search for the perfect algal strain: algal droplet bioreactors on a chip the size of a quarter.

- [**Small collisions make big impact on Mercury's thin atmosphere**](#) [周五, 29 9月 23:29]

Mercury, our smallest planetary neighbor, has very little to call an atmosphere, but it does have a strange weather pattern: morning micro-meteor showers.

- [**Protein that could improve symptoms and reduce mortality in flu**](#) [周五, 29 9月 23:29]

Flu season is on its way, and a new report has identified an innovative strategy for battling this deadly illness.

- [**Arbuscular mycorrhizal fungal communities exposed with new DNA sequencing approach**](#) [周五, 29 9月 23:29]

Arbuscular mycorrhizal fungal systems play crucial roles in their

environment, affecting the plants that can grow there and the nutrients in the soils. Researchers have developed a new DNA sequencing technique using barcoded primers that is capable of detecting rare fungal species in a community, paving the way for future insights into how they might vary in response to environmental changes.

- [**Why do we fall asleep when bored?**](#) [周五, 29 9月 21:34]

Why do we have the tendency to fall asleep in the absence of motivating stimuli, i.e., when bored.

- [**A stinging report: Climate change a major threat to bumble bees**](#) [周五, 29 9月 21:33]

New research is helping to explain the link between a changing global climate and a dramatic decline in bumble bee populations worldwide.

- [**Frequent sauna bathing keeps blood pressure in check**](#) [周五, 29 9月 21:33]

Frequent sauna bathing reduces the risk of elevated blood pressure, according to an extensive follow-up population-based study. The risk of developing elevated blood pressure was nearly 50 percent lower among men who had a sauna 4-7 times a week compared to men who had a sauna only once a week.

- [**New regulator of liver metabolism discovered**](#) [周五, 29 9月 21:33]

Researchers have identified an enzyme that has a major effect on glucose utilization in liver cells. The enzyme, retinol saturase, helps these cells adapt to variations in glucose levels. However, when glucose levels are consistently too high, retinol saturase appears to exert a damaging effect on cells.

- [**How the lungs of premature babies can undergo damage**](#) [周五, 29 9月 21:33]

Premature babies that need ventilation to support their breathing often suffer from a condition known as bronchopulmonary dysplasia. Researchers have now discovered a molecular mechanism that plays a key role in the development of the disease.

- [**Antarctica: Return of the Weddell polynya supports Kiel climate model**](#) [周五, 29 9月 21:33]

Currently, winter has still a firm grip on Antarctica. At this time of the year, the Weddell Sea usually is covered with a thick layer of sea ice. In spite of the icy temperatures in the region, satellite images depict a large ice-free area in the middle of the ice cover.

- [**Ultracold atoms point toward an intriguing magnetic behavior**](#) [周五, 29 9月 21:33]

Researchers have studied the quantum behavior of ultracold atoms and discovered an intriguing magnetic behavior that could help explain how high-temperature superconductivity works.

- [**Breakdown of brain cells' metabolic collaboration linked to Alzheimer's disease**](#) [周五, 29 9月 21:33]

Researchers have discovered that impairing a critical partnership between brain cells can lead to neurodegeneration.

- [**New role for fragile X protein could offer clues for treatment**](#) [周五, 29 9月 21:33]

The protein behind fragile X syndrome, a leading cause of autism and intellectual disability, controls a suite of genetic regulators.

- [**Electrically heated textiles now possible via UMass Amherst research**](#) [周五, 29 9月 21:33]

Skiers, crossing guards and others who endure frozen fingers in cold weather may look forward to future relief as manufacturers are poised to take advantage of a new technique for creating electrically heated cloth. Researchers have made gloves that keep fingers as warm as the palm of the hand.

- [**New clues from brain structures of mantis shrimp**](#) [周五, 29 9月 21:33]

New research sheds new light on the evolution of some of the earliest brain structures, and stirs up new, intriguing questions about the origins

of centers that support learning and memory.

- [**Immune system cells protect against CMV-induced hearing loss in mice**](#) [周五, 29 9月 21:33]

Immune system cells known as natural killer cells play an important protective role against hearing loss in mice infected with cytomegalovirus (CMV), according to a new study.

- [**Sharks and rays live a lot longer than we thought**](#) [周五, 29 9月 21:32]

Sharks and rays live a lot longer than we thought -- some twice as long as previously estimated.

- [**Elderly who have trouble identifying odors face risk of dementia**](#) [周五, 29 9月 21:32]

A long-term study of nearly 3,000 older adults found that those who could not identify at least four out of five common odors were more than twice as likely as those with a normal sense of smell to develop dementia within five years. About 14 percent could name just three, 5 percent could identify only two, and 2 percent could name just one. One percent of the study subjects were not able to identify a single scent.

- [**Global methane emissions from agriculture larger than reported, according to new estimates**](#) [周五, 29 9月 21:32]

Global methane emissions from agriculture are larger than estimated due to the previous use of out-of-date data on carbon emissions generated by livestock, according to a new study.

- [**Transcranial electrical stimulation shows promise for treating mild traumatic brain injury**](#) [周五, 29 9月 21:30]

Using a form of low-impulse electrical stimulation to the brain, documented by neuroimaging, researchers report significantly improved neural function in participants with mild traumatic brain injury (TBI).

- [**Ultra-fast and ultra-sensitive hydrogen sensor**](#) [周五, 29 9月 21:29]

Scientists have made an ultra-fast hydrogen sensor that can detect hydrogen gas levels under 1 percent in less than seven seconds. The sensor also can detect hundreds of parts per million levels of hydrogen gas within 60 seconds at room temperature.

• [Solving the mystery of Pluto's giant blades of ice](#)

[周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

• [Farthest active inbound comet yet seen](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

• [A fresh look at older data yields a surprise near the Martian equator](#) [周五, 29 9月 03:22]

Scientists taking a new look at older data from NASA's longest-operating Mars orbiter have discovered evidence of significant hydration near the Martian equator -- a mysterious signature in a region of the Red Planet where planetary scientists figure ice shouldn't exist.

• [Understanding connection between HIV transmission, racial/ethnic/geographical differences](#) [周五, 29 9月 02:54]

The health effects of where people live, work, and interact are well documented, as are the value of neighborhood-level structural

interventions designed to improve health. But place-based characteristics that contribute to disparities in HIV transmission and disease burden are poorly understood, possibly resulting in less-effective HIV risk reduction interventions and programming.

- [**Disease resistance successfully spread from modified to wild mosquitoes**](#) [周五, 29 9月 02:54]

Using genetically modified mosquitoes to reduce or prevent the spread of disease is a rapidly expanding field of investigation. One challenge is ensuring that GM mosquitoes can mate with their wild counterparts so the desired modification is spread in the wild population. Investigators have engineered mosquitoes with an altered microbiota that suppresses human malaria-causing parasites. These GM mosquitoes preferred to mate with wild mosquitoes and passed the desired protection to offspring.

Physical abuse and punishment impact children's academic performance -- ScienceDaily

A Penn State researcher and her collaborator found that physical abuse was associated with decreases in children's cognitive performance, while non-abusive forms of physical punishment were independently associated with reduced school engagement and increased peer isolation.

Sarah Font, assistant professor of sociology and co-funded faculty member of the Child Maltreatment Solutions Network, and Jamie Cage, assistant professor in Virginia Commonwealth University's School of Social Work, found that children's performances and engagement in the classroom are significantly influenced by their exposure to mild, harsh and abusive physical punishment in the home. Their study was recently published in *Child Abuse and Neglect*.

While corporal punishment and physical abuse have been linked with reduced cognitive development and

academic achievement in children previously, Font's study is one of the few that simultaneously examines abusive and non-abusive physical punishment as reported by both children and caregivers.

Even if physical punishment does not result in serious physical injury, children may experience fear and distress, and this stress has been found to negatively impact brain structure, development and overall well-being.

"This punishment style is meant to inflict minor pain so the child will change their behavior to avoid future punishment, but it does not give children the opportunity to learn how to behave appropriately through explanation and reasoning," stated Font.

In this study, over 650 children and their caregivers were examined in three areas of physical punishment: mild corporal punishment, harsh corporal punishment, and physical abuse. The groups reported their use or experience with physical punishment and researchers then measured cognitive outcomes, school engagement, and peer isolation in the children. The data was analyzed to determine trajectories between cognitive and academic performance and how initial

and varying exposure to physical punishment and abuse influences them.

"We found that while all forms of physical punishment and abuse are associated with declines in school engagement, only initial exposure to physical abuse has a significant negative influence on cognitive performance, and only harsh corporal punishment notably increases peer isolation in children and was observed in both child and caregiver reports. This suggests that preventing physical abuse could promote children's cognitive performance, but it may not be enough to get children to be involved and well-adjusted in school," said Font.

Considering that mild physical punishment can develop into physical abuse and that even these mild punishments have consequences on children's cognitive and social school functioning, parent education on alternative forms of punishment may be one solution to prevent physical abuse.

Programs that reach parents during services that they regularly use may be one way to give them alternative punishment technique education. This could be a medical professional informing parents during a child's

health visit or staff members of an Early Head Start program providing parent education during the child's enrollment. "Further research and efforts in these types of interventions needs to continue so we can learn more," Font said.

This research was made possible support from the Population Research Institute, part of the Social Science Research Institute.

UV-irradiated amorphous ice behaves like liquid at low temperatures -- ScienceDaily

Ice analogs mimicking interstellar ice behave like liquids at temperatures between -210°C and -120°C according to Hokkaido University researchers. This liquid-like ice may enhance the formation of organic compounds including prebiotic molecules and the accretion of dust to form planets.

Molecular bonds in the ice are severed when irradiated by ultraviolet light inside interstellar molecular clouds, facilitating the formation of complex organic substances including prebiotic molecules. Thus, scientists believe interstellar ice to be "cradles" of organic compounds, but little has previously been known about the ice itself.

The team led by Associate Professor Shogo Tachibana of Hokkaido University discovered that ultraviolet-irradiated amorphous ice which mimics interstellar ice exhibited liquid-like behavior at extremely low

temperature ranges. This finding should help unravel the mechanisms behind the formation of prebiotic molecules as well as the process that gives birth to planets.

The team sprayed a mixed gas of water, methanol and ammonia onto a substrate which was chilled to $-263\text{C}/-441\text{F}$ to $-258\text{C}/-432\text{F}$ and simultaneously irradiated with ultraviolet light. After the ice formed, the researchers turned off the freezer to observe the ice with a microscope as the temperature rose. To their surprise, the ice bubbled like boiling water at temperatures between $-210\text{C}/-346\text{F}$ and $-120\text{C}/-184\text{F}$. Analysis of the gas showed it to be hydrogen molecules, which the researchers believe were formed from methanol and ammonia broken up by UV irradiation. The bubbling shows that the ice was behaving like a liquid, with a viscosity estimated to be similar to that of firm honey.

They then examined pure water. Islands of amorphous water ice were created on a substrate by irradiating crystalline ice with ultraviolet light at $-263\text{C}/-441\text{F}$. They observed the islands as the temperature was raised or at a fixed temperature of $-213\text{C}/-351\text{F}$. The researchers witnessed the islands of amorphous ice

changing shape and spreading over the substrate, which is also a sign of ice behaving like a liquid. The estimated viscosity of this ice was similar to that of silicic magma. This result implies this liquid-like state is common in ice consisting of water.

These experiments suggest that real interstellar ice might behave like a liquid, enhancing the formation of organic compounds, including prebiotic molecules. Tachibana says, "The formation of organic molecules, including prebiotic ones, may efficiently occur in a very cold environment."

"The liquid-like ice may help dust accrete to planets because liquid may act as a glue. However, further experiments are needed to understand the material properties of the liquid-like ice " he added.

Snapchat users motivation, level of interest -- ScienceDaily

The simplicity of the platform and brevity of posts are key factors in determining how students can become addicted.

In a world where people struggle with a seemingly diminishing attention span, Snapchat could be the best form of communication.

Posts last just 10 seconds. That's it. No deep thoughts or analytical narrative to the posts. Quick, simple and move on to the next topic.

But a study by Texas Tech University associate professor Narissra Punyanunt-Carter, graduate student J.J. Delacruz and alumni Jason Wrench in the College of Media & Communication shows the interest and popularity of Snapchat goes beyond just its simplicity.

"People use Snapchat a lot because of its entertainment and functional needs," Delacruz said. "For certain people, it enables them to overcome communication

apprehension by using a different means of communication where they don't have a threat in their face. At the same time, there are people who are addicted to it. So for counseling purposes, there is a need to establish the motivations to see if maybe they need to use something other than Snapchat, mediated or not, as a way to fulfill their interaction needs."

In other words, Snapchat, because of its brevity, can provide the perfect medium for those who are hesitant about communicating their life to a public audience, but at the same time can become addictive because those same properties allow for multiple, quick posts that only last a few seconds.

"I noticed people were using it all the time. They are constantly on it," Punyanunt-Carter said. "It's very different from the traditional social media because it only records 10 seconds worth of snaps that are very, very quick. So if I have a lot of friends, that's very time consuming to sit down and watch all their posts on most social media platforms."

Finding their motivations

For the study, Punyanunt-Carter and Delacruz recruited

students in the College of Media & Communication through the department's Sona survey system, where students earn extra credit in certain classes for participating in online surveys. They also administered the survey to those who responded to requests through TechAnnounce, totaling almost 500 students altogether.

The survey asked students who use Snapchat about their reasons for using the medium, including needs and motivations. It also asked about general social media use motivations, such as personality characteristics and what made them tend to gravitate toward Snapchat as a social medium. It also asked questions to help researchers analyze differences between males and females.

The brevity of Snapchat posts was a key factor for two big reasons. One, people using Snapchat felt much more trustworthy with how they shared content with others. Two, because the content disappears quickly, users are able to share their lives and don't feel the pressure to present themselves in any extraordinary form -- they can just be their normal, real self.

"They thought that was a good way to maintain ties

with people they were already very close with, interpersonally," Delacruz said. "It wasn't so much about whether or not they were being controversial as much as just not putting much thought into what is out there. Maybe it's just an ugly selfie or whatever, or maybe it's something that, because the judgement is not there like it is on Facebook or Twitter or Instagram, there's no controversial topics."

There's also an element of familiarity with Snapchat that makes it a preferred medium. Not with the medium itself, but with those on the medium. Delacruz said Snapchat is not the preferred social media platform for starting a new relationship because the posts don't last long. That is something more for Facebook, Twitter and Instagram.

However, it is an optimal platform for those with whom the user already has a relationship, and therefore don't have to impress in their post. It is used to maintain relationships and establish trust between users.

At the same time, Snapchat seems to change faster than other social media platforms, adding things like filters that Facebook and Instagram later added as well.

"It takes away the pressure of coming up with a great message or great topic, or coming up with a way to present yourself that is socially acceptable," Delacruz said.

Analyzing apprehension

While Snapchat can be a useful tool to help overcome apprehension about communicating on a public forum, it can also swing the other way and become addictive.

Understanding the motivations for users who are addicted to it is a crucial part of the study. By knowing what motivates Snapchat users, researchers can help others identify potential alternative outlets for communication.

"Knowing their motivations would definitely help people who advise those with the addiction," Delacruz said. "It can help them have a better understanding of how to be confident and effective communicators."

Punyanunt-Carter would like to expand future research beyond just Snapchat and into other forms of communication.

"I'm going to look further at interpersonal

communication behaviors and how these types of social media platforms affect interpersonal relationships and, perhaps, the sense of identity," Punyanunt-Carter said. "I want to understand the interpersonal and intrapersonal communication elements on social media. There's a lot that needs to be done."

Video gamers have an advantage in learning -- ScienceDaily

Neuropsychologists of the Ruhr-Universität Bochum let video gamers compete against non-gamers in a learning competition. During the test, the video gamers performed significantly better and showed an increased brain activity in the brain areas that are relevant for learning. Prof Dr Boris Suchan, Sabrina Schenk and Robert Lech report their findings in the journal *Behavioural Brain Research*.

The weather prediction task

The research team studied 17 volunteers who -- according to their own statement -- played action-based games on the computer or a console for more than 15 hours a week. The control group consisted of 17 volunteers who didn't play video games on a regular basis. Both teams did the so-called weather prediction task, a well-established test to investigate the learning of probabilities. The researchers simultaneously recorded the brain activity of the participants via magnetic resonance imaging.

The participants were shown a combination of three cue cards with different symbols. They should estimate whether the card combination predicted sun or rain and got a feedback if their choice was right or wrong right away. The volunteers gradually learned, on the basis of the feedback, which card combination stands for which weather prediction. The combinations were thereby linked to higher or lower probabilities for sun and rain. After completing the task, the study participants filled out a questionnaire to sample their acquired knowledge about the cue card combinations.

Video gamers better with high uncertainties

The gamers were notably better in combining the cue cards with the weather predictions than the control group. They fared even better with cue card combinations that had a high uncertainty such as a combination that predicted 60 percent rain and 40 percent sunshine.

The analysis of the questionnaire revealed that the gamers had acquired more knowledge about the meaning of the card combinations than the control group. "Our study shows that gamers are better in analysing a situation quickly, to generate new

knowledge and to categorise facts -- especially in situations with high uncertainties," says first author Sabrina Schenk.

This kind of learning is linked to an increased activity in the hippocampus, a brain region that plays a key role in learning and memory. "We think that playing video games trains certain brain regions like the hippocampus," says Schenk. "That is not only important for young people, but also for older people; this is because changes in the hippocampus can lead to a decrease in memory performance. Maybe we can treat that with video games in the future."

Raccoons solve an ancient puzzle, but do they really understand it? Study investigates whether mammals understand the principles of water displacement -- ScienceDaily

Scientists have been using an ancient Greek fable written by Aesop as inspiration to test whether birds and small children understand cause and effect relationships. In "The Crow and the Pitcher," a thirsty crow realises it should drop stones into a pitcher in order to raise the water level high enough so that the bird is able to drink it. A group of US scientists led by Lauren Stanton of the University of Wyoming have now extended this body of work to study raccoon intelligence. Their research in Springer's journal *Animal Cognition* is the first to use the Aesop's Fable paradigm to assess if mammalian carnivores understand the principles of water displacement.

The research team included Sarah Benson-Amram and Emily Davis from the University of Wyoming, as well

as Shylo Johnson and Amy Gilbert from the USDA National Wildlife Research Center, where the experiments were performed. The scientists first tested whether eight raccoons (*Procyon lotor*) held in captivity would spontaneously drop stones into a clear fifty centimetre tube of water to retrieve floating pieces of marshmallow. They found that, similar to studies of birds, the raccoons did not spontaneously drop stones into the tube from the start.

Following previous studies on birds and human children, the scientists then trained the raccoons to drop stones into the tube. They did this by balancing stones on a rim on top of the tube. If the raccoons accidentally knocked the stones in, this raised the water level high enough to bring the marshmallow reward within reach. Raccoons could then learn that the stones falling into the tube brought the marshmallow closer.

During training, seven raccoons interacted with the stones, and four raccoons retrieved the marshmallow reward after accidentally knocking the stones into the water. Two of the four raccoons that got the marshmallow during training then learned on their own to pick up stones off the ground and drop them into the water to get a reward. A third raccoon surprised the

scientists by inventing an entirely new method for solving the problem. She found a way to overturn the entire, very heavy, tube and base to get the marshmallow reward.

The two raccoons that successfully dropped stones into the tube were then presented with different objects that they could drop into the tube to solve the problem, such as large versus small stones, and sinking versus floating balls. These experiments enabled the researchers to determine whether the raccoons really understood the problem. If the raccoons understand water displacement, they should select the objects that displace the most water, like the large stones and sinking balls.

The raccoons performed differently than birds and human children did in previous Aesop's Fable studies, and they did not always pick the most functional option. Stanton, however, believes the raccoons' performance is not necessarily a reflection of their cognitive abilities, but more so of their exploratory behaviour and the build of their dexterous paws.

"We found raccoons to be innovative in many aspects of this task, and we observed diverse, investigative

behaviours that are unique to raccoons," says Stanton, adding that the way in which the experiment was conducted might also have played a role. She explains that the raccoons had fewer opportunities to interact with the puzzle than did many of the birds that were tested in previous studies. Therefore, the performance of the raccoons might improve if they have more time to familiarize themselves with the stones and the water tube.

Despite the low success rates of the raccoons, Benson-Amram is optimistic about running more experiments with raccoons. As Benson-Amram explains "Our study demonstrates that captive raccoons are able to learn to solve novel problems and that they approach classic tests of animal cognition in diverse and exciting ways. We can't wait to see what they do next."

Scientists have found that physical abuse was associated with decreases in children's cognitive performance, while non-abusive forms of physical punishment were independently associated with reduced school engagement and increased peer isolation.

- [**Video gamers have an advantage in learning**](#) [周六, 30 9月 00:51]

Neuropsychologists let video gamers compete against non-gamers in a learning competition. During the test, the video gamers performed significantly better and showed an increased brain activity in the brain areas that are relevant for learning.

- [**Raccoons solve an ancient puzzle, but do they really understand it?**](#) [周六, 30 9月 00:51]

Scientists have been using an ancient Greek fable written by Aesop as inspiration to test whether birds and small children understand cause and effect relationships. A group of scientists have now extended this body of work to study raccoon intelligence. Their research uses the Aesop's Fable paradigm to assess if mammalian carnivores understand the principles of water displacement.

- [**New study changes our view on flying insects**](#) [周五, 29 9月 23:49]

For the first time, researchers are able to prove that there is an optimal speed for certain insects when they fly. At this speed, they are the most efficient and consume the least amount of energy. Corresponding phenomena have previously been demonstrated in birds, but never

among insects.

- [**Small collisions make big impact on Mercury's thin atmosphere**](#) [周五, 29 9月 23:29]

Mercury, our smallest planetary neighbor, has very little to call an atmosphere, but it does have a strange weather pattern: morning micro-meteor showers.

- [**A stinging report: Climate change a major threat to bumble bees**](#) [周五, 29 9月 21:33]

New research is helping to explain the link between a changing global climate and a dramatic decline in bumble bee populations worldwide.

- [**Antarctica: Return of the Weddell polynya supports Kiel climate model**](#) [周五, 29 9月 21:33]

Currently, winter has still a firm grip on Antarctica. At this time of the year, the Weddell Sea usually is covered with a thick layer of sea ice. In spite of the icy temperatures in the region, satellite images depict a large ice-free area in the middle of the ice cover.

- [**Electrically heated textiles now possible via UMass Amherst research**](#) [周五, 29 9月 21:33]

Skiers, crossing guards and others who endure frozen fingers in cold weather may look forward to future relief as manufacturers are poised to take advantage of a new technique for creating electrically heated cloth. Researchers have made gloves that keep fingers as warm as the palm of the hand.

- [**Sharks and rays live a lot longer than we thought**](#) [周五, 29 9月 21:32]

Sharks and rays live a lot longer than we thought -- some twice as long as previously estimated.

- [**Solving the mystery of Pluto's giant blades of ice**](#) [周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many

discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

- [**Farthest active inbound comet yet seen**](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

- [**A fresh look at older data yields a surprise near the Martian equator**](#) [周五, 29 9月 03:22]

Scientists taking a new look at older data from NASA's longest-operating Mars orbiter have discovered evidence of significant hydration near the Martian equator -- a mysterious signature in a region of the Red Planet where planetary scientists figure ice shouldn't exist.

- [**Disease resistance successfully spread from modified to wild mosquitoes**](#) [周五, 29 9月 02:54]

Using genetically modified mosquitoes to reduce or prevent the spread of disease is a rapidly expanding field of investigation. One challenge is ensuring that GM mosquitoes can mate with their wild counterparts so the desired modification is spread in the wild population. Investigators have engineered mosquitoes with an altered microbiota that suppresses human malaria-causing parasites. These GM mosquitoes preferred to mate with wild mosquitoes and passed the desired protection to offspring.

- [**Tsunami enabled hundreds of aquatic species to raft across Pacific**](#) [周五, 29 9月 02:21]

The 2011 Japanese tsunami set the stage for something unprecedented. For the first time in recorded history, scientists have detected entire communities of coastal species crossing the ocean by floating on makeshift rafts. Nearly 300 species have appeared on the shores of Hawaii and the US West Coast attached to tsunami debris, marine biologists discovered.

- [**New measurements show widespread forest loss has reversed the role of tropics as a carbon sink**](#)

[周五, 29 9月 02:20]

A new report provides the most comprehensive picture of deforestation's toll on critical climate change safeguard; reveals hard-to-measure forest degradation is responsible for nearly 70 percent of emissions from tropical forests. Researchers discovered that tropical regions are now a net source of carbon to the atmosphere.

- [**Modern humans emerged more than 300,000 years ago new study suggests**](#)

[周五, 29 9月 02:20]

A genomic analysis of ancient human remains from KwaZulu-Natal revealed that southern Africa has an important role to play in writing the history of humankind.

- [**Supersonic gas streams left over from the Big Bang drive massive black hole formation**](#)

[周五, 29 9月 02:20]

A super-computer simulation by an international team of researchers has shown the formation of a rapidly growing star from supersonic gas streams in the early universe left over from the Big Bang. The star ends its life with catastrophic collapse to leave a black hole with a mass of 34,000 times that of the Sun.

- [**Perovskite solar cells reach record long-term stability, efficiency over 20 percent**](#)

[周五, 29 9月 02:20]

Scientists have greatly improved the operational stability of perovskite solar cells by introducing cuprous thiocyanate protected by a thin layer of reduced graphene oxide. Devices lost less than 5 percent performance when subjected to a crucial accelerated aging test during which they

were exposed for more than 1,000 hours to full sunlight at 60°C.

- [**Summer could be one long heatwave if planet hits 2 degrees Celsius**](#) [周五, 29 9月 00:18]

New paper highlighting how heatwaves will change with every degree of global warming up to 5 degrees C. It finds tropical summers may be one continuous heatwave at 2 degrees C.

- [**Saber-toothed kittens may have been born with thicker bones than other contemporary cats**](#) [周五, 29 9月 00:17]

Saber-toothed kittens may have been born with thicker bones compared to other contemporary cats, but they have a similar pattern of bone development, according to a new study.

- [**Chimpanzees can learn how to use tools without observing others**](#) [周四, 28 9月 21:42]

New observations have led researchers to believe that chimpanzees can use tools spontaneously to solve a task, without needing to watch others first.

- [**The hormone that could be making your dog aggressive discovered**](#) [周四, 28 9月 04:20]

Thousands of people are hospitalized every year for dog bites, and aggressive behavior is a major reason dogs end up in shelters. Biologists have studied the biology behind canine aggression, specifically the role of the hormones vasopressin and oxytocin.

- [**Black holes with ravenous appetites define Type I active galaxies**](#) [周四, 28 9月 01:36]

Type I and Type II active galaxies do not just appear different -- they are, in fact, very different from each other, both structurally and energetically, new research shows. According to the results of a new study, the key factor that distinguishes Type I and Type II galaxies is the rate at which their central black holes -- or active galactic nuclei -- consume matter and spit out energy.

- [**New light shed on how Earth and Mars were created**](#) [周四, 28 9月 01:36]

Analysing a mixture of earth samples and meteorites, scientists have shed new light on the sequence of events that led to the creation of the planets Earth and Mars.

- [**The volatile processes that shaped Earth**](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

- [**LIGO and Virgo observatories jointly detect black hole collision**](#) [周四, 28 9月 00:36]

The first observation of gravitational waves has been discovered by by three different detectors, marking a new era of greater insights and improved localization of cosmic events now available through globally networked gravitational-wave observatories.

- [**Soft, flexible origami-inspired robot**](#) [周三, 27 9月 22:23]

A Case Western Reserve University researcher has turned the origami she enjoyed as a child into a patent-pending soft robot that may one day be used on an assembly line, in surgery or even outer space.

- [**Emerging infectious disease threatens Darwin's frog with extinction**](#) [周三, 27 9月 22:09]

Iconic species likely to be wiped-out by amphibian fungus, despite lack of obvious short-term evidence.

- [**Geographic variation in Gentoo penguin calls**](#) [周三, 27 9月 21:33]

Vocal communication is central to the lives of many birds, which use sound to attract mates and defend territories. Penguins are no exception, but we know little about how or why penguin vocalizations vary

between isolated populations. A new study takes a broad look at vocalizations across the range of Gentoo penguins and concludes that while their calls do vary from place to place, we still have lots to learn about the processes at work.

- [**Songbird populations may indicate trouble in northwestern forests**](#) [周三, 27 9月 21:33]

Populations of many North American songbirds are declining, and in many cases we don't understand why. Conservation efforts need this information to be effective, and bird banding stations can help fill in the gaps, providing insights into how demographics vary across space and time. A new study presents ten years of data from banding stations across northern California and southern Oregon and offers new hints on what's driving changes in the region's songbird populations.

- [**Tree-dwelling, coconut-cracking giant rat discovered in Solomon Islands**](#) [周三, 27 9月 21:33]

Scientists have discovered a new species of giant rat. It's more than four times the size of the black rats that live in the US, it lives in trees, and it's rumored to crack open coconuts with its teeth. And it's actually pretty cute.

- [**Lost continent of Zealandia: Scientists return from expedition to sunken land**](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

- [**Caribbean praying mantises have ancient African origin**](#) [周三, 27 9月 11:59]

Three seemingly unrelated praying mantis groups inhabiting Cuba and the rest of the Greater Antilles actually share an ancient African ancestor and possibly form the oldest endemic animal lineage on the Caribbean islands, researchers have determined.

- [**Umbilical cord stem cells show promise as heart**](#)

[failure treatment](#) [周三, 27 9月 04:23]

Intravenous stem cell infusion derived from umbilical cords appears to boost heart muscle function in patients with heart failure, according to a small study. In this first-of-its-kind study, patients had 'significant' improvement in their hearts' ability to pump blood and experienced no adverse side effects related to the therapy. The results suggest IV-infused umbilical cord-derived stem cells are a promising avenue to treat heart failure.

• [Energy harvested from evaporation could power much of US](#) [周三, 27 9月 00:51]

In the first evaluation of evaporation as a renewable energy source, researchers find that US lakes and reservoirs could generate 325 gigawatts of power, nearly 70 percent of what the United States currently produces.

• [Amount of water in stem cells can determine its fate as fat or bone](#) [周三, 27 9月 00:51]

Adding or removing water from a stem cell can change the destiny of the cell to either pre-fat cells or pre-bone cells, researchers have discovered in a new study.

• [Wearable solar thermoelectric generator created](#) [周二, 26 9月 22:55]

Engineers have introduced a new advanced energy harvesting system, capable of generating electricity by simply being attached to clothes, windows, and outer walls of a building.

• [Cartography of the Cosmos](#) [周二, 26 9月 21:16]

There are hundreds of billions of stars in our own Milky Way galaxy, interspersed with all manner of matter, from the dark to the sublime. This is the universe that one group of researchers is trying to reconstruct, structure by structure, combining telescope surveys with next-generation data analysis and simulation techniques currently being primed for exascale computing.

• [Pigeons better at multitasking than humans](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Antibody protects against Zika and dengue, mouse study shows**](#) [周二, 26 9月 01:29]

The same countries hard hit by Zika virus -- which can cause brain damage in babies infected before birth -- are also home to dengue virus. Researchers now report that they have found an antibody that protects against both viruses. These findings, in mice, could be a step towards an antibody-based preventative drug to protect fetuses from brain damage, while also protecting their mothers from both Zika and dengue disease.

- [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

- [**Visual attention drawn to meaning, not what stands out**](#) [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning,

rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- **[Panda habitat shrinking, becoming more fragmented](#)** [周一, 25 9月 23:13]

Using remote sensing data, Chinese and US scientists have re-assessed the conservation status of the giant panda. Their analysis shows that while panda numbers are increasing, their habitat still covers less area and is more fragmented than it was in 1988, when the species was listed as endangered on the IUCN Red List.

- **[Child abuse affects brain wiring](#)** [周一, 25 9月 23:13]

For the first time, researchers have been able to see changes in the neural structures in specific areas of the brains of people who suffered severe abuse as children. The researchers believe that these changes may contribute to the emergence of depressive disorders and suicidal behavior.

- **[Genes are controlled by 'Nano footballs,' scientists discover](#)** [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

- **[Brain damage in fish from plastic nanoparticles in water](#)** [周一, 25 9月 22:47]

A new study shows that plastic particles in water may end up inside fish brains. The plastic can cause brain damage, which is the likely cause of behavioral disorders observed in the fish.

- **[Brain guides body much sooner than previously believed](#)** [周一, 25 9月 21:54]

The brain plays an active role much earlier than previously thought. Long before movement or other behaviors occur, the nascent brain of an embryonic frog instructs normal muscle and nerve patterning and

protects the embryo from agents that cause developmental defects. In addition to identifying these essential functions for the first time, researchers successfully rescued defects caused by lack of a brain by using widely available, human-approved drugs.

Health News

Top stories featured on ScienceDaily's Health & Medicine, Mind & Brain, and Living Well sections.

- [**Physical abuse and punishment impact children's academic performance**](#) [周六, 30 9月 03:22]

Scientists have found that physical abuse was associated with decreases in children's cognitive performance, while non-abusive forms of physical punishment were independently associated with reduced school engagement and increased peer isolation.

- [**Snapchat users motivation, level of interest**](#) [周六, 30 9月 01:35]

The simplicity of the platform and brevity of posts are key factors in determining how students can become very regular users.

- [**Video gamers have an advantage in learning**](#) [周六, 30 9月 00:51]

Neuropsychologists let video gamers compete against non-gamers in a learning competition. During the test, the video gamers performed significantly better and showed an increased brain activity in the brain areas that are relevant for learning.

- [**New mouse model replicates an underlying cause of intellectual disability**](#) [周六, 30 9月 00:50]

Researchers have developed the first mice that lack the Upf3b gene, providing a new model for studying its underlying role in intellectual disabilities and neurodevelopmental disorders.

- [**Protein that could improve symptoms and reduce mortality in flu**](#) [周五, 29 9月 23:29]

Flu season is on its way, and a new report has identified an innovative

strategy for battling this deadly illness.

- [**Why do we fall asleep when bored?**](#) [周五, 29 9月 21:34]

Why do we have the tendency to fall asleep in the absence of motivating stimuli, i.e., when bored.

- [**Frequent sauna bathing keeps blood pressure in check**](#) [周五, 29 9月 21:33]

Frequent sauna bathing reduces the risk of elevated blood pressure, according to an extensive follow-up population-based study. The risk of developing elevated blood pressure was nearly 50 percent lower among men who had a sauna 4-7 times a week compared to men who had a sauna only once a week.

- [**New regulator of liver metabolism discovered**](#) [周五, 29 9月 21:33]

Researchers have identified an enzyme that has a major effect on glucose utilization in liver cells. The enzyme, retinol saturase, helps these cells adapt to variations in glucose levels. However, when glucose levels are consistently too high, retinol saturase appears to exert a damaging effect on cells.

- [**How the lungs of premature babies can undergo damage**](#) [周五, 29 9月 21:33]

Premature babies that need ventilation to support their breathing often suffer from a condition known as bronchopulmonary dysplasia. Researchers have now discovered a molecular mechanism that plays a key role in the development of the disease.

- [**Breakdown of brain cells' metabolic collaboration linked to Alzheimer's disease**](#) [周五, 29 9月 21:33]

Researchers have discovered that impairing a critical partnership between brain cells can lead to neurodegeneration.

- [**New role for fragile X protein could offer clues for treatment**](#) [周五, 29 9月 21:33]

The protein behind fragile X syndrome, a leading cause of autism and

intellectual disability, controls a suite of genetic regulators.

- [**Immune system cells protect against CMV-induced hearing loss in mice**](#) [周五, 29 9月 21:33]

Immune system cells known as natural killer cells play an important protective role against hearing loss in mice infected with cytomegalovirus (CMV), according to a new study.

- [**An epidemic of dream deprivation: Unrecognized health hazard of sleep loss**](#) [周五, 29 9月 21:32]

A sleep and dream specialist has completed a comprehensive review of data about the causes, extent and consequences of dream loss includes recommendations for restoring healthy dreaming.

- [**Elderly who have trouble identifying odors face risk of dementia**](#) [周五, 29 9月 21:32]

A long-term study of nearly 3,000 older adults found that those who could not identify at least four out of five common odors were more than twice as likely as those with a normal sense of smell to develop dementia within five years. About 14 percent could name just three, 5 percent could identify only two, and 2 percent could name just one. One percent of the study subjects were not able to identify a single scent.

- [**Transcranial electrical stimulation shows promise for treating mild traumatic brain injury**](#) [周五, 29 9月 21:30]

Using a form of low-impulse electrical stimulation to the brain, documented by neuroimaging, researchers report significantly improved neural function in participants with mild traumatic brain injury (TBI).

- [**Understanding connection between HIV transmission, racial/ethnic/geographical differences**](#) [周五, 29 9月 02:54]

The health effects of where people live, work, and interact are well documented, as are the value of neighborhood-level structural interventions designed to improve health. But place-based

characteristics that contribute to disparities in HIV transmission and disease burden are poorly understood, possibly resulting in less-effective HIV risk reduction interventions and programming.

- [**Disease resistance successfully spread from modified to wild mosquitoes**](#) [周五, 29 9月 02:54]

Using genetically modified mosquitoes to reduce or prevent the spread of disease is a rapidly expanding field of investigation. One challenge is ensuring that GM mosquitoes can mate with their wild counterparts so the desired modification is spread in the wild population. Investigators have engineered mosquitoes with an altered microbiota that suppresses human malaria-causing parasites. These GM mosquitoes preferred to mate with wild mosquitoes and passed the desired protection to offspring.

- [**Massive projected increase in use of antimicrobials in animals by 2030**](#) [周五, 29 9月 02:21]

The amount of antimicrobials given to animals destined for human consumption is expected to rise by a staggering 52 percent and reach 200,000 tons by 2030 unless policies are implemented to limit their use, according to new research.

- [**Smart molecules trigger white blood cells to become better cancer-eating machines**](#) [周五, 29 9月 02:21]

A team of researchers has engineered smart protein molecules that can reprogram white blood cells to ignore a self-defense signaling mechanism that cancer cells use to survive and spread in the body. Researchers say the advance could lead to a new method of re-engineering immune cells to fight cancer and infectious diseases. The team successfully tested this method in a live cell culture system.

- [**How molecular scissors cut in the right place**](#) [周五, 29 9月 02:21]

A research group has found out how CRISPR-Cas9 -- also known as 'molecular scissors' -- can search the genome for a specific DNA sequence. Cas9 already has many applications in biotechnology and is also expected to revolutionize medicine. The new research findings

show how Cas9 can be improved to make the molecular scissors faster and more reliable.

• [**Neuro-immune crosstalk in allergic asthma**](#) [周五, 29 9月 02:21]

A research team has uncovered a fundamental molecular cue that the nervous system uses to communicate with the immune system, and may potentially trigger allergic lung inflammation leading to asthma.

• [**Protecting 'self-reactive' immune cells so they can fight melanoma**](#) [周五, 29 9月 02:21]

Researchers report on a potential new way to fight melanoma by blocking one of the immune system's checks and balances.

• [**Why public appeals may fall flat with some would-be donors**](#) [周五, 29 9月 02:21]

To give or not to give: sometimes the answer is in the question, researchers into human behavior and charitable giving have found. The study suggests that sometimes the 'ask' needs to suit the potential donors' sense of independence or interdependence.

• [**Students know about learning strategies -- but don't use them**](#) [周五, 29 9月 02:21]

Researchers find that university students have high levels of knowledge about self-regulated learning strategies, but many students don't use them. Specific training on how and when to use these techniques could help more students to maximize their academic potential.

• [**Bed bugs attracted to dirty laundry**](#) [周五, 29 9月 02:20]

Bed bugs are attracted to dirty laundry, according to new research.

• [**Molecular fingerprint of breast tumors linked to immune response in bloodstream**](#) [周五, 29 9月 02:20]

Using newly developed software, researchers have shown that genes and molecular processes in breast cancer tumor cells are tightly linked to genes and processes in blood cells, including immune system cells.

• [**Central America 'kissing bug' carries two main**](#)

subtypes of Chagas disease parasite [周五, 29 9月 02:20]

Trypanosoma cruzi, the parasite that causes Chagas disease, is divided into six strains, each of which differs in where they are found and in how important they are in human infections. Now, researchers have found that most T. cruzi parasites in Central America belong to just two of those strains.

• **Male hormones may promote infection by virus that causes Kaposi's sarcoma** [周五, 29 9月 02:20]

Male hormones may facilitate infection with a virus that can cause a type of cancer known as Kaposi's sarcoma. This finding could help explain why men have an increased risk of developing Kaposi's sarcoma.

• **Speedy urine test for amphetamines sends results via app** [周五, 29 9月 00:17]

Researchers have developed a wireless sensor and a smartphone app that can detect the presence of speed in a drop of human urine in seconds. The prototype device is also portable enough to be worn as a bracelet, has unprecedented sensitivity for amphetamines with low risk for false-positive results, and costs about \$50 to produce.

• **For boys at risk of psychopathy, laughter isn't so contagious** [周五, 29 9月 00:17]

For most people, laughter is highly contagious. It's nearly impossible to hear or see someone laughing and not feel the urge to join in. But researchers have new evidence to show that boys at risk of developing psychopathy when they become adults don't have that same urge.

• **Incurable childhood brain tumors split into 10 new diseases** [周五, 29 9月 00:17]

Scientists have found that deadly childhood brain tumors are actually 10 different diseases that should each be diagnosed and treated based on their specific genetic faults. The major new study has important implications for treatment, since personalizing care for each type of

brain tumor is likely to be much more effective than grouping them all together as one.

- [**How brain develops before birth is tightly controlled by RNA modification**](#) [周五, 29 9月 00:17]

A chemical tag added to RNA during embryonic development regulates how the early brain grows. When this development goes awry, problems happen and may cause psychiatric disorders in people.

- [**How do we sense moonlight? Daylight? There's a cell for that**](#) [周五, 29 9月 00:17]

Neuroscientists describe an unexpected way that we sense the overall degree of illumination in our environment. They found that neurons in the retina of the eye divvy up the job, with particular neurons tuned to different ranges of light intensity.

- [**Uncovering why psoriasis recurs**](#) [周五, 29 9月 00:17]

New research helps address a longstanding question about the inflammatory skin condition psoriasis: Why do skin lesions that have resolved with therapy recur in the same locations after a patient stops using topical steroids?

- [**Necessity is indeed mother of invention, regardless of resources, study shows**](#) [周五, 29 9月 00:16]

People who live in extremely resource poor environments can also be highly innovative in a different way and provide benefits to a range of people through creative problem solving, research shows.

- [**Zinc can halt the growth of cancer cells, study says**](#) [周五, 29 9月 00:16]

Zinc supplements can significantly inhibit the proliferation of esophageal cancer cells, according to a new study.

- [**Nearly one in six new HIV diagnoses in Europe are among people over 50**](#) [周五, 29 9月 00:16]

A new study showed that while the rate of newly reported HIV cases in

Europe remained steady in younger people between 2004 and 2015, it increased by 2 percent each year overall in older people. With around 30,000 newly diagnosed HIV infections reported each year over the last decade, the HIV epidemic remains a significant public health problem in the 31 countries of the European Union and European Economic Area.

- [**Highly virulent bacterium causes rampant caries in some children**](#) [周五, 29 9月 00:16]

Researchers have made a novel discovery connecting highly variant types of the caries bacterium *Streptococcus mutans* and their adhesive function to children with rampant caries and increased risk of dental caries.

- [**Study provides first estimate of total US population with felony convictions**](#) [周五, 29 9月 00:16]

New research on the growth in the scope and scale of felony convictions finds that, as of 2010, 3 percent of the total US population and 15 percent of the African-American male population have served time in prison. People with felony convictions more broadly account for 8 percent of the overall population and 33 percent of the African-American male population.

- [**In people with OCD, actions are at odds with beliefs**](#) [周五, 29 9月 00:16]

The repeated behaviors that characterize obsessive-compulsive disorder are a manifestation of an underlying brain dysfunction that is not yet well understood. Now, scientists report the use of a mathematical model that they say will help them get at the root of what causes OCD. They find that people with OCD develop an internal, accurate sense of how things work but do not use it to guide behavior.

- [**Tracking the body's mini-shuttles**](#) [周四, 28 9月 23:30]

The development of a new technique for labelling the body's own transporters -- exosomes -- could have long term benefits in the treatment of life-threatening medical conditions, including cancer.

- [**Fever during labor may present risk to mother**](#) [周

四, 28 9月 23:30]

A new study finds a link between the duration of fever during labor and maternal complications.

• **[Don't rely on mixed messages to change health behaviors](#)** [周四, 28 9月 23:30]

Self-improvement messages to lose weight, quit smoking or eat more fruits and vegetables can fall on deaf ears if the intervention message is mixed, says new research.

• **[Parkinson's disease involves degeneration of the olfactory system](#)** [周四, 28 9月 23:30]

Scientists discover the anatomical link for the loss of smell in Parkinson's disease.

• **[Scientists create endocytosis on demand by 'hotwiring' cells](#)** [周四, 28 9月 22:12]

A solution to the problem of creating endocytosis on demand is being compared to 'hotwiring' a car. A team has managed to trigger clathrin-mediated endocytosis in the lab.

• **[Medication that treats parasite infection also has anti-cancer effect](#)** [周四, 28 9月 21:42]

Scientists report a new gene target, KPNB1, for treatment against epithelial ovarian cancer (EOC). EOC is the fifth leading cause of cancer-related deaths in women and has a particularly grim outlook upon diagnosis. They also find that ivermectin exerts an anti-tumor effect on EOC cells by interacting with the KPNB1 gene. Because ivermectin is already approved to treat parasitic infections in patients, experiments for its effectiveness in an anti-cancer regimen is expected to significantly lower ...

• **[Women with suspected HPV adverse effects more often suffered from psychiatric disorders](#)** [周

四, 28 9月 21:42]

New research shows that women who are referred to an HPV center more often have had psychiatric medicine prescribed or been

hospitalized for psychiatric conditions up to five years before they received the vaccine.

• [Answer to young people's persistent sleep problems](#) [周四, 28 9月 21:41]

A collaborative research project indicates high rates of sleep problems continuing through teenage years and into early adulthood -- but also suggests a natural remedy.

Technology News

Top stories featured on ScienceDaily's Space & Time, Matter & Energy, and Computers & Math sections.

- [**UV-irradiated amorphous ice behaves like liquid at low temperatures**](#) [周六, 30 9月 03:21]

Ice analogs mimicking interstellar ice behave like liquids at temperatures between -210°C and -120°C according to researchers. This liquid-like ice may enhance the formation of organic compounds including prebiotic molecules and the accretion of dust to form planets.

- [**Video gamers have an advantage in learning**](#) [周六, 30 9月 00:51]

Neuropsychologists let video gamers compete against non-gamers in a learning competition. During the test, the video gamers performed significantly better and showed an increased brain activity in the brain areas that are relevant for learning.

- [**There are only 15 possible pentagonal tiles**](#) [周五, 29 9月 23:50]

Tiling the plane with a single pattern is a mathematical problem that has interested humans since Antiquity, notably for the aesthetic quality of tiles in mosaics or tiling. One of the unresolved problems in this field that has been puzzling the scientific community since 1918 has now been definitively resolved.

- [**Bioreactors on a chip renew promises for algal biofuels**](#) [周五, 29 9月 23:29]

Researchers report exciting new technology that may revolutionize the search for the perfect algal strain: algal droplet bioreactors on a chip the size of a quarter.

- [**Small collisions make big impact on Mercury's**](#)

[thin atmosphere](#) [周五, 29 9月 23:29]

Mercury, our smallest planetary neighbor, has very little to call an atmosphere, but it does have a strange weather pattern: morning micro-meteor showers.

• [Ultracold atoms point toward an intriguing magnetic behavior](#) [周五, 29 9月 21:33]

Researchers have studied the quantum behavior of ultracold atoms and discovered an intriguing magnetic behavior that could help explain how high-temperature superconductivity works.

• [Electrically heated textiles now possible via UMass Amherst research](#) [周五, 29 9月 21:33]

Skiers, crossing guards and others who endure frozen fingers in cold weather may look forward to future relief as manufacturers are poised to take advantage of a new technique for creating electrically heated cloth. Researchers have made gloves that keep fingers as warm as the palm of the hand.

• [Ultra-fast and ultra-sensitive hydrogen sensor](#) [周五, 29 9月 21:29]

Scientists have made an ultra-fast hydrogen sensor that can detect hydrogen gas levels under 1 percent in less than seven seconds. The sensor also can detect hundreds of parts per million levels of hydrogen gas within 60 seconds at room temperature.

• [Solving the mystery of Pluto's giant blades of ice](#) [周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

• [Farthest active inbound comet yet seen](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active

inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

- [**A fresh look at older data yields a surprise near the Martian equator**](#) [周五, 29 9月 03:22]

Scientists taking a new look at older data from NASA's longest-operating Mars orbiter have discovered evidence of significant hydration near the Martian equator -- a mysterious signature in a region of the Red Planet where planetary scientists figure ice shouldn't exist.

- [**Flexible new platform for high-performance electronics**](#) [周五, 29 9月 02:21]

A team of engineers has created the most functional flexible transistor in the world -- and with it, a fast, simple and inexpensive fabrication process that's easily scalable to the commercial level. It's an advance that could open the door to an increasingly interconnected world, enabling manufacturers to add 'smart,' wireless capabilities to any number of large or small products or objects -- like wearable sensors and computers for people and animals -- that curve, bend, stretch and move.

- [**Generating terahertz radiation from water makes 'the impossible, possible'**](#) [周五, 29 9月 02:21]

For nearly a decade, researchers have worked to solve a scientific puzzle that many in the research community believed to be impossible: producing terahertz waves -- a form of electromagnetic radiation in the far infrared frequency range -- from liquid water.

- [**Supersonic gas streams left over from the Big Bang drive massive black hole formation**](#) [周五, 29 9月 02:20]

A super-computer simulation by an international team of researchers has shown the formation of a rapidly growing star from supersonic gas

streams in the early universe left over from the Big Bang. The star ends its life with catastrophic collapse to leave a black hole with a mass of 34,000 times that of the Sun.

- [**Perovskite solar cells reach record long-term stability, efficiency over 20 percent**](#) [周五, 29 9月 02:20]

Scientists have greatly improved the operational stability of perovskite solar cells by introducing cuprous thiocyanate protected by a thin layer of reduced graphene oxide. Devices lost less than 5 percent performance when subjected to a crucial accelerated aging test during which they were exposed for more than 1,000 hours to full sunlight at 60°C.

- [**Speedy urine test for amphetamines sends results via app**](#) [周五, 29 9月 00:17]

Researchers have developed a wireless sensor and a smartphone app that can detect the presence of speed in a drop of human urine in seconds. The prototype device is also portable enough to be worn as a bracelet, has unprecedented sensitivity for amphetamines with low risk for false-positive results, and costs about \$50 to produce.

- [**Fluorine-containing molecules from cell cultures**](#) [周五, 29 9月 00:16]

Natural organic compounds that contain fluorine are rare because living organisms -- with a few exceptions -- do not produce them. Scientists have now genetically engineered a microbial host for organofluorine metabolism, allowing it to produce a fluorinated intermediate known as a diketide. As reported, the diketide could then be used as a monomer for the in vivo production of fluorinated bioplastics.

- [**Popping bubbles: Surfactants have surprising effect on nanobubble stability**](#) [周五, 29 9月 00:16]

The stability of nanobubbles is well understood, but the mechanisms causing their eventual destabilization are still in question. Using molecular dynamics simulations, researchers explored the effect of surfactants -- components that lower surface tension -- on the stabilization of nanobubbles.

- **[How do zebrafish develop their stripes?](#)** [周四, 28 9月 22:31]

A mathematician has thrown new light on the longstanding mystery of how zebrafish develop the distinctive striped patterns on their skin.

- **[Bursting with starbirth](#)** [周四, 28 9月 22:12]

This oddly shaped galactic spectacle is bursting with brand new stars. The pink fireworks in this image taken with the NASA/ESA Hubble Space Telescope are regions of intense star formation, triggered by a cosmic-scale collision. The huge galaxy in this image, NGC 4490, has a smaller galaxy in its gravitational grip and is feeling the strain.

- **[Small scale energy harvesters show large scale impact](#)** [周四, 28 9月 22:12]

The production of nano-scale devices has drastically increased with the rise in technological applications, yet a major drawback to the functionality of nano-sized systems is the need for an equally small energy resource. To address this, researchers have been modeling new piezoelectric energy harvester technology at the nano-scale level.

- **[Biodegradable microsensors for food monitoring](#)** [周四, 28 9月 21:42]

A new generation of microsensors could provide the vital link between food products and the Internet of Things. Researchers have developed an ultra-thin temperature sensor that is both biocompatible and biodegradable.

- **[Making surgical screws from bones](#)** [周四, 28 9月 20:51]

Biomechanics are developing surgical screws from donated human bone material for foot and jaw surgery together with an Austrian start-up.

- **[Non-toxic flame retardant enters market, study suggests](#)** [周四, 28 9月 20:51]

Chemists have developed and patented an environmentally friendly way to produce flame retardants for foams that can be used in mattresses and upholstery. Unlike previous flame retardants made of chemicals containing chlorine, the new material is non-toxic and effective, researchers say.

• [**Move towards 'holy grail' of computing by creation of brain-like photonic microchips**](#) [周四, 28 9月 04:20]

Scientists have made a crucial step towards unlocking the 'holy grail' of computing -- microchips that mimic the way the human brain works to store and process information.

• [**High cost of truckers not having enough places to park and rest**](#) [周四, 28 9月 04:20]

A pilot study illustrates the high economic cost of having too few safe places for commercial truck drivers to park and rest.

• [**Band gaps, made to order**](#) [周四, 28 9月 04:20]

Engineers have created atomically thin superlattice materials with precision.

• [**Atomistic simulations go the distance on metal strength**](#) [周四, 28 9月 04:20]

Researchers have dived down to the atomic scale to resolve every 'jiggle and wiggle' of atomic motion that underlies metal strength.

• [**Minimally invasive valve replacements hold up well after five years, study shows**](#) [周四, 28 9月 01:36]

A minimally invasive procedure used to replace heart valves without open heart surgery appears to provide a durable remedy for people with a life-threatening form of heart disease in which the aortic valve opening narrows, diminishing blood flow.

• [**Black holes with ravenous appetites define Type I active galaxies**](#) [周四, 28 9月 01:36]

Type I and Type II active galaxies do not just appear different -- they are, in fact, very different from each other, both structurally and energetically, new research shows. According to the results of a new study, the key factor that distinguishes Type I and Type II galaxies is the rate at which their central black holes -- or active galactic nuclei -- consume matter and spit out energy.

- [**New light shed on how Earth and Mars were created**](#) [周四, 28 9月 01:36]

Analysing a mixture of earth samples and meteorites, scientists have shed new light on the sequence of events that led to the creation of the planets Earth and Mars.

- [**The volatile processes that shaped Earth**](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

- [**Recipe for quantum-enhanced technologies refined**](#) [周四, 28 9月 00:57]

A breakthrough has been made in understanding the structure of entanglement in quantum systems with long-range interactions.

- [**Turbocharging engine design**](#) [周四, 28 9月 00:51]

Researchers have moved the development process into the passing lane. For the first time, scientists and engineers have pinpointed engine designs for a given fuel using the Mira supercomputer at the heart of the Argonne Leadership Computing Facility (ALCF), a DOE Office of Science User Facility.

- [**Prototype UT equipment can detect rheumatoid arthritis**](#) [周四, 28 9月 00:50]

Researchers have designed a device that shows the difference between healthy fingers and arthritic fingers, according to a first clinical study published. The researchers responsible for the development of the compact device believe that it may in time help doctors to objectively diagnose the degree of inflammation in joints.

- [**LIGO and Virgo observatories jointly detect**](#)

[black hole collision](#) [周四, 28 9月 00:36]

The first observation of gravitational waves has been discovered by by three different detectors, marking a new era of greater insights and improved localization of cosmic events now available through globally networked gravitational-wave observatories.

• [Unlocking the mysteries of memory -- and potentially enhancing it](#) [周四, 28 9月 00:36]

Memory acts like an anchor, reminding us of past experiences that have made us who we are today. Attempts to boost it, particularly as we age, have sprouted cottage industries of supplements and brain games. In parallel, researchers have been pursuing pharmaceutical interventions. In some of the latest work on this front, one team reports that they have identified a novel compound that enhances long-term memory in animal studies.

• [Ancient ink for cancer treatment](#) [周四, 28 9月 00:35]

For hundreds of years, Chinese calligraphers have used a plant-based ink to create beautiful messages and art. Now, one group reports that this ink could noninvasively and effectively treat cancer cells that spread, or metastasize, to lymph nodes.

• [Total solar eclipse viewed from space](#) [周四, 28 9月 00:35]

While people across the nation gazed at August's total solar eclipse from Earth, a bread loaf-sized NASA satellite had a front row seat for the astronomical event.

• [On a collision course with game theory](#) [周三, 27 9月 22:23]

How do pedestrians behave in a large crowd? How do they avoid collisions? How can their paths be modeled? A new approach developed by mathematicians provides answers to these questions.

• [Soft, flexible origami-inspired robot](#) [周三, 27 9月 22:23]

A Case Western Reserve University researcher has turned the origami she enjoyed as a child into a patent-pending soft robot that may one day be used on an assembly line, in surgery or even outer space.

• [How old does your computer think you are?](#) [周三, 27 9月 22:23]

月 22:23]

Computerized face recognition is an important part of initiatives to develop security systems, in building social networks, in curating photographs, and many other applications. Systems can allow a computer to estimate with precision a person's age based on an analysis of their face.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**New twist on asymmetric catalysis**](#) [周三, 27 9月 21:33]

Researchers have developed an efficient and simple chemical synthesis of a new kind of twisted helicene molecule containing a sulfur group, thiophene. The unusual screw-like asymmetry of the molecules could be useful for making drugs and other types of chemicals in their pure single-enantiomer forms.

- [**The strange structures of the Saturn nebula**](#) [周三, 27 9月 21:33]

The spectacular planetary nebula NGC 7009, or the Saturn Nebula, emerges from the darkness like a series of oddly-shaped bubbles, lit up in glorious pinks and blues. This colourful image was captured by the MUSE instrument on ESO's Very Large Telescope (VLT). The map -- which reveals a wealth of intricate structures in the dust, including shells, a halo and a curious wave-like feature -- will help astronomers understand how planetary nebulae develop their strange shapes and symmetries.

- [**Computer scientists address gap in messaging privacy**](#) [周三, 27 9月 21:33]

Researchers have developed a solution to a longstanding problem in the field of end-to-end encryption, a technique that ensures that only sender and recipient can read a message.

- [**A beautiful wing design solution inspired by owl**](#)

[feathers](#) [周三, 27 9月 11:59]

Researchers have formulated a mathematical solution that could help minimize noise, maximize aerodynamics in design of porous airfoils (2-D wings) to improve wind turbines and air vehicles.

• [A record number of Americans viewed the 2017 solar eclipse](#) [周三, 27 9月 02:36]

Eighty-eight percent of American adults viewed the August total solar eclipse directly or electronically. This audience of 215 million adults is nearly twice the size of the viewership of recent Super Bowl football games.

• [Engineers to pioneer unprecedented high speed wireless data coverage](#) [周三, 27 9月 01:52]

A major new international research program is responding to the overwhelming demand of internet traffic to develop ubiquitous wireless data coverage with unprecedented speed at millimetre waves.

• [Near-Earth asteroid CubeSat goes full sail](#) [周三, 27 9月 01:39]

NASA's Near-Earth Asteroid Scout, a small satellite the size of a shoebox, designed to study asteroids close to Earth, recently performed a full-scale solar sail deployment test. The test was performed in an indoor clean room to ensure the deployment mechanism's functionality after recent environmental testing.

Environment News

Top stories featured on ScienceDaily's Plants & Animals, Earth & Climate, and Fossils & Ruins sections.

- [**Raccoons solve an ancient puzzle, but do they really understand it?**](#) [周六, 30 9月 00:51]

Scientists have been using an ancient Greek fable written by Aesop as inspiration to test whether birds and small children understand cause and effect relationships. A group of scientists have now extended this body of work to study raccoon intelligence. Their research uses the Aesop's Fable paradigm to assess if mammalian carnivores understand the principles of water displacement.

- [**New study changes our view on flying insects**](#) [周五, 29 9月 23:49]

For the first time, researchers are able to prove that there is an optimal speed for certain insects when they fly. At this speed, they are the most efficient and consume the least amount of energy. Corresponding phenomena have previously been demonstrated in birds, but never among insects.

- [**Erosion from ancient tsunami in Northern California**](#) [周五, 29 9月 23:30]

Geologists use ground-penetrating radar to determine the breadth and depth of erosion from an ancient tsunami in Northern California.

- [**Scandinavia's earliest farmers exchanged terminology with Indo-Europeans**](#) [周五, 29 9月 23:29]

5,000 years ago, the Yamnaya culture migrated into Europe from the Caspian steppe. In addition to innovations such as the wagon and dairy production, they brought a new language -- Indo-European -- that

replaced most local languages the following millennia. But local cultures also influenced the new language, particularly in southern Scandinavia, where Neolithic farmers made lasting contributions to Indo-European vocabulary before their own language went extinct, new research shows.

- [**Algae with light switch**](#) [周五, 29 9月 23:29]

The adhesion of *Chlamydomonas*, a unicellular alga, to surfaces is light-dependent.

- [**Arbuscular mycorrhizal fungal communities exposed with new DNA sequencing approach**](#) [周五, 29 9月 23:29]

Arbuscular mycorrhizal fungal systems play crucial roles in their environment, affecting the plants that can grow there and the nutrients in the soils. Researchers have developed a new DNA sequencing technique using barcoded primers that is capable of detecting rare fungal species in a community, paving the way for future insights into how they might vary in response to environmental changes.

- [**A stinging report: Climate change a major threat to bumble bees**](#) [周五, 29 9月 21:33]

New research is helping to explain the link between a changing global climate and a dramatic decline in bumble bee populations worldwide.

- [**Antarctica: Return of the Weddell polynya supports Kiel climate model**](#) [周五, 29 9月 21:33]

Currently, winter has still a firm grip on Antarctica. At this time of the year, the Weddell Sea usually is covered with a thick layer of sea ice. In spite of the icy temperatures in the region, satellite images depict a large ice-free area in the middle of the ice cover.

- [**New clues from brain structures of mantis shrimp**](#) [周五, 29 9月 21:33]

New research sheds new light on the evolution of some of the earliest brain structures, and stirs up new, intriguing questions about the origins of centers that support learning and memory.

- [**Sharks and rays live a lot longer than we thought**](#) [周五, 29 9月 21:32]

Sharks and rays live a lot longer than we thought -- some twice as long as previously estimated.

- [**Global methane emissions from agriculture larger than reported, according to new estimates**](#) [周五, 29 9月 21:32]

Global methane emissions from agriculture are larger than estimated due to the previous use of out-of-date data on carbon emissions generated by livestock, according to a new study.

- [**Disease resistance successfully spread from modified to wild mosquitoes**](#) [周五, 29 9月 02:54]

Using genetically modified mosquitoes to reduce or prevent the spread of disease is a rapidly expanding field of investigation. One challenge is ensuring that GM mosquitoes can mate with their wild counterparts so the desired modification is spread in the wild population. Investigators have engineered mosquitoes with an altered microbiota that suppresses human malaria-causing parasites. These GM mosquitoes preferred to mate with wild mosquitoes and passed the desired protection to offspring.

- [**Massive projected increase in use of antimicrobials in animals by 2030**](#) [周五, 29 9月 02:21]

The amount of antimicrobials given to animals destined for human consumption is expected to rise by a staggering 52 percent and reach 200,000 tons by 2030 unless policies are implemented to limit their use, according to new research.

- [**Continental controls needed to maintain fightback against tree diseases**](#) [周五, 29 9月 02:21]

Tighter controls on timber and plant movements into Europe are necessary to prevent further disastrous effects of plant diseases, a new study of the ash-dieback pathogen advises.

- [**Smart molecules trigger white blood cells to become better cancer-eating machines**](#) [周五, 29 9月 02:21]

A team of researchers has engineered smart protein molecules that can reprogram white blood cells to ignore a self-defense signaling mechanism that cancer cells use to survive and spread in the body. Researchers say the advance could lead to a new method of re-engineering immune cells to fight cancer and infectious diseases. The team successfully tested this method in a live cell culture system.

- [**Tsunami enabled hundreds of aquatic species to raft across Pacific**](#) [周五, 29 9月 02:21]

The 2011 Japanese tsunami set the stage for something unprecedented. For the first time in recorded history, scientists have detected entire communities of coastal species crossing the ocean by floating on makeshift rafts. Nearly 300 species have appeared on the shores of Hawaii and the US West Coast attached to tsunami debris, marine biologists discovered.

- [**Bed bugs attracted to dirty laundry**](#) [周五, 29 9月 02:20]

Bed bugs are attracted to dirty laundry, according to new research.

- [**Central America 'kissing bug' carries two main subtypes of Chagas disease parasite**](#) [周五, 29 9月 02:20]

Trypanosoma cruzi, the parasite that causes Chagas disease, is divided into six strains, each of which differs in where they are found and in how important they are in human infections. Now, researchers have found that most T. cruzi parasites in Central America belong to just two of those strains.

- [**New measurements show widespread forest loss has reversed the role of tropics as a carbon sink**](#) [周五, 29 9月 02:20]

[周五, 29 9月 02:20]

A new report provides the most comprehensive picture of deforestation's toll on critical climate change safeguard; reveals hard-to-measure forest degradation is responsible for nearly 70 percent of emissions from tropical forests. Researchers discovered that tropical regions are now a

net source of carbon to the atmosphere.

- [**Modern humans emerged more than 300,000 years ago new study suggests**](#) [周五, 29 9月 02:20]

A genomic analysis of ancient human remains from KwaZulu-Natal revealed that southern Africa has an important role to play in writing the history of humankind.

- [**Perovskite solar cells reach record long-term stability, efficiency over 20 percent**](#) [周五, 29 9月 02:20]

Scientists have greatly improved the operational stability of perovskite solar cells by introducing cuprous thiocyanate protected by a thin layer of reduced graphene oxide. Devices lost less than 5 percent performance when subjected to a crucial accelerated aging test during which they were exposed for more than 1,000 hours to full sunlight at 60°C.

- [**Summer could be one long heatwave if planet hits 2 degrees Celsius**](#) [周五, 29 9月 00:18]

New paper highlighting how heatwaves will change with every degree of global warming up to 5 degrees C. It finds tropical summers may be one continuous heatwave at 2 degrees C.

- [**Saber-toothed kittens may have been born with thicker bones than other contemporary cats**](#) [周五, 29 9月 00:17]

Saber-toothed kittens may have been born with thicker bones compared to other contemporary cats, but they have a similar pattern of bone development, according to a new study.

- [**Fluorine-containing molecules from cell cultures**](#) [周五, 29 9月 00:16]

Natural organic compounds that contain fluorine are rare because living organisms -- with a few exceptions -- do not produce them. Scientists have now genetically engineered a microbial host for organofluorine metabolism, allowing it to produce a fluoridated intermediate known as a diketide. As reported, the diketide could then be used as a monomer for the in vivo production of fluorinated bioplastics.

- [**Highly virulent bacterium causes rampant caries in some children**](#) [周五, 29 9月 00:16]

Researchers have made a novel discovery connecting highly variant types of the caries bacterium *Streptococcus mutans* and their adhesive function to children with rampant caries and increased risk of dental caries.

- [**How do zebrafish develop their stripes?**](#) [周四, 28 9月 22:31]

A mathematician has thrown new light on the longstanding mystery of how zebrafish develop the distinctive striped patterns on their skin.

- [**Mapping the Tasmanian tiger's mysterious loss from mainland**](#) [周四, 28 9月 21:42]

Ancient DNA extracted from fossil bones and museum specimens has shed new light on the mysterious loss of the Tasmanian tiger (thylacine) from Australia's mainland.

- [**Did rapid sea-level rise drown fossil coral reefs around Hawaii?**](#) [周四, 28 9月 21:42]

Investigations to predict changes in sea levels and their impacts on coastal systems are a step closer, as a result of a new international collaboration.

- [**Chimpanzees can learn how to use tools without observing others**](#) [周四, 28 9月 21:42]

New observations have led researchers to believe that chimpanzees can use tools spontaneously to solve a task, without needing to watch others first.

- [**Large earthquakes along Olympic Mountain faults, Washington State, USA**](#) [周四, 28 9月 21:42]

A comprehensive study of faults along the north side of the Olympic Mountains of Washington State emphasizes the substantial seismic hazard to the northern Puget Lowland region. The study examined the Lake Creek-Boundary Creek and Sadie Creek faults along the north flank the Olympic Mountains, and concludes that there were three to

five large, surface-rupturing earthquakes along the faults within the last 13,000 years.

- [**Breakthrough in rapid, mass screening for the Ebola virus**](#) [周四, 28 9月 20:49]

A new, faster and safer way of diagnosing the Ebola virus has been developed.

- [**Exploring an ancient event in pumpkin, gourd and melon evolution**](#) [周四, 28 9月 20:47]

Recently, scientists have making great strides in better understanding with the genomes sequenced of cucumber, watermelon, and melons. With these projects completed, a research team has performed the first large comparative genomics exploration of their genome structures and evolution. After reconstructing evolutionary trees and extensive comparisons of common genes between Cucurbitaceae plants, unexpectedly, the research team has found the first evidence of an ancient whole genome duplication ev...

- [**New mechanism points the way to breaking ribosome antibiotic resistance**](#) [周四, 28 9月 20:47]

Research groups reveal a novel mechanism of ribosome dimerization in the bacterium *Lactococcus lactis* using cryo-electron microscopy. As this dimerization renders ribosomes more resistant to antibiotics, this study provides the necessary structural basis to design new generations of antibiotics.

- [**Examining the lifestyles of microbes**](#) [周四, 28 9月 06:43]

Scientists are studying microbes called Parcubacteria that were found by James Cameron (director of 'Terminator') during a recent deep sea expedition. They want to study the microbes' lifestyle and see how similar they are to those found on land.

- [**That cup of coffee may not relieve Parkinson's symptoms**](#) [周四, 28 9月 04:20]

Contrary to previous research, caffeine may not relieve movement

symptoms for people with Parkinson's disease, according to a study.

- [**The hormone that could be making your dog aggressive discovered**](#) [周四, 28 9月 04:20]

Thousands of people are hospitalized every year for dog bites, and aggressive behavior is a major reason dogs end up in shelters. Biologists have studied the biology behind canine aggression, specifically the role of the hormones vasopressin and oxytocin.

- [**How cells recover from the verge of programmed death**](#) [周四, 28 9月 04:20]

Biologists explore the molecular underpinnings of cells that recover from the verge of programmed death.

- [**Earliest evidence for a native African cultigen discovered in Eastern Sudan**](#) [周四, 28 9月 04:20]

Archaeologists examining plant impressions within broken pottery have discovered the earliest evidence for domesticated sorghum in Africa.

- [**Beer can lift your spirits due to malted barley ingredient**](#) [周四, 28 9月 03:28]

Visitors to the Oktoberfest have always known it and now it has been scientifically -- beer can lift your spirits. Scientists examined 13,000 food components to find out whether they stimulate the reward center in the brain and make people feel good. Hordenine which is found in malted barley and beer seems to do the job quite well.

- [**Haplobank: A biobank of reversible mutant embryonic stem cells**](#) [周四, 28 9月 01:38]

Scientists have developed a biobank of revertible, mutant embryonic stem cells – called Haplobank - which contains over 100,000 mutated, conditional mouse embryonic stem cell lines, targeting about 70% of the protein-coding genome.

- [**The volatile processes that shaped Earth**](#) [周四, 28 9月 01:36]

Although it is widely understood that Earth was formed gradually, from

much smaller bodies, many of the processes involved in shaping our growing planet are less clear. Astronomers have now untangled some of these processes, revealing that the mini-planets added to Earth had previously undergone melting and evaporation. They also address another scientific conundrum: Earth's depletion in many economically important chemical elements.

- [**Citizen science can predict butterfly population trends**](#) [周四, 28 9月 00:36]

New research shows that citizen scientists can play a role in gathering meaningful information to inform long-term monitoring of biodiversity trends such as butterfly population change.

- [**Olive mill wastewater transformed: From pollutant to bio-fertilizer, biofuel**](#) [周四, 28 9月 00:36]

Olive oil has long been a popular kitchen staple. Yet producing the oil creates a vast stream of wastewater that can foul waterways, reduce soil fertility and trigger extensive damage to nearby ecosystems. Now scientists report on the development of an environmentally friendly process that could transform this pollutant into 'green' biofuel, bio-fertilizer and safe water for use in agricultural irrigation.

- [**Ancient ink for cancer treatment**](#) [周四, 28 9月 00:35]

For hundreds of years, Chinese calligraphers have used a plant-based ink to create beautiful messages and art. Now, one group reports that this ink could noninvasively and effectively treat cancer cells that spread, or metastasize, to lymph nodes.

- [**New iceberg calved from Pine Island Glacier**](#) [周三, 27 9月 22:45]

A new iceberg calved from Pine Island Glacier -- one of the main outlets where ice from the interior of the West Antarctic Ice Sheet flows into the ocean.

- [**Preservation of floodplains is flood protection**](#) [周三, 27 9月 22:23]

The silting of rivers and streams leads to problems for fish, mussels, and other aquatic organisms because their habitats disappear. However, not

only intensive agriculture and erosion are destroying these habitats. Now a study refutes this widespread view. In order to save the species living in the river basin -- and protect people from the threat of floods -- rivers need more space, diversity, and freedom.

• [**Two new crustacean species discovered on Galician seabed**](#) [周三, 27 9月 22:23]

The fauna of deep seabed tends to be relatively unknown due to the difficulty of collecting samples at great depths. A research team undertook four oceanographic expeditions in the waters off the northwest coast of the Iberian Peninsula that have led to the discovery of several new species that inhabit the abyssal plains. Now they describe two eyeless species of millimetric proportions.

• [**Emerging infectious disease threatens Darwin's frog with extinction**](#) [周三, 27 9月 22:09]

Iconic species likely to be wiped-out by amphibian fungus, despite lack of obvious short-term evidence.

• [**More than a 38 % of the Neotropical parrot population in the American continent is threatened by human activity**](#) [周三, 27 9月 22:09]

More than a 38% of the Neotropical parrot population of the American continent (Neotropic) is endangered due the impact of human activity, according to a scientific study.

• [**Moths: A different weapon against each enemy**](#) [周三, 27 9月 21:56]

It's a dangerous world out there, especially if you are a small insect. Insects have thrived on our planet for hundreds of millions of years, so they must be doing something right despite all the threats to their survival. With so many predators out to get them many animals have evolved chemical defences, making themselves distasteful or even toxic. Wood tiger moths protect themselves from multiple predators using different chemical defences. Choosing the right defence can be tricky as predators ...

Society News

Top stories featured on ScienceDaily's Science & Society, Business & Industry, and Education & Learning sections.

- [**Physical abuse and punishment impact children's academic performance**](#) [周六, 30 9月 03:22]

Scientists have found that physical abuse was associated with decreases in children's cognitive performance, while non-abusive forms of physical punishment were independently associated with reduced school engagement and increased peer isolation.

- [**Video gamers have an advantage in learning**](#) [周六, 30 9月 00:51]

Neuropsychologists let video gamers compete against non-gamers in a learning competition. During the test, the video gamers performed significantly better and showed an increased brain activity in the brain areas that are relevant for learning.

- [**Understanding connection between HIV transmission, racial/ethnic/geographical differences**](#) [周五, 29 9月 02:54]

The health effects of where people live, work, and interact are well documented, as are the value of neighborhood-level structural interventions designed to improve health. But place-based characteristics that contribute to disparities in HIV transmission and disease burden are poorly understood, possibly resulting in less-effective HIV risk reduction interventions and programming.

- [**Massive projected increase in use of antimicrobials in animals by 2030**](#) [周五, 29 9月 02:21]

The amount of antimicrobials given to animals destined for human

consumption is expected to rise by a staggering 52 percent and reach 200,000 tons by 2030 unless policies are implemented to limit their use, according to new research.

- [**Why public appeals may fall flat with some would-be donors**](#) [周五, 29 9月 02:21]

To give or not to give: sometimes the answer is in the question, researchers into human behavior and charitable giving have found. The study suggests that sometimes the 'ask' needs to suit the potential donors' sense of independence or interdependence.

- [**Students know about learning strategies -- but don't use them**](#) [周五, 29 9月 02:21]

Researchers find that university students have high levels of knowledge about self-regulated learning strategies, but many students don't use them. Specific training on how and when to use these techniques could help more students to maximize their academic potential.

- [**Nearly one in six new HIV diagnoses in Europe are among people over 50**](#) [周五, 29 9月 00:16]

A new study showed that while the rate of newly reported HIV cases in Europe remained steady in younger people between 2004 and 2015, it increased by 2 percent each year overall in older people. With around 30,000 newly diagnosed HIV infections reported each year over the last decade, the HIV epidemic remains a significant public health problem in the 31 countries of the European Union and European Economic Area.

- [**Study provides first estimate of total US population with felony convictions**](#) [周五, 29 9月 00:16]

New research on the growth in the scope and scale of felony convictions finds that, as of 2010, 3 percent of the total US population and 15 percent of the African-American male population have served time in prison. People with felony convictions more broadly account for 8 percent of the overall population and 33 percent of the African-American male population.

- [**In people with OCD, actions are at odds with beliefs**](#) [周五, 29 9月 00:16]

The repeated behaviors that characterize obsessive-compulsive disorder are a manifestation of an underlying brain dysfunction that is not yet well understood. Now, scientists report the use of a mathematical model that they say will help them get at the root of what causes OCD. They find that people with OCD develop an internal, accurate sense of how things work but do not use it to guide behavior.

- [**Don't rely on mixed messages to change health behaviors**](#) [周四, 28 9月 23:30]

Self-improvement messages to lose weight, quit smoking or eat more fruits and vegetables can fall on deaf ears if the intervention message is mixed, says new research.

- [**Abusive bosses experience short-lived benefits**](#) [周四, 28 9月 22:12]

Being a jerk to your employees may actually improve your well-being, but only for a short while, suggests new research on abusive bosses.

- [**Self-esteem in kids: Lavish praise is not the answer, warmth is**](#) [周四, 28 9月 20:51]

How do children construct views of themselves and their place in the world? Children's social relationships turn out to be critical. For example, children develop higher self-esteem when their parents treat them warmly. But they develop lower self-esteem when their parents lavish them with inflated praise.

- [**Achieving U.S. National HIV/AIDS Strategy targets would save lives, be cost effective**](#) [周四, 28 9月 20:47]

An analysis shows that achieving the treatment targets of the National HIV/AIDS Strategy by 2020 not only would prevent hundreds of thousands of new infections and deaths but also would demonstrate excellent value.

- [**No evidence to support claims that telephone**](#)

[consultations reduce GP workload or hospital referrals](#) [周四, 28 9月 06:44]

Telephone consultations to determine whether a patient needs to see their GP face-to-face can deal with many problems, but a new study found no evidence to support claims by companies offering to manage these services or by NHS England that the approach saves money or reduces the number of hospital referrals.

[Health and social care changes 'paving way for fewer services' warn experts](#) [周四, 28 9月 06:44]

Current reforms to health and social care services, and radical redesign of the local government finance system, may signal the end of the NHS and local government in England as we know them, warn experts.

[Should we welcome plans to sell off wasted NHS land?](#) [周四, 28 9月 06:44]

With the NHS under severe financial pressure, should we welcome plans to raise capital by selling off inefficiently used land and buildings owned by the health service? Experts debate the issue in a new article.

[New test rapidly diagnoses Zika](#) [周四, 28 9月 04:20]

Researchers have developed a paper-based test that can diagnose Zika infection within 20 minutes. Unlike existing tests, the new diagnostic does not cross-react with Dengue virus, a close relative of the Zika virus that can produce false positives on many Zika tests.

[Citizen science can predict butterfly population trends](#) [周四, 28 9月 00:36]

New research shows that citizen scientists can play a role in gathering meaningful information to inform long-term monitoring of biodiversity trends such as butterfly population change.

[Iron supplements have long-term benefits for low birth-weight babies](#) [周四, 28 9月 00:36]

Babies classified as low birth weight (under 2,500 grams) are at risk of iron deficiency, which is linked to impaired neurological development.

A long-term randomized study now shows that providing such babies with iron supplements can prevent behavioral problems at school age.

- [**Teens' online friendships just as meaningful as face-to-face ones**](#) [周三, 27 9月 22:54]

Many parents worry about how much time teenagers spend texting, sharing selfies and engaging in other online activities with their friends. However, according to a recent research synthesis, many of these digital behaviors serve the same purpose and encompass the same core qualities as face-to-face relationships.

- [**Coping with stressful organizational change**](#) [周三, 27 9月 21:51]

Stress is not a recent phenomenon, but the modern work environment seems to highlight its detrimental effects on employees. This is no more obvious than during times of organizational change. New research considers the impact of such changes on workers in a healthcare authority in New Zealand, highlighting the problems that any organization might face under such circumstances and pointing to possible methods to cope and remediate employee stress.

- [**Monetizing time savings makes toll roads financially stack up**](#) [周三, 27 9月 21:34]

Putting a dollar value on the savings from traffic congestion, noise and air pollution as a result of toll roads and tunnels will make large infrastructure projects more cost effective, according to a new study.

- [**A record number of Americans viewed the 2017 solar eclipse**](#) [周三, 27 9月 02:36]

Eighty-eight percent of American adults viewed the August total solar eclipse directly or electronically. This audience of 215 million adults is nearly twice the size of the viewership of recent Super Bowl football games.

- [**Do deep promotional discounts work? New study sheds light on strategy**](#) [周三, 27 9月 01:53]

Promotional discounts increase store traffic and lead to higher overall

profits, especially if the advertised products are staples – items such as meat and produce that are purchased frequently and by many customers.

- [**Potential Zika vaccine protects against pregnancy transmission and testicular damage**](#) [周三, 27 9月 00:51]

For the first time, a research team led has shown that a potential Zika vaccine quickly can protect fetuses against infection as well as protect males against testicular infection and injury. It also prevents a lowered sperm count after one vaccination.

- [**Discovery: Bernie Sanders spider**](#) [周二, 26 9月 22:55]

Students and a scientist have discovered 15 new species of 'smiley-faced' spiders -- and named them after, among others, David Attenborough, Barack Obama, Michelle Obama, Leonardo DiCaprio, and Vermont Senator Bernie Sanders.

- [**Interventions for reducing hepatitis C infection in people who inject drugs**](#) [周二, 26 9月 22:54]

The first global review to quantify the impact of needle syringe programs (NSP) and opioid substitution treatment (OST) in reducing the risk of becoming infected with the hepatitis C virus has now been published. The study has implications for millions of people who are 'at risk' from infection.

- [**Household chores: Women still do more**](#) [周二, 26 9月 22:54]

Women of all ages still tend to do more household chores than their male partners, no matter how much they work or earn in a job outside the home. New findings demonstrate the persistent gendered nature of how housework is divided.

- [**Preschool teachers need better training in science**](#) [周二, 26 9月 22:54]

Preschool instructors appear to lack the knowledge, skills and confidence to effectively teach their young students science -- a problem that is likely contributing to America's poor global performance in this crucially important subject.

• **[Teachers report weaker relationships with students of color, children of immigrants](#)** [周二, 26 9月 22:54]

The relationship between teachers and students is a critical factor for academic success. However, a new study finds that teachers report weaker relationships with children of immigrants and adolescents of color.

• **[Escaping wildfires](#)** [周二, 26 9月 21:15]

A new study is the first attempt to map escape routes for wildland fire fighters from an aerial perspective. The researchers used LiDAR technology to analyze the terrain slope, ground surface roughness and vegetation density of a fire-prone region in central Utah, and assessed how each landscape condition impeded a person's ability to travel.

• **[Drought: A cause of riots](#)** [周二, 26 9月 21:05]

The scientific community has been working on the possibility of a relationship between periods of drought and rioting for several years. Now a team has formally verified this hypothesis by studying almost 1,800 riots that occurred over a 20-year period in sub-Saharan Africa. The researchers observed a systematic link between the sudden depletion of water resources and the outbreak of unrest. They also succeeded in quantifying the impact of geographic and social factors on the same link.

• **[People are reluctant to use public defibrillators to treat cardiac arrests](#)** [周二, 26 9月 20:59]

A new study suggests that people are reluctant to use public-access defibrillators to treat cardiac arrests.

• **[Psychological impacts of natural disasters on youth](#)** [周二, 26 9月 04:32]

A researcher is fully aware of children's reaction to trauma. Her research focuses on the impact of disasters on youth since Hurricane Andrew in 1992. La Greca has been evaluating how best to define post-traumatic stress disorder (PTSD) in children. This line of research will help to quickly identify the children who need support services post-disaster and

identify key aspects of the post-disaster environment that facilitate their recovery.

• **[Are children who see movie characters use guns more likely to use them?](#)** [周二, 26 9月 01:29]

Children who watched a PG-rated movie clip containing guns played with a disabled real gun longer and pulled the trigger more often than children who saw the same movie not containing guns.

• **[Climate insurance is rarely well thought out in agriculture](#)** [周一, 25 9月 23:33]

Internationally subsidised agricultural insurance is intended to protect farmers in developing countries from the effects of climate change. However, it can also lead to undesirable ecological and social side effects, as researchers have now explained. Their article also contains recommendations for improved insurance schemes which in future should also take account of ecological and social aspects in addition to economic issues.

• **[Group project? Taking turns, working with friends may improve grades](#)** [周一, 25 9月 23:33]

A new study with college students has found that the social dynamics of a group, such as whether one person dominates the conversation or whether students work with a friend, affect academic performance. Put simply, the more comfortable students are, the better they do, which yields benefits beyond the classroom.

• **[Fully renewable India in 2050 can take a shortcut to emission-free future](#)** [周一, 25 9月 23:16]

India can function on a fully renewable electricity system in 2050, research indicates. The study shows that developing countries that have an abundance of renewable resources do not need to take the path of the western countries where increasing living standards have been coupled with heavy emissions from electricity generation and other industry. They can move straight to renewable systems and do it cheaply.

- **[Clarifying perspectives to promote action on loss and damage from climate change](#)** [周一, 25 9月 23:13]

The hurricanes Harvey, Irma and Maria highlight the potential for the climate system to cause loss and damage. 'Loss and damage' is a phrase used in different ways by people who work on climate policy, negotiation and adaptation/resilience. A new study clarifies these different perspectives which is a key issue now that the United Nations Framework Convention on Climate Change, UNFCCC, is encouraging creation and implementation of actions to address loss and damage from climate change.

- **[Visual attention drawn to meaning, not what stands out](#)** [周一, 25 9月 23:13]

Our visual attention is drawn to parts of a scene that have meaning, rather than to those that are salient or 'stick out,' according to new research. The findings overturn the widely held model of visual attention.

- **[World's botanic gardens contain a third of all known plant species, and help protect the most threatened](#)** [周一, 25 9月 23:13]

The most in-depth species survey to date finds an 'astonishing array' of plant diversity in the global botanic garden network, including 41 percent of all endangered species. However, researchers find a significant imbalance between tropical and temperate plants, and say even more capacity should be given to conservation, as there is 'no technical reason for plant species to become extinct.'

- **[Scientists call for more research on how human activities affect the seabed](#)** [周一, 25 9月 22:47]

Extensive research has been released into how industry and environmental change are affecting our seafloors. Researchers say more work is needed to help safeguard these complex ecosystems and the benefits they provide to people for the future.

[New technique spots warning signs of extreme events](#) [周日, 24 9月 22:38]

Engineers have devised a framework for identifying key patterns that precede an extreme event. The framework can be applied to a wide range of complicated, multidimensional systems to pick out the warning signs that are most likely to occur in the real world.

Strange & Offbeat News

Quirky stories from all of ScienceDaily's health, technology, environment, and society sections.

- [**Small collisions make big impact on Mercury's thin atmosphere**](#) [周五, 29 9月 23:29]

Mercury, our smallest planetary neighbor, has very little to call an atmosphere, but it does have a strange weather pattern: morning micro-meteor showers.

- [**New clues from brain structures of mantis shrimp**](#) [周五, 29 9月 21:33]

New research sheds new light on the evolution of some of the earliest brain structures, and stirs up new, intriguing questions about the origins of centers that support learning and memory.

- [**Solving the mystery of Pluto's giant blades of ice**](#)

[周五, 29 9月 03:24]

NASA's New Horizons mission revolutionized our knowledge of Pluto when it flew past that distant world in July 2015. Among its many discoveries were images of strange formations resembling giant knife blades of ice, whose origin had remained a mystery. Now, scientists have turned up a fascinating explanation for this "bladed terrain": the structures are made almost entirely of methane ice, and likely formed as a specific kind of erosion wore away their surfaces.

- [**Farthest active inbound comet yet seen**](#) [周五, 29 9月 03:23]

NASA's Hubble Space Telescope has photographed the farthest active inbound comet ever seen, at a whopping distance of 1.5 billion miles from the Sun (beyond Saturn's orbit). Slightly warmed by the remote Sun, it has already begun to develop an 80,000-mile-wide fuzzy cloud of dust, called a coma, enveloping a tiny, solid nucleus of frozen gas and

dust. These observations represent the earliest signs of activity ever seen from a comet entering the solar system's planetary zone for the first time.

- [**A fresh look at older data yields a surprise near the Martian equator**](#) [周五, 29 9月 03:22]

Scientists taking a new look at older data from NASA's longest-operating Mars orbiter have discovered evidence of significant hydration near the Martian equator -- a mysterious signature in a region of the Red Planet where planetary scientists figure ice shouldn't exist.

- [**Chimpanzees can learn how to use tools without observing others**](#) [周四, 28 9月 21:42]

New observations have led researchers to believe that chimpanzees can use tools spontaneously to solve a task, without needing to watch others first.

- [**Soft, flexible origami-inspired robot**](#) [周三, 27 9月 22:23]

A Case Western Reserve University researcher has turned the origami she enjoyed as a child into a patent-pending soft robot that may one day be used on an assembly line, in surgery or even outer space.

- [**Lost continent of Zealandia: Scientists return from expedition to sunken land**](#) [周三, 27 9月 11:59]

After a nine-week voyage to study the lost, submerged continent of in the South Pacific, a team of 32 scientists from 12 countries has arrived in Hobart, Tasmania, aboard the research vessel JOIDES Resolution.

- [**Innovative control system paves the way for large scale universal quantum computing**](#) [周三, 27 9月 01:30]

Future quantum computers promise exponential scaling in computing power with linearly increasing number of qubits. However, harnessing this power is challenging due to the complexity of controlling a large number of qubits simultaneously. A solution to this problem has now been engineered.

- [**Discovery: Bernie Sanders spider**](#) [周二, 26 9月 22:55]

Students and a scientist have discovered 15 new species of 'smiley-faced' spiders -- and named them after, among others, David Attenborough, Barack Obama, Michelle Obama, Leonardo DiCaprio, and Vermont Senator Bernie Sanders.

- [**Pigeons better at multitasking than humans**](#) [周二, 26 9月 21:05]

Pigeons are capable of switching between two tasks as quickly as humans -- and even more quickly in certain situations. These are the findings of biopsychologists who had performed the same behavioral experiments to test birds and humans. The authors hypothesize that the cause of the slight multitasking advantage in birds is their higher neuronal density.

- [**After 15 years in a vegetative state, nerve stimulation restores consciousness**](#) [周二, 26 9月 01:29]

A 35-year-old man who had been in a vegetative state for 15 years after a car accident has shown signs of consciousness after neurosurgeons implanted a vagus nerve stimulator into his chest. The findings show that vagus nerve stimulation (VNS) -- a treatment already in use for epilepsy and depression--can help to restore consciousness even after many years in a vegetative state.

- [**Bacterial nanosized speargun works like a power drill**](#) [周二, 26 9月 01:28]

In order to get rid of unpleasant competitors, some bacteria use a sophisticated weapon -- a nanosized speargun. Researchers have now gained new insights into the construction, mode of action and recycling of this weapon. The speargun drills a hole into the neighboring cells in only a few thousandths of a second and injects a cocktail of toxins.

- [**Lava tubes: Hidden sites for future human habitats on the Moon and Mars**](#) [周一, 25 9月 23:28]

Lava tubes, underground caves created by volcanic activity, could provide protected habitats large enough to house streets on Mars or even

towns on the Moon, according to new research. A further study shows how the next generation of lunar orbiters will be able to use radar to locate these structures under the Moon's surface.

• [**Genes are controlled by 'Nano footballs,' scientists discover**](#) [周一, 25 9月 23:12]

Genes are controlled by 'nano footballs' -- structures that look like footballs but 10 million times smaller than the average ball -- new research has revealed.

• [**Fish have surprisingly complex personalities**](#) [周一, 25 9月 21:54]

Tiny fish called Trinidadian guppies have individual 'personalities', new research shows.
